UNITED STATES PATENT OFFICE.

SIMON KORPER, OF NEW YORK, N. Y.

MANICURING IMPLEMENT.

No. 847,012.

Specification of Letters Patent.

Patented March 12, 1907.

Application filed November 20, 1906. Serial No. 344,196.

To all whom it may concern:

Be it known that I, SIMON KORPER, a citizen of the United States, residing in New York, in the borough of Manhattan, county and State of New York, have invented certain new and useful Improvements in Manicuring Implements, of which the following is a specification.

This invention relates to a manicuring implement in which the advantages of two different implements are combined so as to facilitate the manicuring of the nails; and the invention consists of a manicuring implement which comprises a handle portion, a flat beveled portion having a layer of abrasive material at one end, and a skin and nail treating device at the opposite end of the handle.

In the accompanying drawings, Figure 1 represents a front view of my improved manicuring implement, showing a combination of nail, file and treating tool. Fig. 2 is a side elevation of the same. Figs. 3 and 4 are transverse sections on lines 3-3 and 4-4, respectively, Fig. 1; and Figs. 5, 6, and 7 are different views showing the combination of the nail-file with different treating-tools.

Similar letters of reference indicate corresponding parts in the several figures.

My improved manicuring implement is preferably made of wood, celluloid, or pearl and composed of a middle portion or handle *a* and a flat beveled portion *b* at one end of the handle, which is covered at one or both sides with a layer of abrading material *c*, such as finely-pulverized emery, secured thereto by means of some adhesive substance, such as glue, so as to form a file for

the nails. One side instead of being provided with a layer of abrasive material may be provided with a layer of chamois or similar material for polishing the nails.

At the opposite end of the handle portion *a* is arranged a tapering point *d* for cleaning the nails or a flattened portion *e*, *e'*, or *e''* with a round, straight, or inclined end, respectively, for performing the different operations for pushing back the skin at the inner end and sides of the nail. Four of these implements form a manicuring set by which the filing, cleaning, and polishing of the nails and the pushing back of the skin surrounding the nails can be quickly and conveniently accomplished.

Having thus described my invention, I claim as new and desire to secure by Letters Patent—

1. A manicuring implement comprising a middle or handle portion, a flat end provided with abrasive material so as to be used for a nail-file, and a nail and skin treating device formed at the opposite end of the handle.

2. A manicuring implement comprising a middle portion or handle, a flat beveled portion at one end of the same provided at one side with an abrasive substance and at the other side with a soft polishing layer, and at the opposite end of the handle a nail and skin treating device.

In testimony that I claim the foregoing as my invention I have signed my name in presence of two subscribing witnesses.

SIMON KORPER.
