Title: OPIOIDS FOR THE TREATMENT OF THE CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD)

Abstract: The present invention relates to an opioid controlled release oral dosage form comprising at least one opioid for the manufacture of a medicament to treat patients with Chronic Obstructive Pulmonary Disease (COPD).
Opioids for the treatment of the Chronic Obstructive Pulmonary Disease (COPD)

10

The invention concerns the treatment of Chronic Obstructive Pulmonary Disease (COPD). In particular, the invention concerns the use of opioids for the manufacture of preparations for the treatment of COPD. The inventive preparations can be used to treat dyspnea associated with COPD and the "pink puffer" type of COPD patient, one of the two stereotypes in severe COPD.

**Background of the invention**

20 Chronic Obstructive Pulmonary Disease, or COPD for short, is a progressive disease of the lungs that affects millions of people each year. It is caused by blockage of the airways in the lungs, and it has no cure.

COPD relates to a number of chronic lung disorders that obstruct the airways, such as emphysema and chronic bronchitis. Emphysema occurs when some of the air sacs deep in the lungs have been damaged. This results in a smaller number of larger air sacs that have poor gas exchange capabilities.

Dyspnea, the most disabling symptom, usually begins after age 50 and worsens progressively. Large day-to-day variation in the degree of dyspnea may indicate bronchospasm. Dyspnea is more severe and more common among men. Wheezing, when present, is usually first noted when the patient is supine. Later, it may occur in any position and is usually associated with bronchospasm.

30 If hypoxemia develops, subtle signs of mental dysfunction, such as an inability to concentrate and reduced short-term memory, may occur. Hypercapnia may develop later and slowly lead to brain swelling and further dysfunction, resulting in confusion, lethargy, and increasing somnolence.
Signs of severe obstruction include pursed-lip breathing, which delays airway closure so that a large tidal volume can be maintained and respiratory muscles can function more efficiently; breathing in the sitting position with elbows resting on the thighs or a table, which may fixate the upper thorax and increase the curvature of the diaphragm, making breathing more efficient; and use of extrathoracic muscles (e.g. the sternocleidomastoid).

Exacerbations of obstructive bronchitis in COPD patients usually result from infection with viruses, Haemophilus influenzae, or Streptococcus pneumoniae. Fever and leukocytosis may not appear. Worsening airway obstruction often leads to increasing dyspnea. Hypoxemia or hypercapnia accompanying a respiratory infection may lead to confusion and restlessness, which may be misinterpreted as an age-related change.

In severe COPD, two stereotypes – the pink puffer and the blue bloater – help define the extremes of the disease. Most patients have features of both stereotypes. The pink puffer is typically an asthenic, barrel-chested emphysematous patient who exhibits pursed-lip breathing and has no cyanosis or edema. Usually, such a patient uses extrathoracic muscles to breathe, produces minimal sputum, and experiences little fluctuation in the day-to-day level of dyspnea. Diaphragmatic excursions are reduced, and breath and heart sounds are distant. The barrel-shaped chest is non-specific because elderly persons commonly have increased lung compliance and larger resting lung volumes. The blue bloater is typically overweight, cyanotic, and edematous and has a chronic productive cough. Elderly blue bloaters are uncommon because blue bloaters often have cor pulmonale, which rapidly leads to death if not treated appropriately.

Treatment for chronic bronchitis and emphysema is palliative, not curative. It is considered successful when it produces a favourable balance between symptomatic relief and drug-related adverse effects.
Theophylline, besides being a bronchodilator, may also be a mild respiratory stimulant.

Inhaled β2-sympathomimetics also are often effective. Corticosteroids are beneficial during acute exacerbations of bronchospasm in elderly patients with severe COPD and may reduce the length of stay in the intensive care unit and in the hospital. Long-term systemic corticosteroid therapy (prednisone 10 to 20 mg/day or its equivalent) is also beneficial in selected patients with end-stage COPD in whom all other forms of therapy are ineffective.

Hypercapnia commonly accompanies severe airway obstruction. A rapid rise in the partial pressure of CO₂ (Pco₂) with a drop in pH suggests that the patient has fatigued respiratory muscles and needs more intensive therapy, perhaps including ventilatory support.

Dyspnea thought to result from respiratory muscle fatigue caused by an inappropriate amount of work for a given level of ventilation or hypoxemia. Therefore, attempts are made to strengthen respiratory muscles, reduce the amount of respiratory muscle work, reduce oxygen requirements, and ensure adequate oxygen delivery. Pursed-lip breathing may reduce dyspnea by allowing for more complete emptying of the lungs, which in turn allows the diaphragm to achieve a more efficient length. There is some evidence that blowing cool air with a fan on the cheeks of patients with COPD reduces the sensation of dyspnea.

Especially patients with severe emphysema of the pink puffer type are symptom-limited due to dyspnea even at low level of activity. However, no adequate medication is presently available to treat severe dyspnea. Opioids have been suggested to be effective for the treatment of dyspnea. However, since COPD is diagnosed mainly in elderly people special care needs to be taken with regard to the correct dosing of the opioids in respect to drug-accumulation e.g. due to renal
disfunction and the convenience of application. Also long term compliance is highly desirable.

**Objects and summary of the invention**

5  
It is an object of the invention to provide an opioid oral dosage form with a prolonged duration of action, preferably at least 12 hours, more preferred at least 24 hours for the treatment of moderate to severe COPD symptoms, preferably severe COPD symptoms.

10  
It is a further object of the invention to provide opioid preparations as outlined above, which cause less side effects such as respiratory depression and obstipation and which are provided with abuse-preventing characteristics.

15  
The invention further comprises a method of treating patients with COPD symptoms with one of the inventive preparations, and the use of such preparations in manufacturing pharmaceutical preparations for the treatment of patients suffering from COPD.

**Detailed description of the invention**

In the context of the invention, the term “opioid composition” or “opioid” or “active” is used interchangeable and is considered to include opioid agonists and opioid antagonists and mixed opioid antagonists/agonists as well as mixtures thereof. The preparations according to the present invention comprise at least one opioid.

25  
In the context of the invention the term “slow release formulations or dosage forms” or “controlled release formulations or dosage forms” “retard formulations or dosage forms” or "sustained release formulations or dosage forms" or "formulations or dosage forms with prolonged duration of action" are used interchangeable and are
understood to be formulations or dosage forms that exhibit a prolonged release profile for the active incorporated and which provide a sufficient therapeutic effect for at least 12 hours at steady state.

The invention is premised on the fact that opioid agonists are useful for the treatment of COPD-symptoms such as dyspnea. In particular, the use of opioid sustained release oral dosage forms results in better patient compliance and renders the patient on constant medication more independent from taking medication during day and night time. The minimum of the therapeutically necessary drug can be administered, thereby reducing side effects accumulation and the risk of addiction. In particular, combinations of opioid agonists and antagonist are advantageous with respect to reduced side effects and additionally reduce the risk of abuse.

**ACTIVE INGREDIENTS**

According to the invention, opioid agonists comprise all compounds that belong to class NO2A of opioid analgesics according to the ATC Classification of the WHO, and that display a therapeutic effect upon application in accordance with the invention. The preparations according to the present invention comprise at least one opioid. Preferably, an opioid agonist is selected from the group of morphine, oxycodone, hydromorphone, propoxyphene, nicomorphine, dihydrocodeine, diamorphine, papaveretum, codeine, ethylmorphine, phenylpiperidine and derivates thereof, methadone, dextropropoxyphene, buprenorphine, pentazocine, tilidine, tramadol and hydrocodone. Further examples for useable analgesics according to the invention are meperidine, oxymorphone, alphaprodine, anileridine, dextromoramide, metopon, levomorphanol, phenazocine, etoheptazine, propiram, profadol, phenampromide, thiambuten, pholcodeine, codeine, dihydrocodeinon, fentanyl, 3-trans-dimethylamino-4-phenyl-4-trans-carbethoxy-A'-cyclohexen, 3-dimethylamino-0-(4-methoxyphenyl-carbamoyl)-propiophenone oxime, (-)β-2'-hydroxy-2, 9-
dimethyl-5-phenyl-6, 7-benzomorphane, (-)2'-hydroxy-2-(3-methyl-2-butenyl)-9-
methyl-5-phenyl-6, 7-benzomorphone, pirinitramide, (-)α-5,9-diethyl-2' hydroxy-2-methyl-6, 7-benzomorphone, ethyl 1-(2-dimethylaminoethyl)-4,5,6,7-tetrahydro-3-methyl-4-oxo-6-phenyl-indol-2-carboxylate, 1-benzoylethyl-2, 3-dimethyl-3- (m-hydroxy-phenyl) -piperidine, N-allyl-7α (1-R-hydroxy-1-methylbutyl)-6,14-endo-ethanotetrahydronororipavine, (-)2'-hydroxy-2-methyl-6,7-benzomorphone, noracymethadol, phenoperidine, α-d1-methadol, α -1-methadol, β-d1-acetylmethadol, α-1-acetylmethadol and β-1-acetylmethadol. These lists are not to be understood as exclusive.

Especially preferred analgesically effective opioid agonists are oxycodone, hydrocodone, hydromorphone, morphine, methadone, oxymorphone, fentanyl and sufentanyl. More preferred embodiments contain oxycodone or morphine.

According to the invention, antagonists comprise such compounds that counteract opioid agonists (as defined earlier). Such compounds can also be found in the ATC Classification of the WHO. According to the invention, compounds are preferred that upon application in accordance with the invention decrease the side effects, the habituation effects and the addictive potential caused by the opioid agonists. Antagonists can comprise among others, naltrexone, naloxone, nalmefene, nalorphine, nalbuphine, naloxoneazinen, methylnaltrexone, ketylcyclazocine, nornbinalorphimine, naltrindol, 6-β-naloxol and 6-β-naltrexol.

Especially preferred antagonists comprise naltrexone, nalmefene and naloxone. More preferred embodiments comprise naloxone.

Most preferred embodiments of the invention comprise the combination of oxycodone and naloxone in a sustained release oral dosage form. Preferably, oxycodone is present in excess to the unit dosage amount of naloxone.
In the case of oxycodone and naloxone, preferred weight ratios of agonist to antagonist lie within a weight ratio range of 25:1 at maximum, preferably of 20:1 at maximum, especially preferred are the weight ratio ranges 15:1 and 10:1 and more preferred 5:1, 4:1, 3:1, 2:1 and 1:1.

The absolute amounts of agonist and antagonist to be used depend on the choice of the active compounds. Preferably the agonist and antagonist are released from the pharmaceutical preparation only in an independent and invariant manner.

If oxycodone and naloxone are used for a combination preparation, preferably between 10 and 150 mg, especially preferably between 10 and 80 mg of oxycodone (typical amounts for use) and preferably between 1 and 50 mg naloxone per unit dosage are used.

In other preferred embodiments of the invention, the preparations may comprise between 5 and 50 mg of oxycodone, between 10 and 40 mg of oxycodone, between 10 and 30 mg of oxycodone or approximately 20 mg of oxycodone. Preferred embodiments of the invention may also comprise preparations with between 1 and 40 mg naloxone, 1 and 30 mg naloxone, 1 and 20 mg naloxone or between 1 and 10 mg naloxone per unit dosage.

Preferably, the ratio of oxycodone and naloxone has to be chosen in such a way that release profiles for both active substances guarantee and that the agonist can display its therapeutic effect while the amount of the antagonist is chosen in such a way that habituation- or addiction-promoting effects and side effects of the agonist are reduced or abolished, without (substantially) affecting the therapeutic effect of the agonist. According to the invention, development of habituation and addiction as well as obstipation and breath depression are to be considered as side effects of therapeutically effective opioid agonists.
In the context of this invention, all kinds of pharmaceutically acceptable salts and derivatives (including prodrugs) of the active ingredient may be used instead or together with the active unmodified ingredient, in amounts equivalent to the amount of unmodified active ingredient as indicated herein.

Oxycodone and naloxone may be present as their hydrochloride, sulphate, bisulfate, tetrate, nitrate, citrate, bitartrate, phosphate, malate, maleate, hydrobromide, hydroiodide, fumarate or succinate.

DOSAGE FORMS

Preferably the opioid is provided in an oral dosage form. The oral dosage form may be designed as a controlled release preparation or it may be a combined immediate release and controlled release oral dosage form. The dosage form may thus e.g. comprise a controlled-release portion outwardly coated with an immediate-release formulation. The active ingredient may be the same, or may be different in these different portions.

In certain embodiments, the oral dosage forms of the present invention comprise an opioid combined with excipients, i.e., pharmaceutically acceptable organic or inorganic carrier substances suitable for oral administration which are known in the art. Suitable pharmaceutically acceptable carriers include but are not limited to water salt solutions, alcohols, gum arabic, vegetable oils, benzyl alcohols, polyethylene glycols, gelate, carbohydrates such as lactose, amylose or starch, magnesium stearate, talc, silicic acid, viscous paraffin, perfume oil, digestible long chain substituted or unsubstituted hydrocarbons such as fatty acid monoglycerides and diglycerides, pentaerythritol fatty acid esters, hydrophilic or hydrophobic polymers, such as cellulose and cellulose derivatives, such as alkylcellulose or hydroxyalkylcellulose, acrylic resins, such as the polymers known under the Eudragit® trade name, polyvinylpyrrolidone, etc. The pharmaceutical compositions can be sterilized and if desired mixed with auxiliary agents, e.g., lubricants, preservatives, stabilizers,
wetting agents, emulsifiers, salts for influencing osmotic pressure buffers, coloring, 
flavoring and/or aromatic substances.

The oral pharmaceutical compositions of the present invention can be in the form of 
tablets, coated tablets, liquids, drops, gelcaps, troches, lozenges, aqueous or oily 
suspensions, multiparticulate formulations including dispersable powders, granules, 
pellets, matrix spheroids, beads or coated inert beads, emulsions, hard or soft 
capsules or syrups or elixirs, microparticles (e.g., microcapsules, microspheres and 
the like), buccal tablets, etc.

The oral compositions may be prepared according to methods known in the art and 
such compositions may contain one or more agents selected from the group 
consisting of inert, non-toxic pharmaceutically acceptable excipients which are 
suitable for the manufacture of tablets. Such excipients include, for example an inert 
diluent such as lactose; granulating and disintegrating agents such as cornstarch; 
binding agents such as starch; and lubricating agents such as magnesium stearate. 
The tablets may be uncoated or they may be coated by known techniques for 
elegance or to delay release of the active ingredients. Formulations for oral use may 
also be presented as hard gelatin capsules wherein the active ingredients is mixed 
with an inert diluent.

Aqueous suspensions preferably contain the opioid in a mixture that has one or more 
excipients suitable as suspending agents, for example, pharmaceutically acceptable 
synthetic gums such as hydroxypropylmethylcellulose or natural gums. Oily 
suspensions may be formulated by suspending the above-identified combination of 
drugs in a vegetable oil or mineral oil. The oily suspensions may contain at 
thickening agent such as beeswax or cetyl alcohol. A syrup, elixir, or the like can be 
used, wherein a sweetened vehicle is employed.
The pharmaceutical oral compositions of the present invention comprise an effective amount of opioid (at least one) in a sustained release formulations. For example, a sustained release carrier can be included in the formulation to provide a release of the opioid antagonist over a 12 to 24 hour period. As used herein an effective amount of opioid means that the amount is sufficient to provide the desired therapeutic effect within the desired period of time. The therapeutic effect may also be the effect of an antagonist.

For example the sustained release oral dosage form which is effective for 24 hours at steady state conditions includes from about 1 to about 640 mg of oxycodone or a pharmaceutically acceptable salt thereof (e. g., oxycodone hydrochloride). Preferably the sustained release oral dosage form includes from about 5 to about 500 mg oxycodone or a pharmaceutically acceptable salt thereof, more preferably from about 10 to about 320 mg oxycodone or a pharmaceutically acceptable salt thereof and even more preferably from about 10 to about 160 mg oxycodone or a pharmaceutically acceptable salt thereof.

For example the sustained release oral dosage form which is effective for 12 hours at steady state conditions includes from about 1 to about 160 mg of oxycodone or a pharmaceutically acceptable salt thereof (e. g., oxycodone hydrochloride).

Other opioids may be present in amounts that are equivalent to the above mentioned oxycodone amounts with regard to the desired therapeutic effect.

In certain preferred embodiments, the oral dosage form includes a sustained-release material which is incorporated into a matrix along with the at least one opioid, to provide for the sustained release of the agent. The sustained-release material may be hydrophobic or hydrophilic as desired. The oral dosage form of the present invention may be prepared as granules, spheroids, matrix multiparticulates, etc. which comprise the at least one opioid in a sustained release matrix which may be
compressed into a tablet or encapsulated. The oral dosage form of the present invention may optionally include other pharmaceutically acceptable ingredients (e.g. diluents, binders, colorants, lubricants, etc.).

In certain other embodiments, the oral dosage form of the present invention may be an osmotic dosage form having a push or displacement composition as one of the layers of a bilayer core for pushing the at least one opioid from the dosage form, and a semipermeable wall composition surrounding the core, wherein the wall has at least one exit means or passageway for delivering the at least one opioid from the dosage form. Alternatively, the core of the osmotic dosage form may comprise a single layer core including a controlled release polymer and the at least one opioid.

 Preferably the dosage forms of the present invention provides an effect for at least about 12 hours after administration.

SUSTAINED-RELEASE MATRIX FORMULATIONS

In preferred embodiments of the present invention, the formulation can be a matrix with the opioid interdispersed in the sustained release carrier, to provide for the sustained release of the opioid.

A non-limiting list of suitable sustained-release materials which may be included in a sustained-release matrix according to the invention include hydrophilic and/or hydrophobic materials, such as gums, cellulose ethers, acrylic resins, protein derived materials, waxes, shellac, and oils such as hydrogenated castor oil and hydrogenated vegetable oil. However, any pharmaceutically acceptable hydrophobic or hydrophilic sustained-release material which is capable of imparting sustained-release of the opioid may be used in accordance with the present invention. Preferred sustained-release polymers include alkylcelluloses such as ethylcellulose, acrylic and methacrylic acid polymers and copolymers; and cellulose ethers, especially
hydroxyalkylcelluloses (especially hydroxypropylmethylcellulose) and carboxyalkylcelluloses. Preferred acrylic and methacrylic acid polymers and copolymers include methyl methacrylate, methyl methacrylate copolymers, ethoxyethyl methacrylates, ethyl acrylate, trimethyl ammonioethyl methacrylate, cyanoethyl methacrylate, aminoalkyl methacrylate copolymer, poly(acrylic acid), Poly(methacrylic acid), methacrylic acid alkylamine copolymer, poly(methyl) methacrylate, poly(methacrylic acid) (anhydride), polymethacrylate, polyacrylamide, poly(methacrylic acid anhydride), and glycidyl methacrylate copolymers. Certain preferred embodiments utilise mixtures of any of the foregoing sustained-release materials in the matrix of the invention.

The matrix also may include a binder. In such embodiments, the binder preferably contributes to the sustained-release of the opioid from the sustained-release matrix.

If an additional hydrophobic binder material is included, it is preferably selected from natural and synthetic waxes, fatty acids, fatty alcohols, and mixtures of the same. Examples include beeswax, carnauba wax, stearic acid and stearyl alcohol. This list is not meant to be exclusive. In certain preferred embodiments, a combination of two or more hydrophobic binder materials are included in the matrix formulations.

Preferred hydrophobic binder materials which may be used in accordance with the present invention include digestible, long chain (C₈-C₅₀, especially C₁₂-C₄₀), substituted or unsubstituted hydrocarbons, such as fatty acids, fatty alcohols, glyceryl esters of fatty acids, mineral and vegetable oils, natural and synthetic waxes and polyakylene glycols. Hydrocarbons having a melting point of between 25 °C and 90 °C are preferred. Of the long-chain hydrocarbon binder materials, fatty (aliphatic) alcohols are preferred in certain embodiments. The oral dosage form may contain up to 80 % (by weight) of at least one digestible, long chain hydrocarbon.
In certain embodiments, the hydrophobic binder material may comprise natural or synthetic waxes, fatty alcohols (such as lauryl, myristyl, stearyl, cetyl or preferably cetostearyl alcohol), fatty acids, including but not limited to fatty acid esters, fatty acid glycerides (mono-, di-, and tri-glycerides), hydrogenated fats, hydrocarbons, normal waxes, stearic acid, stearyl alcohol and hydrophobic and hydrophilic materials having hydrocarbon backbones. Suitable waxes include, for example, beeswax, glycowax, castor wax and carnauba wax. For purposes of the present invention, a wax-like substance is defined as any material which is normally solid at room temperature and has a melting point of from about 30 to about 100 °C.

In certain preferred embodiments, the dosage form comprises a sustained release matrix comprising the opioid and at least one water soluble hydroxyalkyl cellulose, at least one C<sub>12</sub>-C<sub>36</sub>, especially C<sub>14</sub>-C<sub>22</sub>, aliphatic alcohol and, optionally, at least one polyalkylene glycol. The hydroxyalkyl cellulose is preferably a hydroxy C<sub>1</sub>-C<sub>8</sub> alkyl cellulose, such as hydroxypropylcellulose, hydroxypropylmethylcellulose and, especially, hydroxyethyl cellulose. The amount of the at least one hydroxyalkyl cellulose in the present oral dosage form may be determined, inter alia, by the precise rate of opioid release required.

In certain other preferred embodiments, the dosage form comprises a sustained release matrix comprising the at least one opioid and at least one acrylic resin, at least one C<sub>12</sub>-C<sub>36</sub>, especially C<sub>14</sub>-C<sub>22</sub>, aliphatic alcohol and, optionally, at least one polyalkylene glycol. The acrylic resin includes but is not limited to acrylic acid and methacrylic acid copolymers, methyl methacrylate copolymers, ethoxyethyl methacrylates, cyanoethyl methacrylate, poly(acrylic acid), poly(methacrylic acid), methacrylic acid alkylamide copolymer, poly(methyl methacrylate), polymethacrylate, poly(methyl methacrylate) copolymer, polyacrylamide, aminoalkyl methacrylate copolymer, poly(methacrylic acid anhydride) and glycidyl methacrylate copolymers. In certain preferred embodiments, the acrylic polymer is comprised of one or more ammonio methacrylate copolymers. Ammonio
methacrylate copolymers are well known in the art, and are described as fully polymerised copolymers of acrylic and methacrylic acid esters with a low content of quaternary ammonium groups. Preferably the acrylic resin is an acrylic polymer or an acrylic copolymer such as poly(meth)acrylate or methacrylic acid - ethyl acrylate copolymer or poly(meth)acrylate copolymerised with trimethyl ammonium (meth)acrylate chloride, such as poly(meth)acrylate with 5% trimethyl ammonium methacrylate chloride. The amount of the at least one acrylic resin in the present oral dosage form may be determined, inter alia, by the precise rate of opioid release required. In order to obtain a desirable dissolution profile, it may be necessary to incorporate two or more ammonio methacrylate copolymers having differing physical properties, such as different molar ratios of the quaternary ammonium groups to the neutral (meth)acrylic esters. Certain methacrylic acid ester-type polymers are useful for preparing pH-dependent matrices which may be used in accordance with the present invention. For example, there are a family of copolymers synthesized from diethylaminoethyl methacrylic acid copolymer or polymeric methacrylates, commercially available as Eudragit(R) from Röhm Tech, Inc. There are several different types of Eudragit(R). For example, Eudragit E is an example of a methacrylic acid copolymer which does not swell at about pH <5.7 and is soluble at about pH >6. Eudragit S does not swell at about pH <6.5 and is soluble at about pH >7. Eudragit RL and Eudragit RS are water swellable, and the amount of water absorbed by these polymers is pH-dependent, however, dosage forms with Eudragit RL and RS are pH-independent. In certain preferred embodiments, the acrylic matrix comprises a mixture of two acrylic resins commercially available from Röhm Pharma under the Tradenames Eudragit(R) RL30D and Eudragit(R) RS30D, respectively. Eudragit(R) RL30D and Eudragit(R) RS30D are copolymers of acrylic and methacrylic esters with a low content of quaternary ammonium groups, the molar ratio of ammonium groups to the remaining neutral (meth)acrylic esters being 1:20 in Eudragit(R) RL30D and 1:40 in Eudragit(R) RS30D. The mean molecular weight is about 150,000. The code designations RL (high permeability) and RS (low permeability) refer to the permeability properties of these agents. Eudragit(R) RL/RS
mixtures are insoluble in water and in digestive fluids. However, coatings formed from the same are swellable and permeable in aqueous solutions and digestive fluids. The Eudragit\(^{(R)}\) RL/RS dispersions of the present invention may be mixed together in any desired ration in order to ultimately obtain a controlled-release formulation having a desirable dissolution profile. Desirable controlled-release formulations may be obtained, for instance, from a retard matrices derived from Eudragit\(^{(R)}\) RL, Eudragit\(^{(R)}\) RL and Eudragit\(^{(R)}\) RS, and Eudragit\(^{(R)}\) RL and Eudragit\(^{(R)}\) RS. Of course, one skilled in the art will recognize that other acrylic polymers may also be used, such as, for example, Eudragit\(^{(R)}\) L.

The aliphatic alcohol may be, for example, lauryl alcohol, myristyl alcohol, cetostearyl alcohol or stearyl alcohol. In particularly preferred embodiments of the present oral dosage form, however, the at least one aliphatic alcohol is cetyl alcohol or cetostearyl alcohol. The amount of the aliphatic alcohol in the present oral dosage form may be determined, as above, by the precise rate of opioid release required. It may also depend on whether at least one polyalkylene glycol is present in or absent from the oral dosage form. In the absence of at least one polyalylene glycol, the oral dosage form preferably contains between about 20 % and about 50 % (by wt) of the aliphatic alcohol. When a polyalkylene glycol is present in the oral dosage form, then the combined weight of the aliphatic alcohol and the polyalkylene glycol preferably constitutes between about 20 % and about 50 % (by wt) of the total dosage form.

In one preferred embodiment, the ration of, e.g., the at least one hydroxyalkyl cellulose or acrylic resin to the at least one aliphatic alcohol/polyalkylene glycol determines, to a considerable extent, the release rate of the opioid from the formulation. In certain embodiments, a ration of the hydroxyalkyl cellulose to the aliphatic alcohol/polyalkylene glycol of between 1:1 and 1:4 is preferred, with a ratio of between 1:2 and 1:3 being particularly preferred.
In certain embodiments, the polyalkylene glycol may be, for example, polypropylene glycol, or polyethylene glycol which is preferred. The average molecular weight of the at least one polyallylene glycol is preferably between 1,000 and 15,000, especially between 1,500 and 12,000.

Another suitable sustained-release matrix comprises an alkylcellulose (especially ethylcellulose), a C_{12} to C_{36} aliphatic alcohol and, optionally, a polyalkylene glycol.

In addition to the above ingredients, a sustained-release matrix may also contain suitable quantities of other materials, e.g., diluents, lubricants, binders, granulating aids, colorants, flavorants and glidants that are conventional in the pharmaceutical art.

In order to facilitate the preparation of a solid, sustained-release oral dosage form according to this invention incorporation the opioid in the matrix may be effected, for example, by:

(a) forming granules comprising at least one hydrophobic and/or hydrophilic material as set forth above (e.g., a water soluble hydroxyalkyl cellulose) together with the opioid;
(b) mixing the granules containing at least one hydrophobic and/or hydrophilic material with at least one C_{12}-C_{36} aliphatic alcohol, (and, in case, other matrix components) and
(c) optionally, compressing and shaping the granules.

The granules may be formed by any of the procedures well-known to those skilled in the art of pharmaceutical formulation. For example, in one preferred method, the granules may be formed by wet granulating hydroxyalkyl cellulose/opoid with water.

In a particularly preferred embodiment of this process, the amount of water added
during the wet granulation step is preferably between 1.5 and 5 times, especially between 1.75 and 3.5 times, the dry weight of opioid.

A sustained-release matrix can also be prepared by, e.g., melt-granulation or melt-extrusion techniques. Generally, melt-granulation techniques involve melting a normally solid hydrophobic binder material, e.g., a wax, and incorporating a powdered drug therein. To obtain a sustained release dosage form, it may be necessary to incorporate a hydrophobic sustained-release material, e.g. ethylcellulose or a water-insoluble acrylic polymer, into the molten wax hydrophobic binder material. Examples of sustained-release formulations prepared via melt-granulation techniques are found, e.g., in U.S. Patent No. 4,861,598 (incorporated by reference).

The additional hydrophobic binder material may comprise one or more water-insoluble wax-like thermoplastic substances possibly mixed with one or more wax-like thermoplastic substances being less hydrophobic than said one or more water-insoluble wax-like substances in the formulation should be substantially non-degradable and insoluble in gastrointestinal fluids during the initial release phases. Useful water-insoluble wax-like binder substances may be those with a water-solubility that is lower than about 1:5,000 (w/w).

Extruded formulations employing starch, as e.g. disclosed in DE 19918325 A1 (incorporated by reference), can be advantageously employed in the context of the invention.

The preparation of a suitable melt-extruded matrix according to the present invention may, for example, include the steps of blending the opioid, together with a sustained release material and preferably a binder material to obtain a homogenous mixture. The homogenous mixture is then heated to a temperature sufficient to at least soften the mixture sufficiently to extrude the same. The resulting homogenous mixture is then extruded, e.g., using a twin-screw extruder, to form strands. The extrudate is
preferably cooled and cut into multiparticulates by any means known in the art. The matrix multiparticulates are then divided into unit doses. The extrudate preferably has a diameter of from about 0.1 to about 5 mm and provides sustained release of the opioid for a time period of at least about 24 hours.

An optional process for preparing the melt extruded formulations of the present invention includes directly metering into an extruder a hydrophobic sustained release material, the at least one opioid and an optional binder material; heating the homogenous mixture; extruding the homogenous mixture to thereby form stands; cooling the strands containing the homogeneous mixture; cutting the strands into matrix multiparticulates having a size from about 0.1 mm to about 12 mm; and dividing said particles into unit doses. In this aspect of the invention a relatively continuous manufacturing procedure is realized.

Plasticizers, such as those described above, may be included in melt-extruded matrices. The plasticizer is preferably included as from about 0.1 to about 30 % by weight of the matrix. Other pharmaceutical excipients, e.g., talc, mono or poly saccharides, colorants, flavorants, lubricants and the like may be included in the sustained release matrices of the present invention as desired. The amounts included will depend upon the desired characteristic to be achieved.

The diameter of the extruder aperture or exit port can be adjusted to vary the thickness of the extruded strands. Furthermore, the exit part of the extruder need not be round; it can be oblong, rectangular, etc. The exiting strands can be reduced to particles using a hot wire cutter, guillotine, etc.

A melt extruded matrix multiparticulate system can be, for example, in the form of granules, spheroids or pellets depending upon the extruder exit orifice. For purposes of the present invention, the terms “melt-extruded matrix multiparticulate(s)” and “melt-extruded matrix multiparticulate system(s)” and “melt-extruded matrix
particles” shall refer to a plurality of units, preferably within a range of similar size and/or shape and containing one or more actives and one or more excipients, preferably including a hydrophobic sustained release material as described herein. Preferably the melt-extruded matrix multiparticulates will be of a range of from about 0.1 to about 12 mm in length and have a diameter of from about 0.1 to about 5 mm. In addition, it is to be understood that the melt-extruded matrix multiparticulates can be any geometrical shape within this size range. In certain embodiments, the extrudate may simply be cut into desired lengths and divided into unit doses of the therapeutically active agent without the need of a spheronization step.

In one preferred embodiment, oral dosage forms are prepared that include an effective amount of melt-extruded matrix multiparticulates within a capsule. For example, a plurality of the melt-extruded matrix multiparticulates may be placed in a gelatin capsule in an amount sufficient to provide an effective sustained release dose when ingested and contacted by gastrointestinal fluid.

In another embodiment, a suitable amount of the multiparticulate extrudate is compressed into an oral tablet using conventional tableting equipment using standard techniques. Techniques and compositions for making tablets (compressed and molded), capsules (hard and soft gelatin) and pills are also described in Remington’s Pharmaceutical Sciences, (Arthur Oso, editor), 1553-1593 (1980).

In yet another preferred embodiment, the extrudate can be shaped into tablets as set forth in U. S. Patent No. 4,957,681 (Klicesch, et. al.).

Optionally, the sustained-release matrix multiparticulate systems, tablets, or capsules can be coated with a sustained release coating such as the sustained release coatings described herein. Such coatings preferably include a sufficient amount of hydrophobic and/or hydrophilic sustained-release material to obtain a weight gain
level from about 2 to about 25 percent, although the overcoat may be greater depending upon, e.g., the desired release rate.

The dosage forms of the present invention may further include combinations of melt-extruded matrix multiparticulates containing the at least one opioid. Furthermore, the dosage forms can also include an amount of an immediate release therapeutically active opioid for prompt therapeutic effect. The immediate release opioid may be incorporated, e.g., as separate multiparticulates within a gelatin capsule, or may be coated on the surface of, e.g., melt-extruded matrix multiparticulates.

The sustained-release profile of the melt-extruded formulations of the invention can be altered, for example, by varying the amount of sustained-release material, by varying the amount of plasticizer relative to other matrix constituents, by varying the amount of hydrophobic material, by the inclusion of additional ingredients or excipients, by altering the method of manufacture, etc.

In other embodiments of the invention, melt-extruded formulations are prepared without the inclusion of the opioid, which is added thereafter to the extrudate. Such formulations typically will have the opioid blended together with the extruded matrix material, and then the mixture would be tableted in order to provide a slow release formulation. Such formulations may be advantageous, for example, when the therapeutically active agent included in the formulations is sensitive to temperatures needed for softening the hydrophobic material and/or the retardant material.

Typical melt-extrusion production systems suitable for use in accordance with the present invention include a suitable extruder drive motor having variable speed and constant torque control, start-stop controls, and a meter. In addition, the production system will include a temperature control console which includes temperature sensors, cooling means and temperature indicators throughout the length of the extruder. In addition, the production system will include an extruder such as a twin-
screw extruder which consists of two counter-rotating intermeshing screws enclosed within a cylinder of barrel having an aperture or die at the exit thereof. The feed materials enter through a feed hopper and are moved through the barrel by the screws and are forced through the die into strands which are thereafter conveyed such as by a continuous movable belt to allow for cooling and being directed to a pelletizier or other suitable device to render the extruded ropes into the matrix multiparticulate system. The pelletizer can consist of rollers, fixed knife, rotating cutter and the like. Suitable instruments and systems are available from distributors such as C.W. Brabender Instruments, Inc. of South Hackensack, New Jersey. Other suitable apparatus will be apparent to those of ordinary skill in the art.

In the preparation of melt-extruded matrix multiparticulates as set forth above the amount of air included in the extrudate can be controlled and the release rate of the at least one opioid thereof may be altered.

Thus the melt-extruded is prepared in a manner which substantially excludes air during the extrusion phase of the process. This may be accomplished, for example, by using a Leistritz extruder having a vacuum attachment. The extruded matrix multiparticulates prepared according to the invention using a Leistritz extruder under vacuum provides a melt-extruded product having different physical characteristics. In particular, the extrudate is substantially non-porous when magnified, e.g., using a scanning electron microscope. Such substantially non-porous formulations may provide a faster release of the therapeutically active agent, relative to the same formulation prepared without vacuum. Scanning electron micrographs of the matrix multiparticulates prepared using an extruder under vacuum appear very smooth, as compared to multiparticulates prepared without vacuum. It has been observed that in at least certain formulations, the use of extrusion under vacuum provides an extruded matrix multiparticulates product which is more pH-dependent than its counterpart formulation prepared without vacuum.
Alternatively, the melt-extruded product is prepared using a Werner-Pfleiderer twin screw extruder.

In certain embodiments, a spheronizing agent is added to a granulate or matrix multiparticulate and then spheronized to produce sustained release spheroids. The spheroids are then optionally overcoated with a sustained release coating by methods such as those described above.

Spheronizing agents which may be used to prepare the matrix multiparticulate formulations of the present invention include any art-known spheronizing agent.

Cellulose derivatives are preferred, and microcrystalline cellulose is especially preferred. A suitable microcrystalline cellulose is, for example, the material sold as Avicel PH 101 (TradeMark, FMC Corporation). The spheronizing agent is preferably included as about 1 to about 99 % of the matrix multiparticulate by weight.

In certain embodiments, in addition to the active ingredient and spheronizing agent, the spheroids may also contain a binder. Suitable binders, such as low viscosity, water soluble polymers, will be well known to those skilled in the pharmaceutical art.

However, water soluble hydroxy lower alkyl cellulose, such as hydroxy propyl cellulose, are preferred. Additionally (or alternatively) the spheroids may contain a water insoluble polymer, especially an acrylic polymer, an acrylic copolymer, such as a methacrylic acid-ethyl acrylate copolymer, or ethyl cellulose.

In certain embodiments, a sustained release coating is applied to the sustained release spheroids, granules, or matrix multiparticulates. In such embodiments, the sustained-release coating may include a water insoluble material such as (a) a wax, either alone or in admixture with a fatty alcohol; or (b) shellac or zein. The coating is preferably derived from an aqueous dispersion of the hydrophobic sustained release material.
In certain embodiments, it is necessary to overcoat the sustained release spheroids, granules, or matrix multiparticulates comprising the opioid and sustained release carrier with a sufficient amount of the aqueous dispersion of, e.g., alkylcellulose or acrylic polymer, to obtain a weight gain level form about 2 to about 50%, e.g., about 2 to about 25%, in order to obtain a sustained-release formulation. The overcoat may be lesser or greater depending upon, e.g., the desired release rate, the inclusion of plasticizer in the aqueous dispersion and the manner of incorporation of the same. Cellulosic materials and polymers, including alkylcelluloses, are sustained release materials well suited for coating the sustained release spheroids, granules, or matrix multiparticulates according to the invention. Simply by way of example, one preferred alkylcellulosic polymer is ethylcellulose, although the artisan will appreciate that other cellulose and/or alkylcellulose polymers may be readily employed, singly or in any combination, as all or part of a hydrophobic coating according to the invention.

One commercially-available aqueous dispersion of ethylcellulose is Aquacoat™ (FMC Corp., Philadelphia, Pennsylvania, U.S.A.). Aquacoat™ is prepared by dissolving the ethylcellulose in a water-immiscible organic solvent and then emulsifying the same in water in the presence of a surfactant and a stabilizer. After homogenization to generate submicron droplets, the organic solvent is evaporated under vacuum to form a pseudolatex. The plasticizer is not incorporated in the pseudolatex during the manufacturing phase. Thus, prior to using the same as a coating, it is necessary to intimately mix the Aquacoat™ with a suitable plasticizer prior to use.

Another aqueous dispersion of ethylcellulose is commercially available as Surelease™ (Colorcon, Inc., Weset Point, Pennsylvania, U.S.A.). This product is prepared by incorporating plasticizer into the dispersion during the manufacturing process. A hot melt of a polymer, plasticizer (dibutyl sebacate), and stabilizer (oleic acid) is prepared as a homogeneous mixture, which is then diluted with an alkaline
solution to obtain an aqueous dispersion which can be applied directly to the sustained release spheroids, granules, or matrix multiparticulates.

In other preferred embodiments of the present invention, the sustained release material comprising the sustained-release coating is a pharmaceutically acceptable acrylic polymer, including but not limited to acrylic acid and methacrylic acid copolymers, methyl methacrylate copolymers, ethoxyethyl methacrylates, cyanoethyl methacrylate, poly(acrylic acid), poly(methacrylic acid), methacrylic acid alkylamide copolymer, poly(methyl methacrylate), polymethacrylate, poly(methyl methacrylate) copolymer, polyacrylamide, aminoalkyl methacrylate copolymer, poly(methacrylic acid anhydride), and glycidyl methacrylate copolymers. Useful acrylic polymers are the resins known under the Tradename Eudragit\textsuperscript{R}, commercially available from Rohm Pharma. These acrylic resins can be tailored to provide a pH dependent or a pH independent release rate of the active.

In addition to the above ingredients, the spheroids, granules or matrix multiparticulates may also contain suitable quantities of other materials, e.g., diluents, lubricants, binders, granulating aids, colorants, flavorants and glidants that are conventional in the pharmaceutical art in amounts up to about 50 % by weight of the formulation if desired. The quantities of these additional materials will be sufficient to provide the desired effect to the desired formulation.

Specific examples of orally acceptable carriers and excipients that may be used to formulate oral dosage forms are described in the Handbook of Pharmaceutical Excipients, American Pharmaceutical Association (1986).

It has further been found that the addition of a small amount of talc to the sustained release coating reduces the tendency of the aqueous dispersion to stick during processing, and acts as a polishing agent.
If oxycodone is used for the preparation the formulation is chosen the matrix comprises at least one acrylic resin and at least one C_{12}-C_{36} aliphatic alcohol as they are described above. The preparation is preferably accomplished by the above described granulation method with the above described preferred amounts of ingredients.

If oxycodone and naloxone are used for a combination preparation the formulation is chosen to ensure that the active compounds are released from the preparation in a sustained, independent and invariant manner. Preferably those formulations are storage stable.

The terms "released from the preparation in a sustained, independent and invariant manner" and "storage stable" as used herein are defined as in PCT/EP 03/03541.

If oxycodone and naloxone are used for a combination preparation the formulation is chosen that it comprises a release matrix that has the character of a substantially non-water- or non-buffer-swellable and non-erosive diffusion matrix as defined in PCT/EP 03/0354. PCT/EP 03/0354 is incorporated by reference.

If oxycodone and naloxone are used for a combination preparation a formulation is especially preferred that comprises ethylcellulose or Surelease® E-7-7050 as a matrix-building substance, stearyl alcohol as fatty alcohol, magnesium stearate as lubricant, lactose as filler and povidone as a granulating aid.

Such preparations can be produced as all common application forms which, on principle, are suitable for retardation formulations and which ensure that the active compounds are released in a manner as outlined above. Especially suitable are tablets, multi-layer tablets and capsules. Additional application forms like granules or powders can be used, with only those applications forms being admissible that provide a sufficient retardation and a release behaviour as outlined above.
Such pharmaceutical preparations may also comprise film coatings. However, it has to be ensured that the film coatings do not negatively influence the release properties of the active compounds from the matrix and the storage stability of the active compounds within the matrix. Such film coatings may be colored or may comprise a initial dosage of the active compounds if required. The active compounds of this initial dosage will be immediately released so that the therapeutically effective blood plasma level is reached very quickly.

A detailed description of the preparation of these oxycodone/naloxone combination preparations can be taken from PCT/EP 03/03541.

Process for preparing matrix beads

Controlled-release dosage forms according to the present invention may also be prepared as matrix beads formulations. The matrix beads include a spheronising agent and the at least one opioid.

The at least one opioid preferably comprises from about 0.01 to about 99 % by weight of the matrix bead by weight. It is preferable that the at least one opioid is included as about 0.1 to about 50 % by weight of the matrix bead.

Spheronising agents which may be used to prepare the matrix bead formulations of the present invention include any art-known spheronising agent. Cellulose derivatives are preferred, and microcrystalline cellulose is especially preferred. A suitable microcrystalline cellulose is, for example, the material sold as Avicel PH 101 (TradeMark, FMC Corporation). The spheronising agent is preferably included as about 1 to about 99 % of the matrix bead by weight.
In addition to the active ingredient and spheronizing agent, the spheroids may also contain a binder. Suitable binders, such as low viscosity, water soluble polymers, will be well known to those skilled in the pharmaceutical art. However, water soluble hydroxy lower alkylcellulose, such as hydroxypropylcellulose, are preferred.

In addition to the at least one opioid and spheronising agent, the matrix bead formulations of the present invention may include a controlled release material such as those described hereinabove. Preferred controlled-release materials for inclusion in the matrix bead formulations include acrylic and methacrylic acid polymers or copolymers, and ethylcellulose. When present in the formulation, the controlled-release material will be included in amounts of from about 1 to about 80 % of the matrix bead, by weight. The controlled-release material is preferably included in the matrix bead formulation in an amount effective to provide controlled release of the at least one opioid from the bead.

Pharmaceutical processing aids such as binders, diluents, and the like may be included in the matrix bead formulations. Amounts of these agents included in the formulations will vary with the desired effect to be exhibited by the formulation.

The matrix beads may be overcoated with a controlled-release coating including a controlled-release material such as those described hereinabove. The controlled-release coating can be applied to a weight gain of from about 5 to about 30 %. The amount of the controlled release coating to be applied will vary according to a variety of factors, e.g., the composition of the matrix beads.

Matrix beads are generally prepared by granulating the spheronizing agent together with the agent, e.g. by wet granulation. The granulate is then spheronized to produce the matrix beads. The matrix beads are then optionally overcoated with the controlled release coating by methods such as those described hereinabove.
Another method for preparing matrix beads, for example, by (a) forming granules comprising at least one water soluble hydroxyalkyl cellulose and an opioid (b) mixing the hydroxyalkyl cellulose containing granules with at least one C<sub>12</sub> - C<sub>36</sub> aliphatic alcohol; and (c) optionally, compressing and shaping the granules. Preferably, the granules are formed by wet granulating the hydroxyalkyl cellulose/opioid with water.

In yet another alternative embodiment, spheronizing agent, together with the active ingredient can be spheronized to form spheroids. Microcrystalline cellulose is preferred. A suitable microcrystalline cellulose is, for example, the material sold as Avicel PH 101 (Trade mark, FMC Corporation). In such embodiments, in addition to the active ingredient and spheronizing agent, the spheroids may also contain a binder. Suitable binders, such as low viscosity, water soluble polymers, will be well known to those skilled in the pharmaceutical art. However, water soluble hydroxy lower alkyl cellulose, such as hydroxy propyl cellulose, are preferred. Additionally (or alternatively) the spheroids may contain a water insoluble polymer, especially an acrylic polymer, an acrylic copolymer, such as a methacrylic acid-ethyl acrylate copolymer, or ethyl cellulose. In such embodiments, the sustained-release coating will generally include a water insoluble material such as (a) a wax, either alone or in admixture with a fatty alcohol; or (b) shellac or zein.

In one especially preferred embodiment, the oral dosage form comprises an effective number of controlled release spheroids contained within a gelatin capsule.

In another preferred embodiment of the present invention, the controlled-release dosage form comprises spheroids containing the active ingredient coated with a controlled-release coating including a controlled release material. The term spheroid is known in the pharmaceutical art and means, e.g., a spherical granule having a diameter of between 0.1 mm and 2.5 mm, or between 0.5 mm and 2 mm. This range
is not meant to be limiting as the diameter can be higher or lower than disclosed above.

The spheroids are preferably film coated with a controlled release material that permits release of the opioid at a controlled rate in an aqueous medium. The film coat is chosen so as to achieve, in combination with the other stated properties, the desired in-vitro release rates. The controlled-release coating formulations of the present invention preferably produce a strong, continuous film that is smooth and elegant, capable of supporting pigments and other coating additives, non-toxic, inert, and tack-free.

SUSTAINED-RELEASE COATING FORMULATIONS

The oral dosage forms of the present invention may optionally be coated with one or more coatings suitable for the regulation of release of for the protection of the formulation. In one embodiment, coatings are provided to permit either pH-dependent or pH-independent release, e.g., when exposed to gastrointestinal fluid. When a pH-independent coating is desired, the coating is designed to achieve optimal release regardless of pH-changes in the environmental fluid, e.g., the GI tract, to avoid dose dumping. Other preferred embodiments include a pH-dependent coating that releases the at least one opioid antagonist in desired areas of the gastrointestinal (GI) tract, e.g., the stomach or small intestine. It is also possible to formulate compositions which release a portion of the dose in one desired area of the GI tract, e.g., the stomach, and release the remainder of the dose in another area of the GI tract, e.g., the small intestine.

Formulations according to the invention that utilize pH-dependent coatings may also impart a repeat-action effect whereby unprotected drug is coated over an enteric coat and is released in the stomach, while the remainder, being protected by the enteric coating, is released further down the gastrointestinal tract. Coatings which are pH-
dependent may be used in accordance with the present invention include a controlled release material such as, e.g., shellac, cellulose acetate phthalate (CAP), polyvinyl acetate phthalate (PVAP), hydroxypropyl methylcellulose phthalate, and methacrylic acid ester copolymers, zein, and the like.

In another preferred embodiment, the present invention is related to a stabilized solid controlled dosage form comprising the opioid coated with a hydrophobic controlled release material selected from (i) an alkylcellulose; (ii) an acrylic polymer; or (iii) mixtures thereof. The coating may be applied in the form of an organic or aqueous solution or dispersion.

In certain preferred embodiments, the controlled release coating is derived from an aqueous dispersion of the hydrophobic controlled release material. The coated substrate containing the opioid (e.g., a tablet core or inert pharmaceutical beads or spheroids) is then cured until an endpoint is reached at which the substrate provides a stable dissolution. The curing endpoint may be determined by comparing the dissolution profile (curve) of the dosage form immediately after curing to the dissolution profile (curve) of the dosage form after exposure to accelerated storage conditions of, e.g., at least one month at a temperature of 40 °C and a relative humidity of 75 %. These formulations are described in detail in U.S. Patent Nos. 5,273,760 and 5,286,493. Other examples of controlled-release formulations and coatings which may be used in accordance with the present invention include Assignee’s U.S. Patent Nos. 5,324,351, 5,356,467, and 5,472,712.

In preferred embodiments, the controlled release coatings include a plasticizer such as those described herein below.

In certain embodiments, it is necessary to overcoat the substrate comprising the opioid with a sufficient amount of the aqueous dispersion of e.g., alkylcellulose or acrylic polymer, to obtain a weight gain level from about 2 to about 50 %, e.g., about
2 to about 25% in order to obtain a controlled-release formulation. The overcoat may be lesser or greater depending upon the physical properties of the therapeutically active agent and the desired release rate, the inclusion of plasticizer in the aqueous dispersions and the manner of incorporation of the same, for example.

Alkylcellulose Polymers

Cellulosic materials and polymers, including alkylcelluloses are controlled release materials well suited for coating the substrates, e.g., beads, tablets, etc. according to the invention. Simply by way of example, one preferred alkylcellulosic polymer is ethylcellulose, although the artisan will appreciate that other cellulose and/or part of a hydrophobic coatings according to the invention.

One commercially-available aqueous dispersion of ethylcellulose is Aquacoat(R) (FMC Corp., Philadelphia, Pennsylvania, U.S.A.). Aquacoat(R) is prepared by dissolving the ethylcellulose in a water-immiscible organic solvent and then emulsifying the same in water in the presence of a surfactant and a stabilizer. After homogenisation to generate submicron droplets, the organic solvent is evaporated under vacuum to form a pseudolatex. The plasticizer is not incorporated in the pseudolatex during the manufacturing phase. Thus, prior to using the same as a coating, it is necessary to intimately mix the Aquacoat(R) with a suitable plasticizer prior to use.

Another aqueous dispersion of ethylcellulose is commercially available as Surelease(R) (Colorcon, Inc., West Point, Pennsylvania, U.S.A.). This product is prepared by incorporating plasticizer into the dispersion during the manufacturing process. A hot melt of a polymer, plasticizer (dibutyl sebacate), and stabilizer (oleic acid) is prepared as a homogeneous mixture, which is then diluted with an alkaline solution to obtain an aqueous dispersion which can be applied directly onto substrates.
Acrylic Polymers

In other preferred embodiments of the present invention, the controlled release material comprising the controlled-release coating is a pharmaceutically acceptable acrylic polymer, including but not limited to acrylic acid and methacrylic acid copolymers, methyl methacrylate copolymers, ethoxyethyl methacrylates, cynaoethyl methacrylate, poly(acrylic acid), poly(methacrylic acid), methacrylic acid alkylamide copolymer, poly(methyl methacrylate), polymethacrylate, poly(methyl methacrylate) copolymer, polyacrylamide, aminoalkyl methacrylate copolamer, poly(methacrylic acid anhydride) and glycidyl methacrylate copolymers.

In certain preferred embodiments, the acrylic polymer is comprised of one or more ammonio methacrylate copolymers. Ammonio methacrylate copolymers are well known in the art, and are described as fully polymerised copolymers of acrylic and methacrylic acid esters with a low content of quaternary ammonium groups.

In order to obtain a desirable dissolution profile, it may be necessary to incorporate two or more ammonio methacrylate copolymers having differing physical properties, such as different molar ratios of the quaternary ammonium groups to the neutral (meth)acrylic esters.

Certain methacrylic acid ester-type polymers are useful for preparing pH-dependent coatings which may be used in accordance with the present invention. For example, there are a family of copolymers synthesized from diethylaminoethyl methacrylic acid copolymer or polymeric methacrylates, commercially available as Eudragit® from Röhm Tech, Inc. There are several different types of Eudragit®. For example, Eudragit E is an example of a methacrylic acid copolymer which does not swell at about pH <5.7 and is soluble at about pH >6. Eudragit S does not swell at about pH <6.5 and is soluble at about pH >7. Eudragit RL and Eudragit RS are water
swellable, and the amount of water absorbed by these polymers is pH-dependent, however, dosage forms coated with Eudragit RL and RS are pH-independent.

In certain preferred embodiments, the acrylic coating comprises a mixture of two acrylic resin lacquers commercially available from Rohm Pharma under the Tradenames Eudragit® RL30D and Eudragit® RS30D, respectively. Eudragit® RL30D and Eudragit® RS30D are copolymers of acrylic and methacrylic esters with a low content of quaternary ammonium groups, the molar ratio of ammonium groups to the remaining neutral (meth)acrylic esters being 1:20 in Eudragit® RL30D and 1:40 in Eudragit® RS30D. The mean molecular weight is about 150,000. The code designations RL (high permeability) and RS (low permeability) refer to the permeability properties of these agents. Eudragit® RL/RS mixtures are insoluble in water and in digestive fluids. However, coatings formed from the same are swellable and permeable in aqueous solutions and digestive fluids.

The Eudragit® RL/RS dispersions of the present invention may be mixed together in any desired ratio in order to ultimately obtain a controlled-release formulation having a desirable dissolution profile. Desirable controlled-release formulations may be obtained, for instance, from a retardant coating derived from 100% Eudragit® RL, 50% Eudragit® RL and 50% Eudragit® RS, and 10% Eudragit® RL: Eudragit® RS. Of course, one skilled in the art will recognize that other acrylic polymers may also be used, such as, for example, Eudragit® L.

Plasticizers

In embodiments of the present invention where the coating comprises an aqueous dispersion of a hydrophobic controlled release material, the inclusion of an effective amount of a plasticizer in the aqueous dispersion of hydrophobic material will further improve the physical properties of the controlled-release coating. For example, because ethylcellulose has a relatively high glass transition temperature and does not
form flexible films under normal coating conditions, it is preferable to incorporate a plasticizer into an ethylcellulose coating containing controlled-release coating before using the same as a coating material. Generally, the amount of plasticizer included in a coating solution is based on the concentration of the film-former, e.g., most often from about 1 to about 50 percent by weight of the film-former. Concentration of the plasticizer, however, can only be properly determined after careful experimentation with the particular coating solution and method of application.

Examples of suitable plasticizers for ethylcellulose include water insoluble plasticizers such as dibutyl sebacate, diethyl phthalate, triethyl citrate, tibutyl citrate, and triacetin, although it is possible that other water-insoluble plasticizers (such as acetylated monoglycerides, phthalate esters, castor oil, etc.) may be used. Triethyl citrate is an especially preferred plasticizer for the aqueous dispersions of ethyl cellulose of the present invention.

Examples of suitable plasticizers for the acrylic polymers of the present invention include, but are not limited to citric acid esters such as triethyl citrate NF XVI, tributyl citrate, dibutyl phthalate, and possibly 1,2-propylene glycol. Other plasticizers which have proved to be suitable for enhancing the elasticity of the films formed from acrylic films such as Eudragit® RL/RS lacquer solutions include polyethylene glycols, propylene glycol, diethyl phthalate, castor oil, and triacetin. Triethyl citrate is an especially preferred plasticizer for the aqueous dispersions of ethyl cellulose of the present invention.

It has further been found that the addition of a small amount of talc to the controlled release coating reduces the tendency of the aqueous dispersion to stick during processing, and act as a polishing agent.
Preparation of coated bead formulations

When an aqueous dispersion of hydrophobic material is used to coat substrates, e.g., inert pharmaceutical beads such as nu pariel 18/20 beads, a plurality of the resultant stabilized solid controlled-release beads may thereafter be places in a gelatin capsule in an amount sufficient to provide an effective controlled-release dose when ingested and contacted by an environmental fluid, e.g., gastric fluid or dissolution media.

The stabilized controlled-release bead formulations of the present invention slowly release the opioid antagonist, e.g., when ingested and exposed to gastric fluids, and then to intestinal fluids. The controlled-release profile of the formulations of the invention can be altered, for example, by varying the amount of overcoating with the aqueous dispersion of hydrophobic controlled release material, altering the manner in which the plasticizer is added to the aqueous dispersion of hydrophobic controlled release material, by varying the amount of plasticizer relative to hydrophobic controlled release material, by the inclusion of additional ingredients or excipients, by altering the method of manufacture, etc. The dissolution profile of the ultimate product may also be modified, for example, by increasing or decreasing the thickness of the controlled release coating.

Substrates coated with a therapeutically active agent are prepared, e.g. by dissolving the therapeutically active agent in water and then spraying the solution onto a substrate, for example, nu pariel 18/20 beads, using a Wuster insert. Optionally, additional ingredients are also added prior to coating the beads in order to assist the binding of the opioid to the beads, and/or to color the solution, etc. For example, a product which includes hydroxypropyl methylcellulose, etc. with or without colorant (e.g., Opadry(R), commercially available from Colorcon, Inc.) may be added to the solution and the solution mixed (e.g., for about 1 hour) prior to application of the same onto the substrate. The resultant coated substrate may then be optionally
overcoated with a barrier agent, to separate the therapeutically active agent from the hydrophobic controlled-release coating.

An example of a suitable barrier agent is one which comprises hydroxypropyl methylcellulose. However, any film-former known in the art may be used. It is preferred that the barrier agent does not affect the dissolution rate of the final product.

The substrates may then be overcoated with an aqueous dispersion of the hydrophobic controlled release material. The aqueous dispersion of hydrophobic controlled release material preferably further includes an effective amount of plasticizer, e.g. triethyl citrate. Pre-formulated aqueous dispersions of ethylcellulose, such as Aquacoat® or Surelease®, may be used. If Surelease® is used, it is not necessary to separately add a plasticizer. Alternatively, pre-formulated aqueous dispersions of acrylic polymers such as Eudragit® can be used.

The coating solutions of the present invention preferably contain, in addition to the film-former, plasticizer, and solvent system (i.e., water) a colorant to provide elegance and product distinction. Color may be added to the solution of the therapeutically active agent instead, or in addition to the aqueous dispersion of hydrophobic material. For example, color can be added to Aquacoat® via the use of alcohol or propylene glycol based color dispersions, milled aluminium lakes and opacifiers such as titanium dioxide by adding color with shear to water soluble polymer solution and then using low shear to the plasticized Aquacoat®.

Alternatively, any suitable method of providing color to the formulations of the present invention may be used. Suitable ingredients for providing color to the formulation when an aqueous dispersion of an acrylic polymer is used include titanium dioxide and color pigments, such as iron oxide pigments. The incorporation of pigments, may, however, increase the retard effect of the coating.
The plasticized aqueous dispersion of hydrophobic controlled release material may be applied onto the substrate comprising the therapeutically active agent by spraying using any suitable spray equipment known in the art. In a preferred method, a Wurster fluidized-bed system is used in which an air jet, injected from underneath fluidizes the core material and effects drying while the acrylic polymer coating is sprayed on. A sufficient amount of the aqueous dispersion of hydrophobic material to obtain a predetermined controlled-release of said therapeutically active agent when said coated substrate is exposed to aqueous solutions, e.g. gastric fluid, is preferably applied, taking into account the physical characteristics of the therapeutically active agent, the manner of incorporation of the plasticizer, etc. After coating with the hydrophobic controlled release material, a further overcoat of a film-former, such as Opadry(R), is optionally applied to the beads. This overcoat is provided, if at all, in order to substantially reduce agglomeration of the beads.

The release of the therapeutically active agent from the controlled-release formulation of the present invention can be further influenced, i.e., adjusted to a desired rate, by the addition of one or more release-modifying agents, or by providing one or more passageways through the coating. The ratio of hydrophobic controlled release material to water soluble material is determined by, among other factors, the release rate required and the solubility characteristics of the materials selected.

The release-modifying agents which function as pore-formers may be organic or inorganic, and include materials that can be dissolved, extracted or leached form the coating in the environment of use. The pore-formers may comprise one or more hydrophilic materials such as hydroxypropylmethylcellulose.

The controlled-release coatings of the present invention can also include erosion-promoting agents such as starch and gums.
The controlled-release coatings of the present invention can also include materials useful for making microporous lamina in the environment of use, such as polycarbonates comprised of linear polyesters of carbonic acid in which carbonate groups reoccur in the polymer chain.

The release-modifying agent may also comprise a semi-permeable polymer. In certain preferred embodiments, the release-modifying agent is selected from hydroxypropylmethylcellulose, lactose, metal stearates, and mixtures of any of the foregoing.

The controlled-release coatings of the present invention may also include an exit means comprising at least one passageway, orifice, or the like. The passageway may be formed by such methods as those disclosed in U.S. Patent Nos. 3,845,770; 3,916,889; 4,063,064; and 4,088,864. The passageway can have any shape such as round, triangular, square, elliptical, irregular, etc.

Another method of producing controlled release bead formulations suitable for about 24-hour administration is via powder layering. U.S. Patent No. 5,411,745 teaches preparation of 24-hour morphine formulations prepared via powder layering techniques utilizing a processing aid consisting essentially of hydrous lactose impalpable. The powder-layered beads are prepared by spraying an aqueous binder solution onto inert beads to provide a tacky surface, and subsequently spraying a powder that is a homogenous mixture of morphine sulfate and hydrous lactose impalpable onto the tacky beads. The beads are then dried and coated with a hydrophobic material such as those described hereinabove to obtain the desired release of drug when the final formulation is exposed to environmental fluids. An appropriate amount of the controlled release beads are then, e.g. encapsulated to provide a final dosage form which provides effective plasma concentrations of morphine for about 24 hours.
SUSTAINED RELEASE OSMOTIC DOSAGE

Sustained release dosage forms according to the present invention may also be prepared as osmotic dosage formulations. The osmotic dosage forms preferably include a bilayer core comprising a drug layer and a delivery or push layer, wherein the bilayer core is surrounded by a semipermeable wall and optionally having at least one passageway disposed therein.

The expression “passageway” as used for the purpose of this invention, includes aperture, orifice, bore, pore, porous element through which the at least one opioid can be pumped, diffuse or migrate through a fiber, capillary tube, porous overlay, porous insert, microporous member, or porous composition. The passageway can also include a compound that erodes or is leached from the wall in the fluid environment of use to produce at least one passageway. Representative compounds for forming a passageway include erodible poly(glycolic) acid, or poly(lactic) acid in the wall; a gelatinous filament; a water-removable poly(vinyl alcohol); leachable compounds such as fluid-removable pore-forming polysaccharides, acids, salts or oxides. A passageway can be formed by leaching a compound from the wall, such as sorbitol, sucrose, lactose, maltose, or fructose, to form a sustained-release dimensional pore-passageway. The passageway can have any shape, such as round, triangular, square and elliptical, for assisting in the sustained metered release of the at least one opioid from the dosage form. The dosage form can be manufactured with one or more passageway in spaced-apart relation on one or more surfaces of the dosage form. A passageway and equipment for forming a passageway are disclosed in U.S. Patent Nos. 3,845,770; 3,916,899; 4,063,064 and 4,088,864. passageways comprising sustained-release dimensions sized, shaped and adapted as a releasing-pore formed by aqueous leaching to provide a releasing-pore of a sustained-release rate are disclosed in U.S. Patent Nos. 4,200,098 and 4,285,987.
In certain embodiments, the bilayer core comprises a drug layer with the opioid and a displacement or push layer. In certain embodiments the drug layer may also comprise at least one polymer hydrogel. The polymerhydrogel may have an average molecular weight of between about 500 and about 6,000,000. Examples of polymer hydrogels include but are not limited to a maltodextrin polymer comprising the formula \((C_6 H_{12} O_2)_n \cdot H_2O\), wherein \(n\) is 3 to 7,500, and the maltodextrin polymer comprises a 500 to 1,250,000 number-average molecular weight; a poly(alkylene oxide) represented by, e.g., a poly(ethylene oxide) and a poly(propylene oxide) having a 50,000 to 750,000 weight-average molecular weight, and more specifically represented by a poly(ethylene oxide) of at least one of 100,000, 200,000, 300,000 or 400,000 weight-average molecular weights; an alkali carboxyalkylcellulose, wherein the alkali is sodium or potassium, the alkyl is methyl, ethyl, propyl, or butyl of 10,000 to 175,000 weight-average molecular weight; and a copolymer of ethylene-acrylic acid, including methacrylic and ethacrylic acid of 10,000 to 500,000 number-average molecular weight.

In certain embodiments of the present invention, the delivery or push layer comprises an osmopolymer. Examples of an osmopolymer include but are not limited to a member selected from the group consisting of a polyalkylene oxide and a carboxyalkylcellulose. The polyalkylene oxide possesses a 1,000,000 to 10,000,000 weight-average molecular weight. The polyalkylene oxide may be a member selected from the group consisting of polyethylene oxide, polypropylene oxide, comprising a 5,000,000 average molecular weight, polyethylene oxide comprising a 7,000,000 average molecular weight, cross-linked polymethylene oxide possessing a 1,000,000 average molecular weight, and polypropylene oxide of 1,200,000 average molecular weight. Typical osmopolymer carboxyalkylcellulose comprises a member selected from the group consisting of alkali carboxyalkylcellulose, sodium carboxymethylcellulose, potassium carboxymethylcellulose, sodium carboxyethylcellulose, lithium carboxymethylcellulose, sodium carboxyethylcellulose,
carboxyalkylhydroxyalkylcellulose, carboxymethylhydroxyethyl cellulose,
carboxyethylhydroxyethylcellulose and carboxymethylhydroxypropylcellulose. The
osmopolymers used for the displacement layer exhibit an osmotic pressure gradient
across the semipermeable wall. The osmopolymers imbibe fluid into dosage form,
thereby swelling and expanding as an osmotic hacrogel (also known as osmogel),
whereby they push the opioid from the osmotic dosage form.

The push layer may also include one or more osmotically effective compounds also
known as osmagents and as osmotically effective solutes. They imbibe an
environmental fluid, for example, form the gastrointestinal tract, into dosage form
and contribute to the delivery kinetics of the displacement layer. Examples of
osmotically active compounds comprise a member selected from the group
consisting of osmotic salts and osmotic carbohydrates. Examples of specific
osmagents include but are not limited to sodium chloride, potassium chloride,
magnesium sulphate, lithium phosphate, lithium chloride, sodium phosphate,
potassium sulphate, potassium phosphate, glucose, fructose and maltose.

The push layer may optionally include a hydroxypropylalkylcellulose possessing a
9,000 to 450,000 number-average molecular weight. The
hydroxypropylalkylcellulose is represented by a member selected from the group
consisting of hydroxypropylmethylcellulose, hydroxypropylethylcellulose,
hydroxypropolisopropylcellulose, hydroxypropylbutylcellulose and
hydroxypropylpentylcellulose.

The push layer optionally may comprise a non-toxic colorant or dye. Examples of
colorants or dyes include but are not limited to Food and Drug Administration
Colorant (FD&C), such as FD&C No. 1 blue dye, FD&C No. 4 red dye, red ferric
oxide, yellow ferric oxide, titanium dioxide, carbon black, and indigo.
The push layer may also optionally comprise an antioxidant to inhibit the oxidation of ingredients. Some examples of antioxidants include but are not limited to a member selected from the group consisting of ascorbic acid, ascorbyl palmitate, butylated hydroxyanisole, a mixute of 2 and 3 tertiary-butyl-4-hydroxyanisole, butylated hydroxytoluene, sodium isoascorbate, dihydroguaretic acid, potassium sorbate, sodium bisulphate, sodium meta bisulphate, sorbic acid, potassium ascorbate, vitamin E, 4-chloro-2,6-ditertiary butylphenol, alpha tocopherol, and propylgallate.

In certain alternative embodiments, the dosage form comprises a homogenous core comprising the opioid, a pharmaceutically acceptable polymer (e.g., polyethylene oxide), optionally a disintegrant (e.g., polyvinylpyrrolidone), optionally an absorption enhancer (e.g., a fatty acid, a surfactant, a chelating agent, a bile salt, etc.). The homogenous core is surrounded by a semipermeable wall having a passageway (as defined above) for the release of the opioid.

In certain embodiments, the semipermeable wall comprises a member selected from the group consisting of a cellulose ester polymer, a cellulose ether polymer and a cellulose ester-ether polymer. Representative wall polymers comprise a member selected from the group consisting of cellulose acrylate, cellulose diacrylate, cellulose triacrylate, cellulose acetate, cellulose diacetate, cellulose triacetate, mono-, di- and tricellulose alkenylates, and mono-, di and tricellulose alkinylates. The poly(cellulose) used for the present invention comprises a number-average molecular weight of 20,000 to 7,500,000.

Additional semipermeable polymers for the purpose of this invention comprise acetaldehyde dimethylcellulose acetate, cellulose acetate ethylcarbamate, cellulose acetate methylcarbamate, cellulose diacetate, propylcarbamate, cellulose acetate diethylaminoacetate; semipermeable polyamide; semipermeable polyurethane; semipermeable sulfonated polystyrene; semipermeable cross-linked polymer formed
by the coprecipitation of a polyanion and a polycation as disclosed in U.S. Patent Nos. 3,173,876; 3,276,586; 3,541,005; 3,541,006 and 3,546,876; semipermeable polymers as disclosed by Loeb and Sourirajan in U.S. Patent No. 3,133,132; semipermeable crosslinked polystyrenes; semipermeable crosslinked (poly(sodium styrene sulfonate); semipermeable crosslinked poly(vinylbenzyltrimethyl ammonium chloride); and semipermeable polymers possessing a fluid permeability of 2.5x10^8 to 2.5x10^2 (cm^2/hr · atm) expressed per atmosphere of hydrostatic or osmotic pressure difference across the semipermeable wall. Other polymers useful in the present invention are known in the art in U.S. Patent Nos. 3,845,770; 3,916,899 and 4,160,020; and in Handbook of Common Polymers, Scott, J.R. and W.J. Roff, 1971, CRC Press, Cleveland, Ohio.

In certain embodiments, preferably the semipermeable wall is non-toxic, inert, and it maintains its physical and chemical integrity during the dispensing life of the drug.

In certain embodiments, the dosage form comprises a binder. An example of a binder includes, but is not limited to a therapeutically acceptable vinyl polymer having a 5,000 to 350,000 viscosity-average molecular weight, represented by a member selected from the group consisting of poly-n-vinylamide, poly-n-vinylacetamide, poly(vinylpyrrolidone), also known as poly-n-vinylpyrrolidone), poly-n-vinylcaprolactone, poly-n-vinyl-5-methyl-2-pyrrolidone, and poly-n-vinylpyrrolidone copolymers with a member selected from the group consisting of vinyl acetate, vinyl alcohol, vinyl chloride, vinyl fluoride, vinyl butyrate, vinyl laureate, and vinyl stearate. Other binders include for example, acacia, starch, gelatin, and hydroxypropylalkylcellulose of 9,200 to 250,000 average molecular weight.

In certain embodiments, the dosage form comprises a lubricant, which may be used during the manufacture of the dosage form to prevent sticking to die wall or punch faces. Examples of lubricants include but are not limited to magnesium stearate, sodium stearate, stearic acid, calcium stearate, magnesium oleate, oleic acid, potassium oleate, carpyrylic acid, sodium stearyl fumarate, and magnesium palmitate.
In certain preferred embodiments, the present invention includes a therapeutic composition comprising 1 to 640 mg of the opioid, 25 to 500 mg of poly(alkylene oxide) having a 150,000 to 500,000 average molecular weight 1 to 50 mg of poly(vinylpyrrolidone) having a 40,000 average molecular weight, and 0 to about 7.5 mg of a lubricant.

In certain embodiments, the invention also provides a method for administering at least one opioid by admitting orally a dosage form comprising 1 to 640 mg of opioid, a semipermeable wall permeable to aqueous-biological fluid and impervious to the passageway of the opioid which semipermeable wall surrounds an internal space comprising the opioid composition and a push composition, the opioid composition comprising 1 to 640 mg of opioid, 25 to 500 mg of a poly(alkylene oxide) having a 150,000 to 500,000 average molecular weight, 1 to 50 mg of a poly(vinylpyrrolidone) having a 40,000 average molecular weight, and 0 to 7.5 mg of a lubricant, said push composition comprising 15 to 250 mg of a poly(alkylene oxide) of 3,000,000 to 7,500,000 average molecular weight, 0 to 75 mg of an osmagent, 1 to 50 mg of a hydroxyalkylcellulose, 0 to 10 mg of ferric oxide, 0 to 10 mg of a lubricant, and 0 to 10 mg of an antioxidant; and a passageway in the imbibing fluid through the semipermeable wall into the dosage form causing the opioid composition to become dispensable and the push composition to expand and push the opioid composition through the passageway, whereby through the combined operations of the dosage form, the opioid is delivered at a therapeutically effective dose at a rate controlled over a sustained period of time.

The dosage forms of the present invention may optionally be coated with one or more coating suitable for the regulation of release or for the protection of the formulation. In one embodiment, coatings are provided to permit either pH-dependent or pH-independent release, e.g., when exposed to gastrointestinal (GI) fluid. When a pH-independent coating is desired, the coating is designed to achieve
optimal release regardless of pH-changes in the environmental fluid, e.g., the GI tract. Other preferred embodiments include a pH-dependent coating that releases the opioid in desired areas of the GI tract, e.g., the stomach or small intestine, such that an absorption profile is provided which is capable of providing at least about twelve hours and preferably about twenty-four hours or more of a therapeutical effect to a patient. It is also possible to formulate compositions which release a portion of the dose in one desired area of the GI tract, e.g., the stomach, and release the remainder of the dose in another area of the GI tract, e.g., the small intestine.

Formulations according to the invention that utilize pH-dependent coatings may also impart a repeat-action effect whereby unprotected drug is coated over an enteric coat and is released in the stomach, while the remainder, being protected by the enteric coating, is released further down the gastrointestinal tract. Coatings which are pH-dependent and may be used in accordance with the present invention include a sustained release material such as, e.g., shellac, cellulose acetate phthalate (CAP), polyvinyl acetate phthalate (PVAP), hydroxypropyl methylcellulose phthalate, and methacrylic acid ester copolymers, zein, and the like.

In certain embodiments of the present invention, an effective amount of an opioid in immediate release form is included in the formulation. By including such an effective amount of immediate release opioid in the unit dose. In such embodiments, an effective amount of the opioid in immediate release form may be coated onto the tablet of the present invention. For example, where the extended release of the opioid from the formulation is due to a sustained release coating, the immediate release layer would be overcoated on top of the sustained release coating. On the other hand, the immediate release layer may be coated onto the surface of tablets wherein the opioid is incorporated in a sustained release matrix. One skilled in the art would recognize still other alternative manners of incorporating the immediate release opioid portion into the formulation. Such alternatives are deemed to be encompassed by the appended claims.
The following examples illustrate some preferred preparations. They are not to be construed to limit the claims in any manner whatsoever.

Example 1 – Production of tablets with different oxycodone/naloxone amounts in a non-swellable diffusion matrix by spray granulation:

The following amounts of the listed components were used for the production of oxycodone/naloxone tablets according to the invention.

<table>

The Surelease® E-7-7050 polymer mixture used had the following composition.

Surelease®
Ethylcellulose 20 cps
Dibutylsebacate
Ammoniumhydroxide
Oleic acid
Siliciumdioxide
Water
For the production of tablets oxycodone HCl, naloxone HCl, Povidone 30 and Lactose Flow Lac 100 were mixed in a tumbling mixer (Bohle) and subsequently spray-granulated with Surelease® E-7-7050 in a fluidized bath granulating device (GPCG3). The material was sieved over a Comill 1.4 mm sieve. An additional granulation step was carried out with melted fatty alcohol in a high-shear mixer (Collette). All tablet cores produced by this approach had a weight of 123 mg, based on dry substance.

Example 2 – Production of tablets with oxycodone and naloxone in a non-swellable diffusion matrix by extrusion:

The following amounts of the listed components were used for the production of the oxycodone/naloxone tablets according to the invention.

<table>
<thead>

</tbody>
</table>

The listed amounts of oxycodone HCl, naloxone HCl, ethylcellulose 45 epi, Povidone 30, stearyl alcohol and Lactose Flow Lac 100 were mixed in a tumbling mixer (Bohle). This mixture was subsequently extruded with a counter-rotating twin screw extruder of the type Micro 18 GGL (Leistritz AG, Nürnberg, Germany). The temperature of heating zone 1 was 25°C, of heating zone 2, 50°C, of heating zones 3 to 5, 60°C, of heating zones 6 to 8, 55°C, of heating zone 9, 60°C and of heating zone 10, 65°C. The screw rotating speed was 150 revolutions per minute (rpm), the resulting melt temperature was 87°C, the feed rate was 1.5 kg/h and the diameter of
the nozzle opening was 3 mm. The extruded material was sieved with a Frewitt 0.68 x 1.00 mm sieve. The grinded extrudate was then mixed with talcum and magnesium stearate that had been added over a 1 mm hand sieve and was subsequently pressed into tablets.

5
In comparison to the oxycodone/naloxone tablets which also have the Surelease®-based non-swellable diffusion matrix produced by spray granulation (see Example 1), extruded preparations comprise less components.

10
Example 3 – Release profile of the oxycodone/naloxone tablets from Example 1:

The release of the active compounds was measured over a time period of 12 hours, applying the Basket Method according to USP at pH 1.2 using HPLC. Tablets Ox/Nal-0, Ox/Nal-5 and Ox/Nal-10 were tested.

One recognizes from the table that in the case of a non-swellable diffusion matrix based on Surelease®, the release rates of different oxycodone amounts, independent of the naloxone amount, remain equal (invariant). Correspondingly, invariant release profiles are observed for naloxone at different oxycodone amounts.

</tbody>
</table>

The release values refer to oxycodone or naloxone (line 2) and are given as percentages. The mean value for the release of naloxone at e.g. 420 min is 92.7%.
The maximal deviation at 420 min is 1%. Oxy and Nal stand for oxycodone and
naloxone and indicate the active compound which has been measured.

Example 4 – Release profile of oxycodone/naloxone tablets from Example 2 at
different pH-values:

The release of active compounds from the tablets was measured over a time period of
12 hours at pH 1.2 or for 1 hour at 1.2 and subsequently for 11 hours at pH 6.5.

Release rates were determined by the basket method according to USP using HPLC.

The following release rates were measured for 12 hours at pH 1.2:

<table>
<thead>
<tr>
<th>Time (min)</th>

</tbody>
</table>
The release rates refer to oxycodone and naloxone (line 2) and are given as percentages. Oxy and Nal stand for oxycodone and naloxone and indicate the active compound measured.

Further suitable examples with a combination of oxycodone as agonist and naloxone as antagonist are disclosed in PCT/EP 03/03541.

Examples 5 and 6 – Controlled Release Oxycodone formulations, 10 and 20 mg tablets

Eudragit® RS 30D and Triacetine are combined while passing though a 60 mesh screen, and mixed under low shear for approximately 5 minutes or until a uniform dispersion is observed.

Next, suitable quantities of Oxycodone HCl, lactose, and povidone are placed into a fluid bed granulator/dryer (FBD) bowl, and the suspension sprayed onto the powder in the fluid bed. After spraying, the granulation is passed through a #12 screen if necessary to reduce lumps. The dry granulation is placed in a mixer.

In the meantime, the required amount of stearyl alcohol is melted at a temperature of approximately 70°C. The melted stearyl alcohol is incorporated into the granulation while mixing. The waxed granulation is transferred to a fluid bed granulator/dryer or trays and allowed to cool to room temperature or below. The cooled granulation is then passed through a #12 screen. Thereafter, the waxed granulation is placed in a mixer/blender and lubricated with the required amounts of talc and magnesium stearate for approximately 3 minutes, and then the granulate is compressed into 125 mg tablets on a suitable tableting machine.

The formula for the tablets of Example 5 (10 mg tablet) is set forth in the table below:
Component  | Mg/Tablet | % (by wt)
--- | --- | ---
Oxycodone Hydrochloride  | 10.0 | 8.0
Lactose (spray dried)  | 69.25 | 55.4
Pvidone  | 5.0 | 4.0
Eudragit® RS 30D (solids)  | 10.0* | 8.0
Triacetin®  | 2.0 | 1.6
Stearyl Alcohol  | 25.0 | 20.0
Talc  | 2.5 | 2.0
Magnesium Stearate  | 1.25 | 1.0

Total: 125.0 | 100.0

*Approximately 33.33 mg Eudragit® RS 30D Aqueous dispersion is equivalent to 10 mg of Eudragit® RS 30D dry substance.

The formula for the tablets of Example 6 (20 mg tablet) is set forth in the table below:

Component  | Mg/Tablet
--- | ---
Oxycodone Hydrochloride  | 20.0
Lactose (spray dried)  | 59.25
Povidone  | 5.0
Eudragit® RS 30D (solids)  | 10.0*
Triacetin®  | 2.0
Stearyl Alcohol  | 25.0
Talc  | 2.5
Magnesium Stearate  | 1.25

Total: 125.0

Example 7— The tablets of Example 5 are then tested for dissolution via the USP Basket Method at 37°C, 100 RPM, first hour 700 ml simulated gastric fluid at pH 1.2, then changed to 900 ml at pH 7.5. The results are set forth in the table below:
<table>

</tbody>
</table>

Further suitable examples with oxycodone as agonist and corresponding in vivo data are disclosed in EP 0 576 643 (incorporated herein by reference).
Example 9 — 24 hour 160 mg oxycodone sustained release capsules were prepared with the formula set forth in table below:

<table>
<thead>
<tr>
<th>Component</th>
<th>Mg/unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxycodone HCL</td>
<td>160</td>

<tr>
<td><strong>Total</strong></td>
<td><strong>400</strong></td>
</tr>
</tbody>
</table>

The formulation above was prepared according to the following procedure:
1. Pass the stearyl alcohol flakes through an impact mill.
2. Blend the Oxycodone HCl, stearic acid, stearyl alcohol and the Eudragit RSPO in a suitable lender/mixer.
3. Continuously feed the blended material into a twin screw extruder at elevated temperatures and collect the resultant strands on a conveyor.
4. Allow the strands to cool on the conveyor.
5. Cut the strands into 1 mm pellets using a pelletizer.
6. Screen the pellets for fines and oversized pellets to an acceptable range of about 0.8
   1.4 mm in size.
7. Fill into capsules with a fill weight of 400 mg/capsule (Fill into size 00 capsules).

Example 10 — The tablets of Example 9 are then tested for dissolution. The pellets were then using the following procedure:
Fiber optic UV dissolution using USP apparatus 1 (basket) at 100 rpm in 900 ml simulated gastric fluid (SGF) and in 900 ml simulated intestinal fluid (SIF) monitoring at 282nm.
The dissolution parameters for the above formulation are set forth in Table below:

Clinical Studies

Example 11 is a multicenter, randomized, placebo controlled double blind parallel group study. The study was conducted on 7 male and female COPD emphysematous patients at stage II or III (ATS staging) of the pink puffer stereotype at the age from 54 to 76 years.

4 patients were treated with Oxygesic® (Oxycodon twice-a-day oral controlled release dosage form) and 3 patients received placebo. The effect of oral controlled release oxycodone on the tolerance with regard to physiological strain and dyspnea was determined.

The tolerance with regard to physiological strain was rated by determining the average distance covered in 6 minutes at 0,7 and 42 days after the start of treatment. The results are set forth in the table below:
Average distance (m) covered in 6 minutes:

<td>-13.3</td>
<td></td>
</tr>
<tr>
<td>relative change (%)</td>
<td>+44.9%</td>
<td>-4.7%</td>
<td></td>
</tr>
</tbody>
</table>

Dyspnea was rated on a scale from −3 to +3 (−3 = noticeable declined, −2 = declined, −1 = slightly declined, 0 = no change, +1 = slightly improved, +2 = improved, +3 = noticeable improved). The results from the case report form are set forth in the table below.

<td>1.7</td>
<td>-1.5</td>
<td></td>
</tr>
</tbody>
</table>
Dyspnea rating on a scale out of 0 to 10 (0 = no dyspnea to 10 = most imaginable dyspnea) over a treatment period of 14 days from the patient diary are summarized in Fig. 1.

The overall efficacy was rated by the patient and investigator to be 2.8 and 2.5, respectively, with respect to the treatment with Oxygesic® and 5.0 and 3.7, respectively, with respect to the placebo treatment, on a scale out of 1 to 7 (1 = very good, 7 = very bad). The patient compliance was generally good.
CLAIMS

1. Use of an opioid controlled release oral dosage form comprising at least one opioid for the manufacture of a medicament to treat patients with Chronic Obstructive Pulmonary Disease (COPD).

2. Use of an opioid controlled release oral dosage form comprising at least one opioid for the manufacture of a medicament to treat patients with Chronic Obstructive Pulmonary Disease (COPD) which provides an effective treatment when administered every twelve hours at steady state.

3. Use of an opioid controlled release oral dosage form comprising at least one opioid for the manufacture of a medicament to treat patients with Chronic Obstructive Pulmonary Disease (COPD) which provides an effective treatment when administered every 24 hours at steady state.

4. Use according to any preceding claim, wherein the oral dosage form comprises an opioid agonist selected from the group comprising oxycodone, hydrocodone, hydromorphone, morphine, methadone, oxymorphone, fentanyl and sufentanyl, in the form of the free base or a pharmaceutically acceptable salt.

5. Use according to any preceding claim, wherein the oral dosage form comprises a mixture of an opioid agonist and an opioid antagonist selected from the group comprising naltrexone, nalmefene and naloxone, in the form of the free base or a pharmaceutically acceptable salt.

6. Use according to any preceding claim, wherein the oral dosage form contains oxycodone or a pharmaceutically acceptable salt thereof.
7. Use according to any preceding claim, wherein the oral dosage form comprises morphine or a pharmaceutically acceptable salt thereof.

8. Use according to any preceding claim, wherein the oral dosage form comprises a mixture of oxycodone and naloxone, in the form of the free base or as pharmaceutically acceptable salts thereof.

9. Use according to claim 8, wherein the oral dosage form is a storage stable pharmaceutical preparation and the active compounds are released from the preparation in a sustained, invariant and independent manner.

10. Use according to claim 8 or 9, wherein oxycodone is present in excess referred to the unit dosage amount of naloxone.

11. Use according to claims 8 to 10, wherein Naloxone is present in an amount range of 1 to 50 mg.

12. Use according to claims 8 to 11, wherein oxycodone is present in an amount range of 10 to 150 mg, preferably of 10 to 80 mg.

13. Use according to claims 8 to 12, wherein oxycodone and naloxone are present in weight ratio ranges of maximal 25 : 1, preferably of maximal 20:1, 15:1, especially preferably of 5:1, 4:1, 3:1, 2:1 or 1:1.
