WO 2008/010921 A3

MODULATORS OF PHARMACOKINETIC
PROPERTIES OF THERAPEUTICS

FIELD OF THE INVENTION

5 This application relates generally to compounds and pharmaceutical compositions which modify, *e.g.*, improve, the pharmacokinetics of a co-administered drug, and methods of modifying, *e.g.*, improving, the pharmacokinetics of a drug by co-administration of the compounds with the drug.

BACKGROUND OF THE INVENTION

10 Oxidative metabolism by cytochrome P450 enzymes is one of the primary mechanisms of drug metabolism. It can be difficult to maintain therapeutically effective blood plasma levels of drugs which are rapidly metabolized by
15 cytochrome P450 enzymes. Accordingly, the blood plasma levels of drugs which are susceptible to cytochrome P450 enzyme degradation can be maintained or enhanced by co-administration of cytochrome P450 inhibitors, thereby improving the pharmacokinetics of the drug.

20 While certain drugs are known to inhibit cytochrome P450 enzymes, more and/or improved inhibitors for cytochrome P450 monooxygenase are desirable. Particularly, it would be desirable to have cytochrome P450 monooxygenase inhibitors which do not have appreciable biological activity other than cytochrome P450 inhibition. Such inhibitors can be useful for minimizing undesirable biological activity, *e.g.*, side effects. In addition, it would be desirable
25 to have P450 monooxygenase inhibitors that lack significant or have a reduced level of protease inhibitor activity. Such inhibitors could be useful for enhancing the effectiveness of antiretroviral drugs, while minimizing the possibility of eliciting viral resistance, especially against protease inhibitors.

SUMMARY OF THE INVENTION

One aspect of the present application is directed to compounds and
 5 pharmaceutical compositions which modify, *e.g.*, improve, the pharmacokinetics
 of a co-administered drug, *e.g.*, by inhibiting cytochrome P450 monooxygenase.

Typical substituents include, but are not limited to, -X, -R, -O-, =O, -OR, -SR, -S-,
20 -NR₂, -N⁺R₃, =NR, -CX₃, -CN, -OCN, -SCN, -N=C=O, -NCS, -NO, -NO₂, =N₂, -N₃, -NHC(=O)R, -NHS(=O)₂R, -C(=O)R, -C(=O)NRR, -S(=O)₂O-, -S(=O)₂OH, -S(=O)₂R, -OS(=O)₂OR, -S(=O)₂NR, -S(=O)R, -OP(=O)(OR)₂, -P(=O)(OR)₂, -P(=O)(O-)₂, -P(=O)(OH)₂, -P(O)(OR)(O-), -C(=O)R, -C(=O)OR, -C(=O)X, -C(S)R, -C(O)OR, -C(O)O-, -C(S)OR, -C(O)SR, -C(S)SR, -C(O)NRR, -C(S)NRR, -C(=NR)NRR, where
25 each X is independently a halogen: F, Cl, Br, or I; and each R is independently H, alkyl, aryl, arylalkyl, a heterocycle, or a protecting group or prodrug moiety. Alkylene, alkenylene, and alkynylene groups may also be similarly substituted. When the number of carbon atoms is designated for a substituted group, the

number of carbon atoms refers to the group, not the substituent (unless otherwise indicated). For example, a C₁₋₄ substituted alkyl refers to a C₁₋₄ alkyl, which can be substituted with groups having more the, e.g., 4 carbon atoms.

The term "prodrug" as used herein refers to any compound that when administered to a biological system generates the drug substance, i.e., active ingredient, as a result of spontaneous chemical reaction(s), enzyme catalyzed chemical reaction(s), photolysis, and/or metabolic chemical reaction(s). A prodrug is thus a covalently modified analog or latent form of a therapeutically active compound.

One skilled in the art will recognize that substituents and other moieties of the compounds of Formula I should be selected in order to provide a compound which is sufficiently stable to provide a pharmaceutically useful compound which can be formulated into an acceptably stable pharmaceutical composition. Compounds of Formula I which have such stability are contemplated as falling within the scope of the present invention.

"Heteroalkyl" refers to an alkyl group where one or more carbon atoms have been replaced with a heteroatom, such as, O, N, or S. For example, if the carbon atom of the alkyl group which is attached to the parent molecule is replaced with a heteroatom (e.g., O, N, or S) the resulting heteroalkyl groups are, respectively, an alkoxy group (e.g., -OCH₃, etc.), an amine (e.g., -NHCH₃, -N(CH₃)₂, etc.), or a thioalkyl group (e.g., -SCH₃). If a non-terminal carbon atom of the alkyl group which is not attached to the parent molecule is replaced with a heteroatom (e.g., O, N, or S) the resulting heteroalkyl groups are, respectively, an alkyl ether (e.g., -CH₂CH₂-O-CH₃, etc.), an alkyl amine (e.g., -CH₂NHCH₃, -CH₂N(CH₃)₂, etc.), or a thioalkyl ether (e.g., -CH₂-S-CH₃). If a terminal carbon atom of the alkyl group is replaced with a heteroatom (e.g., O, N, or S), the resulting heteroalkyl groups are, respectively, a hydroxyalkyl group (e.g., -CH₂CH₂-OH), an aminoalkyl group (e.g., -CH₂NH₂), or an alkyl thiol group (e.g., -CH₂CH₂-SH). A heteroalkyl group can

have, for example, 1 to 20 carbon atoms, 1 to 10 carbon atoms, or 1 to 6 carbon atoms. A C₁-C₆ heteroalkyl group means a heteroalkyl group having 1 to 6 carbon atoms.

5 The term "chiral" refers to molecules which have the property of non-superimposability of the mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner.

 The term "stereoisomers" refers to compounds which have identical chemical constitution, but differ with regard to the arrangement of the atoms or
10 groups in space.

 "Diastereomer" refers to a stereoisomer with two or more centers of chirality and whose molecules are not mirror images of one another. Diastereomers have different physical properties, *e.g.*, melting points, boiling points, spectral properties, and reactivities. Mixtures of diastereomers may
15 separate under high resolution analytical procedures such as electrophoresis and chromatography.

 "Enantiomers" refer to two stereoisomers of a compound which are non-superimposable mirror images of one another.

 Stereochemical definitions and conventions used herein generally follow
20 S. P. Parker, Ed., McGraw-Hill Dictionary of Chemical Terms (1984) McGraw-Hill Book Company, New York; and Eliel, E. and Wilen, S., Stereochemistry of Organic Compounds (1994) John Wiley & Sons, Inc., New York. Many organic compounds exist in optically active forms, *i.e.*, they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the
25 prefixes D and L or R and S are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes d and l or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or l meaning that the compound is levorotatory. A

compound prefixed with (+) or d is dextrorotatory. For a given chemical structure, these stereoisomers are identical except that they are mirror images of one another. A specific stereoisomer may also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. A 50:50 mixture of enantiomers is referred to as a racemic mixture or a racemate, which may occur where there has been no stereoselection or stereospecificity in a chemical reaction or process. The terms "racemic mixture" and "racemate" refer to an equimolar mixture of two enantiomeric species, devoid of optical activity.

Protecting Groups

In the context of the present invention, protecting groups include prodrug moieties and chemical protecting groups.

Protecting groups are available, commonly known and used, and are optionally used to prevent side reactions with the protected group during synthetic procedures, *i.e.* routes or methods to prepare the compounds of the invention. For the most part the decision as to which groups to protect, when to do so, and the nature of the chemical protecting group "PG" will be dependent upon the chemistry of the reaction to be protected against (*e.g.*, acidic, basic, oxidative, reductive or other conditions) and the intended direction of the synthesis. The PG groups do not need to be, and generally are not, the same if the compound is substituted with multiple PG. In general, PG will be used to protect functional groups such as carboxyl, hydroxyl, thio, or amino groups and to thus prevent side reactions or to otherwise facilitate the synthetic efficiency. The order of deprotection to yield free, deprotected groups is dependent upon the intended direction of the synthesis and the reaction conditions to be encountered, and may occur in any order as determined by the artisan.

Various functional groups of the compounds of the invention may be protected. For example, protecting groups for -OH groups (whether hydroxyl,

carboxylic acid, phosphonic acid, or other functions) include "ether- or ester-forming groups". Ether- or ester-forming groups are capable of functioning as chemical protecting groups in the synthetic schemes set forth herein. However, some hydroxyl and thio protecting groups are neither ether- nor ester-forming groups, as will be understood by those skilled in the art, and are included with amides, discussed below.

A very large number of hydroxyl protecting groups and amide-forming groups and corresponding chemical cleavage reactions are described in Protective Groups in Organic Synthesis, Theodora W. Greene and Peter G. M. Wuts (John Wiley & Sons, Inc., New York, 1999, ISBN 0-471-16019-9) ("Greene"). See also Kocienski, Philip J.; Protecting Groups (Georg Thieme Verlag Stuttgart, New York, 1994), which is incorporated by reference in its entirety herein. In particular Chapter 1, Protecting Groups: An Overview, pages 1-20, Chapter 2, Hydroxyl Protecting Groups, pages 21-94, Chapter 3, Diol Protecting Groups, pages 95-117, Chapter 4, Carboxyl Protecting Groups, pages 118-154, Chapter 5, Carbonyl Protecting Groups, pages 155-184. For protecting groups for carboxylic acid, phosphonic acid, phosphonate, sulfonic acid and other protecting groups for acids see Greene as set forth below. Such groups include by way of example and not limitation, esters, amides, hydrazides, and the like.

Ether- and Ester-forming protecting groups

Ester-forming groups include: (1) phosphonate ester-forming groups, such as phosphoramidate esters, phosphorothioate esters, phosphonate esters, and phosphon-bis-amidates; (2) carboxyl ester-forming groups, and (3) sulphur ester-forming groups, such as sulphonate, sulfate, and sulfinde.

Metabolites of the Compounds of the Invention

Also falling within the scope of this invention are the in vivo metabolic products of the compounds described herein. Such products may result for example from the oxidation, reduction, hydrolysis, amidation, esterification and the like of the administered compound, primarily due to enzymatic processes.

5 Accordingly, the invention includes compounds produced by a process comprising contacting a compound of this invention with a mammal for a period of time sufficient to yield a metabolic product thereof. Such products typically are identified by preparing a radiolabelled (e.g., C^{14} or H^3) compound of the invention, administering it parenterally in a detectable dose (e.g., greater than
10 about 0.5 mg/kg) to an animal such as rat, mouse, guinea pig, monkey, or to man, allowing sufficient time for metabolism to occur (typically about 30 seconds to 30 hours) and isolating its conversion products from the urine, blood or other biological samples. These products are easily isolated since they are labeled (others are isolated by the use of antibodies capable of binding epitopes
15 surviving in the metabolite). The metabolite structures are determined in conventional fashion, e.g., by MS or NMR analysis. In general, analysis of metabolites is done in the same way as conventional drug metabolism studies well-known to those skilled in the art. The conversion products, so long as they are not otherwise found in vivo, are useful in diagnostic assays for therapeutic
20 dosing of the compounds of the invention even if they possess no anti-infective activity of their own.

In still yet another embodiment, the compounds of Formula I are named below in tabular format (Table 6) as compounds of general Formula II:

15

Formula II.

Compounds of general formula II are depicted as a "core" structure (Z) substituted with four moieties T1, T2, X1 and X2. The core structures Z are depicted in Table 1. The points of attachment of T1, T2, X1 and X2 are indicated on each of the core structures depicted in Table 1. Tables 2-5, respectively, show the structures of the T1, T2, X1 and X2 moieties. The point of attachment of the core structure Z is indicated in each of the structures of T1, T2, X1 and X2. Each

core structure Z in Table 1, and each substituent T1, T2, X1 and X2 and Tables 2-5 is represented by a "code" comprising a letter and a number. Each structure of a compound of Formula II can be designated in tabular form by combining the "code" representing each structural moiety using the following syntax:

5 Z.T1.T2.X1.X2. Thus, for example, Z1.T1A.T2B.X1A.X2A represents the following structure:

In the structures depicted in Tables 1-5, the term "Alk" means a substituted or unsubstituted alkyl, cycloalkyl, or alkylene group, wherein the terms "alkyl", "cycloalkyl", and "alkylene" are as defined herein. "Alk" means an alkyl or cycloalkyl group when depicted as monovalent, and an alkylene group when depicted as divalent. "Het" is a substituted or unsubstituted heterocyclyl or heterocyclylene group, wherein the term "heterocyclyl" is as defined herein, and the term "heterocyclylene" means a heterocyclyl group as defined herein, in which a hydrogen atom has been replaced by an open valence (in analogy to alkylene), thereby defining a divalent heterocyclyl. "Het" is a heterocyclyl when depicted as monovalent, and heterocyclylene when depicted as divalent. "Ar" is a substitute or unsubstituted aryl or arylene group, wherein the term "aryl" is as defined herein, and the term "arylene" means an aryl group as defined herein, in which a hydrogen atom has been replaced by an open valence (in analogy to alkylene), thereby defining a divalent aryl. "Ar" is aryl when depicted as monovalent, and arylene when depicted as divalent. When substituted, "Alk", "Het", and "Ar" can be substituted with any of the substituents defined or exemplified herein. For example, substituents of "Alk" can include ether, halogen, -OH, amide, amine, etc., substituents of "Het" can include alkyl, aryl, carbonyl, -OH, halogen, and substituents of "Ar" can include

alkyl, aryl, -OH, halogen, etc., with the proviso that the resulting structure is chemically reasonable, and would provide compounds which are sufficiently stable for formulation in a pharmaceutically acceptable composition. When a structure or substructure shown in the tables below contains more than one

5 "Alk", "Het" or "Ar" group, these groups are independently selected and can be the same or different. So, for example, each of the "Alk" groups of substructure T1A are independently selected and may be the same or different.

In still another embodiment, selected compounds of Formula I are named below in tabular format (Table 12) as compounds of general Formula III (below):

10

Formula III

where 1, 2, 3, 4 and 5 are defined in Tables 7-11, below. Each compound is designated in tabular form by combining the "code" representing each structural moiety using the following syntax: 1.2.3.4.5. Thus, for example, 1a.2a.3a.4a.5a represents the following structure:

15 Pharmaceutical Formulations

The compounds of this invention are formulated with conventional carriers and excipients, which will be selected in accord with ordinary practice. Tablets will contain excipients, glidants, fillers, binders and the like. Aqueous formulations are prepared in sterile form, and when intended for delivery by
20 other than oral administration generally will be isotonic. All formulations will optionally contain excipients such as those set forth in the Handbook of Pharmaceutical Excipients (1986), herein incorporated by reference in its entirety. Excipients include ascorbic acid and other antioxidants, chelating agents such as EDTA, carbohydrates such as dextrin, hydroxyalkylcellulose,
25 hydroxyalkylmethylcellulose, stearic acid and the like. The pH of the formulations ranges from about 3 to about 11, but is ordinarily about 7 to 10.

While it is possible for the active ingredients to be administered alone it may be preferable to present them as pharmaceutical formulations. The

formulations of the invention, both for veterinary and for human use, comprise at least one active ingredient, e.g. a compound of the present invention, together with one or more acceptable carriers and optionally other therapeutic ingredients. The carrier(s) must be "acceptable" in the sense of being compatible
5 with the other ingredients of the formulation and physiologically innocuous to the recipient thereof.

The formulations include those suitable for the foregoing administration routes. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy.
10 Techniques and formulations generally are found in Remington's Pharmaceutical Sciences (Mack Publishing Co., Easton, Pa.), herein incorporated by reference in its entirety. Such methods include the step of bringing into association the active ingredient with the carrier which constitutes one or more accessory ingredients. In general the formulations are prepared by uniformly and intimately bringing
15 into association the active ingredient with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product.

Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient; as a powder or granules; as a
20 solution or a suspension in an aqueous or non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be administered as a bolus, electuary or paste.

A tablet is made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a
25 suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the powdered active ingredient moistened with an

inert liquid diluent. The tablets may optionally be coated or scored and optionally are formulated so as to provide slow or controlled release of the active ingredient.

For administration to the eye or other external tissues e.g., mouth and skin, the formulations are preferably applied as a topical ointment or cream containing the active ingredient(s) in an amount of, for example, 0.075 to 20% w/w (including active ingredient(s) in a range between 0.1% and 20% in increments of 0.1% w/w such as 0.6% w/w, 0.7% w/w, etc.), preferably 0.2 to 15% w/w and most preferably 0.5 to 10% w/w. When formulated in an ointment, the active ingredients may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base.

If desired, the aqueous phase of the cream base may include, for example, at least 30% w/w of a polyhydric alcohol, *i.e.* an alcohol having two or more hydroxyl groups such as propylene glycol, butane 1,3-diol, mannitol, sorbitol, glycerol and polyethylene glycol (including PEG 400) and mixtures thereof. The topical formulations may desirably include a compound which enhances absorption or penetration of the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethyl sulphoxide and related analogs.

The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an emulsifier (otherwise known as an emulgent), it desirably comprises a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make up the so-called emulsifying

wax, and the wax together with the oil and fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations.

Emulgents and emulsion stabilizers suitable for use in the formulation of the invention include Tween® 60, Span® 80, cetostearyl alcohol, benzyl alcohol,
5 myristyl alcohol, glyceryl mono-stearate and sodium lauryl sulfate.

The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties. The cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl
10 esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters known as Crodamol CAP may be used, the last three being preferred esters. These may be used alone or in combination depending on the properties required. Alternatively, high
15 melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils are used.

Pharmaceutical formulations according to the present invention comprise one or more compounds of the invention together with one or more pharmaceutically acceptable carriers or excipients and optionally other
20 therapeutic agents. Pharmaceutical formulations containing the active ingredient may be in any form suitable for the intended method of administration. When used for oral use for example, tablets, troches, lozenges, aqueous or oil suspensions, dispersible powders or granules, emulsions, hard or soft capsules, syrups or elixirs may be prepared. Compositions intended for oral use may be
25 prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents including sweetening agents, flavoring agents, coloring agents and preserving agents, in order to provide a palatable preparation. Tablets

containing the active ingredient in admixture with non-toxic pharmaceutically acceptable excipient which are suitable for manufacture of tablets are acceptable. These excipients may be, for example, inert diluents, such as calcium or sodium carbonate, lactose, lactose monohydrate, croscarmellose sodium, povidone,
5 calcium or sodium phosphate; granulating and disintegrating agents, such as maize starch, or alginic acid; binding agents, such as cellulose, microcrystalline cellulose, starch, gelatin or acacia; and lubricating agents, such as magnesium stearate, stearic acid or talc. Tablets may be uncoated or may be coated by known techniques including microencapsulation to delay disintegration and
10 adsorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate alone or with a wax may be employed.

Formulations for oral use may be also presented as hard gelatin capsules where the active ingredient is mixed with an inert solid diluent, for example
15 calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, such as peanut oil, liquid paraffin or olive oil.

Aqueous suspensions of the invention contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions.
20 Such excipients include a suspending agent, such as sodium carboxymethylcellulose, methylcellulose, hydroxypropyl methylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia, and dispersing or wetting agents such as a naturally occurring phosphatide (e.g., lecithin), a condensation product of an alkylene oxide with a fatty acid (e.g.,
25 polyoxyethylene stearate), a condensation product of ethylene oxide with a long chain aliphatic alcohol (e.g., heptadecaethyleneoxycetanol), a condensation product of ethylene oxide with a partial ester derived from a fatty acid and a hexitol anhydride (e.g., polyoxyethylene sorbitan monooleate). The aqueous

suspension may also contain one or more preservatives such as ethyl or n-propyl p-hydroxy-benzoate, one or more coloring agents, one or more flavoring agents and one or more sweetening agents, such as sucrose or saccharin.

Oil suspensions may be formulated by suspending the active ingredient in
5 a vegetable oil, such as arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oral suspensions may contain a thickening agent, such as beeswax, hard paraffin or cetyl alcohol. Sweetening agents, such as those set forth herein, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by
10 the addition of an antioxidant such as ascorbic acid.

Dispersible powders and granules of the invention suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, a suspending agent, and one or more preservatives. Suitable dispersing or wetting agents and
15 suspending agents are exemplified by those disclosed above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, such as olive oil
20 or arachis oil, a mineral oil, such as liquid paraffin, or a mixture of these. Suitable emulsifying agents include naturally-occurring gums, such as gum acacia and gum tragacanth, naturally occurring phosphatides, such as soybean lecithin, esters or partial esters derived from fatty acids and hexitol anhydrides, such as sorbitan monooleate, and condensation products of these partial esters with
25 ethylene oxide, such as polyoxyethylene sorbitan monooleate. The emulsion may also contain sweetening and flavoring agents. Syrups and elixirs may be formulated with sweetening agents, such as glycerol, sorbitol or sucrose. Such

formulations may also contain a demulcent, a preservative, a flavoring or a coloring agent.

The pharmaceutical compositions of the invention may be in the form of a sterile injectable preparation, such as a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned herein. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, such as a solution in 1,3-butane-diol or prepared as a lyophilized powder. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile fixed oils may conventionally be employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid may likewise be used in the preparation of injectables.

The amount of active ingredient that may be combined with the carrier material to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. For example, a time-release formulation intended for oral administration to humans may contain approximately 1 to 1000 mg of active material compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95% of the total compositions (weight:weight). The pharmaceutical composition can be prepared to provide easily measurable amounts for administration. For example, an aqueous solution intended for intravenous infusion may contain from about 3 to 500 μg of the active ingredient per milliliter of solution in order that infusion of a suitable volume at a rate of about 30 mL/hr can occur.

Formulations suitable for administration to the eye include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier,

especially an aqueous solvent for the active ingredient. The active ingredient is preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10% particularly about 1.5% w/w.

Formulations suitable for topical administration in the mouth include
5 lozenges comprising the active ingredient in a flavored basis, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert basis such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active ingredient in a suitable liquid carrier.

Formulations for rectal administration may be presented as a suppository
10 with a suitable base comprising for example cocoa butter or a salicylate.

Formulations suitable for intrapulmonary or nasal administration have a particle size for example in the range of 0.1 to 500 μm (including particle sizes in a range between 0.1 and 500 μm in increments such as 0.5 μm , 1 μm , 30 μm , 35 μm , etc.), which is administered by rapid inhalation through the nasal passage or
15 by inhalation through the mouth so as to reach the alveolar sacs. Suitable formulations include aqueous or oily solutions of the active ingredient. Formulations suitable for aerosol or dry powder administration may be prepared according to conventional methods and may be delivered with other therapeutic agents such as compounds heretofore used in the treatment or prophylaxis of
20 infections as described herein.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

25 Formulations suitable for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of

the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents.

The formulations are presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried
5 (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injection, immediately prior to use. Extemporaneous injection solutions and suspensions are prepared from sterile powders, granules and tablets of the kind previously described. Preferred unit dosage formulations are those containing a daily dose or unit daily sub-dose, as herein above recited, or
10 an appropriate fraction thereof, of the active ingredient.

It should be understood that in addition to the ingredients provided by the present invention the formulations of this invention may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavoring agents.

15 The invention further provides veterinary compositions comprising at least one active ingredient, *e.g.*, a compound of the present invention together with a veterinary carrier.

Veterinary carriers are materials useful for the purpose of administering the composition and may be solid, liquid or gaseous materials which are
20 otherwise inert or acceptable in the veterinary art and are compatible with the active ingredient. These veterinary compositions may be administered orally, parenterally or by any other desired route.

Compounds of the invention can also be formulated to provide controlled release of the active ingredient to allow less frequent dosing or to improve the
25 pharmacokinetic or toxicity profile of the active ingredient. Accordingly, the invention also provided compositions comprising one or more compounds of the invention formulated for sustained or controlled release.

The effective dose of an active ingredient depends at least on the nature of the condition being treated, toxicity, whether the compound is being used prophylactically (lower doses) or against an active disease or condition, the method of delivery, and the pharmaceutical formulation, and will be determined
5 by the clinician using conventional dose escalation studies. The effective dose can be expected to be from about 0.0001 to about 100 mg/kg body weight per day. Typically, from about 0.01 to about 10 mg/kg body weight per day. More typically, from about 0.01 to about 5 mg/kg body weight per day. More typically, from about 0.05 to about 0.5 mg/kg body weight per day. For example, the daily
10 candidate dose for an adult human of approximately 70 kg body weight will range from 1 mg to 1000 mg, or between 5 mg and 500 mg, and may take the form of single or multiple doses.

It is also contemplated that the compounds of the present invention can be used with any other active therapeutic agent or ingredient which is appreciably metabolized by cytochrome P450 monooxygenase enzymes, e.g. cytochrome P450 monooxygenase 3A, thereby reducing the amount or rate at which the other
5 active therapeutic agent or ingredient is metabolized, whereby the pharmacokinetics of the other active therapeutic agent or ingredient is improved. Such improvements can include elevating the blood plasma levels of the other therapeutic agent or ingredient or maintaining a more therapeutically effective blood plasma level of the other therapeutic active agent or ingredient --
10 compared to blood plasma levels of the other therapeutic agent or ingredient administered without the compound of the present invention.

It is also possible to combine any compound of the invention with one or more other active therapeutic agents in a unitary dosage form for simultaneous or sequential administration to a patient. The combination therapy may be
15 administered as a simultaneous or sequential regimen. When administered sequentially, the combination may be administered in two or more administrations.

Co-administration of a compound of the invention with one or more other active therapeutic agents generally refers to simultaneous or sequential
20 administration of a compound of the invention and one or more other active therapeutic agents, such that therapeutically effective amounts of the compound of the invention and one or more other active therapeutic agents are both present in the body of the patient.

Co-administration includes administration of unit dosages of the
25 compounds of the invention before or after administration of unit dosages of one or more other active therapeutic agents, for example, administration of the compounds of the invention within seconds, minutes, or hours of the administration of one or more other active therapeutic agents. For example, a

unit dose of a compound of the invention can be administered first, followed within seconds or minutes by administration of a unit dose of one or more other active therapeutic agents. Alternatively, a unit dose of one or more other therapeutic agents can be administered first, followed by administration of a unit
5 dose of a compound of the invention within seconds or minutes. In some cases, it may be desirable to administer a unit dose of a compound of the invention first, followed, after a period of hours (e.g., 1-12 hours), by administration of a unit dose of one or more other active therapeutic agents. In other cases, it may be desirable to administer a unit dose of one or more other active therapeutic agents
10 first, followed, after a period of hours(e.g., 1-12 hours), by administration of a unit dose of a compound of the invention.

The combination therapy may provide "synergy" and "synergistic effect", *i.e.* the effect achieved when the active ingredients used together is greater than the sum of the effects that results from using the compounds separately. A
15 synergistic effect may be attained when the active ingredients are: (1) co-formulated and administered or delivered simultaneously in a combined formulation; (2) delivered by alternation or in parallel as separate formulations; or (3) by some other regimen. When delivered in alternation therapy, a synergistic effect may be attained when the compounds are administered or
20 delivered sequentially, e.g., in separate tablets, pills or capsules, or by different injections in separate syringes. In general, during alternation therapy, an effective dosage of each active ingredient is administered sequentially, *i.e.* serially, whereas in combination therapy, effective dosages of two or more active ingredients are administered together.

To a solution of Compound 1 (ritonavir) (1.8 g, 2.5 mmol) in 1,2-dichloroethane (15 mL) was added 1,1'-thiocarbonyldiimidazole (890 mg, 5.0 mmol). The mixture was heated at 75 °C for 6 hours and cooled to 25 °C. Evaporation under reduced pressure gave a white solid. Purification by flash column chromatography (stationary phase: silica gel; eluent: EtOAc) gave Compound 2 (1.6 g). *m/z*: 831.1 (M+H)⁺.

Preparation of Example CScheme 35 Compound 3

Compound 3 was prepared according to the procedures of J. Med. Chem. 1998, 41, 602, herein incorporated by reference in its entirety for all purposes.

Compound 4

A flask was charged with cyclopropylamine (8.2 mL, 117.8 mmol) at room temperature. A solution of Compound 3 (1 g, 4.71 mmol) in MeCN (8.5 mL) was added dropwise over 5 min. to produce a clear yellow solution that was allowed to stand at room temperature overnight. Volatiles were removed *in vacuo*, and the resulting residue was purified via silica gel chromatography (gradient elution, 0 to 50% EtOAc/hexane) to afford 0.65 g (70%) of 4 as a yellow liquid (LC/MS *m/z* 197 (M+H)⁺; 218 (M+Na)⁺).

Scheme 4Compound 5

Compound 5 was purchased from Aldrich or alternatively prepared according to the procedures of J. Org. Chem. 1994, 59, 1937, herein incorporated by reference in its entirety for all purposes.

Compound 6

To a solution of Compound 4 in DCM (3 mL) at room temperature was added 5 (0.1 mL, 0.695 mmol). The resulting clear solution was allowed to stand

at room temperature for 2 h. The solvent was removed *in vacuo*, and the residue was chromatographed directly using silica gel chromatography (gradient elution, 0 to 50% EtOAc/hexane) to produce 0.218 g (89%) of 6 (LC/MS m/z 354 (M+H)⁺; 729 (2M + Na)⁺) as a colorless glass.

5 Compound 7

Compound 6 was taken up in THF (5 mL) at room temperature, and LiOH (1 M in H₂O) was added. The resulting reaction mixture was then stirred vigorously for 1.5 h. The reaction mixture was acidified with 1 M HCl to a pH of 3 (monitored using pH test strips). The acidified reaction mixture was then
 10 extracted several times with EtOAc. The combined organic phases were washed with brine, dried over anhydrous Na₂SO₄, and concentrated *in vacuo* to produce 0.20 g (quantitative yield) of 7 (LC/MS m/z 340 (M+H)⁺) as a colorless film. This material was used without further purification.

Compound 30

Compound 30 was purchased from Aldrich Chemical Co., and used without further purification.

Compound 31

To a solution of Compound 30 (8.25 g, 80 mmol) in MeOH (50 mL), was added benzaldehyde (8.1 mL, 80 mmol) and the resulting solution was allowed to stir at room temperature. After 2 h, the reaction mixture was cooled to 0°C and NaBH_4 (3.33 g, 88 mmol) was added in portions. After allowing the reaction mixture to warm to room temperature over 2 h, glacial acetic acid (2 mL) was added. The resulting viscous solution was concentrated *in vacuo*. EtOAc and H_2O (50 mL each) were added and the aqueous phase was extracted with EtOAc . The combined organic phases were washed with saturated NaHCO_3 , brine, and concentrated *in vacuo*. The resulting material was taken up in THF (25 mL) and

H₂O (25 mL) at room temperature and Boc₂O (15.1 g, 69.2 mmol) was added to produce an opaque suspension that was stirred vigorously for 2 h at room temperature. THF was removed *in vacuo*, and the aqueous layer was extracted with EtOAc. The combined organic layers were washed with brine and dried over anhydrous MgSO₄ and concentrated *in vacuo*. Chromatography on SiO₂ (3/1 Hex/EtOAc) afforded 18.5 g (79%) of Compound 31 as a colorless oil (LC/MS *m/z* 293.9 (M+H)⁺.

Compound 32

Compound 31 (5.95 g, 20.3 mmol) and Et₃N (9.9 mL, 71 mmol) were diluted in DMSO (65 mL) and allowed to age at room temperature for 30 min before cooling to 0 °C. Pyridine•SO₃ was added in one portion and the reaction mixture was maintained at 5 °C to prevent freezing. After 45 min, the reaction mixture was poured into icewater and extracted with EtOAc. The combined organic layers were washed with saturated NaHCO₃, H₂O, and dried over anhydrous MgSO₄ prior to concentration *in vacuo* (bath temperature 25 °C) to produce 4.39 g (74%) of Compound 32 as a clear, yellow colored oil that was used without further purification. ¹H-NMR (CDCl₃, 300 MHz) δ (major rotamer) 9.36 (br s, 1H); 5.01 (d, *J* = 15 Hz, 1H); 4.12 (d, *J* = 15 Hz, 1H); 3.45 (m, 1H); 2.04-1.88 (m, 1H); 1.80-1.58 (m, 1H); 1.54-1.20 (m, 2H); 1.47 (s, 9H); 0.91 (t, *J* = 7.2 Hz, 3H). Compound 34

A suspension of Compound 33 (6.23 g, 16.6 mmol) in THF (500 mL) was heated under reflux until a homogeneous solution was obtained. The solution was cooled to -78 °C and 1.6M *n*-BuLi (19.7 mL, 31.5 mmol) was introduced to produce a clear yellow solution. Meanwhile, DIBAL-OMe was prepared by dilution of DIBAL-H (1M in hexanes, 18.1 mL, 18.1 mmol) in THF (8 mL) and

cooling to 0 °C prior to addition of MeOH (0.73 mL, 18.1 mmol). This solution was allowed to age while Compound 32 (4.39 g, 15.1 mmol) was diluted in THF (15 mL) and cooled to -78 °C. The DIBAL-OMe solution was cannulated to the solution of Compound 32 and allowed to age for 5 min prior to cannulation to the sulfur dianion solution. The resulting clear yellow solution was allowed to age at -78 °C for 1h. The reaction was quenched by addition of saturated NH₄Cl (100 mL) at -78 °C and allowed to warm to room temperature. Water was added until all precipitated solids were dissolved and the layers separated. The THF layer was concentrated *in vacuo* while the aqueous layer was extracted with EtOAc. The recombined organic layers were washed with brine, and the resulting emulsion was treated with solid NaOH until homogeneous bilayers resulted. The aqueous layer was extracted with EtOAc and the combined organics dried over anhydrous Na₂SO₄. Concentration *in vacuo* produced 9.57 g (95%) of Compound 34 as an amorphous white solid (LC/MS *m/z*: 689.3 (M+Na)⁺) that was used in the following procedures without further purification.

Compound 35

Crude Compound 34 was suspended in CH₂Cl₂ (65 mL) followed by addition of pyridine (6.7 mL, 83 mmol) and acetic anhydride (3.5 mL, 36.5 mmol). The resulting solution was allowed to age at room temperature overnight. MeOH (6 mL) was added and after 10 min, the reaction was poured into brine. Addition of water produced a bilayer that was separated and the aqueous phase was repeatedly extracted with CH₂Cl₂. The combined organic layers were dried over anhydrous MgSO₄ and concentrated *in vacuo* to produce 8.95 g (88%) of a white solid that was immediately taken up in MeOH (100 mL). Na₂HPO₄ (11.4 g, 80.3 mmol) was added and the resulting slurry was cooled to 0 °C prior to addition of Na-Hg (6%, 14.5 g, 37.8 mmol) in portions. After aging at room temperature overnight, H₂O (30 mL) was added and the reaction was filtered through a celite pad. MeOH was removed *in vacuo* and the aqueous residue was

extracted with EtOAc. The combined organic layers were washed with brine, dried over anhydrous MgSO_4 and concentrated *in vacuo* to a yellow oil that was purified by chromatography on SiO_2 (0-15% EtOAc/hexanes) to afford 2.14 g (34%) of Compound 35 as a colorless oil (LC/MS m/z : 531.2 ($\text{M}+\text{Na}$)⁺).

5 Compound 36

Compound 35 (1.73 g, 3.4 mmol) was diluted in MeOH (7.5 mL) and 10% Pd/C (0.36 g, 0.34 mmol) was added. The atmosphere was replaced with a H_2 balloon and the reaction mixture allowed to age at room temperature. After 2 h, the reaction mixture was filtered through a pad of celite, the filtrate was washed
10 several times with MeOH, and the combined organic layers were concentrated *in vacuo* to afford 1.45 g (83%) of Compound 36 as a colorless oil (LC/MS m/z : 533.2 ($\text{M}+\text{Na}$)⁺) that was used in the following procedures without further purification.

Compound 37

Compound 36 (0.528 g, 1.03 mmol) was diluted in THF (3 mL) and added
15 to liquefied ammonia (approx. 20 mL) at -35 °C. Small pieces of Na were added until a blue color persisted. After 1.5 h, solid NH_4Cl was added in portions until the remaining Na was destroyed and the ammonia was allowed to escape at ambient temperature. Water and EtOAc (20 mL each) were added, and the aqueous layer was extracted with EtOAc. The combined organic layers were
20 washed with brine, dried over Na_2SO_4 and concentrated *in vacuo* to afford 0.395 g (91%) of Compound 37 as an amorphous white solid that was used without further purification in the following procedures (LC/MS m/z : 421.1 ($\text{M}+\text{H}$)⁺; 443.2 ($\text{M}+\text{Na}$)⁺).

Compound 38

25 Compound 37 (0.362 g, 0.861 mmol) was diluted in CH_2Cl_2 (3.2 mL). Trifluoroacetic acid (0.8 mL) was added and the clear solution was allowed to age overnight. Following concentration *in vacuo*, the residue was azeotroped with toluene several times to remove residual TFA. 0.382 g (99%) of the bis-

trifluoroacetate salt of Compound 38 was collected as a colorless oil that was used without further purification (LC/MS m/z : 221.1(M+H)⁺).

Scheme 15

The clear, yellow solution was allowed to age at room temperature for 4h and the volatiles were removed *in vacuo*. The residue was taken up in a 3/1 CHCl₃/IPA (v/v, 13 mL) and treated with saturated Na₂CO₃ (3 mL). The resulting suspension was diluted with H₂O (3 mL), and the aqueous phase thoroughly extracted with 3/1 CHCl₃/IPA. The combined organic layers were dried over a 3/2 (w/w) mixture of anhydrous Na₂SO₄/anhydrous Na₂CO₃ and concentrated *in vacuo*. Chromatography on SiO₂ (0-20% MeOH/CH₂Cl₂) afforded 0.043 g (14%) of Compound 39 as a colorless film (LC/MS m/z : 362.1 (M+H)⁺) and 0.105 g (34%) of Compound 40 as a colorless film (LC/MS m/z : 362.1 (M+H)⁺).

Example S

Example S (185 mg, 57%) was prepared following the same procedure as for Example Q, except that Compound 57 (160 mg, 0.42 mmol) was used instead of Compound 52. mass m/z : 776.2 ($\text{M}+\text{H}$)⁺.

The skilled practitioner will recognize that the procedure outlined in Scheme 22 can be used to prepare a variety of compounds analogous to Compounds 55-57:

I. TFA, CH_2Cl_2 ; II. Ex. R, NaBH_3CN , $\text{H}_2\text{O}/\text{CH}_3\text{CN}$; III. LiOH , $\text{THF}/\text{H}_2\text{O}$

where

in R^7 , R^8 and Y are as defined herein.

It will also be recognized that stereochemical configurations other than those shown (i.e., enantiomers or diastereomers) can be prepared by the selection of analogs of Compound 51 having the appropriate stereochemical configuration at the chiral center.

Compound 121

Compound 121 is commercially available from Aldrich, and was used as received.

Compound 122

To a suspension of Compound 121 (2.05 g, 11.3 mmol) in CH₂Cl₂ (40 mL) was added. iPr₂NEt (5.87 mL, 33.9 mmol) followed by CDI (1.86 g, 11.3 mmol). The resulting mixture was stirred at room temperature for 6 h, then Compound 9 (2.33g, 11.3 mmol) was added. The resulting mixture was stirred for another 10 h before it was evaporated to dryness. The mixture was re-dissolved in CH₂Cl₂ and the solid was removed by filtration. The filtrate was evaporated to dryness and

purified by CombiFlash (eluted with 20-80% EtOAc/hexanes) to give 3.2 g of Compound 207 as a pale yellow oil. m/z 298.0 (M+H)⁺.

Compound 123

To a solution of Compound 122 (3.2g, 10.8 mmol) in THF (100 mL) was
 5 added freshly prepared 1M LiOH (10.8 mmol). The biphasic reaction was stirred vigorously at room temperature for 16 h before being quenched with 1M HCl. The pH of the mixture was adjusted to 2.5-3, and then evaporated to a small volume. The mixture was partitioned between CH₂Cl₂ and brine (50 mL), the aqueous layer was separated and extracted with CH₂Cl₂ twice. The combined
 10 CH₂Cl₂ layers were dried over anhydrous Na₂SO₄ and concentrated to give 3.37 g of Compound 123 a pale yellow oil that is used with further purification. m/z 316.0 (M+H)⁺, 338 (M+Na)⁺;

IC₅₀ Determinations for Human Liver Cytochrome P450

10 Materials and General Methods

Pooled (n ≥ 15 donors) human hepatic microsomal fraction was obtained from BD-Gentest (Woburn, MA) who also supplied hydroxy-terfenadine, 4'-hydroxydiclofenac and NADPH regenerating system. Ritonavir was prepared from commercial Norvir® oral solution (Abbott Laboratories, Abbott Park, IL).

15 Other reagents were from Sigma-Aldrich (St. Louis, MO) and included terfenadine, fexofenadine, BRL 15572, diclofenac and mefenamic acid.

Incubations were performed in duplicate in 50 mM potassium phosphate buffer, pH 7.4 with NADPH regenerating system used as described by the manufacturer. The final microsomal protein concentrations had previously been determined to be within the linear range for activity and resulted in less than 20% consumption of substrate over the course of the incubation. The final substrate concentrations used were equal to the apparent K_m values for the activities determined under the same conditions. Inhibitors were dissolved in DMSO, and the final concentration of DMSO, from both substrate and inhibitor vehicles, was

1% (v/v). Incubations were performed at 37°C with shaking and were initiated by addition of substrate. Aliquots were then removed at 0, 7 and 15 minutes. Samples were quenched by treatment with an acetonitrile, formic acid, water (94.8%/0.2%/5%, v/v/v) mixture containing internal standard. Precipitated
5 protein was removed by centrifugation at 3000 rpm for 10 min and aliquots of the supernatant were then subjected to LC-MS analysis.

The LC-MS system consisted of a Waters Acquity UPLC, with a binary solvent manager and a refrigerated (8°C) sample organizer and sample manager, interfaced to a Micromass Quattro Premier tandem mass spectrometer operating
10 in electrospray ionization mode. The column was a Waters Acquity UPLC BEH C₁₈ 2.1 × 50 mm, 1.7 µm pore size. Mobile phases consisted of mixtures of acetonitrile, formic acid and water, the composition for mobile phase A being 1%/0.2%/98.8% (v/v/v) and that for mobile phase B being 94.8%/0.2%/5% (v/v/v). The injection volumes were 5 µL and the flow rate was 0.8 mL/min.
15 Concentrations of metabolites were determined by reference to standard curves generated with authentic analytes under the same conditions as the incubations.

IC₅₀ values (the concentration of inhibitor reducing CYP3A activity by 50%) were calculated by non-linear regression using GraphPad Prism 4.0 software and a sigmoidal model.

20 CYP3A Inhibition Assay

The potencies of the compounds as inhibitors of human hepatic cytochromes P450 of the CYP3A subfamily (particularly CYP3A4) were assessed using terfenadine oxidase, a well-characterized CYP3A-selective activity described in Ling, K.-H.J., et al *Drug Metab. Dispos.* 23, 631-636, (1995) and
25 Jurima-Romet, et al *Drug Metab. Dispos.* 22, 849-857, (1994). The final concentrations of microsomal protein and terfenadine substrate were 0.25 mg/mL and 3 µM, respectively. Metabolic reactions were terminated by treatment with

seven volumes of quench solution containing 0.1 μ M BRL 15572 as internal standard. A further 8 volumes of water were added before centrifugation and aliquots of the supernatant were removed for analysis.

For LC-MS analysis chromatographic elution was achieved by a series of linear gradients starting at 20% B and holding for 0.1 minutes, then increasing to 80% B over 1.5 minutes, holding for 0.4 minutes and then returning to the starting conditions for 0.05 min. The system was allowed to re-equilibrate for at least 0.25 minutes prior to the next injection. The mass spectrometer was operated in positive ion mode and the following precursor ($[M+H]^+$)/product ion pairs were monitored and quantified using MassLynx 4.0 (SP4, 525) software: hydroxy-terfenadine 488.7/452.4, fexofenadine 502.7/466.4 and BRL 15572 407.5/209.1. Terfenadine oxidase activity was determined from the sum of hydroxy-terfenadine and carboxy-terfenadine (fexofenadine) metabolites.

CYP2C9 Inhibition Assay

The potencies of the compounds as inhibitors of human hepatic CYP2C9 were assessed using diclofenac 4'-hydroxylase, an activity specific for this enzyme, as described in Leeman, T., et al *Life Sci.* 52, 29-34, (1992). The final concentrations of microsomal protein and diclofenac substrate were 0.08 mg/mL and 4 μ M, respectively. Metabolic reactions were terminated by treatment with three volumes of quench solution containing 1 μ M mefenamic acid as internal standard. After centrifugation a further 4 volumes of water were added. Aliquots of the supernatant were then subjected to LC-MS analysis.

For LC-MS analysis chromatographic elution was achieved by a series of linear gradients starting at 20% B and holding for 0.3 minutes, then increasing to 99% B over 1.2 minutes, holding for 0.5 minutes and then returning to the starting conditions for 0.25 min. The system was allowed to re-equilibrate for at least 0.25 minutes prior to the next injection. The mass spectrometer was

operated in negative ion mode and the following precursor ([M-H]⁻)/product ion pairs were monitored and quantified: 4'-hydroxy-diclofenac 312.4/294.2 and mefenamic acid 242.4/224.2.

5 **Biological Assays Used for the Characterization of HIV Protease Inhibitors**

HIV-1 Protease Enzyme Assay (K_i)

The assay is based on the fluorimetric detection of synthetic hexapeptide substrate cleavage by HIV-1 protease in a defined reaction buffer as initially described by M.V. Toth and G.R.Marshall, Int. J. Peptide Protein Res. 36, 544
10 (1990) (herein incorporated by reference in its entirety for all purposes).

The assay employed (2-aminobenzoyl)Thr-Ile-Nle-(p-nitro)Phe-Gln-Arg as the substrate and recombinant HIV-1 protease expressed in E.Coli as the enzyme. Both of the reagents were supplied by Bachem California, Inc. (Torrance, CA; Cat. no. H-2992). The buffer for this reaction was 100 mM ammonium acetate,
15 pH 5.3, 1 M sodium chloride, 1 mM ethylenediaminetetraacetic acid, 1 mM dithiothreitol, and 10% dimethylsulfoxide.

To determine the inhibition constant K_i , a series of solutions were prepared containing identical amount of the enzyme (1 to 2.5 nM) and the inhibitor to be tested at different concentrations in the reaction buffer. The
20 solutions were subsequently transferred into a white 96-well plate (190 μ l each) and preincubated for 15 min at 37 °C. The substrate was solubilized in 100% dimethylsulfoxide at a concentration of 800 μ M and 10 μ l of 800 μ M substrate was added into each well to reach a final substrate concentration of 40 μ M. The real-time reaction kinetics was measured at 37 °C using a Gemini 96-well plate
25 fluorimeter (Molecular Devices, Sunnyvale, CA) at $\lambda(\text{Ex}) = 330$ nm and $\lambda(\text{Em}) = 420$ nm. Initial velocities of the reactions with different inhibitor concentrations were determined and the K_i value (in picomolar concentration units) was calculated by using EnzFitter program (Biosoft, Cambridge, U.K.) according to an

algorithm for tight-binding competitive inhibition described by Ermoloeff J., Lin X., and Tang J., *Biochemistry* **36**, 12364 (1997).

HIV-1 Protease Enzyme Assay (IC₅₀)

As for the K_i assay, above, the IC₅₀ assay is based on the fluorimetric
5 detection of synthetic hexapeptide substrate cleavage by HIV-1 protease in a defined reaction buffer as initially described by M.V. Toth and G.R.Marshall, Int. J. Peptide Protein Res. **36**, 544 (1990).

The assay employed (2-aminobenzoyl)Thr-Ile-Nle-(p-nitro)Phe-Gln-Arg as the substrate and recombinant HIV-1 protease expressed in E.Coli as the enzyme.
10 Both of the reagents were supplied by Bachem California, Inc. (Torrance, CA; Cat. nos. H-2992 and H-9040, respectively). The buffer for this reaction was 100 mM ammonium acetate, pH 5.5, 1 M sodium chloride, 1 mM ethylenediaminetetraacetic acid, and 1 mM dithiothreitol, and 10% dimethylsulfoxide.

15 To determine the IC₅₀ value, 170 μ L of reaction buffer was transferred into the wells of a white 96-well microtiter plate. A series of 3-fold dilutions in DMSO of the inhibitor to be tested was prepared, and 10 μ L of the resulting dilutions was transferred into the wells of the microtiter plate. 10 μ L of a 20-50 nM enzyme stock solution in reaction buffer was added to each well of the 96-
20 well plate to provide a final enzyme concentration of 1-2.5 nM. The plates were then preincubated for 10 minutes at 37°C. The substrate was solubilized in 100% dimethylsulfoxide at a concentration of 400 μ M and 10 μ L of the 400 μ M substrate was added into each well to reach a final substrate concentration of 20 μ M. The real-time reaction kinetics were measured using a Gemini 96-well plate
25 fluorimeter (Molecular Devices, Sunnyvale, CA) at λ (Ex) = 330 nm and λ (Em) = 420 nm. Initial velocities of the reactions with different inhibitor concentrations were determined and the IC₅₀ value (in nanomolar concentration units) was

calculated by using GraphPad Prism™ software to fit nonlinear regression curves.

Anti-HIV-1 Cell Culture Assay (EC50)

The assay is based on quantification of the HIV-1-associated cytopathic
5 effect by a colorimetric detection of the viability of virus-infected cells in the
presence or absence of tested inhibitors. HIV-1-induced cell death was
determined using a metabolic substrate 2,3-bis(2-methoxy-4-nitro-5-sulfophenyl)-
2H-tetrazolium-5-carboxanilide (XTT) which is converted only by intact cells into
a product with specific absorption characteristics as described by Weislow OS,
10 Kiser R, Fine DL, Bader J, Shoemaker RH and Boyd MR, J. Natl. Cancer Inst. 81,
577 (1989) (herein incorporated by reference in its entirety for all purposes).

MT2 cells (NIH AIDS reagent program, Cat # 237) maintained in RPMI-
1640 medium supplemented with 5% fetal bovine serum and antibiotics were
infected with the wild-type HIV-1 strain IIIB (Advanced Biotechnologies,
15 Columbia, MD) for 3 hours at 37 °C using the virus inoculum corresponding to a
multiplicity of infection equal to 0.01. The infected cells in culture media were
distributed into a 96-well plate (20,000 cells in 100 µl/well), and incubated in the
presence of a set of solutions containing 5-fold serial dilutions of the tested
inhibitor (100 µl/well) for 5 days at 37 °C. Samples with untreated infected and
20 untreated mock-infected control cells were also distributed to the 96-well plate
and incubated under the same conditions.

To determine the antiviral activity of the tested inhibitors, a substrate XTT
solution (6 mL per assay plate) at a concentration of 2 mg/mL in a phosphate-
buffered saline pH 7.4 was heated in water-bath for 5 min at 55 °C before 50 µl of
25 N-methylphenazonium methasulfate (5 µg/mL) was added per 6 mL of XTT
solution. After removing 100 µl media from each well on the assay plate, 100 µl
of the XTT substrate solution was added to each well. The cells and the XTT
solution were incubated at 37 °C for 45 to 60 min in a CO₂ incubator. To

inactivate the virus, 20 μ l of 2% Triton X-100 was added to each well. Viability, as determined by the amount of XTT metabolites produced, was quantified spectrophotometrically by the absorbance at 450 nm (with subtraction of the background absorbance at 650 nm). Data from the assay was expressed as the percentage absorbance relative to untreated control and the fifty percent effective concentration (EC₅₀) was calculated as the concentration of compound that effected an increase in the percentage of XTT metabolite production in infected, compound treated cells to 50% of that produced by uninfected, compound-free cells.

10 Anti-HIV-1 Cell Culture Assay (EC₅₀) in presence of 40% Human Serum or Human Serum Proteins

This assay is almost identical to the Anti-HIV-1 Cell Culture Assay described above, except that the infection was made in the presence or absence of 40% human serum (Type AB Male Cambrex 14-498E) or human serum proteins (Human α -acid Glycoprotein, Sigma G-9885; Human Serum Albumin, Sigma A1653, 96-99%) at physiological concentration. The HIV-1-induced cell death was determined as described above, except that the infected cells distributed in the 96-well plate were incubated in 80% Human Serum (2X concentration) or in 2 mg/mL Human α -acid Glycoprotein + 70 mg/mL HSA (2X concentration) rather than in culture media.

20 Cytotoxicity Cell Culture Assay (CC₅₀)

The assay is based on the evaluation of cytotoxic effect of tested compounds using a metabolic substrate 2,3-bis(2-methoxy-4-nitro-5-sulfophenyl)-2H-tetrazolium-5-carboxanilide (XTT) as described by Weislow OS, Kiser R, Fine DL, Bader J, Shoemaker RH and Boyd MR, J. Natl. Cancer Inst. 81, 577 (1989). This assay is almost identical to the previous assay described (Anti-HIV-1 Cell Culture Assay), except that the cells were not infected. The compound induced cell death (or growth reduction) was determined as previously described.

MT-2 cells maintained in RPMI-1640 medium supplemented with 5% fetal bovine serum and antibiotics were distributed into a 96-well plate (20,000 cells in 100 μ l/well) and incubated in the presence or absence of 5-fold serial dilutions of the tested inhibitor (100 μ l/well) for 5 days at 37 °C. Controls included untreated
5 infected cells and infected cells protected by 1 μ M of P4405 (Podophyllotoxin, Sigma Cat # P4405).

To determine cytotoxicity, an XTT solution (6 mL per assay plate) at a concentration of 2 mg/mL in phosphate-buffered saline pH 7.4 was heated in the dark in a water-bath for 5 min at 55 °C before 50 μ l of N-methylphenazonium
10 methasulfate (5 μ g/mL) was added per 6 mL of XTT solution. After removing 100 μ L media from each well on the assay plate, 100 μ L of the XTT substrate solution was added to each well. The cells and the XTT solution were incubated at 37 °C for 45 to 60 min in a CO₂ incubator. To inactivate the virus, 20 μ l of 2% Triton X-
15 100 was added to each well. Viability, as determined by the amount of XTT metabolites produced, is quantified spectrophotometrically by the absorbance at 450 nm (with subtraction of the background absorbance at 650 nm). Data from the assay is expressed as the percentage absorbance relative to untreated control, and the fifty percent cytotoxicity concentration (EC₅₀) was calculated as the
20 concentration of compound that effected an increase in the percentage of cell growth in compound treated cells to 50% of the cell growth provided by uninfected, compound-free cells.
