(54) Title: FORMULATIONS AND METHODS FOR TREATMENT OF INFLAMMATORY SKIN DISEASES

FIG. 1

(57) Abstract: Topically administrable compositions and methods are included for treating inflammatory skin disease in mammals. The composition includes a therapeutic amount of antihistamine selected from the group consisting of a non-sedating antihistamine, a physiologically acceptable acid of a non-sedating antihistamine, a salt of a non-sedating antihistamine, an amide of a non-sedating antihistamine, and a combination of two or more of these, and emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination of these. The composition further includes a therapeutic amount of topical corticosteroid. The combination of non-sedating antihistamine and corticosteroid with emu oil has been found to produce a synergistic effect that is more effective in the treatment of inflammatory skin disease than the compounds used separately.

FORMULATIONS AND METHODS FOR TREATMENT OF INFLAMMATORY SKIN DISEASES

PRIORITY

[0001] This application is related to, and claims the priority benefit of, U.S. Provisional Patent Application Serial Nos. 61/624,725, filed April 16, 2012, and 61/725,761, filed November 13, 2012, both of which are hereby incorporated by reference in their entirety into this disclosure.

BACKGROUND

[0002] The emu (*Dromiceius novae-hollandiae*) is the second largest member of the group of flightless birds and is indigenous to Australia. Emus can be raised like ordinary farm animals and used for their valuable products, which include very low fat meat, supple leather hides, decorative and nutritional eggs, and rich oil. Emu oil may be extracted or rendered from the body fat of the emu and is known to contain triglyceride esters of long-chain saturated and unsaturated fatty acids, including oleic acid, linoleic acid, palmitic acid, and stearic acid.

[0003] Atopic dermatitis and other forms of eczema are inflammatory, pruritic (i.e., itchy) skin diseases that affect between 10 and 20 percent of the United States (U.S.) population, causing considerable morbidity, poor quality of life, and high medical costs for both the patient and society. Topically administered glucocorticoids are a main form of therapy; however, prolonged use of topical glucocorticoids is associated with skin thinning, permanent stretch marks, dermal atrophy, rebound effects, tachyphylaxis, and potential systemic absorption, which can cause numerous systemic side effects. Topical calcineurin inhibitors (e.g., Elidel[®] and Protopic[®] creams and ointments) are effective but are infrequently used as a result of FDA-required "black box" warnings concerning a potential increase in systemic malignancies in patients using these topical preparations.

[0004] Psoriasis is also a chronic pruritic inflammatory skin disease affecting 2% of the U.S. population. Inflammation and tumor necrosis factor-alpha ("TNF-alpha") are of crucial

importance in the pathogenesis of psoriasis and its treatment. Based on the severity of the disease presentation, topical glucocorticoids and vitamin D analogs, either by themselves or in combination with phototherapy or systemic agents (such as methotrexate, cyclosporine A, Humira[®], Stelara[®], Soriatane[®], etc.), have been used for therapy. However, these agents can be extremely expensive, costing more than \$20,000 per year per patient.

[0005] Histamine is a compound involved in local immune responses of humans and other animals. As part of an immune response to foreign pathogens, histamine is produced by basophils and mast cells found in nearby connective tissues. Upon release from these cells, histamines produce increased vascular permeability, causing fluid to escape from capillaries into tissues, which can lead to inflammation and itchiness, among other responses. Histamine triggers an immune system response by combining with specific cellular histamine receptors. The four histamine receptors that have been discovered in humans and animals are designated H₁ through H₄. Compounds, known as antihistamines, have been developed that do not prevent the release of histamine but instead inhibit the action of histamine by blocking it from attaching to the histamine receptors. Most commonly used antihistamines inhibit action specifically at the H₁ receptor and are referred to as H₁ antihistamines. While some H₁ antihistamines have sedative side effects, so-called "second generation" or "non-sedating" antihistamines do not cross the blood-brain barrier and, thus, do not cause drowsiness. Further, not all H₁ antihistamines inhibit the inflammatory response that results from the release of histamine in humans.

[0006] Extensive investments of time and capital are required to obtain Federal Drug Administration (FDA) approval to sell and market a new drug. The cost of approval is one reason that only three topical dermatological drugs were approved by the FDA in the last five years. Instead, pharmaceutical companies are primarily directing their efforts to develop and patent new delivery systems and formulations to more efficiently carry active ingredients

(i.e., drugs) through the stratum corneum skin barrier. These new formulations include solid lipid nanoparticles, liposomes and niosomes, transferosomes, ethosomes, cyclodextrins, and sol-gel microcapsules.

[0007] Accordingly, there is a need for an anti-inflammatory, antipruritic, moisturizing topical formulation for treating atopic dermatitis, psoriasis, and other inflammatory diseases of the skin without the side effects of chronic topical steroid use.

BRIEF SUMMARY

[0008] According to one aspect of the present invention, a composition for the treatment of inflammatory skin diseases is disclosed. In at least one embodiment, a topically administrable composition for treating inflammatory skin disease in mammals includes a therapeutic amount of antihistamine selected from the group consisting of a non-sedating antihistamine, a physiologically acceptable acid of a non-sedating antihistamine, a salt of a non-sedating antihistamine, an amide of a non-sedating antihistamine, and a combination of two or more thereof, and emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof.

[0009] In at least one embodiment, the non-sedating antihistamine is selected from the group consisting of cetirizine, levocetirizine, loratadine, fexofenadine, rupatadine, acrivastine, ebastine, bilastine, and a combination of two or more thereof. The physiologically acceptable acid of the non-sedating antihistamine is selected from the group consisting of an acid of cetirizine, an acid of levocetirizine, an acid of loratadine, an acid of fexofenadine, an acid of rupatadine, an acid of acrivastine, an acid of ebastine, an acid of bilastine, and a combination of two or more thereof. The non-sedating antihistamine is selected from the group consisting of a salt of cetirizine, a salt of levocetirizine, a salt of loratadine, a salt of fexofenadine, a salt of rupatadine, a salt of acrivastine, a salt of ebastine, a salt of bilastine, and a combination of two or more thereof. The amide of a non-sedating antihistamine is selected from the group

consisting of an amide of cetirizine, an amide of levocetirizine, an amide of loratadine, an amide of fexofenadine, an amide of rupatadine, an amide of acrivastine, an amide of ebastine, an amide of bilastine, and a combination of two or more thereof.

[0010] In at least one embodiment, the composition includes 0.1 to 5.0 wt.-% of the antihistamine and at least 75 wt.-% of the emu oil product. In at least one embodiment, the composition includes 2.0 wt.-% of the antihistamine, and at least 85 wt.-% of the emu oil product.

[0011] In at least one embodiment, the composition includes a therapeutic amount of topical corticosteroid. The topical corticosteroid is selected from the group consisting of desoximethasone, fluocinonide, halcinonide, amcinonide, hydrocortisone, and a combination of two or more thereof. In at least one embodiment, the composition includes 0.1 to 3.0 wt.-% of the topical corticosteroid, 0.1 to 5.0 wt.-% of the antihistamine, and at least 75 wt.-% of the emu oil product. In at least one embodiment the composition includes 0.25 wt.-% of the topical corticosteroid, 2.0 wt.-% of the antihistamine, and at least 85 wt.-% of the emu oil product. In at least one embodiment, the composition includes 1.0 wt.-% of the topical corticosteroid, 2.0 wt.-% of the antihistamine, and at least 85 wt.-% of the emu oil product.

[0012] In at least one embodiment, the composition further includes a preservative, and a neutral emulsifying agent. In at least one embodiment, the composition includes 0.1 to 1.0 wt.-% of preservative. In at least one embodiment, the composition includes 0.2 wt.-% of preservative. In at least one embodiment, the preservative includes methylparaben and the emulsifying agent includes propylene glycol.

[0013] In at least one embodiment, the antihistamine is selected from the group consisting of cetirizine, a physiologically acceptable acid of cetirizine, a salt of cetirizine, an amide of cetirizine, and a combination of two or more thereof. In at least one embodiment, the antihistamine is selected from the group consisting of levocetirizine, a physiologically

acceptable acid of levocetirizine, a salt of levocetirizine, an amide of levocetirizine, and a combination of two or more thereof. In at least one embodiment, the composition includes antihistamine selected from the group consisting of cetirizine, a physiologically acceptable acid of cetirizine, a salt of cetirizine, an amide of cetirizine, and a combination of two or more thereof, and the topical corticosteroid is desoximethasone. In at least one embodiment, the composition includes antihistamine selected from the group consisting of levocetirizine, a physiologically acceptable acid of levocetirizine, a salt of levocetirizine, an amide of levocetirizine, and a combination of two or more thereof, and the topical corticosteroid is desoximethasone. In at least one embodiment, the composition includes antihistamine selected from the group consisting of cetirizine, a physiologically acceptable acid of cetirizine, a salt of cetirizine, an amide of cetirizine, and a combination of two or more thereof, and the topical corticosteroid is hydrocortisone. In at least one embodiment, the composition includes antihistamine selected from the group consisting of levocetirizine, a physiologically acceptable acid of levocetirizine, a salt of levocetirizine, an amide of levocetirizine, and a combination of two or more thereof, and the topical corticosteroid is hydrocortisone.

[0014] According to one aspect of the present invention, a method of treating inflammatory skin disease in mammals is disclosed. The method includes topically applying to the skin of a mammal a topically administrable composition including a therapeutic amount of antihistamine selected from the group consisting of a non-sedating antihistamine, a physiologically acceptable acid of a non-sedating antihistamine, a salt of a non-sedating antihistamine, an amide of a non-sedating antihistamine, and a combination of two or more thereof, and emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof. The method further includes repeating the topical application of the composition as indicated for resolution or control of the skin

disease. In at least one embodiment, the method includes applying a composition further including a topical corticosteroid.

[0015] According to one aspect of the present invention, a kit for treating inflammatory skin disease in mammals is disclosed. The kit includes a first composition, where the first composition includes a therapeutic amount of a first antihistamine selected from the group consisting of a first non-sedating antihistamine, a first physiologically acceptable acid of a non-sedating antihistamine, a first salt of a non-sedating antihistamine, a first amide of a non-sedating antihistamine, and a combination of two or more thereof, and a first emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof. The kit further includes a second composition, where the second composition includes a therapeutic amount of a second antihistamine selected from the group consisting of a second non-sedating antihistamine, a second physiologically acceptable acid of a non-sedating antihistamine, a second salt of a non-sedating antihistamine, a second amide of a non-sedating antihistamine, and a combination of two or more thereof; a therapeutic amount of topical corticosteroid; and a second emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof.

[0016] In at least one embodiment, a method of treating inflammatory skin disease in mammals includes topically applying to the skin of a mammal a topically administrable first composition that includes a therapeutic amount of a first antihistamine selected from the group consisting of a first non-sedating antihistamine, a first physiologically acceptable acid of a non-sedating antihistamine, a first salt of a non-sedating antihistamine, a first amide of a non-sedating antihistamine, and a combination of two or more thereof; a therapeutic amount of topical corticosteroid; and a first emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof. The method

further includes repeating the topical application of the first composition as indicated for resolution or control of the skin disease. The method further includes topically applying a topically administrable second composition that includes a therapeutic amount of a second antihistamine selected from the group consisting of a second non-sedating antihistamine, a second physiologically acceptable acid of a non-sedating antihistamine, a second salt of a non-sedating antihistamine, a second amide of a non-sedating antihistamine, and a combination of two or more thereof; and a second emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof. The method further includes repeating the topical application of the second composition as indicated for one or more benefits, such benefits selected from the group consisting of control of the skin disease, prevention of recurrence of the skin disease, and avoiding side effects of the first composition. The method further includes topically applying the first composition as indicated to control recurrence of the skin disease.

[0017] In at least one embodiment, the first non-sedating antihistamine and the second non-sedating antihistamine are selected from the group consisting of cetirizine, levocetirizine, loratadine, fexofenadine, rupatadine, acrivastine, ebastine, bilastine, and a combination of two or more thereof. In at least one embodiment, the first acid of the non-sedating antihistamine and the second acid of the non-sedating antihistamine are selected from the group consisting of an acid of cetirizine, an acid of levocetirizine, an acid of loratadine, an acid of fexofenadine, an acid of rupatadine, an acid of acrivastine, an acid of ebastine, an acid of bilastine, and a combination of two or more thereof. In at least one embodiment, the first salt of the non-sedating antihistamine and the second salt of the non-sedating antihistamine are selected from the group consisting of a salt of cetirizine, a salt of levocetirizine, a salt of loratadine, a salt of fexofenadine, a salt of rupatadine, a salt of acrivastine, a salt of ebastine, a salt of bilastine, and a combination of two or more thereof. In at least one embodiment, the

first amide of a non-sedating antihistamine and the second amide of a non-sedating antihistamine are selected from the group consisting of an amide of cetirizine, an amide of levocetirizine, an amide of loratadine, an amide of fexofenadine, an amide of rupatadine, an amide of acrivastine, an amide of ebastine, an amide of bilastine, and a combination of two or more thereof. In at least one embodiment, the first antihistamine and the second antihistamine are the same antihistamine.

[0018] In at least one embodiment, the first composition and the second composition each include 0.1 to 5.0 wt.-% of antihistamine and at least 75 wt.-% of the emu oil product. In at least one embodiment, the first composition and the second composition each include 2.0 wt.-% of antihistamine and at least 85 wt.-% of the emu oil product. In at least one embodiment, the first composition includes 0.1 to 3.0 wt.-% of the topical corticosteroid. In at least one embodiment, the first composition includes 0.25 wt.-% of topical corticosteroid. In at least one embodiment, the first composition includes 1.0 wt.-% of topical corticosteroid. In at least one embodiment, the inflammatory skin disease is selected from the group consisting of psoriasis, atopic dermatitis, eczema, forms of eczema, rash, and a combination of two or more thereof.

BRIEF DESCRIPTION OF THE DRAWINGS

[0019] FIG. 1 shows a method of treating inflammatory skin disease according to the present disclosure;

[0020] FIG. 2 shows a method of treating inflammatory skin disease according to the present disclosure; and

[0021] FIG. 3 shows a method of treating inflammatory skin disease according to the present disclosure.

DETAILED DESCRIPTION

[0022] The present application discloses various formulations and methods for using the same for the treatment of inflammatory skin diseases in mammals. According to one aspect of the present disclosure, a formulation for the treatment of psoriasis, atopic dermatitis, and other forms of eczema, rash, and other inflammatory skin diseases is disclosed. For the purposes of promoting an understanding of the principles of the present disclosure, reference will now be made to various embodiments and specific language will be used to describe the same. It will nevertheless be understood that no limitation of the scope of this disclosure is thereby intended, such alterations, modifications, and further applications of the principles of the disclosure being contemplated as would normally occur to one skilled in the art to which the disclosure relates.

[0023] A number of explanations and clinical trials are provided by way of explanation and not limitation. No theory of how the disclosure operates is to be considered limiting, whether proffered by virtue of description, comparison, or example. For the purposes of this disclosure, the term "emu oil" refers to lipid compositions, oils, and preparations of oils derived from the emu.

[0024] Emu oil, extracted or rendered from the body fat of the emu bird, has a number of beneficial properties for the treatment of inflammatory skin diseases. The beneficial properties of emu oil include that emu oil is noncomedogenic, antibacterial, moisturizing, anti-inflammatory, emulsifying, enhances transdermal penetration, and has a low potential for skin irritation. Taking each of these beneficial properties in turn, emu oil is noncomedogenic, meaning emu oil will not clog skin pores. Other oils tend to clog pores in skin, which can result in the development of acne. Such other oils include synthetic oils, like mineral oils, or animal oils, like mink or lard. Moreover, emu oil has been demonstrated to be antibacterial and moisturizing to skin. Bacterial secondary colonization and infection play important roles in the pathogenesis of atopic dermatitis, and the antibacterial properties of emu oil address

this contributing factor. Further, moisturizers by themselves are therapeutic agents in the treatment of patients with psoriasis, atopic dermatitis, and other forms of eczema because moisturizers can improve skin hydration and normalize keratinocyte differentiation.

[0025] Emu oil has excellent skin barrier penetrating features and can enhance the transdermal penetration of active compounds, compounds otherwise unable to effectively treat disease beyond the epidermis. Emu oil is known to contain triglyceride esters of long-chain saturated and unsaturated fatty acids, including oleic acid, linoleic acid, palmitic acid, and stearic acid. Table 1 contains the typical chemical composition of emu oil which, being almost entirely triglyceride in nature, is a nearly completely neutral lipid. The transdermal penetration properties of emu oil are generally attributable to oleic acid, which enables penetration by fluidizing the intercellular lipids of the stratum corneum. However, studies of various long-chain fatty acids, including oleic acid, used as penetration enhancers have not reported a synergistic effect of using this particular property of emu oil with other active compounds as described herein.

[0026] Two other valuable properties of emu oil for a topical treatment delivery system are its emulsifying properties and low potential for irritation. Such emulsifying properties, absent the potential for irritation, enable emu oil to serve as both a carrier and an active compound in a formulation. In addition to the beneficial properties mentioned above, emu oil has anti-inflammatory properties. For example, topically administered emu oil has been shown to be as effective as orally administered, high-dose ibuprofen. Research suggests that at least some of emu oil's anti-inflammatory properties are due to TNF-alpha inhibition, which is a key target inflammatory molecule in systemic psoriasis therapy. Examples of prescription treatments for systemic psoriasis that operate by inhibiting TNF-alpha include Enbrel[®] and Humira[®]. However, prior to the present disclosure, no topical formulation with TNF-alpha inhibitory effects has been used to treat inflammatory or any other disease of the

skin. Therefore, emu oil may act as a therapeutic agent for some skin diseases independent of any other active compound.

[0027] Certain of the beneficial properties of emu oil are most effective in treating specific types of skin diseases and less effective on others. Nonetheless, by combining emu oil with additional active compounds, the beneficial properties of emu oil may potentiate the therapeutic effects of both the emu oil and the additional active compounds. Accordingly, in at least one embodiment of the present disclosure, emu oil may be included in a formulation to dissolve one or more additional active compounds, carry the one or more additional active compounds through the skin barrier, and provide one or more therapeutic effects that are synergistically enhanced by the combination with the one or more additional active compounds.

[0028] In at least one embodiment according to the present disclosure, emu oil may be combined with a non-sedating antihistamine compound to treat inflammatory skin diseases such as psoriasis and atopic dermatitis. One non-limiting example of a non-sedating antihistamine is cetirizine. Cetirizine is commonly used orally to treat hay fever, urticaria (i.e., hives), angioedema, and allergies. In addition to antiallergic, bronchodilatory, and antispasmodic properties, cetirizine has numerous pharmacological effects that are highly useful for the treatment of inflammatory skin disease if used as a topical agent.

[0029] As a potent second-generation antihistamine, cetirizine has antipruritic properties that are very beneficial in treating inflammatory skin conditions, particularly atopic dermatitis, which has been described as a vicious cycle of itch-scratch-itch. In addition to relieving the symptoms of itch, antipruritic antihistamines help to prevent progression of the disease by suppressing the scratching impulse (i.e., the so-called Koebner phenomenon). Moreover, as a second-generation, non-sedating antihistamine, cetirizine has an excellent safety profile, which enables cetirizine (marketed as Zyrtec®) to be sold over-the-counter without a

prescription. Further, cetirizine and its related isomers are unique among non-sedating antihistamines in that each has various anti-inflammatory properties useful for the treatment of inflammatory skin disease. Namely, cetirizine inhibits expression of adhesion molecules in patients with both atopic dermatitis and psoriasis and inhibits both T lymphocytes and monocytes, which play a central role in the pathogenesis of atopic dermatitis and psoriasis. Finally, cetirizine exerts anti-inflammatory effects on neutrophils apart from H₁ antagonism and inhibits eosinophil-related skin inflammation.

[0030] The anti-inflammatory properties of cetirizine are distinct from its other H₁ antihistamine features. For example, diphenhydramine (marketed as Benadryl[®]) is specifically contraindicated to treat inflammatory skin disease, such as eczema and psoriasis. In fact, where sold in the United States, the packaging for diphenhydramine includes a warning label clearly stating that it should not be used on "raw or broken skin" or "areas producing discharge." Other commonly used non-sedating antihistamines that do not have anti-inflammatory properties include loratadine (marketed as Claritin[®]) and fexofenadine (marketed as Allegra[®]). Therefore, not all non-sedating, H₁ antihistamines are appropriate for the treatment of inflammatory skin diseases.

[0031] Though emu oil and cetirizine both have anti-inflammatory properties, each utilizes completely different biochemical pathways. Consequently, instead of enabling merely additive beneficial anti-inflammatory effects, the combination of emu oil and cetirizine provides a synergistic enhancement of the beneficial effects of both active compounds in treating inflammatory skin conditions. Furthermore, emu oil, in addition to being a therapeutic agent, also enables penetration of cetirizine into the skin, thereby improving the efficacy of cetirizine separate from the synergistic effect.

[0032] Cetirizine is a racemic 50/50 mixture of levocetirizine, which is the active enantiomer (or L-stereoisomer), and the much less biologically active enantiomer (or D-stereoisomer).

Like cetirizine, levocetirizine is a non-sedating antihistamine that includes anti-inflammatory properties. Accordingly, in at least one embodiment of the present disclosure, emu oil may be combined with levocetirizine to treat inflammatory skin diseases such as psoriasis and atopic dermatitis. Other non-sedating, anti-inflammatory antihistamines include, but are not limited to rupatadine, acrivastine, ebastine and bilastine.

[0033] In at least one embodiment of the present disclosure, emu oil may be combined with a topical steroid compound, such as a glucocorticoid, to treat inflammatory skin diseases such as psoriasis and atopic dermatitis. Non-limiting examples of topical glucocorticoids include desoximethasone, fluocinonide, halcinonide, amcinonide, and hydrocortisone. Such topical glucocorticoids have anti-inflammatory properties by preventing phospholipid release, decreasing eosinophil action, and a number of other mechanisms. Accordingly, the anti-inflammatory properties of topical glucocorticoids operate by completely different biochemical pathways than either H₁ antihistamines or emu oil.

[0034] Topical steroids are among the most commonly prescribed topical medications for the treatment of rash, eczema, and dermatitis. However, the use of topical steroids comes with a risk of various side effects, including allergic contact dermatitis, steroid-induced dermal atrophy, and tachyphylaxis, among others. Steroid-induced dermal atrophy is a particularly common side effect because glucocorticoids are absorbed at different rates depending on the thickness of the stratum corneum. Consequently, a mild topical steroid that works on the face may achieve little on the palm, but a potent steroid required to treat the thick skin of the palm may quickly cause side effects on the face. As a result, weaker topical steroids generally are utilized for thin-skinned and sensitive areas, especially areas under occlusion, such as the armpit and groin. However, moderate steroids are commonly used for atopic dermatitis and eczema, among others, and strong steroids are used for such conditions as psoriasis, lichen sclerosis, discoid lupus, nummular eczema, and severe atopic dermatitis in adults. When

these conditions appear in thin-skinned and sensitive areas, the risk of steroid-induced dermal atrophy is increased.

[0035] The formulations of the present disclosure enable the use of relatively weaker topical steroids or, alternatively, less frequent use of stronger topical steroids for the treatment of inflammatory skin diseases. In one isolated clinical study performed in connection with the present disclosure, a middle-aged patient with severe lichen sclerosis ("LSA") of the genitals was first given a standard 4-week treatment with an ultra-potent topical glucocorticoid. Though the condition of the LSA greatly improved, the patient developed severe side effects associated with topical steroid therapy, namely, persistent yeast discharge infections and dermal atrophy of the skin. The application of the topical glucocorticoid was decreased to an as-needed basis, which amounted to at least twice a week. However, even at the decreased rate of application, the patient continued to suffer discharge infections and the skin continued to thin due to the dermal atrophy.

[0036] In response, and in accordance with the present disclosure, the therapy was again revised to include the application of emu oil twice a day and topical glucocorticoid on an as-needed basis only. In the following two months, the patient reported that the discharge infections had resolved, as had the symptoms of pain and itching, and the dermal atrophy had ended and reversed. Further, the patient also reported using the topical glucocorticoid only once in the preceding two months. Consequently, the combination of treatments using emu oil and a topical steroid produced a significant and unexpectedly superior outcome to the use of ultra-potent topical glucocorticoid alone. Without being bound to a particular theory, the inventor suggests that the antibacterial, anti-inflammatory, and moisturizing properties of the emu oil were effective in treating the discharge infection and side effects of the topical steroid, while the transdermal penetration properties of emu oil synergistically potentiated the

beneficial effects of the topical steroid, thereby enabling its less frequent but more effective use.

[0037] In at least one embodiment according to the present disclosure, a first formulation 10 may contain by weight 75-100% emu oil, 0.1-5.0% non-sedating antihistamine, and 0.1-1.0% preservative, with the balance being a neutral emulsifying solvent. In at least one embodiment, the first formulation 10 may contain by weight 75-100% emu oil, 0.1-5.0% cetirizine, 0.1-1.0% methylparaben preservative, and the balance propylene glycol or other neutral emulsifying solvent. In at least one embodiment, the first formulation 10 may contain by weight at least 85% emu oil, 2.0% cetirizine, 0.2% methylparaben preservative, and the balance propylene glycol. In at least one embodiment, the first formulation 10 may contain by weight 75-100% emu oil, 0.1-5.0% levocetirizine, 0.1-1.0% methylparaben preservative, and the balance propylene glycol or other neutral emulsifying solvent. In at least one embodiment, the first formulation 10 may contain by weight at least 85% emu oil, 2.0% levocetirizine, 0.2% methylparaben preservative, and the balance propylene glycol.

[0038] In at least one embodiment according to the present disclosure, a second formulation 20 may contain by weight 75-100% emu oil, 0.1-5.0% non-sedating antihistamine, 0.1-3.0% topical steroid, and 0.1-1.0% preservative, with the balance being a neutral emulsifying solvent. In at least one embodiment, the second formulation 20 may contain by weight 75-100% emu oil, 0.1-5.0% cetirizine, 0.1-1.0% desoximethasone, 0.1-1.0% methylparaben preservative, and the balance propylene glycol or other neutral emulsifying solvent. In at least one embodiment, the second formulation 20 may contain by weight at least 85% emu oil, 2.0% cetirizine, 0.25% desoximethasone, 0.2% methylparaben preservative, and the balance propylene glycol. In at least one embodiment, the second formulation 20 may contain by weight 75-100% emu oil, 0.1-5.0% cetirizine, 0.1-2.0% hydrocortisone, 0.1-1.0% methylparaben preservative, and the balance propylene glycol or other neutral emulsifying

solvent. In at least one embodiment, the second formulation 20 may contain by weight at least 85% emu oil, 2.0% cetirizine, 1.0% hydrocortisone, 0.2% methylparaben preservative, and the balance propylene glycol.

[0039] In at least one embodiment according to the present disclosure, the second formulation 20 may contain by weight 75-100% emu oil, 0.1-5.0% levocetirizine, 0.1-1.0% desoximethasone, 0.1-1.0% methylparaben preservative, and the balance propylene glycol or other neutral emulsifying solvent. In at least one embodiment, the second formulation 20 may contain by weight at least 85% emu oil, 2.0% levocetirizine, 0.25% desoximethasone, 0.2% methylparaben preservative, and the balance propylene glycol. In at least one embodiment, the second formulation 20 may contain by weight 75-100% emu oil, 0.1-5.0% levocetirizine, 0.1-2.0% hydrocortisone, 0.1-1.0% methylparaben preservative, and the balance propylene glycol or other neutral emulsifying solvent. In at least one embodiment, the second formulation 20 may contain by weight at least 85% emu oil, 2.0% levocetirizine, 1.0% hydrocortisone, 0.2% methylparaben preservative, and the balance propylene glycol.

[0040] In one aspect of the present disclosure, the formulations disclosed herein may be used in a method 100 of treating inflammatory skin diseases such as atopic dermatitis, rash, and psoriasis as shown in FIG. 1. The method 100 may include a step 110 of applying the first formulation 10 to an affected area of skin. The method 100 may further include a step 120 of periodically repeating application of the first formulation 10 to the affected area of skin until the disease is resolved or controlled. Alternatively, a method 200 for treating inflammatory skin diseases such as atopic dermatitis, rash, and psoriasis is shown in FIG. 2. The method 200 may include a step 210 of applying the second formulation 20 to an affected area of skin. The method 200 may further include a step 220 of periodically repeating application of the second formulation 20 to the affected area of skin until the disease is resolved or controlled.

[0041] In one embodiment according to the present disclosure, a kit 50 may include a package, such as a tube, vial, dispenser, or other suitable container, of the first formulation 10 and a separate package of the second formulation 20. The kit 50 may be used with the methods described herein for the staged or pulsed treatment of inflammatory skin disease. The kit 50 enables a physician to direct a patient to use the second formulation 20, including the combination of emu oil, non-sedating antihistamine, and topical steroid, for a relatively short period of time and for localized areas to clear active inflammatory lesions and then to use the first formulation 10, including the combination of emu oil and non-sedating antihistamine, as a moisturizer to prevent recurrence of the disease, thereby treating the disease while avoiding the side effects of chronic topical steroid use described herein.

[0042] In one aspect of the present disclosure, one or more of the formulations disclosed herein, such as in the kit 50, may be used in a method 300 for treating inflammatory skin diseases as shown in FIG. 3. The method 300 may include a step 310 of periodically applying the second formulation 20 to an affected area of skin for a relatively short period of time. The period of time may be limited by a given patient's tolerance for the specific composition of the second formulation 20, by the sensitivity of the area of the patient's skin under treatment, or by resolution of the skin condition. The method 300 may further include a step 320 of periodically applying the first formulation 10 to an affected area of skin to avoid the side effects of chronic topical steroid use described herein and to prevent recurrence of the disease. Optionally, the method 300 may include a step 330 of repeating the periodic application of the second formulation 20 to the affected area as required to maintain control of chronic disease. For example, the method 300 may include the application of the second formulation 20 (step 310) for two or three consecutive days, followed by the application of the first formulation 10 (step 320), and repeating (step 330) as needed to maintain control of a

particular disease. Such alternating methods of therapy are commonly known as "pulse therapy."

[0043] The efficacy of combining emu oil with non-sedating antihistamine and with topical steroid was determined by the following experiment. The following experiment is illustrative, but not limiting, of the methods and compositions of the present disclosure. Other suitable modifications and adaptations of the variety of conditions and parameters normally encountered in clinical therapy and obvious to those skilled in the art, having the benefit of this disclosure, are within the scope of the present disclosure.

[0044] EXPERIMENT

[0045] In order to determine the efficacy of combining emu oil, a non-sedating antihistamine, and a topical steroid as active compounds for the treatment of inflammatory skin disease, a clinical study was conducted. The study was designed to determine: (i) the efficacy of the active compounds in treating inflammatory skin disease; (ii) whether the active compounds worked synergistically or simply provided additive effects; and (iii) the relative quantifiable effectiveness of the active compounds. As a single blind study, ten research subjects received four tubes of preparations in cream form, labeled as A, B, C, and D, without knowledge of the formulations therein. However, a principal investigator and a study coordinator knew and recorded the formulations contained in each tube. Regarding the active compounds included in the study, Cream A included desoximethasone and cetirizine in an emu oil base, Cream B included desoximethasone in a propylene glycol base, Cream C included desoximethasone in an emu oil base, and Cream D included desoximethasone and cetirizine in a propylene glycol base. Each cream included an identical amount of desoximethasone, namely 0.25% by weight. Further, each cream included methylparaben as a preservative and varying amounts of propylene glycol as a neutral emulsifying solvent. Cream B, which included only desoximethasone as an active compound, was used as a control to provide a reference point

for the degree of improvement observed for the other trial preparations. The study was conducted for 15 days.

[0046] To improve the statistical significance of the results, the study was designed as a comparative half/split body study. Specifically, each research subject applied each of the trial creams to diseased skin on different locations on the subject's body. For example, a given subject applied Cream A to one side of the body and, on the identical abnormal skin condition on the opposite side of the body, applied cream B, C, or D. Consequently, each research subject was his/her own positive and negative control. At the end of the study, each research subject completed a questionnaire specifically asking "which of the four creams worked the best" and asking the subject to numerically rate the efficacy of each cream on a scale of 1 (not effective) to 10 (extremely effective). The subjects' ratings were then multiplied by a factor of ten to enable simple percentage point comparisons between the trial creams. Moreover, each subject was asked to report any systemic or dermatological side effects of the creams, such as irritation, stinging, or pruritus.

[0047] The clinical response of each subject was assessed by the principal investigator, a physician trained, experienced, and Board Certified in dermatology, at the end of the 15-day clinical study by comparing the condition of the subjects to a pre-trial evaluation on the same 1 to 10 scale used by the subjects. Similarly, the physician's evaluations were then multiplied by a factor of ten to enable simple percentage point comparisons between the trial creams. Finally, the study coordinator obtained clinical photographs of all areas treated at the beginning and end of the study.

[0048] The research subjects did not use any other prescription medication or over-the-counter topical preparation during the duration of the study. Informed written consent was obtained prior to initiation of the study from each research subject. No financial compensation was provided to any of the research subjects; however, each received a

complimentary office visit and free medication. Further, at the end of the study, the subjects were offered and received a free complimentary tube of the cream of their choice (either cream A, B, C, or D). The subjects' clinical diagnoses included either psoriasis, atopic dermatitis, or stasis dermatitis.

[0049] Table 2 presents the physician's evaluations of the improvement or worsening of the research subjects' skin conditions by the end of the study, relative to the beginning of the study, for each of the trial creams A, B, C, and D. As shown Table 2, Cream A was rated most effective because it demonstrated the greatest improvement compared to creams B, C, and D, as reflected in the mean evaluation ratings across all subjects. Further, statistical analysis determined that the demonstrated improved effect of Cream A was statistically significant (i.e., $p < 0.05$). Table 2 further shows that Cream A was demonstrated to be 63% more effective than Cream B (i.e., the control) to a statistically significant degree as evaluated by the physician.

[0050] Table 2 includes a column of data for the "Additive Effect of Creams C and D" calculated for each subject based upon the physician's evaluations. The calculated additive effect of Cream C and Cream D was determined by, first, subtracting the rated effect of Cream B (the control) from the ratings given to Cream C and Cream D, which results in a value representing the beneficial effect of each cream in addition to the effect provided by Cream B. The resulting additional effects were then added together. Essentially, the calculated additive effect quantifies the combined effects of Cream C and Cream D, beyond the effect of the control cream, attributable to the active compounds operating separately. Thus, the calculated additive effect represents the expected or anticipated effect of combining and administering the three active compounds, desoximethasone, cetirizine, and emu oil. On the other hand, the extent to which the rated effect of Cream A exceeds the calculated additive effect of Cream C and Cream D represents the unexpected and synergistic effect of

combining and administering the three active compounds together. The synergistic effect may be calculated by subtracting the calculated additive effect of Cream C and Cream D from the rated evaluations for Cream A. Accordingly, Table 2 further includes the resulting unexpected and synergistic effect for each subject under column heading, "Synergistic Effect of Cream A," which contains the calculated percentage point improvement produced by the synergistic effect of Cream A beyond the simple additive effects of the active compounds administered separately via Cream C and Cream D.

[0051] As shown in Table 2, Cream A was on average 31% more effective than the net effects of Cream C and Cream D taken separately. Further, the synergistic effect was statistically significant. Because the ratings given to Cream A were statistically greater than the calculated additive effect of Cream C and Cream D, one may conclude that the combined effect of the active compounds included in Cream A exceeded the expected effect of these compounds acting separately by 31% on average. Therefore, the study unequivocally demonstrated that desoximethasone, cetirizine, and emu oil synergistically potentiate each other's beneficial effects and that the synergistic effect is statistically significant. Furthermore, the study unequivocally demonstrated that cetirizine and emu oil synergistically potentiate each other's beneficial effects and that the synergistic effect is statistically significant.

[0052] Table 3 presents the research subjects' ratings of their own skin conditions at the end of the study, relative to the beginning of the study, for each of the trial creams A, B, C, and D. As shown in Table 3, the subjects' ratings generally corroborated the physician's evaluations. For example, each of the research subjects rated Cream A as the most effective for the treatment of his/her skin disease to a statistically significant degree. As shown in Table 3, Cream A was demonstrated to be 58% more effective than Cream B (the control) to a statistically significant degree as rated by the research subjects. In addition, Cream A was

on average 28% more effective than the net effects of Cream C and Cream D taken separately, thereby demonstrating the synergistic effect of combining desoximethasone, cetirizine, and emu oil as indicated by the subjects' ratings. Further, each research subject, at the end of the study, requested an additional free tube of Cream A only.

[0053] Certain individual results were particularly dramatic. For example, Subject #2, with chronic atopic dermatitis on the neck unresponsive to ultra-potent clobetasol steroid cream, had complete clearance of the rash after a 5-day therapy with Cream A. Subject #5, with chronic severe plaque psoriasis under reasonable control with subcutaneous etanercept injections, had persistent psoriatic lesions on the abdomen unresponsive to therapy with potent fluocinonide steroid cream. However, the disease had completely cleared within 15 days of therapy with Cream A.

[0054] None of the research subjects reported any systemic side effects from any of the creams A, B, C, or D. Concerning cutaneous dermatological side effects, one subject reported mild pruritus associated with Cream A use. Nonetheless, that subject still gave Cream A the highest ranking in all categories and requested an additional tube of Cream A. None of other research subjects reported dermatological side effects associated with the use of Cream A.

[0055] The clinical study clearly demonstrated that the combination of a non-sedating antihistamine, a topical steroid, and emu oil synergistically potentiates the mutually beneficial effects of the active compounds in treating skin inflammatory conditions, utilizing different biochemical pathways. Further, the study clearly demonstrated that the combination of a non-sedating antihistamine and emu oil synergistically potentiates the mutually beneficial effects of the active compounds in treating skin inflammatory conditions, utilizing different biochemical pathways.

[0056] While various embodiments of a formulation for the treatment of inflammatory skin diseases and methods for using the same have been described in considerable detail herein, the embodiments are merely offered by way of non-limiting examples of the disclosure described herein. It will therefore be understood that various changes and modifications may be made, and equivalents may be substituted for elements thereof, without departing from the scope of the disclosure. Indeed, this disclosure is not intended to be exhaustive or to limit the scope of the disclosure.

[0057] Further, in describing representative embodiments, the disclosure may have presented a method and/or process as a particular sequence of steps. However, to the extent that the method or process does not rely on the particular order of steps set forth herein, the method or process should not be limited to the particular sequence of steps described. Other sequences of steps may be possible and are therefore contemplated by the inventor. Therefore, the particular order of the steps disclosed herein should not be construed as limitations of the present disclosure. In addition, disclosure directed to a method and/or process should not be limited to the performance of their steps in the order written. Such sequences may be varied and still remain within the scope of the present disclosure.

CLAIMS

1. A topically administrable composition for treating inflammatory skin disease in mammals, the composition comprising:

a therapeutic amount of antihistamine selected from the group consisting of a non-sedating antihistamine, a physiologically acceptable acid of a non-sedating antihistamine, a salt of a non-sedating antihistamine, an amide of a non-sedating antihistamine, and a combination of two or more thereof; and

emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof.

2. A method of treating inflammatory skin disease in mammals, the method comprising:

topically applying to the skin of a mammal a topically administrable composition comprising:

a therapeutic amount of antihistamine selected from the group consisting of a non-sedating antihistamine, a physiologically acceptable acid of a non-sedating antihistamine, a salt of a non-sedating antihistamine, an amide of a non-sedating antihistamine, and a combination of two or more thereof; and

emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof; and

repeating the topical application of the composition as indicated for resolution or control of the skin disease.

3. The inventions of claims 1 and 2, wherein the non-sedating antihistamine is selected from the group consisting of cetirizine, levocetirizine, loratadine, fexofenadine, rupatadine, acrivastine, ebastine, bilastine, and a combination of two or more thereof.

4. The inventions of claims 1 and 2, wherein the physiologically acceptable acid of the non-sedating antihistamine is selected from the group consisting of an acid of cetirizine, an acid of levocetirizine, an acid of loratadine, an acid of fexofenadine, an acid of rupatadine, an acid of acrivastine, an acid of ebastine, an acid of bilastine, and a combination of two or more thereof.

5. The inventions of claims 1 and 2, wherein the salt of the non-sedating antihistamine is selected from the group consisting of a salt of cetirizine, a salt of levocetirizine, a salt of loratadine, a salt of fexofenadine, a salt of rupatadine, a salt of acrivastine, a salt of ebastine, a salt of bilastine, and a combination of two or more thereof.

6. The inventions of claims 1 and 2, wherein the amide of a non-sedating antihistamine is selected from the group consisting of an amide of cetirizine, an amide of levocetirizine, an amide of loratadine, an amide of fexofenadine, an amide of rupatadine, an amide of acrivastine, an amide of ebastine, an amide of bilastine, and a combination of two or more thereof.

7. The inventions of claims 1 and 2, wherein the composition comprises:

0.1 to 5.0 wt.-% of the antihistamine; and
at least 75 wt.-% of the emu oil product.

8. The inventions of claims 1 and 2, wherein the composition comprises:

2.0 wt.-% of the antihistamine; and
at least 85 wt.-% of the emu oil product.

9. The inventions of claims 1 and 2, wherein the composition further comprises:
a therapeutic amount of topical corticosteroid.
10. The inventions of claim 9, wherein the topical corticosteroid is selected from the group consisting of desoximethasone, fluocinonide, halcinonide, amcinonide, hydrocortisone, and a combination of two or more thereof.
11. The inventions of claim 9, wherein the composition comprises:
0.1 to 3.0 wt.-% of the topical corticosteroid;
0.1 to 5.0 wt.-% of the antihistamine; and
at least 75 wt.-% of the emu oil product.
12. The inventions of claim 9, wherein the composition comprises:
0.25 wt.-% of the topical corticosteroid;
2.0 wt.-% of the antihistamine; and
at least 85 wt.-% of the emu oil product.
13. The inventions of claim 9, wherein the composition comprises:
1.0 wt.-% of the topical corticosteroid;
2.0 wt.-% of the antihistamine; and
at least 85 wt.-% of the emu oil product.
14. The inventions of claims 1 and 2, wherein the composition further comprises:
a preservative; and

a neutral emulsifying agent.

15. The inventions of claims 1 and 2, wherein the composition comprises:
0.1 to 1.0 wt.-% of preservative.
16. The inventions of claims 1 and 2, wherein the composition comprises:
0.2 wt.-% of preservative.
17. The inventions of claims 1 and 2, wherein the preservative comprises methylparaben, and the emulsifying agent comprises propylene glycol.
18. The composition of claim 8, wherein the antihistamine is selected from the group consisting of cetirizine, a physiologically acceptable acid of cetirizine, a salt of cetirizine, an amide of cetirizine, and a combination of two or more thereof.
19. The composition of claim 8, wherein the antihistamine is selected from the group consisting of levocetirizine, a physiologically acceptable acid of levocetirizine, a salt of levocetirizine, an amide of levocetirizine, and a combination of two or more thereof.
20. The composition of claim 12, wherein the antihistamine is selected from the group consisting of cetirizine, a physiologically acceptable acid of cetirizine, a salt of cetirizine, an amide of cetirizine, and a combination of two or more thereof, and wherein the topical corticosteroid is desoximethasone.

21. The composition of claim 12, wherein the antihistamine is selected from the group consisting of levocetirizine, a physiologically acceptable acid of levocetirizine, a salt of levocetirizine, an amide of levocetirizine, and a combination of two or more thereof, and wherein the topical corticosteroid is desoximethasone.

22. The composition of claim 13, wherein the antihistamine is selected from the group consisting of cetirizine, a physiologically acceptable acid of cetirizine, a salt of cetirizine, an amide of cetirizine, and a combination of two or more thereof, and wherein the topical corticosteroid is hydrocortisone.

23. The composition of claim 13, wherein the antihistamine is selected from the group consisting of levocetirizine, a physiologically acceptable acid of levocetirizine, a salt of levocetirizine, an amide of levocetirizine, and a combination of two or more thereof, and wherein the topical corticosteroid is hydrocortisone.

24. A kit for treating inflammatory skin disease in mammals, the kit comprising:

a first composition, the first composition comprising:

a therapeutic amount of a first antihistamine selected from the group consisting of a first non-sedating antihistamine, a first physiologically acceptable acid of a non-sedating antihistamine, a first salt of a non-sedating antihistamine, a first amide of a non-sedating antihistamine, and a combination of two or more thereof, and

a first emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof; and

a second composition, the second composition comprising:

a therapeutic amount of a second antihistamine selected from the group consisting of a second non-sedating antihistamine, a second physiologically acceptable acid of a non-sedating antihistamine, a second salt of a non-sedating antihistamine, a second amide of a non-sedating antihistamine, and a combination of two or more thereof,

a therapeutic amount of topical corticosteroid, and

a second emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof.

25. A method of treating inflammatory skin disease in mammals, the method comprising:

topically applying to the skin of a mammal a topically administrable first composition comprising:

a therapeutic amount of a first antihistamine selected from the group consisting of a first non-sedating antihistamine, a first physiologically acceptable acid of a non-sedating antihistamine, a first salt of a non-sedating antihistamine, a first amide of a non-sedating antihistamine, and a combination of two or more thereof,

a therapeutic amount of topical corticosteroid, and

a first emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof;

repeating the topical application of the first composition as indicated for resolution or control of the skin disease;

topically applying a topically administrable second composition comprising:

a therapeutic amount of a second antihistamine selected from the group consisting of a second non-sedating antihistamine, a second physiologically acceptable acid of a non-sedating antihistamine, a second salt of a non-sedating antihistamine, a second amide of a non-sedating antihistamine, and a combination of two or more thereof, and

a second emu oil product selected from the group consisting of emu oil, a biologically active fraction of emu oil, and a combination thereof; and

repeating the topical application of the second composition as indicated for one or more benefits, such benefits selected from the group consisting of control of the skin disease, prevention of recurrence of the skin disease, and avoiding side effects of the first composition.

26. The method of claim 25, wherein the method further comprises:

topically applying the first composition as indicated to control recurrence of the skin disease.

27. The inventions of claims 24 and 25, wherein the first non-sedating antihistamine and the second non-sedating antihistamine are selected from the group consisting of cetirizine, levocetirizine, loratadine, fexofenadine, rupatadine, acrivastine, ebastine, bilastine, and a combination of two or more thereof.

28. The inventions of claims 24 and 25, wherein the first acid of the non-sedating antihistamine and the second acid of the non-sedating antihistamine are selected from the group consisting of an acid of cetirizine, an acid of levocetirizine, an acid of loratadine, an acid of fexofenadine, an acid of rupatadine, an acid of acrivastine, an acid of ebastine, an acid of bilastine, and a combination of two or more thereof.

29. The inventions of claims 24 and 25, wherein the first salt of the non-sedating antihistamine and the second salt of the non-sedating antihistamine are selected from the group consisting of a salt of cetirizine, a salt of levocetirizine, a salt of loratadine, a salt of

fexofenadine, a salt of rupatadine, a salt of acrivastine, a salt of ebastine, a salt of bilastine, and a combination of two or more thereof.

30. The inventions of claims 24 and 25, wherein the first amide of a non-sedating antihistamine and the second amide of a non-sedating antihistamine are selected from the group consisting of an amide of cetirizine, an amide of levocetirizine, an amide of loratadine, an amide of fexofenadine, an amide of rupatadine, an amide of acrivastine, an amide of ebastine, an amide of bilastine, and a combination of two or more thereof.

31. The inventions of claims 24 and 25, wherein the first antihistamine and the second antihistamine are the same antihistamine.

32. The inventions of claims 24 and 25, wherein the first composition and the second composition each comprise:

0.1 to 5.0 wt.-% of antihistamine; and
at least 75 wt.-% of the emu oil product.

33. The inventions of claims 24 and 25, wherein the first composition and the second composition each comprise:

2.0 wt.-% of antihistamine; and
at least 85 wt.-% of the emu oil product.

34. The inventions of claims 24 and 25, wherein the first composition comprises:

0.1 to 3.0 wt.-% of the topical corticosteroid.

35. The inventions of claims 24 and 25, wherein the first composition comprises:
0.25 wt.-% of topical corticosteroid.
36. The inventions of claims 24 and 25, wherein the first composition comprises:
1.0 wt.-% of topical corticosteroid.
37. The inventions of claims 24 and 25, wherein the topical corticosteroid is selected from the group consisting of desoximethasone, fluocinonide, halcinonide, amcinonide, hydrocortisone, and a combination of two or more thereof.
38. The inventions of claims 1, 2, 24, and 25, wherein the inflammatory skin disease is selected from the group consisting of psoriasis, atopic dermatitis, eczema, forms of eczema, rash, and a combination of two or more thereof.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC(8)- A61K 9/00, A61K 45/08, A61K 47/44 (2013.01);

USPC- 424/78.06, 424/522, 514/315

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched
Patents and NPL (classification, keyword; search terms below)

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

PubWest, PatBase (USPTO, EPO, JPO, WIPO, PCT), GoogleScholar (PL, NPL), FreePatentsOnline (USPTO, EPO, JPO, WIPO, NPL);
search terms: emu, rhea, novaehollandae, antihistamine, nonsedating, oil, fraction, product, cetirizine, levacetrizine, loratadine,
fexofenadine, rupatidine, acrivastine, ebastine, bilastine

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 2009/0053290 A1 (SAND et al.) 26 February 2009 (26.02.2009), para [0020], [0025], [0070], [0087], [0088], [0116], [0161], [0176], [0243], [0311], [0325], [0329], [0335], [0341]	1, 2

☐ Further documents are listed in the continuation of Box C.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

Date of the actual completion of the international search

18 May 2013 (18.05.2013)

Date of mailing of the international search report

10 JUN 2013

Name and mailing address of the ISA/US

Mail Stop PCT, Attn: ISA/US, Commissioner for Patents

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 13/32726

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☒ Claims Nos.: 3-23, 27-38
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- ☐ The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- ☐ No protest accompanied the payment of additional search fees.
