THIADIOXOBENZODIAZEPINE INHIBITORS OF FARNESYL PROTEIN TRANSFERASE

Field of the Invention

5 This invention relates to compounds that inhibit farnesyl protein transferase and ras protein farnesylation, thereby making them useful as anticancer agents. The compounds are also useful in the treatment of
10 diseases, other than cancer, associated with signal transduction pathways operating through ras and those associated with CAAX-containing proteins other than ras that are also post-translationally modified by the enzyme farnesyl protein transferase. The compounds may also act as inhibitors of other prenyl transferases, and thus be effective in the treatment of diseases
15 associated with other prenyl modifications of proteins.

Background of the Invention

20 The mammalian ras gene family comprises three genes, H-ras, K-ras and N-ras. The ras proteins are a family of GTP-binding and hydrolyzing proteins that regulate cell growth and differentiation. Overproduction of normal ras proteins or mutations that inhibit their GTPase activity can lead to uncontrolled cell division. The transforming activity of ras is dependent on localization of the protein to plasma membranes. This membrane binding
25 occurs via a series of posttranslational modifications of the cytosolic ras proteins. The first and mandatory step in this sequence of events is the farnesylation of these proteins. The reaction is catalyzed by the enzyme farnesyl protein transferase (FPT), and farnesyl pyrophosphate (FPP) serves as the farnesyl group donor in this reaction. The ras C-terminus contains a
30 sequence motif termed a "Cys-Aaa1-Aaa2-Xaa" box (CAAX box), wherein Cys is cysteine, Aaa is an aliphatic amino acid, and Xaa is a serine or methionine. Farnesylation occurs on the cysteinyl residue of the CAAX box (Cys-186), thereby attaching the prenyl group on the protein via a thio-ether linkage.

Compounds of formula I-II, as modulators of apoptosis, will be useful in the treatment of a variety of human diseases with aberrations in apoptosis including cancer (particularly, but not limited to follicular lymphomas, carcinomas with p53 mutations, hormone dependent tumors of the breast, prostate and ovary, and precancerous lesions such as familial adenomatous polyposis), viral infections (including but not limited to herpes virus, pox virus, Epstein-Barr virus, Sindbis virus and adenovirus), autoimmune diseases (including but not limited to systemic lupus erythematosus, immune mediated glomerulonephritis, rheumatoid arthritis, psoriasis, inflammatory bowel diseases and autoimmune diabetes mellitus), neurodegenerative disorders (including but not limited to Alzheimer's disease, AIDS-related dementia, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, spinal muscular atrophy and cerebellar degeneration), AIDS, myelodysplastic syndromes, aplastic anemia, ischemic injury associated myocardial infarctions, stroke and reperfusion injury, arrhythmia, atherosclerosis, toxin-induced or alcohol induced liver diseases, hematological diseases (including but not limited to chronic anemia and aplastic anemia), degenerative diseases of the musculoskeletal system (including but not limited to osteoporosis and arthritis), aspirin-sensitive rhinosinusitis, cystic fibrosis, multiple sclerosis, kidney diseases, and cancer pain.

Compounds of formulas I-II may also be useful in the treatment of diseases associated with farnesyl transferase substrates other than ras (e.g., nuclear lamins, transducin, rhodopsin kinase, cGMP phosphodiesterase, TC21, phosphorylase kinase, Rap2, RhoB, RhoE, PRL1) that are also post-translationally modified by the enzyme farnesyl protein transferase.

Compounds of formulas I-II may also act as inhibitors of other prenyl transferases (e.g., geranylgeranyl transferase I and II), and thus be effective in the treatment of diseases associated with other prenyl modifications (e.g., geranylgeranylation) of proteins (e.g. the rap, rab, rac and rho gene products and the like). For example, they may find use as drugs against Hepatitis delta virus (HDV) infections, as suggested by the recent finding that geranylgeranylation of the large isoform of the delta antigen of HDV is a requirement for productive viral infection [J. S. Glen, et al., Science, 256, 1331 (1992)].

added dropwise 15 μ l (0.19 mmol) of mesyl chloride. Stirring was continued with cooling for 1 hr, and then at rt for 1 hr. The mixture was evaporated to dryness and the residue diluted with ethyl acetate. The solution was washed once with water, dried (MgSO_4) and the solvent removed to afford an oil residue which crystallized. The crude product was subjected to flash chromatography on a 30 cc column of silica gel. Elution with chloroform afforded first, 25 mg (50 %) of unreacted Compound A, followed by 28 mg (0.076 mmol, 44%) of Compound B as a white solid.

B. 2,3,4,5-Tetrahydro-5-(1H-imidazol-4-ylmethyl)-2-(methylsulfonyl)-3-(phenylmethyl)-1,2,5-benzothiadiazepine, 1,1-dioxide, monohydrochloride

A solution of 25 mg (0.068 mmol) of Compound A and 13 mg (0.14 mmol) of 4-formylimidazole in 1 ml of methylene chloride and 0.5 ml of acetic acid was stirred at rt and under argon for 0.5 hr, after which time was added 30 mg (0.14 mmol) of sodium triacetoxyborohydride. Stirring was continued for 1 hr, after which time an additional 13 mg of 4-formylimidazole and 30 mg of sodium triacetoxy borohydride was added. Stirring was continued overnight. Additional portions of 4-formylimidazole and hydride were added after 15 hr, and again after 24 hr. The mixture was stirred overnight, evaporated to dryness and the residue diluted with ethyl acetate. Conc. ammonium hydroxide (5 ml) was added and the mixture stirred briefly. The aqueous layer was separated and the organic solution washed twice with brine, dried (MgSO_4) and the solvent removed to afford 28 mg of a solid foam, which was subjected to flash chromatography on a 30 cc column of silica gel. Elution with 5% methanol-chloroform afforded 21 mg of the free base of Compound C as a clear, colorless glass. The hydrochloride was prepared from this material by the addition of excess 1 M HCl in ether to a solution of the free base in ethyl acetate. The resulting white precipitate was removed by filtration, dried (50° C, high vac, overnight) to afford 15 mg (0.031 mmole, 46 %) of Example 15 as a white solid.
