This application claims the benefit of priority to U.S. provisional application Ser. No. 62/690,565, filed June 27, 2018, the disclosure of which is hereby incorporated by reference as if set forth in its entirety.

BACKGROUND OF THE INVENTION

Cells normally maintain a balance between protein synthesis, folding, trafficking, aggregation, and degradation, referred to as protein homeostasis, utilizing sensors and networks of pathways [Sitia et al., *Nature* **426**: 891-894, 2003; Ron et al., *Nat Rev Mol Cell Biol* **8**: 519-529, 2007]. The cellular maintenance of protein homeostasis, or proteostasis, refers to controlling the conformation, binding interactions, location and concentration of individual proteins making up the proteome. Protein folding *in vivo* is accomplished through interactions between the folding polypeptide chain and macromolecular cellular components, including multiple classes of chaperones and folding enzymes, which minimize aggregation [Wiseman et al., *Cell* **131**: 809-821, 2007]. Whether a given protein folds in a certain cell type depends on the distribution, concentration, and subcellular localization of chaperones, folding enzymes, metabolites and the like [Wiseman et al.]. Human loss of function diseases are often the result of a disruption of normal protein homeostasis, typically caused by a mutation in a given protein that compromises its cellular folding, leading to efficient degradation [Cohen et al., *Nature* **426**: 905-909, 2003]. Human gain of function diseases are similarly frequently the result of a disruption in protein homeostasis, such as the accumulation of misfolded proteins, leading to protein aggregation [Balch et al. (2008), *Science* 319: 916-919].

The proteasome is a large protein complex of multiple subunits which acts as a protease to degrade misfolded proteins. Most proteasome substrates are targeted for degradation by the covalent attachment of ubiquitin moieties which are recognized by the proteasome [Lee et al. (2010), *Nature* 467(7312): 179-184]. Proteins with longer ubiquitin chains tend to have a stronger association with the proteasome than those with smaller chains [Lee et al. (2010); Proctor et al. (2007), *BMC Systems Biology* 1: 17]. The length of the ubiquitin chains is modulated, in part, by proteasome-associated deubiquitinating enzymes. One such mammalian

deubiquitinating enzyme is Usp14 which has been shown to act as an inhibitor of the proteasome [Lee et al. (2010)].

Both proteasome dysfunction and dysfunction in proteostasis have been implicated in a diverse range of diseases including, for example, neurodegenerative disease, metabolic diseases, inflammatory diseases, and cancer. In many such diseases and conditions, the proteasome has decreased ability to degrade misfolded or abnormal proteins, leading to the presence of toxic protein aggregates. In addition, the enhancement of proteasome activity can be therapeutic for any disease characterized by deficient proteasome activity, or deficient activity of other components of the ubiquitin-proteasome pathway including, but not limited to, von Hippel-Lindau disease, spinocerebellar ataxia 1, Angelman syndrome, giant axon neuropathy, inclusion body myopathy with Paget disease of bone and frontotemporal dementia (IBMPFD), and others [Lehman, N. L., (2009), *Acta Neuropathologica*, 118(3), 329-347; Weihl et al., (2007), *Neuromuscular Disorders*, 17, 87-87]. Enhancing proteasome activity is also therapeutic for diseases in which proteasome substrates are involved and contribute to pathology, but which do not satisfy a strict definition of proteinopathies. For example, numerous oncoproteins are proteasome substrates and their ability to promote cancer can potentially be attenuated by enhancing proteasome activity.

Therefore, there is a need for compounds and pharmaceutical compositions to treat conditions associated with proteostasis dysfunction and/or that provide therapies based on enhancing proteasome activity.

Exemplary synthetic routes for the preparation of compounds of Formulae (Ia), (Ib), (Ic), or (Id) or the compounds of Formulae (II), (IIa), (IIb), or (IIc) of the invention are shown in the Schemes I to III below. As will be understood by the skilled artisan, diastereomers can be separated from the reaction mixture using column chromatography.

Scheme I

A copper-catalyzed arylation of substituted indole of type **A** with substituted halobenzenes affords intermediate **B** (Scheme I).^{1,2} Additionally, nucleophilic-aromatic substitution of electron poor benzenes with indole **A** affords product **B**.³ A Friedel-Crafts acylation with an acyl chloride or chloro acetyl chloride, in conjunction with an aluminum-based Lewis acid and/or pyridine provides compounds Δ .^{4,5} In intermediate Δ the chloride is easily displaced with a variety of O⁶ and N⁷-based nucleophiles, followed in some instances by further modifications, to provide desired compounds of type **E**.

Scheme II

Indoles (**A**, Scheme II), when treated with substituted aryl and heteroaryl compounds in the presence of copper (I) reagents, affords intermediates **I**.⁸ Intermediates like **I** can be further modified through processes analogous to those described above (Scheme 1) to afford compounds of type **K**.

Scheme III

Substituted indoles of type **A** (Scheme III) are prepared via a Larock indole synthesis from substituted alkynes and halogenated anilines of type **M**.^{9,10} Compounds of type **A** are also prepared directly from compounds of type **M** by treating with ketones, copper (II) salts, and palladium (II) salts.¹⁰ Alternatively, compounds of type **A** are also prepared in a step-wise fashion from compounds of type **M** through Sonogoshira couplings with terminal alkynes to afford compounds of type **N**,^{11,12} which are then cyclized by treating with a base to compounds of type **A**.¹²

Exemplary synthetic routes for the preparation of compounds of Formulae (III), (IIIa), (IIIb), (IIIc), (IIId), and (IIIe) of the invention are shown in the Schemes 1 through 3 below. As will be understood by the skilled artisan, diastereomers can be separated from the reaction mixture using column chromatography.

Scheme 1.

20

As depicted in Scheme 1, a Paal-Knorr pyrrole synthesis utilizing an aniline and an appropriate diketone affords pyrrole **A**.¹ A Friedel-Crafts acylation with chloroacetyl chloride and an aluminum-based Lewis acid (ex. AlCl₃ or diethylaluminum chloride) provides intermediate **B**. The chlorine can be easily displaced with a variety of O², N³, S and C based nucleophiles to provide the desired compounds, such as scaffold **C**.

Scheme 2.

Another exemplary method for the preparation of compounds described in the invention is depicted in Scheme 2. Aryl pyrrole **D**, which is prepared through metal-catalyzed coupling⁴ or nucleophilic aromatic substitution⁵ between a pyrrole and suitably substituted aryl group, is acylated with an acyl chloride⁶ or amide of similar structure via Vilsmeier chemistry to yield ketone **E**.⁷ Complete reduction of ketone **E** to pyrrole **F** can be achieved with borane or related-borohydride reagents, where the pyrrole product **F** can be processed further, as shown in Scheme 1, to obtain compounds of the invention. Alternatively, pyrrole **F** is transformed in a two step procedure to obtain bromo-ketone **G**,⁹ which is further processed to obtain compounds of the invention.

Scheme 3.

Scheme 3 depicts yet another method of preparing compound described by the invention. Pyrrole **I**, which is prepared via methods analogues to those presented for pyrrole **D** (Scheme 2), is halogenated at the 5-position to generate pyrrole **J**.¹⁰ Sonagoshira¹¹ or Heck¹² chemistries are used to couple pyrrole **J** with substituted alkynes or alkenes, respectively, to obtain pyrroles **K** and **L**, which can be directly processed as shown in Schemes 1 and 2 to generate compounds relevant to the invention. Alternatively, pyrroles **K** and **L** can be reduced via common hydrogenation methods and further processed, as described above, to further obtain compounds relevant to the invention.

Certain of the compounds described herein contain one or more asymmetric centers and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (R)- or (S)-. The present invention is meant to include all such possible isomers, including racemic mixtures, optically pure forms and intermediate mixtures. Optically active (R)- and (S)-isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. "Isomers" are different compounds that have the same molecular formula. "Stereoisomers" are isomers that differ only in the way the atoms are arranged in space. "Enantiomers" are a pair of stereoisomers that are non-superimposable mirror images of each other. A 1:1 mixture of a pair of enantiomers is a "racemic" mixture. The term "(±)" is used to designate a racemic mixture where appropriate. "Diastereoisomers" are stereoisomers that have at least two asymmetric atoms, but which are not mirror-images of each other. The absolute stereochemistry is specified according to the Cahn-Ingold-Prelog R-S system. When a compound is a pure enantiomer the stereochemistry at each chiral carbon may be specified by either R or S. Resolved compounds whose absolute configuration is unknown can be designated (+) or (-) depending on the direction (dextro- or levorotatory) which they rotate plane polarized light at the wavelength of the sodium D line. When the compounds described herein contain olefinic double bonds or other centers of geometric asymmetry, and unless specified otherwise, it is intended that the compounds include

both E and Z geometric isomers. Likewise, all tautomeric forms are also intended to be included.

The term "enantiomerically pure" means a stereomerically pure composition of a compound. For example, a stereochemically pure composition is a composition that is free or substantially free of other stereoisomers of that compound. In another example, for a compound having one chiral center, an enantiomerically pure composition of the compound is free or substantially free of the other enantiomer. In yet another example, for a compound having two chiral centers, an enantiomerically pure composition is free or substantially free of the other diastereomers.

Where a particular stereochemistry is described or depicted it is intended to mean that a particular enantiomer is present in excess relative to the other enantiomer. A compound has an R-configuration at a specific position when it is present in excess compared to the compound having an S-configuration at that position. A compound has an S-configuration at a specific position when it is present in excess compared to the compound having an R-configuration at that position.

Likewise, all tautomeric forms are also intended to be included. Where a particular compound is described or depicted, it is intended to encompass that chemical structure as well as tautomers of that structure.

It is to be understood that atoms making up the compounds of the present invention are intended to include isotopic forms of such atoms. Isotopes, as used herein, include those atoms having the same atomic number but different mass numbers. administration of the composition depends on the condition to be treated. For example, intravenous injection may be preferred for treatment of a systemic disorder and oral administration may be preferred to treat a gastrointestinal disorder. The route of administration and the dosage of the composition to be administered can be determined by the skilled artisan without undue experimentation in conjunction with standard dose-response studies. Relevant circumstances to be considered in making those determinations include the condition or conditions to be treated, the choice of composition to be administered, the age, weight, and response of the individual patient, and the severity of the patient's symptoms.

Formulations

The compositions can also include, depending on the formulation desired, pharmaceutically-acceptable, non-toxic carriers or diluents, which are defined as vehicles commonly used to formulate pharmaceutical compositions for animal or human administration. The diluent is selected so as not to affect the biological activity of the pharmacologic agent or composition. Examples of such diluents are distilled water, physiological phosphate-buffered saline, Ringer's solutions, dextrose solution, and Hank's solution. In addition, the pharmaceutical composition or formulation may also include other carriers, adjuvants, or nontoxic, nontherapeutic, nonimmunogenic stabilizers and the like. Pharmaceutical compositions can also include large, slowly metabolized macromolecules such as proteins, polysaccharides such as chitosan, polylactic acids, polyglycolic acids and copolymers (such as latex functionalized SEPHAROSE™, agarose, cellulose, and the like), polymeric amino acids, amino acid copolymers, and lipid aggregates (such as oil droplets or liposomes).

The compositions can be administered parenterally such as, for example, by intravenous, intramuscular, intrathecal or subcutaneous injection. Parenteral administration can be accomplished by incorporating a composition into a solution or suspension. Such solutions or suspensions may also include sterile diluents such as water for injection, saline solution, fixed

oils, polyethylene glycols, glycerine, propylene glycol or other synthetic solvents. Parenteral formulations may also include antibacterial agents such as, for example, benzyl alcohol or methyl parabens, antioxidants such as, for example, ascorbic acid or sodium bisulfite and chelating agents such as EDTA. Buffers such as acetates, citrates or phosphates and agents for the adjustment of tonicity such as sodium chloride or dextrose may also be added. The parenteral preparation can be enclosed in ampules, disposable syringes or multiple dose vials made of glass or plastic.

Additionally, auxiliary substances, such as wetting or emulsifying agents, surfactants, pH buffering substances and the like can be present in compositions. Other components of pharmaceutical compositions are those of petroleum, animal, vegetable, or synthetic origin, for example, peanut oil, soybean oil, and mineral oil. In general, glycols such as propylene glycol or polyethylene glycol are preferred liquid carriers, particularly for injectable solutions.

Injectable formulations can be prepared either as liquid solutions or suspensions; solid forms suitable for solution in, or suspension in, liquid vehicles prior to injection can also be prepared. The preparation also can also be emulsified or encapsulated in liposomes or micro particles such as polylactide, polyglycolide, or copolymer for enhanced adjuvant effect [Langer, *Science* 249: 1527, 1990 and Hanes, *Advanced Drug Delivery Reviews* 28: 97-119, 1997]. The compositions and pharmacologic agents described herein can be administered in the form of a depot injection or implant preparation which can be formulated in such a manner as to permit a sustained or pulsatile release of the active ingredient.

Additional formulations suitable for other modes of administration include oral, intranasal, and pulmonary formulations, suppositories, transdermal applications and ocular delivery. For suppositories, binders and carriers include, for example, polyalkylene glycols or triglycerides; such suppositories can be formed from mixtures containing the active ingredient in the range of about 0.5% to about 10%, preferably about 1% to about 2%. Oral formulations include excipients, such as pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharine, cellulose, and magnesium carbonate. Topical application can result in transdermal or intradermal delivery. Transdermal delivery can be achieved using a skin patch or using transferosomes. [Paul et al., *Eur. J. Immunol.* 25: 3521-24, 1995; Cevc et al., *Biochem. Biophys. Acta* 1368: 201-15, 1998].

For the purpose of oral therapeutic administration, the pharmaceutical compositions can be incorporated with excipients and used in the form of tablets, troches, capsules, elixirs, suspensions, syrups, wafers, chewing gums and the like. Tablets, pills, capsules, troches and the like may also contain binders, excipients, disintegrating agent, lubricants, glidants, sweetening

agents, and flavoring agents. Some examples of binders include microcrystalline cellulose, gum tragacanth or gelatin. Examples of excipients include starch or lactose. Some examples of disintegrating agents include alginic acid, corn starch and the like. Examples of lubricants include magnesium stearate or potassium stearate. An example of a glidant is colloidal silicon dioxide. Some examples of sweetening agents include sucrose, saccharin and the like. Examples of flavoring agents include peppermint, methyl salicylate, orange flavoring and the like. Materials used in preparing these various compositions should be pharmaceutically pure and non-toxic in the amounts used. In another embodiment, the composition is administered as a tablet or a capsule.

Various other materials may be present as coatings or to modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain, in addition to the active ingredient, sucrose as a sweetening agent, methyl and propylparabens as preservatives, a dye and a flavoring such as cherry or orange flavor, and the like. For vaginal administration, a pharmaceutical composition may be presented as pessaries, tampons, creams, gels, pastes, foams or spray.

The pharmaceutical composition can also be administered by nasal administration. As used herein, nasally administering or nasal administration includes administering the composition to the mucus membranes of the nasal passage or nasal cavity of the patient. As used herein, pharmaceutical compositions for nasal administration of a composition include therapeutically effective amounts of the compounds prepared by well-known methods to be administered, for example, as a nasal spray, nasal drop, suspension, gel, ointment, cream or powder. Administration of the composition may also take place using a nasal tampon or nasal sponge.

For topical administration, suitable formulations may include biocompatible oil, wax, gel, powder, polymer, or other liquid or solid carriers. Such formulations may be administered by applying directly to affected tissues, for example, a liquid formulation to treat infection of conjunctival tissue can be administered dropwise to the subject's eye, or a cream formulation can be administered to the skin.

Rectal administration includes administering the pharmaceutical compositions into the rectum or large intestine. This can be accomplished using suppositories or enemas. Suppository formulations can easily be made by methods known in the art. For example, suppository formulations can be prepared by heating glycerin to about 120°C, dissolving the pharmaceutical composition in the glycerin, mixing the heated glycerin after which purified water may be added, and pouring the hot mixture into a suppository mold.

Transdermal administration includes percutaneous absorption of the composition through the skin. Transdermal formulations include patches, ointments, creams, gels, salves and the like.

In addition to the usual meaning of administering the formulations described herein to
5 any part, tissue or organ whose primary function is gas exchange with the external environment, for purposes of the present invention, “pulmonary” will also mean to include a tissue or cavity that is contingent to the respiratory tract, in particular, the sinuses. For pulmonary administration, an aerosol formulation containing the active agent, a manual pump spray, nebulizer or pressurized metered-dose inhaler as well as dry powder formulations are
10 contemplated. Suitable formulations of this type can also include other agents, such as antistatic agents, to maintain the disclosed compounds as effective aerosols.

A drug delivery device for delivering aerosols comprises a suitable aerosol canister with a metering valve containing a pharmaceutical aerosol formulation as described and an actuator housing adapted to hold the canister and allow for drug delivery. The canister in the drug
15 delivery device has a head space representing greater than about 15% of the total volume of the canister. Often, the compound intended for pulmonary administration is dissolved, suspended or emulsified in a mixture of a solvent, surfactant and propellant. The mixture is maintained under pressure in a canister that has been sealed with a metering valve.

The invention also encompasses a method of treating a patient suffering from a condition
20 associated with a dysfunction in protein homeostasis comprising administering to said patient a therapeutically effective amount of a compound described herein.

“Treating” or “treatment” includes preventing or delaying the onset of the symptoms, complications, or biochemical indicia of a disease, alleviating or ameliorating the symptoms or arresting or inhibiting further development of the disease, condition, or disorder. A “subject” is
25 an animal to be treated or in need of treatment. A “patient” is a human subject in need of treatment.

An “effective amount” refers to that amount of an agent that is sufficient to achieve a desired and/or recited effect. In the context of a therapeutic agent, an “effective amount” of the therapeutic agent that is sufficient to ameliorate one or more symptoms of a disorder and/or
30 prevent advancement of a disorder, cause regression of the disorder and/or to achieve a desired effect.

As used herein, the term “inhibiting” or “decreasing” encompasses causing a net decrease by either direct or indirect means. The term “increasing” or “enhancing” means to cause a net gain by either direct or indirect means.

The invention encompasses the treatment of a condition associated with a dysfunction in proteostasis. Proteostasis refers to protein homeostasis. Dysfunction in protein homeostasis is a result of protein misfolding, protein aggregation, defective protein trafficking or protein degradation. Exemplary proteins of which there can be a dysfunction in proteostasis, for example that can exist in a misfolded state, include, but are not limited to, glucocerebrosidase, hexosamine A, cystic fibrosis transmembrane conductance regulator, aspartylglucosaminidase, α -galactosidase A, cysteine transporter, acid ceramidase, acid α -L-fucosidase, protective protein, cathepsin A, acid β -glucosidase, acid β -galactosidase, iduronate 2-sulfatase, α -L-iduronidase, galactocerebrosidase, acid α -mannosidase, acid β -mannosidase, arylsulfatase B, arylsulfatase A, N-acetylgalactosamine-6-sulfate sulfatase, acid β -galactosidase, N-acetylglucosamine-1-phosphotransferase, acid sphingomyelinase, NPC-1, acid α -glucosidase, β -hexosamine B, heparin N-sulfatase, α -N-acetylglucosaminidase, islet amyloid polypeptide (IAPP or amylin), α -glucosaminide N-acetyltransferase, N-acetylglucosamine-6-sulfate sulfatase, α 1 anti-trypsin, α -N-acetylgalactosaminidase, α -neuramidase, β -glucuronidase, β -hexosamine A and acid lipase, polyglutamine, α -synuclein, A β peptide, tau protein, hERG potassium channel, islet amyloid polypeptide, transthyretin, Huntingtin, superoxide dismutase, TAR DNA-binding protein 43 (TDP-43), ataxin-3, superoxide dismutase (SOD) and rhodopsin.

Protein conformational diseases encompass gain of function disorders and loss of function disorders. In one embodiment, the protein conformational disease is a gain of function disorder. The terms “gain of function disorder,” “gain of function disease,” “gain of toxic function disorder” and “gain of toxic function disease” are used interchangeably herein. A gain of function disorder is a disease characterized by increased aggregation-associated proteotoxicity. In these diseases, aggregation exceeds clearance inside and/or outside of the cell. Gain of function diseases include, but are not limited to neurodegenerative diseases associated with aggregation of polyglutamine, Lewy body diseases, amyotrophic lateral sclerosis, transthyretin-associated aggregation diseases, Alzheimer’s disease, Machado-Joseph disease, cerebral B-amyloid angiopathy, retinal ganglion cell degeneration, tautopathies (progressive supranuclear palsy, corticobasal degeneration, frontotemporal lobar degeneration), cerebral hemorrhage with amyloidosis, Alexander disease, Serpinopathies, familial amyloidotic neuropathy, senile systemic amyloidosis, ApoAI amyloidosis, ApoAII amyloidosis, ApoAIV amyloidosis, familial amyloidosis of the Finnish type, lysozyme amyloidosis, fibrinogen

In a further embodiment, the protein conformation disease is a loss of function disorder. The terms "loss of function disease" and "loss of function disorder" are used interchangeably herein. Loss of function diseases are a group of diseases characterized by inefficient folding of a protein resulting in excessive degradation of the protein. Loss of function diseases include, for example, lysosomal storage diseases. Lysosomal storage diseases are a group of diseases characterized by a specific lysosomal enzyme deficiency which may occur in a variety of tissues, resulting in the build-up of molecules normally degraded by the deficient enzyme. Co-administered agents, compounds, or therapeutics need not be administered at exactly the same time. By "substantially simultaneously," it is meant that any compound of Formulae (Ia), (Ib), (Ic), or (Id); or any compound of Formulae (II), (IIa), (IIb), or (IIc); or any compound of Formulae (III), (IIIa), (IIIb), (IIIc), (IIId), or (IIIe) or any compound described herein, or a pharmaceutically acceptable salt, solvate, clathrate or prodrug of any compound of any formula thereof is administered before, at the same time, and/or after the administration of the second agent, and encompasses, for example, administration within the same treatment session or as part of the same treatment regimen. In an additional embodiment, the invention is directed to a pharmaceutical composition comprising any compound of Formulae (Ia), (Ib), (Ic), or (Id); or any compound of Formulae (II), (IIa), (IIb), or (IIc); or any compound of Formulae (III), (IIIa), (IIIb), (IIIc), (IIId), or (IIIe) or any compound described herein, or a pharmaceutically acceptable salt, solvate, clathrate or prodrug of any compound of any formula thereof and a second agent, wherein the second agent is selected from the group consisting of a pharmacologic chaperone and a proteostasis regulator. The invention also encompasses a method of treating a patient suffering from a condition associated with a dysfunction in proteostasis comprising administering a therapeutically effective amount of a compound of the invention and a second agent, wherein the second agent is a pharmacologic chaperone. Pharmacologic chaperones or kinetic stabilizers refer to compounds that bind an existing steady state level of the folded mutant protein and chemically enhance the folding equilibrium by stabilizing the fold [Bouvier, *Chem Biol* **14**: 241-242, 2007; Fan et al., *Nat Med* **5**: 112-115, 1999; Sawkar et al., *Proc Natl Acad Sci U S A* **99**: 15428-15433, 2002; Johnson and Kelly, *Accounts of Chemical Research* **38**: 911-921, 2005]. The pharmacologic chaperone is administered in amount that in combination with a compound described herein in an amount that is sufficient to treat a patient suffering from a condition associated with a dysfunction in proteostasis. Exemplary pharmacologic chaperones are described in U.S. Patent Application Publication No's. 20080056994, 20080009516, 20070281975, 20050130972, 20050137223, 20050203019, 20060264467 and 20060287358, the contents of each of which are incorporated by reference herein.

In another embodiment, the invention is a method of treating a patient suffering from a condition associated with a dysfunction in proteostasis comprising administering to said patient an effective amount of a compound described herein or a pharmaceutically acceptable salt, solvate, clathrate or prodrug, of any of thereof, and a second agent, wherein the second agent is a proteostasis regulator. The term "proteostasis regulator" refers to small molecules, siRNA and biologicals (including, for example, proteins) that enhance cellular protein homeostasis. For example, proteostasis regulators can be agents that influence protein synthesis, folding, trafficking and degradation pathways. Proteostasis regulators encompass pharmacologic agents that stimulate the heat shock response (HSR) signaling activity. Proteostasis regulators function

by manipulating signaling pathways, including, but not limited to, the heat shock response or the unfolded protein response, or both, resulting in transcription and translation of proteostasis network components. Proteostasis regulators can enhance the folding, trafficking and function of proteins (for example, mutated proteins). Proteostasis regulators can also regulate protein chaperones by upregulating transcription or translation of the protein chaperone, or inhibiting degradation of the protein chaperone. Proteostasis regulators can influence the biology of folding, often by the coordinated increase in chaperone and folding enzyme levels and macromolecules that bind to partially folded conformational ensembles, thus enabling their progression to intermediates with more native structure and ultimately increasing the concentration of folded mutant protein for export. In one aspect, the proteostasis regulator is distinct from a chaperone in that the proteostasis regulator can enhance the homeostasis of a mutated protein but does not bind the mutated protein. In addition, proteostasis regulators can upregulate an aggregation pathway or a disaggregase activity. Exemplary proteostasis regulators are the celastrols, MG-132 and L-type Ca^{2+} channel blockers (e.g., diltiazem and verapamil). The term “celastrols” refers to celastrol and derivatives or analogs thereof, including, but not limited to, those celastrol derivatives described in Westerheide et al., *J Biol Chem*, 2004, **279**(53): p. 56053-60, the contents of which are expressly incorporated by reference herein. Celastrol derivatives include, for example, celastrol methyl ester, dihydrocelastrol diacetate, celastrol butyl ether, dihydrocelastrol, celastrol benzyl ester, primesterol, primesterol diacetate and triacetate of celastrol. In certain aspects, the proteostasis regulator is a heat shock response activator. A heat shock response activator is an agent that indirectly or directly activates the heat shock response, for example, by directly or indirectly activating heat shock transcription factor 1 (HSF1), inhibiting Hsp90, and/or activating chaperone expression (Westerheide et al., *J Biol Chem*, 2004, **279**(53): p. 56053-60, the contents of which are expressly incorporated by reference herein). The terms “heat shock response activator,” “heat shock activator,” “heat shock response inducer,” and “heat shock inducer” are used interchangeably herein. Non-limiting examples of heat shock response activators are celastrols, non-steroidal anti-inflammatory drugs, ansamycin, geldenamycin, radicicol, glucuronic acid, and tributyltin. Heat shock response activators have also been described, for example, in U.S. Patent Application Publication No’s. 20070259820, 20070207992, 20070179087, 20060148767, the contents of each of which are expressly incorporated by reference herein. In some embodiments, the heat shock response activator is a small molecule heat shock response activator.

Example A. Preparation of Intermediates IA through IVA

Preparation of Intermediate IA: (Ethenesulfonyl)cyclopropane

To a 250 mL 3-necked round-bottom flask, was placed a solution of cyclopropanesulfonyl chloride (7.05 g, 50.2 mmol) in THF (50 mL). To this solution was added vinylmagnesium bromide (6.55 g, 49.9 mmol) under nitrogen. The reaction was stirred overnight at 60°C, then the mixture was cooled to rt and quenched with 100 mL of cooled brine. The resulting solution was extracted with EtOAc (3x100 mL). The combined organic layers was washed with brine (2x80 mL), dried over anhydrous Na₂SO₄ and concentrated under vacuum. The crude product was purified by column chromatography using EtOAc/petroleum ether (1:3) as eluent affording 798 mg (12%) of the title compound as light yellow oil. ¹H NMR (400 MHz, CDCl₃): δ 6.74-6.78 (m, 1H), 6.42-6.38 (d, 1H, *J* = 13.8 Hz), 6.11-6.09 (d, 1H, *J* = 10.0 Hz), 2.41-2.35 (m, 1H), 1.34-1.22 (m, 2H), 1.14-1.05 (m, 2H).

(6B)

A. (*E*)-2-Methyl-1-(3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)allyl)-1*H*-imidazole

Into a 50 mL round-bottom flask, being maintained under an inert atmosphere of nitrogen, was placed a mixture of 2-methyl-1-(prop-2-yn-1-yl)-1*H*-imidazole (120 mg, 1.00 mmol) and 4,4,4',4',5,5,5',5'-octamethyl-2,2'-bi(1,3,2-dioxaborolane) (381 mg, 1.50 mmol) in ethanol (3 mL). Then copper sand (6 mg, 0.09 mmol) and sodium methoxide (11 mg, 0.20 mmol) were added to the flask. The resulting mixture was allowed to stir at room temperature overnight. The reaction mixture was then diluted with ethyl acetate (100 mL) and washed with brine (3x50 mL). The organic phase was then dried over anhydrous sodium sulfate and concentrated under vacuum to afford 340 mg of (*E*)-2-methyl-1-(3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)allyl)-1*H*-imidazole as green, crude oil. Mass Spectrum (LCMS, ESI pos.): Calcd. for C₁₃H₂₁BN₂O₂: 249 (M+H); found: 249.

B. (*E*)-4-(3-Acetyl-2-methyl-5-(3-(2-methyl-1*H*-imidazol-1-yl)prop-1-en-1-yl)-1*H*-pyrrol-1-yl)benzonitrile

Into a 100 mL round-bottom flask, being maintained under an inert atmosphere of nitrogen, was placed a mixture of 4-(3-acetyl-2-methyl-1*H*-pyrrol-1-yl)benzonitrile (1.40 g, 4.00

mmol), (*E*)-2-methyl-1-(3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)allyl)-1*H*-imidazole (1.98 g, 8.00 mmol) and potassium carbonate (1.65 g, 11.94 mmol) in 1,4-dioxane (18 mL) and water (6 mL). Then Pd(dppf)Cl₂ (293 mg, 0.40 mmol) was added to the flask. The resulting mixture was heated at 100 °C overnight. After cooling to room temperature the reaction mixture was diluted with brine (100 mL) and then extracted with ethyl acetate (3x150 mL). The combined organic extracts were dried over anhydrous sodium sulfate and concentrated under vacuum. The remaining residue was purified by column chromatography on silica gel, using a gradient of ethyl acetate/petroleum ether (1:1-10:1), to afford 870 mg (63%) of (*E*)-4-(3-acetyl-2-methyl-5-(3-(2-methyl-1*H*-imidazol-1-yl)prop-1-en-1-yl)-1*H*-pyrrol-1-yl)benzonitrile as a yellow solid. Mass Spectrum (LCMS, ESI pos.): Calcd. for C₂₁H₂₀N₄O: 345 (M+H); found: 345.

C. (*E*)-4-(3-(2-Bromoacetyl)-2-methyl-5-(3-(2-methyl-1*H*-imidazol-1-yl)prop-1-en-1-yl)-1*H*-pyrrol-1-yl)benzonitrile

Into a 50 mL round-bottom flask, being maintained under an inert atmosphere of nitrogen, was placed a solution of (*E*)-2-methyl-1-(3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)allyl)-1*H*-imidazole (250 mg, 0.73 mmol) and diisopropylethylamine (281 mg, 2.17 mmol) in tetrahydrofuran (5 mL). The flask was cooled to 0 °C and then TMSOTf (323 mg, 1.45 mmol) was added in a dropwise fashion. The reaction mixture was allowed to stir at 0 °C for 1 h and then a solution of NBS (155 mg, 0.87 mmol) in tetrahydrofuran (3 mL) was added in a dropwise fashion. The resulting mixture was allowed to stir for 0.5 hour at 0 °C and then warm to room temperature and stir for an additional 1 h. The reaction mixture was diluted with ethyl acetate (100 mL) and then washed with brine (3x100 mL). The organic phase was dried over anhydrous sodium sulfate and concentrated under vacuum. The remaining residue was purified by column chromatography on silica gel, using dichloromethane/methanol (15:1) as the eluant, to afford 50 mg (16%) of (*E*)-4-(3-(2-bromoacetyl)-2-methyl-5-(3-(2-methyl-1*H*-imidazol-1-yl)prop-1-en-1-yl)-1*H*-pyrrol-1-yl)benzonitrile as a yellow solid. Mass Spectrum (LCMS, ESI pos.): Calcd. for C₂₁H₁₉BrN₄O: 423 (M+H); found: 423.

D. (±)-4-(3-(2-((2R)-2-Hydroxy-7-azabicyclo[2.2.1]heptan-7-yl)acetyl)-2-methyl-5-((E)-3-(2-methyl-1H-imidazol-1-yl)prop-1-en-1-yl)-1H-pyrrol-1-yl)benzonitrile (**6B**)

Into a 50 mL round-bottom flask, being maintained under an inert atmosphere of nitrogen, was placed a solution of (E)-4-(3-(2-bromoacetyl)-2-methyl-5-(3-(2-methyl-1H-imidazol-1-yl)prop-1-en-1-yl)-1H-pyrrol-1-yl)benzonitrile (50 mg, 0.12 mmol) in *N,N*-dimethylformamide (1 mL). Then solid potassium carbonate (24 mg, 0.17 mmol) and (±)-(1*S*,2*S*,4*R*)-7-azabicyclo[2.2.1]heptan-2-ol (21 mg, 0.14 mmol) were added to the flask. The resulting mixture was allowed to stir overnight at room temperature. The reaction mixture was then filtered and the filtrate was purified by preparative-HPLC by the following conditions: Column-XBridge C18 OBD Prep Column, 19 mm X 250 mm, 5 μm 13 nm; Mobile Phase A-Water with 0.05% NH₄HCO₃, Mobile Phase B-acetonitrile; Flow rate-20 mL/min; Gradient-25% B to 40% B in 8 min; Detector-UV 254 nm. This process afforded 5 mg (9%) of (±)-4-(3-(2-((2R)-2-hydroxy-7-azabicyclo[2.2.1]heptan-7-yl)acetyl)-2-methyl-5-((E)-3-(2-methyl-1H-imidazol-1-yl)prop-1-en-1-yl)-1H-pyrrol-1-yl)benzonitrile (**6B**) as a yellow solid. Example 28B. (±)-4-(3-(2-((2R)-2-Hydroxy-7-azabicyclo[2.2.1]heptan-7-yl)acetyl)-2,5-dimethyl-1H-pyrrol-1-yl)benzonitrile (64B)

Into a 25 mL round-bottom flask was placed a solution of 4-(3-(2-chloroacetyl)-2,5-dimethyl-1H-pyrrol-1-yl)benzonitrile (100 mg, 0.37 mmol) in *N,N*-dimethylformamide (5 mL). To the solution were added (±)-(1*S*,2*S*,4*R*)-7-azabicyclo[2.2.1]heptan-2-ol (62 mg, 0.55 mmol) and potassium carbonate (152 mg). The resulting mixture was allowed to stir at room temperature for 2 h. The solids were filtered from the reaction mixture and the filtrate was purified by preparative-HPLC under the following conditions: IntelFlash-1 Column-C18; mobile phase- H₂O:CH₃CN=75:25 increasing to H₂O:CH₃CN=25:75 within 20 min; Detector-UV 254 nm. This process afforded 71 mg (56%) of (±)-4-(3-(2-((2*R*)-2-Hydroxy-7-azabicyclo[2.2.1]heptan-7-yl)acetyl)-2,5-dimethyl-1H-pyrrol-1-yl)benzonitrile (**64B**) as a yellow solid. Mass Spectrum (LCMS, ESI pos.): Calcd. for C₂₁H₂₃N₃O₂: 350 (M+H); found: 350. ¹H NMR (400 MHz, CDCl₃): δ 7.83 (d, *J*= 8.4 Hz, 2H), 7.33 (d, *J*= 8.0 Hz, 2H), 6.35 (s, 1H), 4.56-4.55 (m, 2H), 3.77 (d, *J*= 6.8 Hz, 2H), 3.66 (brs, 1H), 3.57 (brs, 1H), 2.44-2.41 (m, 1H), 2.32 (s, 3H), 2.22-2.19 (m, 1H), 1.99 (s, 3H), 1.92-1.89 (m, 2H), 1.74-1.68 (m, 1H), 1.61-1.55 (m, 1H), 1.06-1.03 (m, 1H).

Using the procedures described in Example 28B, reagents, starting materials, and conditions known to those skilled in the art, the following compounds representative of the present invention were prepared:

Into a 30 mL sealed tube, being maintained under an inert atmosphere of nitrogen, was placed a mixture of 4-(3-acetyl-5-iodo-2-methyl-1*H*-pyrrol-1-yl)benzonitrile (2.10 g, 6.01 mmol), copper(I) cyanide (815 mg), and potassium *tert*-butoxide (141 mg, 1.26 mmol) in *N,N*-dimethylacetamide (20 mL). To the mixture was then added Pd(dppf)Cl₂·CH₂Cl₂ (470 mg). The

The resulting mixture was extracted with ethyl acetate (3x100 mL) and the combined organic extracts were concentrated under vacuum. The remaining residue was purified by column chromatography on silica, using ethyl acetate/petroleum ether (1:8) as the eluant, to afford 368 mg 4-acetyl-1-(4-cyanophenyl)-5-
 15 methyl-1*H*-pyrrole-2-carbonitrile as a light yellow solid. Mass Spectrum (LCMS, ESI pos.): Calcd. for C₁₅H₁₁N₃O: 250 (M+H); found: 250. ¹H NMR (400 MHz, CDCl₃): δ 7.94-7.91 (m, 2H), 7.51-7.48 (m, 2H), 7.36 (s, 1H), 2.51 (s, 3H), 2.48 (s, 3H).
