DIARYLUREA COMPOUNDS AND DERIVATIVES AS CHK-1 INHIBITORS FOR THE TREATMENT OF CANCER

RELATED APPLICATIONS

This application claims the benefit of U.S. Provisional Application No. 60/384,207, filed May 29, 2002, and U.S. Provisional Application No. 60/432,796, filed December 12, 2002. The entire teachings of these two applications are incorporated herein by reference.

BACKGROUND OF THE INVENTION

Cell cycle checkpoints are regulatory pathways that control the order and timing of cell cycle transitions. They ensure that critical events such as DNA replication and chromosome segregation are completed in high fidelity. The regulation of these cell cycle checkpoints is a critical determinant of the manner in which tumor cells respond to many chemotherapies and radiation. Many effective cancer therapies work by causing DNA damage; however, resistance to these agents remains a significant limitation in the treatment of cancer. Of the several mechanisms of drug resistance, an important one is attributed to the prevention of cell cycle progression through the control of critical activation of a checkpoint pathway. This arrests the cell cycle to provide time for repair, and induces the transcription of genes to facilitate repair, thereby avoiding immediate cell death. By abrogating checkpoint arrests, for example, the G2 checkpoint, it may be possible to synergistically augment tumor cell death induced by DNA damage and
circumvent resistance. Human Chk-1 plays a role in regulating cell cycle arrest by phosphorylating the phosphatase cdc25 on Serine 216, which may be involved in preventing activation of cdc2/cyclin B and initiating mitosis. Therefore, inhibition of Chk-1 should enhance DNA damaging agents by initiating mitosis before DNA repair is complete and thereby causing tumor cell death.

SUMMARY OF THE INVENTION

It has now been found that certain diaryl ureas are effective inhibitors of Chk-1. For example, the compounds shown in Table 1 of Example 37 have an IC₅₀ less than 20 μmol when tested in an in vitro assay that assesses the inhibitory activity of test compounds. It has also been found that phenyl urea CHK-1 inhibitors substituted ortho to the urea nitrogen with an -X-NH₂ group, wherein X is an inert linking group, are significantly more effective in enhancing the cytotoxicity of DNA damaging agents than other CHK-1 inhibitors (see Example 38). Linking groups whose length corresponds to the length of -O-(C₂₋₅ alkylidene)- are particularly efficacious. Based on these discoveries, novel Chk-1 inhibitors, methods of inhibiting Chk-1 in a subject and methods of treating cancer are disclosed herein.

One embodiment of the present invention is a method of inhibiting Chk-1 in a subject in need of such treatment. The method comprises administering to the subject an effective amount of a compound of Formula I:

Z is O, S, or N-CN.

Ring A is optionally substituted at any substitutable carbon by R⁴. Preferably, Ring A is a phenyl ring optionally substituted at any substitutable carbon by R⁴.

R¹ is –H, halogen, T-R⁶ or V-T-R⁶, or R¹ and R² taken together with their intervening atoms form a 5-7 membered ring, preferably a 5-7 membered heterocycle. When R¹, R² and their intervening carbons together form a heterocycle, preferred values for R¹ and R² together include an optionally substituted methylene, ethylene and propylene. Suitable substituents are as defined below for an alkylidene group. Preferred substituents are =O, C₁₋₃ aliphatic, amine [N(R₈)₂] and amino alkyl [(CH₃)₄N(R₈)₂]. Each R₈ is independently C₁₋₆ alkyl or, taken together with the nitrogen atom to which they are bonded, is a 5-7 membered nitrogen-containing heterocycle; and q is an integer from 1-6.

T is a C₁₋₆ straight or branched alkylidene chain that is optionally interrupted by –O-, -S-, -N(R₅)₂, -S(O)₂-, -SO₂-, -C(O)₂-, -OC(O)₂-, -N(R₅)₂C(O)₂-, -C(O)N(R₅)₂-, -SO₂N(R₅)₂-, or -N(R₅)₂SO₂-, wherein the alkylidene chain or a portion thereof is optionally part of a 3-6 membered ring system.

V is –O-, -S-, -N(R₅)₂, -S(O)₂-, -SO₂-, -C(O)₂-, -OC(O)₂-, -N(R₅)₂C(O)₂-, -C(O)N(R₅)₂-, -SO₂N(R₅)₂-, or -N(R₅)₂SO₂-. R² and R³ are each independently selected from hydrogen, C₁₋₆ alkyl optionally substituted with an amine [N(R₈)₂], -C(=O)R, -CO₂R, or SO₂R, or R² and R³ taken together with their intervening atoms form an optionally substituted 5-6 membered ring, preferably a 5-6 membered heterocycle. When R², R³ and the intervening carbons together form a 5-6 membered heterocycle, R² and R³ together form, for example, an optionally substituted ethylene, propylene or CH₂NHCH₂. Suitable substituents for the carbon atoms in the groups formed by R² and R³ are as defined below for an alkylidene group and preferred substituents are =O, C₁₋₃ alkyl, amine [N(R₈)₂] and amino alkyl [(CH₃)₄N(R₈)₂]; and suitable substituents for the

Additionally, two R⁴’s ortho to each other, taken together with the carbon  
atoms of Ring A to which they are bonded, form an optionally substituted five or six

for heterocycles.

In another alternative, R¹ and an R⁴ ortho to R¹, taken together with the  
carbon atoms of Ring A to which they are bonded, form an optionally substituted  
five or six membered heterocycle fused to Ring A. When R¹, an ortho R⁴ and the

Additionally, pharmaceutically acceptable salts of the compounds of Formula I, II and III are included in the present invention. For example, an acid salt of a compound containing an amine or other basic group can be obtained, by reacting the compound with a suitable organic or inorganic acid, such as hydrogen chloride, hydrogen bromide, acetic acid, perchloric acid and the like. Compounds with a quaternary ammonium group also contain a counteranion such as chloride, bromide, iodide, acetate, perchlorate and the like. Other examples of such salts include hydrochlorides, hydrobromides, sulfates, methanesulfonates, nitrates, maleates, acetates, citrates, fumarates, tartarates [e.g. (+)-tartrates, (-)-tartrates or mixtures thereof including racemic mixtures], succinates, benzoates and salts with amino acids such as glutamic acid.

Salts of compounds containing a carboxylic acid or other acidic functional group can be prepared by reacting with a suitable base. Such a pharmaceutically acceptable salt may be made with a base which affords a pharmaceutically acceptable cation, which includes alkali metal salts (especially sodium and potassium), alkaline earth metal salts (especially calcium and magnesium), aluminum salts and ammonium salts, as well as salts made from physiologically acceptable organic bases such as trimethylamine, triethylamine, morpholine, pyridine, piperidine, picoline, dicyclohexylamine, N,N'-dibenzylethlyenediamine, 2-hydroxyethylamine, bis-(2-hydroxyethyl)amine, tri-(2-hydroxyethyl)amine, procaine, dibenzylpiperidine, N-benzyl-β-phenethylamine, dehydroabietylamine, N,N'-bisdehydroabietylamine,

The disclosed Chk-1 inhibitors are advantageously administered to inhibit Chk-1 in a subject in whom a beneficial therapeutic or prophylactic effect can be achieved by inhibiting Chk-1, i.e., a subject in need of Chk-1 inhibition. A "subject" is a mammal, preferably a human, but can also be an animal in need of veterinary treatment, e.g., companion animals (e.g., dogs, cats, and the like), farm animals (e.g., cows, sheep, pigs, horses, and the like) and laboratory animals (e.g., rats, mice, guinea pigs, and the like).

Chk-1 inhibition can be used to achieve a beneficial therapeutic or prophylactic effect, for example, in subjects with cancer. Cancers which can be treated with Chk-1 inhibitors include cancers or cell types (e.g., solid tumors such as colon, breast, lung, ovarian, pancreatic or non-solid tumors such as non-Hodgkins lymphomas and leukemias) in which p53 or the p53 pathway has been inactivated or abrogated. Chk-1 inhibitors are particularly useful in the treatment of cancers or cell types in which Chkl protein or activity is up regulated (e.g., retinoblastomas such as Rb negative or inactivated cells or where the ARF^{p16}p19 locus has been inactivated or misregulated. Use of Chk-1 inhibitors as drugs for the treatment of cancer is particularly advantageous and can enhance the effectiveness of the treatment when:

1) combined with radiation therapy or with an anti-cancer drugs which act by causing damage to the genetic material of cells (referred to herein as "DNA damaging anti-cancer drugs"); 2) combined with agents which are otherwise cytotoxic to cancer cells during cell division; 3) combined with agents which are proteasome inhibitors; 4) combined with agents which inhibit NF-κB (e.g., IKK inhibitors); or 5) used with combinations of cancer drugs with which are not cytotoxic when administered alone, yet in combination produce a toxic effect.

Examples of DNA damaging anti-cancer drugs include Topoisomerase I inhibitors (e.g., irinotecan, camptothecin and analogs or metabolites thereof and doxorubicin); Topoisomerase II inhibitors (e.g., etoposide and daunorubicin); alkylating agents (e.g., methotrexate or cyclophosphamide); DNA intercalators (e.g., cisplatin and carboplatin); DNA intercalators and free radical generators such as bleomycin; and
nucleoside mimetics (e.g., 5-fluorouracil gemcitabine and hydroxyurea). Agents which disrupt cell replication include: taxol, taxol analogs vinblastin and vinblastin analogs; antibodies such as Trastuzumab (Herceptin) which bind to proteins overexpressed in cancers and thereby downregulate cell replication; and inhibitors such as STI-571 (e.g., Gleevec) of proteins or enzymes known to be upregulated, over-expressed or activated in cancers, the inhibition of which downregulates cell replication.

The disclosed Chk-1 inhibitors are also effective when used in combination with DNA-damaging anti-cancer drugs and/or radiation therapy to treat subjects with multi-drug resistant cancers. A cancer is resistant to a drug when it resumes a normal rate of tumor growth while undergoing treatment with the drug after the tumor had initially responded to the drug. A tumor “responds to a drug” when it exhibits a decrease in tumor mass or a decrease in the rate of tumor growth. The term “multi-drug resistant cancer” refers to cancer that is resistant to two or more drugs, typically five or more.

As such, an “effective amount” of the disclosed Chk-1 inhibitors is the quantity which inhibits Chk-1 when administered to a subject or which, when administered to a subject with cancer, slows tumor growth, ameliorates the symptoms of the disease and/or increases longevity. When used in combination with radiation therapy, with a DNA-damaging drug or other anti-cancer drug, an effective amount of the Chk-1 inhibitor is the quantity in which a greater response is achieved when the Chk-1 inhibitor is co-administered with the DNA damaging anti-cancer drug and/or radiation therapy compared with when the DNA damaging anti-cancer drug and/or radiation therapy is administered alone. When used as a combination therapy, an “effective amount” of the DNA damaging drug and/or an “effective” radiation dose are administered to the subject, which is a quantity in which anti-cancer effects are normally achieved. The disclosed Chk-1 inhibitors and the DNA damaging anti-cancer drug can be co-administered to the subject as part of the same pharmaceutical composition or, alternatively, as separate pharmaceutical compositions. When administered as separate pharmaceutical compositions, the disclosed Chk-1 inhibitors and the DNA-damaging anti-cancer drug (and/or
radiation therapy) can be administered simultaneously or at different times, provided
that the enhancing effect of the Chk-1 inhibitor is retained.

The amount of Chk-1 inhibitor, DNA damaging anti-cancer drug and
radiation dose administered to the subject will depend on the type and severity of the
disease or condition and on the characteristics of the subject, such as general health,
age, sex, body weight and tolerance to drugs. The skilled artisan will be able to
determine appropriate dosages depending on these and other factors. Effective
dosages for commonly used anti-cancer drugs and radiation therapy are well known
to the skilled person. Effective amounts of the disclosed Chk-1 inhibitors typically
range between about 1 mg/mm² per day and about 10 grams/mm² per day, and
preferably between 10 mg/mm² per day and about 5 grams/mm².

The Chk-1 inhibitors described herein, and the pharmaceutically acceptable
salts, solvates and hydrates thereof can be used in pharmaceutical preparations in
combination with a pharmaceutically acceptable carrier or diluent. Suitable
pharmaceutically acceptable carriers include inert solid fillers or diluents and sterile
aqueous or organic solutions. The Chk-1 inhibitor will be present in such
pharmaceutical compositions in amounts sufficient to provide the desired dosage
amount in the range described herein. Techniques for formulation and
administration of the compounds of the instant invention can be found in

For oral administration, the Chk-1 inhibitor or salts thereof can be combined
with a suitable solid or liquid carrier or diluent to form capsules, tablets, pills,
powders, syrups, solutions, suspensions and the like.

The tablets, pills, capsules, and the like contain from about 1 to about 99
weight percent of the active ingredient and a binder such as gum tragacanth, acacias,
corn starch or gelatin; excipients such as dicalcium phosphate; a disintegrating agent
such as corn starch, potato starch, alginic acid, a lubricant such as magnesium
stearate; and a sweetening agent such as sucrose lactose or saccharin. When a
dosage unit form is a capsule, it may contain, in addition to materials of the above
type, a liquid carrier such as a fatty oil.
Various other materials may be present as coatings or to modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain, in addition to the active ingredient, sucrose as a sweetening agent, methyl and propylparabens as preservatives, a dye and a flavoring such as cherry or orange flavor.

For parental administration the disclosed Chk-1 inhibitor, or salts thereof can be combined with sterile aqueous or organic media to form injectable solutions or suspensions. For example, solutions in sesame or peanut oil, aqueous propylene glycol and the like can be used, as well as aqueous solutions of water-soluble pharmaceutically-acceptable salts of the compounds. Dispersions can also be prepared in glycerol, liquid polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

In addition, to the formulations described previously, the compounds may also be formulated as a depot preparation. Such long acting formulations may be administered by implantation, for example, subcutaneously or intramuscularly or by intramuscular injection. Thus, for example, as an emulsion in an acceptable oil, or ion exchange resins, or as sparingly soluble derivatives, for example, as sparingly soluble salts.

Preferably disclosed Chk-1 inhibitors or pharmaceutical formulations containing these compounds are in unit dosage form for administration to a mammal. The unit dosage form can be any unit dosage form known in the art including, for example, a capsule, an IV bag, a tablet, or a vial. The quantity of active ingredient (viz., a compound of Structural Formula I, II or III or salts thereof) in a unit dose of composition is an effective amount and may be varied according to the particular treatment involved. It may be appreciated that it may be necessary to make routine variations to the dosage depending on the age and condition of the patient. The dosage will also depend on the route of administration which may be by a variety of routes including oral, aerosol, rectal, transdermal, subcutaneous, intravenous, intramuscular, intraperitoneal and intranasal.
A synthesis for the preparation of the Chk-1 inhibitors disclosed herein is shown below in the Synthetic Scheme. Specific conditions for carrying out these reactions are provided in Examples 1-28.

Example 36 Biological Assays

Chk1 Expression & Purification:
Recombinant human Chk1 was expressed as a fusion protein with glutathione S-transferase at the amino-terminus (GST-Chk1) using standard baculovirus vectors and (Bac-to-Bac®) insect cell expression system purchased from GIBCO™ Invitrogen. Recombinant protein expressed in insect cells was purified using glutathione sepharose (Amersham Biotech) using standard procedures described by the manufacturer.

Chk1 Fluorescence Polarization Assays:
Chk1 kinase inhibitors were identified using fluorescence polarization to monitor kinase activity. This assay utilized 10 nM GST-Chk1 and contained 5 mM 2-(N-Morpholino)ethanesulfonic acid (MES, pH 6.5), 5 mM magnesium chloride
(MgCl₂), 0.05% Tween®-20, 1 μM adenosine 5’ triphosphate (ATP), 2 mM 1,4-Dithio-DL-threitol (DTT), 1 μM peptide substrate (Biotin-ILSRRPSYRKILND-free acid) (SEQ ID NO: 1), 10 nM peptide substrate tracer (Fluorescine-GSRRP-pS-YRKI-free acid) (pS = phosphorylated-Serine) (SEQ ID NO: 2), 60 ng anti-phospho-CREB(S133) mouse monoclonal IgG purified on Protein G sepharose from crude mouse ascites purchased from Cell Signaling Technologies (Beverly, MA), 4% dimethyl sulfoxide (DMSO) and 30 μM inhibitor. Reactions were incubated at room temperature for 140 minutes and terminated by addition of 25 mM EDTA (pH 8.0). Stopped reactions were incubated for 120 minutes at room temperature and fluorescence polarization values determined using a Molecular Devices / LJL Biosystems Analyst™ AD (Sunnyvale, CA) with standard fluorescence settings.

Additional assays were also used to determine inhibitor potency and ability of inhibitors to compete for ATP binding site of Chk1:

**Chk1 SPA filtration Assay:**

Assays (25 μl) contained 10 nM GST-Chk1, 10 mM MES, 2 mM DTT, 10 mM MgCl₂, 0.025% Tween®-20, 1 μM peptide substrate (Biotin-ILSRRPSYRKILND-free acid) (SEQ ID NO: 1), 1 μM ATP, 0.1 μCi ³²P-γ-ATP (New England Nuclear, NEN) and reacted for 90 minutes at room temperature. Reactions were terminated by adding 55 μl of phosphate buffered saline containing 50 mM EDTA, 6.9 mM ATP, 0.5 mg Scintillation proximity assay (SPA) beads (Amersham Biosciences). Peptide substrate was allowed to bind beads for 10 minutes at room temperature followed by filtration on a Packard GF/B Unifilter plate and washing with phosphate buffered saline. Dried plates were sealed with Topseal™ (NEN) and ³²P incorporated to peptide substrate detected using a Packard Topcount® scintillation counter with standard settings for ³²P.

Reactions were incubated for 30 minutes at room temperature, terminated with 50 ul of 50 mM EDTA and 90 ul were transferred to streptavidin-coated FlashPlates® (NEN) and incubated for 1 hour at room temperature. Plates were washed with phosphate buffered salaine containing 0.01% Tween-20 and 10 mM sodium pyrophosphate. Plates were dried, sealed with Topseal™ (NEN) and amount of $^{32}$P incorporated into the peptide substrate measure using a Packard Topcount® NXT™ scintillation counter with standard settings.

Chk1 DELFIA® kinase assay:

Assays (25 ul) utilized 6.4 nM GST-Chk1 containing 25 mM Tris, pH 8.5, 20% glycerol, 50 mM sodium chloride (NaCl), 0.1% Surfact-Amps® 20, 1 uM peptide substrate (Biotin-GLYRSPSMPEN-amide) (SEQ ID NO: 3), 2 mM DTT, 4% DMSO, 12.5 uM ATP, 5 mM MgCl$_2$ and reacted for 30 minutes at room temperature. Reactions were terminated with 100 ul of Stop buffer containing 1% BSA, 10 mM Tris, pH 8.0, 150 mM NaCl, 100 mM EDTA. Stopped reactions (100 ul) were transferred to 96 well neutravidin plates (Pierce) to capture the biotin-peptide substrate during a 30 minute room temperature incubation. Wells were washed and reacted with 100 ul PerkinElmer Wallac Assay Buffer containing 21.5 ng/ml anti-phospho-Ser216-Cdc25c rabbit polyclonal antibody from Cell Signaling Technology (Beverly, MA) and 292ng/ml europium labeled anti-rabbit-IgG for 1 hour at room temperature. Wells were washed and europium released from the bound antibody by addition of Enhancement Solution (100 ul) (PerkinElmer Wallac) and detected using a Wallac Victor2™ using standard manufacturer settings.

Example 38  **WST Assay Procedure**

HT29, HCT116 (5000 cells/well) or other cells were seeded (75 ul) to 96 well clear bottom plates at densities which provide linear growth curves for 72 hours. Cells were cultured under sterile conditions in appropriate media and for HT29 & HCT116 this media was McCoy's 5A containing 10% Fetal Bovine Serum (FBS). Following the initial seeding of cells they are incubated at 37°C, 5% CO_{2} from 17 to 24 hours at which time the appropriate DNA damaging agents (camptothecins, 5-fluorouracil and etoposid) are added at increasing concentrations to a point which is capable of causing at least 80% cell killing with in 48 hours. Final volume of all DNA damaging agent & compound additions was 25 ul and assays contained <1 % DMSO final. At the same time as DNA Damaging agent addition, Chk1 inhibitor was added at fixed concentrations to each DNA damaging agent titration to observe enhancement of cell killing. In addition, toxicity of each Chk1 inhibitor alone was observed. By doing this over a range of Chk1 inhibitor concentrations we were able to identify compounds which maximally enhance (2-30 fold) cell killing by each DNA damaging agent and generated ≤ 80% cell killing by the compound alone. Cell viability/cell killing under the conditions described above
was determined by addition WST reagent (Roche) according to the manufacturer at 47 hours following DNA damage & Chk1 inhibitor addition and following a 3.5 hour or 2.5 hour incubation at 37°C, 5% CO2, OD_{450} was measured. The results from these experiments are shown below in Table 2.

INTERNATIONAL SEARCH REPORT

Box I  Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☑ Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
   Although claims 1-26 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compounds.

2. □ Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. □ Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II  Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. □ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. □ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. □ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. □ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.: 

Remark on Protest

[ ] The additional search fees were accompanied by the applicant’s protest.
[ ] No protest accompanied the payment of additional search fees.
