Background of the Invention
[0002] NMDA receptors are heteromeric complexes comprised of NR1, NR2, and/or NR3 subunits and possess distinct recognition sites for exogenous and endogenous ligands. These recognition sites include binding sites for glycine, and glutamate agonists and modulators. NMDA receptors are expressed in the peripheral tissues and the CNS, where they are involved in excitatory synaptic transmission. Activating these receptors contributes to synaptic plasticity in some circumstances and excitotoxicity in others. These receptors are ligand-gated ion channels that admit Ca²⁺ after binding of the glutamate and glycine, and are fundamental to excitatory neurotransmission and normal CNS function. Positive modulators may be useful as therapeutic agents with potential clinical uses as cognitive enhancers and in the treatment of psychiatric disorders in which glutamatergic transmission is reduced or defective (see, e.g., Horak et al., J. of Neuroscience, 2004, 24(46), 10318-10325). In contrast, negative modulators may be useful as therapeutic agents with potential clinical uses in the treatment of psychiatric disorders in which glutamatergic transmission is pathologically increased (e.g., treatment resistant depression).

[0003] Oxysterols are cholesterol analogs that are modulators of NMDA receptor function. There is a need for new oxysterols that modulate the NMDA receptor for the prevention and treatment of conditions associated with NMDA expression and function. Compounds, compositions, and methods described herein are directed toward this end.

Summary of the Invention
[0004] Provided herein are substituted oxysterols useful for preventing and/or treating a broad range of disorders, including, but not limited to, NMDA-mediated disorders. Further provided are pharmaceutical compositions comprising the compounds of the present invention, and methods of their use and treatment.

Chemical Definitions

[0074] Compounds described herein can comprise one or more asymmetric centers, and thus can exist in various isomeric forms, e.g., enantiomers and/or diastereomers. For example, the compounds described herein can be in the form of an individual enantiomer, diastereomer or geometric isomer, or can be in the form of a mixture of stereoisomers, including racemic mixtures and mixtures enriched in one or more stereoisomer. Isomers can be isolated from mixtures by methods known to those skilled in the art, including chiral high pressure liquid chromatography (HPLC) and the formation and crystallization of chiral salts; or preferred isomers can be prepared by asymmetric syntheses. See, for example, Jacques et al, Enantiomers, Racemates and Resolutions (Wiley Interscience, New York, 1981); Wilen et al., Tetrahedron 33:2725 (1977); Eliel, Stereochemistry of Carbon Compounds (McGraw-Hill, NY, 1962); and Wilen, Tables of Resolving Agents and Optical Resolutions p. 268 (E.L. Eliel, Ed., Univ. of Notre Dame Press, Notre Dame, IN 1972). The invention additionally encompasses compounds described herein as individual isomers substantially free of other isomers, and alternatively, as mixtures of various isomers.
The "enantiomeric excess" ("e.e.") or "% enantiomeric excess" ("%e.e.") of a composition as used herein refers to an excess of one enantiomer relative to the other enantiomer present in the composition. For example, a composition can contain 90% of one enantiomer, e.g., the S enantiomer, and 10% of the other enantiomer, i.e., the R enantiomer.

Thus, a composition containing 90% of one enantiomer and 10% of the other enantiomer is said to have an enantiomeric excess of 80%.

The "diastereomeric excess" ("d.e.") or "% diastereomeric excess" ("%d.e.") of a composition as used herein refers to an excess of one diastereomer relative to one or more different diastereomers present in the composition. For example, a composition can contain 90% of one diastereomer, and 10% of one or more different diastereomers.

Thus, a composition containing 90% of one diastereomers and 10% of one or more different diastereomers is said to have a diastereomeric excess of 80%.

In an alternative embodiment, compounds described herein may also comprise one or more isotopic substitutions. For example, hydrogen may be $^2$H (D or deuterium) or $^3$H (T or tritium); carbon may be, for example, $^{13}$C or $^{14}$C; oxygen may be, for example, $^{16}$O; nitrogen may be, for example, $^{15}$N, and the like. In other embodiments, a particular isotope (e.g., $^3$H, $^{13}$C, $^{14}$C, $^{16}$O, or $^{15}$N) can represent at least 1%, at least 5%, at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, at least 55%, at least 60%, at least 65%, at least 70%, at least 75%, at least 80%, at least 85%, at least 90%, at least 95%, at least 99%, or at least 99.9% of the total isotopic abundance of an element that occupies a specific site of the compound.

[00134] The term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, Berge et al., describes pharmaceutically acceptable salts in detail in J. Pharmaceutical Sciences (1977) 66:1-19. Pharmaceutically acceptable salts of the compounds of this invention include those derived from suitable inorganic and organic acids and bases. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p-toluenesulfonate, undecanoate, valerate salts, and the like. [00135] A "subject" to which administration is contemplated includes, but is not limited to, humans (i.e., a male or female of any age group, e.g., a pediatric subject (e.g., infant, child, adolescent) or adult subject (e.g., young adult, middle-aged adult or senior adult)) and/or a non-human animal, e.g., a mammal such as primates (e.g., cynomolgus monkeys, rhesus monkeys), cattle, pigs, horses, sheep, goats, rodents, cats, and/or dogs. In certain embodiments, the subject is a human. In certain embodiments, the subject is a non-human animal. The terms "human," "patient," and "subject" are used interchangeably herein.
Disease, disorder, and condition are used interchangeably herein.

As used herein, and unless otherwise specified, the terms "treat," "treating" and "treatment" contemplate an action that occurs while a subject is suffering from the specified disease, disorder or condition, which reduces the severity of the disease, disorder or condition, or retards or slows the progression of the disease, disorder or condition ("therapeutic treatment"), and also contemplates an action that occurs before a subject begins to suffer from the specified disease, disorder or condition ("prophylactic treatment").

In general, the "effective amount" of a compound refers to an amount sufficient to elicit the desired biological response. As will be appreciated by those of ordinary skill in this art, the effective amount of a compound of the invention may vary depending on such factors as the desired biological endpoint, the pharmacokinetics of the compound, the disease being treated, the mode of administration, and the age, health, and condition of the subject. An effective amount encompasses therapeutic and prophylactic treatment.

As used herein, and unless otherwise specified, a "therapeutically effective amount" of a compound is an amount sufficient to provide a therapeutic benefit in the treatment of a disease, disorder or condition, or to delay or minimize one or more symptoms associated with the disease, disorder or condition. A therapeutically effective amount of a compound means an amount of therapeutic agent, alone or in combination with other therapies, which provides a therapeutic benefit in the treatment of the disease, disorder or condition. The term "therapeutically effective amount" can encompass an amount that improves overall therapy, reduces or avoids symptoms or causes of disease or condition, or enhances the therapeutic efficacy of another therapeutic agent.

As used herein, and unless otherwise specified, a "prophylactically effective amount" of a compound is an amount sufficient to prevent a disease, disorder or condition, or one or more symptoms associated with the disease, disorder or condition, or prevent its recurrence. A prophylactically effective amount of a compound means an amount of a therapeutic agent, alone or in combination with other agents, which provides a prophylactic benefit in the prevention of the disease, disorder or condition. The term "prophylactically effective amount" can encompass an amount that improves overall prophylaxis or enhances the prophylactic efficacy of another prophylactic agent.

5 **Pharmaceutical Compositions**

[00193] In another aspect, the invention provides a pharmaceutical composition comprising a pharmaceutically acceptable carrier and an effective amount of a compound of Formula 1-59, 1-66, 1-61, 1-62, or 1-60.

[00194] When employed as pharmaceuticals, the compounds provided herein are typically administered in the form of a pharmaceutical composition. Such compositions can be prepared in a manner well known in the pharmaceutical art and comprise at least one active compound.

[00195] In one embodiment, with respect to the pharmaceutical composition, the carrier is a parenteral carrier, oral or topical carrier.

[00196] The present invention also relates to a compound of Formula 1-59, 1-66, 1-61, 1-62, or 1-60 or pharmaceutical composition thereof for use as a pharmaceutical or a medicament.

[00197] Generally, the compounds provided herein are administered in a therapeutically effective amount. The amount of the compound actually administered will typically be determined by a physician, in the light of the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound administered, the age, weight, and response of the individual patient, the severity of the patient's symptoms, and the like.

[00198] The pharmaceutical compositions provided herein can be administered by a variety of routes including oral, rectal, transdermal, subcutaneous, intravenous, intramuscular, and intranasal. Depending on the intended route of delivery, the compounds provided herein are preferably formulated as either injectable or oral compositions or as salves, as lotions or as patches all for transdermal administration.

[00199] The compositions for oral administration can take the form of bulk liquid solutions or suspensions, or bulk powders. More commonly, however, the compositions are presented in unit dosage forms to facilitate accurate dosing. The term "unit dosage forms" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient. Typical unit dosage forms include prefilled, premeasured ampules or syringes of the liquid compositions or pills, tablets, capsules or the like in the case of solid compositions. In such compositions, the compound is usually a minor component (from about 0.1 to about 50% by weight or preferably
from about 1 to about 40% by weight) with the remainder being various vehicles or carriers and processing aids helpful for forming the desired dosing form.

[00200] Liquid forms suitable for oral administration may include a suitable aqueous or nonaqueous vehicle with buffers, suspending and dispensing agents, colorants, flavors and the like. Solid forms may include, for example, any of the following ingredients, or compounds of a similar nature: a binder such as microcrystalline cellulose, gum tragacanth or gelatin; an excipient such as starch or lactose, a disintegrating agent such as alginic acid, Primogel, or corn starch; a lubricant such as magnesium stearate; a glidant such as colloidal silicon dioxide; a sweetening agent such as sucrose or saccharin; or a flavoring agent such as peppermint, methyl salicylate, or orange flavoring.

[00201] Injectable compositions are typically based upon injectable sterile saline or phosphate-buffered saline or other injectable carriers known in the art. As before, the active compound in such compositions is typically a minor component, often being from about 0.05 to 10% by weight with the remainder being the injectable carrier and the like.

[00202] Transdermal compositions are typically formulated as a topical ointment or cream containing the active ingredient(s), generally in an amount ranging from about 0.01 to about 20% by weight, preferably from about 0.1 to about 20% by weight, preferably from about 0.1 to about 10% by weight, and more preferably from about 0.5 to about 15% by weight. When formulated as a ointment, the active ingredients will typically be combined with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with, for example, an oil-in-water cream base. Such transdermal formulations are well-known in the art and generally include additional ingredients to enhance the dermal penetration of stability of the active ingredients or the formulation. All such known transdermal formulations and ingredients are included within the scope provided herein.

[00203] The compounds provided herein can also be administered by a transdermal device. Accordingly, transdermal administration can be accomplished using a patch either of the reservoir or porous membrane type, or of a solid matrix variety.

[00204] The above-described components for orally administrable, injectable or topically administrable compositions are merely representative. Other materials as well as processing techniques and the like are set forth in Part 8 of Remington's *Pharmaceutical Sciences*, 17th edition, 1985, Mack Publishing Company, Easton, Pennsylvania, which is incorporated herein by reference.

[00205] The above-described components for orally administrable, injectable, or topically administrable compositions are merely representative. Other materials as well as processing techniques and the like are set forth in Part 8 of Remington's *The Science and Practice of*
Pharmacy, 21st edition, 2005, Publisher: Lippincott Williams & Wilkins, which is incorporated herein by reference.

The compounds of this invention can also be administered in sustained release forms or from sustained release drug delivery systems. A description of representative sustained release materials can be found in Remington's Pharmaceutical Sciences.

The present invention also relates to the pharmaceutically acceptable formulations of a compound of Formula 1-59, 1-66, 1-61, 1-62, or 1-60. In one embodiment, the formulation comprises water. In another embodiment, the formulation comprises a cyclodextrin derivative. The most common cyclodextrins are α-, β- and γ- cyclodextrins consisting of 6, 7 and 8 α-1,4-linked glucose units, respectively, optionally comprising one or more substituents on the linked sugar moieties, which include, but are not limited to, methylated, hydroxyalkylated, acylated, and sulfoalkyl ether substitution. In certain embodiments, the cyclodextrin is a sulfoalkyl ether β-cyclodextrin, e.g., for example, sulfobutyl ether β-cyclodextrin, also known as Captisol®. See, e.g., U.S. 5,376,645. In certain embodiments, the formulation comprises hexapropyl-β-cyclodextrin. In a more particular embodiment, the formulation comprises hexapropyl-β-cyclodextrin (10-50% in water).

The present invention also relates to the pharmaceutically acceptable acid addition salt of a compound of Formula 1-59, 1-66, 1-61, 1-62, or 1-60. The acid which may be used to prepare the pharmaceutically acceptable salt is that which forms a non-toxic acid addition salt, i.e., a salt containing pharmacologically acceptable anions such as the hydrochloride, hydroiodide, hydrobromide, nitrate, sulfate, bisulfate, phosphate, acetate, lactate, citrate, tartrate, succinate, maleate, fumarate, benzoate, para-toluenesulfonate, and the like.

Injection dose levels range from about 0.1 mg/kg/hour to at least 10 mg/kg/hour, all for from about 1 to about 120 hours and especially 24 to 96 hours. A preloading bolus of from about 0.1 mg/kg to about 10 mg/kg or more may also be administered to achieve adequate steady state levels. The maximum total dose is not expected to exceed about 2 g/day for a 40 to 80 kg human patient.

For the prevention and/or treatment of long-term conditions the regimen for treatment usually stretches over many months or years so oral dosing is preferred for patient convenience and tolerance. With oral dosing, one to five and especially two to four and typically three oral doses per day are representative regimens. Using these dosing patterns, each dose provides from about 0.01 to about 20 mg/kg of the compound provided herein, with preferred doses each providing from about 0.1 to about 10 mg/kg, and especially about 1 to about 5 mg/kg.

Transdermal doses are generally selected to provide similar or lower blood levels than are achieved using injection doses.

When used to prevent the onset of a CNS-disorder, the compounds provided herein will be administered to a subject at risk for developing the condition, typically on the advice and under the supervision of a physician, at the dosage levels described above. Subjects at risk for developing a particular condition generally include those that have a family history of the condition, or those who have been identified by genetic testing or screening to be particularly susceptible to developing the condition.

Movement Disorders

[00237] Also described herein are methods for treating a movement disorder. As used herein, “movement disorders” refers to a variety of diseases and disorders that are associated
with hyperkinetic movement disorders and related abnormalities in muscle control. Exemplary movement disorders include, but are not limited to, Parkinson’s disease and Parkinsonism (defined particularly by bradykinesia), dystonia, chorea and Huntington’s disease, ataxia, tremor (e.g., essential tremor), myoclonus and startle, tics and Tourette syndrome, Restless legs syndrome, stiff person syndrome, and gait disorders.

[00238] Tremor is an involuntary, at times rhythmic, muscle contraction and relaxation that can involve oscillations or twitching of one or more body parts (e.g., hands, arms, eyes, face, head, vocal folds, trunk, legs). Tremor includes hereditary, degenerative, and idiopathic disorders such as Wilson’s disease, Parkinson’s disease, and essential tremor, respectively; metabolic diseases (e.g., thyroid-parathyroid-, liver disease and hypoglycemia); peripheral neuropathies (associated with Charcot-Marie-Tooth, Roussy-Levy, diabetes mellitus, complex regional pain syndrome); toxins (nicotine, mercury, lead, CO, Manganese, arsenic, toluene); drug-induced (narcoleptics, tricyclics, lithium, cocaine, alcohol, adrenaline, bronchodilators, theophylline, caffeine, steroids, valproate, amiodarone, thyroid hormones, vincristine); and psychogenic disorders. Clinical tremor can be classified into physiologic tremor, enhanced physiologic tremor, essential tremor syndromes (including classical essential tremor, primary orthostatic tremor, and task- and position-specific tremor), dystonic tremor, parkinsonian tremor, cerebellar tremor, Holmes’ tremor (i.e., rubral tremor), palatal tremor, neuropathic tremor, toxic or drug-induced tremor, and psychogenic tremor. Other forms of tremor include cerebellar tremor or intention tremor, dystonic tremor, essential tremor, orthostatic tremor, parkinsonian tremor, physiological tremor, psychogenic tremor, or rubral tremor.

[00239] Cerebellar tremor or intention tremor is a slow, broad tremor of the extremities that occurs after a purposeful movement. Cerebellar tremor is caused by lesions in or damage to the cerebellum resulting from, e.g., tumor, stroke, disease (e.g., multiple sclerosis, an inherited degenerative disorder).

[00240] Dystonic tremor occurs in individuals affected by dystonia, a movement disorder in which sustained involuntary muscle contractions cause twisting and repetitive motions and/or painful and abnormal postures or positions. Dystonic tremor may affect any muscle in the body. Dystonic tremors occur irregularly and often can be relieved by complete rest.

[00241] Essential tremor or benign essential tremor is the most common type of tremor. Essential tremor may be mild and nonprogressive in some, and may be slowly progressive, starting on one side of the body but affect both sides within 3 years. The hands are most often affected, but the head, voice, tongue, legs, and trunk may also be involved. Tremor frequency may decrease as the person ages, but severity may increase. Heightened emotion, stress, fever,
physical exhaustion, or low blood sugar may trigger tremors and/or increase their severity. Symptoms generally evolve over time and can be both visible and persistent following onset.

Orthostatic tremor is characterized by fast (e.g., greater than 12 Hz) rhythmic muscle contractions that occurs in the legs and trunk immediately after standing. Cramps are felt in the thighs and legs and the patient may shake uncontrollably when asked to stand in one spot. Orthostatic tremor may occur in patients with essential tremor.

Parkinsonian tremor is caused by damage to structures within the brain that control movement. Parkinsonian tremor is often a precursor to Parkinson's disease and is typically seen as a "pill-rolling" action of the hands that may also affect the chin, lips, legs, and trunk. Onset of parkinsonian tremor typically begins after age 60. Movement starts in one limb or on one side of the body and can progress to include the other side.

Physiological tremor can occur in normal individuals and have no clinical significance. It can be seen in all voluntary muscle groups. Physiological tremor can be caused by certain drugs, alcohol withdrawal, or medical conditions including an overactive thyroid and hypoglycemia. The tremor classically has a frequency of about 10 Hz.

Psychogenic tremor or hysterical tremor can occur at rest or during postural or kinetic movement. Patient with psychogenic tremor may have a conversion disorder or another psychiatric disease.

Rubral tremor is characterized by coarse slow tremor which can be present at rest, at posture, and with intention. The tremor is associated with conditions that affect the red nucleus in the midbrain, classical unusual strokes.

Parkinson's disease affects nerve cells in the brain that produce dopamine. Symptoms include muscle rigidity, tremors, and changes in speech and gait. Parkinsonism is characterized by tremor, bradykinesia, rigidity, and postural instability. Parkinsonism shares symptoms found in Parkinson's disease, but is a symptom complex rather than a progressive neurodegenerative disease.

Dystonia is a movement disorder characterized by sustained or intermittent muscle contractions causing abnormal, often repetitive movements or postures. Dystonic movements can be patterned, twisting, and may be tremulous. Dystonia is often initiated or worsened by voluntary action and associated with overflow muscle activation.

Chorea is a neurological disorder characterized by jerky involuntary movements typically affecting the shoulders, hips, and face.

Huntington's Disease is an inherited disease that causes nerve cells in the brain to waste away. Symptoms include uncontrolled movements, clumsiness, and balance problems. Huntington's disease can hinder walk, talk, and swallowing.
Ataxia refers to the loss of full control of bodily movements, and may affect the fingers, hands, arms, legs, body, speech, and eye movements.

Myoclonus and Startle is a response to a sudden and unexpected stimulus, which can be acoustic, tactile, visual, or vestibular.

Tics are an involuntary movement usually onset suddenly, brief, repetitive, but non-rhythmical, typically imitating normal behavior and often occurring out of a background of normal activity. Tics can be classified as motor or vocal, motor tics associated with movements while vocal tics associated with sound. Tics can be characterized as simple or complex. For example simple motor tics involve only a few muscles restricted to a specific body part.

Tourette Syndrome is an inherited neuropsychiatric disorder with onset in childhood, characterized by multiple motor tics and at least one vocal tic.

Restless Legs Syndrome is a neurologic sensorimotor disorder characterized by an overwhelming urge to move the legs when at rest.

Stiff Person Syndrome is a progressive movement disorder characterized by involuntary painful spasms and rigidity of muscles, usually involving the lower back and legs. Stiff-legged gait with exaggerated lumbar hyperlordosis typically results. Characteristic abnormality on EMG recordings with continuous motor unit activity of the paraspinal axial muscles is typically observed. Variants include "stiff-limb syndrome" producing focal stiffness typically affecting distal legs and feet.

Gait disorders refer to an abnormality in the manner or style of walking, which results from neuromuscular, arthritic, or other body changes. Gait is classified according to the system responsible for abnormal locomotion, and include hemiplegic gait, diplegic gait, neuropathic gait, myopathic gait, parkinsonian gait, choreiform gait, ataxic gait, and sensory gait.

Mood disorders

Also provided herein are methods for treating a mood disorder, for example clinical depression, postnatal depression or postpartum depression, perinatal depression, atypical depression, melancholic depression, psychotic major depression, cationic depression, seasonal affective disorder, dysthymia, double depression, depressive personality disorder, recurrent brief depression, minor depressive disorder, bipolar disorder or manic depressive disorder, depression caused by chronic medical conditions, treatment-resistant depression, refractory depression, suicidality, suicidal ideation, or suicidal behavior.

Clinical depression is also known as major depression, major depressive disorder (MDD), severe depression, unipolar depression, unipolar disorder, and recurrent depression, and
refers to a mental disorder characterized by pervasive and persistent low mood that is accompanied by low self-esteem and loss of interest or pleasure in normally enjoyable activities. Some people with clinical depression have trouble sleeping, lose weight, and generally feel agitated and irritable. Clinical depression affects how an individual feels, thinks, and behaves and may lead to a variety of emotional and physical problems. Individuals with clinical depression may have trouble doing day-to-day activities and make an individual feel as if life is not worth living.

[00260] Postnatal depression (PND) is also referred to as postpartum depression (PPD), and refers to a type of clinical depression that affects women after childbirth. Symptoms can include sadness, fatigue, changes in sleeping and eating habits, reduced sexual desire, crying episodes, anxiety, and irritability. In some embodiments, the PND is a treatment-resistant depression (e.g., a treatment-resistant depression as described herein). In some embodiments, the PND is refractory depression (e.g., a refractory depression as described herein).

[00261] In some embodiments, a subject having PND also experienced depression, or a symptom of depression during pregnancy. This depression is referred to herein as perinatal depression. In an embodiment, a subject experiencing perinatal depression is at increased risk of experiencing PND.

[00262] Atypical depression (AD) is characterized by mood reactivity (e.g., paradoxical anhedonia) and positivity, significant weight gain or increased appetite. Patients suffering from AD also may have excessive sleep or somnolence (hypersomnia), a sensation of limb heaviness, and significant social impairment as a consequence of hypersensitivity to perceived interpersonal rejection.

[00263] Melancholic depression is characterized by loss of pleasure (anhedonia) in most or all activities, failures to react to pleasurable stimuli, depressed mood more pronounced than that of grief or loss, excessive weight loss, or excessive guilt.

[00264] Psychotic major depression (PMD) or psychotic depression refers to a major depressive episode, in particular of melancholic nature, where the individual experiences psychotic symptoms such as delusions and hallucinations.

[00265] Catatonic depression refers to major depression involving disturbances of motor behavior and other symptoms. An individual may become mute and stuporose, and either is immobile or exhibits purposeless or bizarre movements.

[00266] Seasonal affective disorder (SAD) refers to a type of seasonal depression wherein an individual has seasonal patterns of depressive episodes coming on in the fall or winter.
[00267] **Dysthymia** refers to a condition related to unipolar depression, where the same physical and cognitive problems are evident. They are not as severe and tend to last longer (e.g., at least 2 years).

[00268] **Double depression** refers to fairly depressed mood (dysthymia) that lasts for at least 2 years and is punctuated by periods of major depression.

[00269] **Depressive Personality Disorder (DPD)** refers to a personality disorder with depressive features.

[00270] **Recurrent Brief Depression (RBD)** refers to a condition in which individuals have depressive episodes about once per month, each episode lasting 2 weeks or less and typically less than 2-3 days.

[00271] **Minor depressive disorder** or minor depression refers to a depression in which at least 2 symptoms are present for 2 weeks.

[00272] **Bipolar disorder or manic depressive disorder** causes extreme mood swings that include emotional highs (mania or hypomania) and lows (depression). During periods of mania the individual may feel or act abnormally happy, energetic, or irritable. They often make poorly thought out decisions with little regard to the consequences. The need for sleep is usually reduced. During periods of depression there may be crying, poor eye contact with others, and a negative outlook on life. The risk of suicide among those with the disorder is high at greater than 6% over 20 years, while self-harm occurs in 30-40%. Other mental health issues such as anxiety disorder and substance use disorder are commonly associated with bipolar disorder.

[00273] **Depression caused by chronic medical conditions** refers to depression caused by chronic medical conditions such as cancer or chronic pain, chemotherapy, chronic stress.

[00274] **Treatment-resistant depression** refers to a condition where the individuals have been treated for depression, but the symptoms do not improve. For example, antidepressants or psychological counseling (psychotherapy) do not ease depression symptoms for individuals with treatment-resistant depression. In some cases, individuals with treatment-resistant depression improve symptoms, but come back. **Refractory depression** occurs in patients suffering from depression who are resistant to standard pharmacological treatments, including tricyclic antidepressants, MAOIs, SSRIs, and double and triple uptake inhibitors and/or anxiolytic drugs, as well as non-pharmacological treatments (e.g., psychotherapy, electroconvulsive therapy, vagus nerve stimulation and/or transcranial magnetic stimulation).

[00275] **Suicidality, suicidal ideation, suicidal behavior** refers to the tendency of an individual to commit suicide. Suicidal ideation concerns thoughts about or an unusual preoccupation with suicide. The range of suicidal ideation varies greatly, from e.g., fleeting thoughts to extensive thoughts, detailed planning, role playing, incomplete attempts. Symptoms
include talking about suicide, getting the means to commit suicide, withdrawing from social contact, being preoccupied with death, feeling trapped or hopeless about a situation, increasing use of alcohol or drugs, doing risky or self-destructive things, saying goodbye to people as if they won't be seen again.

Symptoms of depression include persistent anxious or sad feelings, feelings of helplessness, hopelessness, pessimism, worthlessness, low energy, restlessness, difficulty sleeping, sleeplessness, irritability, fatigue, motor challenges, loss of interest in pleasurable activities or hobbies, loss of concentration, loss of energy, poor self-esteem, absence of positive thoughts or plans, excessive sleeping, overeating, appetite loss, insomnia, self-harm, thoughts of suicide, and suicide attempts. The presence, severity, frequency, and duration of symptoms may vary on a case to case basis. Symptoms of depression, and relief of the same, may be ascertained by a physician or psychologist (e.g., by a mental state examination).

Anxiety Disorders

Provided herein are methods for treating anxiety disorders. Anxiety disorder is a blanket term covering several different forms of abnormal and pathological fear and anxiety. Current psychiatric diagnostic criteria recognize a wide variety of anxiety disorders.

Generalized anxiety disorder is a common chronic disorder characterized by long-lasting anxiety that is not focused on any one object or situation. Those suffering from generalized anxiety experience non-specific persistent fear and worry and become overly concerned with everyday matters. Generalized anxiety disorder is the most common anxiety disorder to affect older adults.

In panic disorder, a person suffers from brief attacks of intense terror and apprehension, often marked by trembling, shaking, confusion, dizziness, nausea, difficulty breathing. These panic attacks, defined by the APA as fear or discomfort that abruptly arises and peaks in less than ten minutes, can last for several hours and can be triggered by stress, fear, or even exercise; although the specific cause is not always apparent. In addition to recurrent unexpected panic attacks, a diagnosis of panic disorder also requires that said attacks have chronic consequences: either worry over the attacks' potential implications, persistent fear of future attacks, or significant changes in behavior related to the attacks. Accordingly, those suffering from panic disorder experience symptoms even outside of specific panic episodes. Often, normal changes in heartbeat are noticed by a panic sufferer, leading them to think something is wrong with their heart or they are about to have another panic attack. In some cases, a heightened awareness (hypervigilance) of body functioning occurs during panic attacks,
wherein any perceived physiological change is interpreted as a possible life threatening illness (i.e. extreme hypochondriasis).

[00280] **Obsessive compulsive disorder** is a type of anxiety disorder primarily characterized by repetitive obsessions (distressing, persistent, and intrusive thoughts or images) and compulsions (urges to perform specific acts or rituals). The OCD thought pattern may be likened to superstitions insofar as it involves a belief in a causative relationship where, in reality, one does not exist. Often the process is entirely illogical; for example, the compulsion of walking in a certain pattern may be employed to alleviate the obsession of impending harm. And in many cases, the compulsion is entirely inexplicable, simply an urge to complete a ritual triggered by nervousness. In a minority of cases, sufferers of OCD may only experience obsessions, with no overt compulsions; a much smaller number of sufferers experience only compulsions.

[00281] The single largest category of anxiety disorders is that of **phobia**, which includes all cases in which fear and anxiety is triggered by a specific stimulus or situation. Sufferers typically anticipate terrifying consequences from encountering the object of their fear, which can be anything from an animal to a location to a bodily fluid.

[00282] **Post-traumatic stress disorder** or PTSD is an anxiety disorder which results from a traumatic experience. Post-traumatic stress can result from an extreme situation, such as combat, rape, hostage situations, or even serious accident. It can also result from long term (chronic) exposure to a severe stressor, for example soldiers who endure individual battles but cannot cope with continuous combat. Common symptoms include flashbacks, avoidant behaviors, and depression.

**Epilepsy**

[00283] Epilepsy is a brain disorder characterized by repeated seizures over time. Types of epilepsy can include, but are not limited to generalized epilepsy, e.g., childhood absence epilepsy, juvenile myoclonic epilepsy, epilepsy with grand-mal seizures on awakening, West syndrome, Lennox-Gastaut syndrome, partial epilepsy, e.g., temporal lobe epilepsy, frontal lobe epilepsy, benign focal epilepsy of childhood.

**Epileptogenesis**

[00284] Epileptogenesis is a gradual process by which a normal brain develops epilepsy (a chronic condition in which seizures occur). Epileptogenesis results from neuronal damage precipitated by the initial insult (e.g., status epilepticus).
Status epilepticus (SE)

Status epilepticus (SE) can include, e.g., convulsive status epilepticus, e.g., early status epilepticus, established status epilepticus, refractory status epilepticus, super-refractory status epilepticus; non-convulsive status epilepticus, e.g., generalized status epilepticus, complex partial status epilepticus; generalized periodic epileptiform discharges; and periodic lateralized epileptiform discharges. Convulsive status epilepticus is characterized by the presence of convulsive status epileptic seizures, and can include early status epilepticus, established status epilepticus, refractory status epilepticus, super-refractory status epilepticus. Early status epilepticus is treated with a first line therapy. Established status epilepticus is characterized by status epileptic seizures which persist despite treatment with a first line therapy, and a second line therapy is administered. Refractory status epilepticus is characterized by status epileptic seizures which persist despite treatment with a first line and a second line therapy, and a general anesthetic is generally administered. Super refractory status epilepticus is characterized by status epileptic seizures which persist despite treatment with a first line therapy, a second line therapy, and a general anesthetic for 24 hours or more.

Non-convulsive status epilepticus can include, e.g., focal non-convulsive status epilepticus, e.g., complex partial non-convulsive status epilepticus, simple partial non-convulsive status epilepticus, subtle non-convulsive status epilepticus; generalized non-convulsive status epilepticus, e.g., late onset absence non-convulsive status epilepticus, atypical absence non-convulsive status epilepticus, or typical absence non-convulsive status epilepticus.

Seizure

A seizure is the physical findings or changes in behavior that occur after an episode of abnormal electrical activity in the brain. The term "seizure" is often used interchangeably with "convulsion." Convulsions are when a person's body shakes rapidly and uncontrollably. During convulsions, the person's muscles contract and relax repeatedly.

Based on the type of behavior and brain activity, seizures are divided into two broad categories: generalized and partial (also called local or focal). Classifying the type of seizure helps doctors diagnose whether or not a patient has epilepsy.

Generalized seizures are produced by electrical impulses from throughout the entire brain, whereas partial seizures are produced (at least initially) by electrical impulses in a relatively small part of the brain. The part of the brain generating the seizures is sometimes called the focus.

There are six types of generalized seizures. The most common and dramatic, and therefore the most well-known, is the generalized convolution, also called the grand-mal seizure.
In this type of seizure, the patient loses consciousness and usually collapses. The loss of consciousness is followed by generalized body stiffening (called the "tonic" phase of the seizure) for 30 to 60 seconds, then by violent jerking (the "clonic" phase) for 30 to 60 seconds, after which the patient goes into a deep sleep (the "postictal" or after-seizure phase). During grandmal seizures, injuries and accidents may occur, such as tongue biting and urinary incontinence.

Absence seizures cause a short loss of consciousness (just a few seconds) with few or no symptoms. The patient, most often a child, typically interrupts an activity and stares blankly. These seizures begin and end abruptly and may occur several times a day. Patients are usually not aware that they are having a seizure, except that they may be aware of "losing time."

Myoclonic seizures consist of sporadic jerks, usually on both sides of the body. Patients sometimes describe the jerks as brief electrical shocks. When violent, these seizures may result in dropping or involuntarily throwing objects.

Clonic seizures are repetitive, rhythmic jerks that involve both sides of the body at the same time.

Tonic seizures are characterized by stiffening of the muscles.

Atonic seizures consist of a sudden and general loss of muscle tone, particularly in the arms and legs, which often results in a fall.

Seizures described herein can include epileptic seizures; acute repetitive seizures; cluster seizures; continuous seizures; unremitting seizures; prolonged seizures; recurrent seizures; status epilepticus seizures, e.g., refractory convulsive status epilepticus, non-convulsive status epilepticus seizures; refractory seizures; myoclonic seizures; tonic seizures; tonic-clonic seizures; simple partial seizures; complex partial seizures; secondarily generalized seizures; atypical absence seizures; absence seizures; atomic seizures; benign Rolandic seizures; febrile seizures; emotional seizures; focal seizures; gelastic seizures; generalized onset seizures; infantile spasms; Jacksonian seizures; massive bilateral myoclonus seizures; multifocal seizures; neonatal onset seizures; nocturnal seizures; occipital lobe seizures; post traumatic seizures; subtle seizures; Sylvan seizures; visual reflex seizures; or withdrawal seizures. In some embodiments, the seizure is a generalized seizure associated with Dravet Syndrome, Lennox-Gastaut Syndrome, Tuberous Sclerosis Complex, Rett Syndrome or PCDH19 Female Pediatric Epilepsy.

Whole-cell Patch Clamp of Mammalian Cells (Ionworks Barracuda (IWB))

The whole-cell patch-clamp technique was used to investigate the effects of compounds on GluN1/GluN2A glutamate receptors expressed in mammalian cells.

HEK293 cells were transformed with adenovirus 5 DNA and transfected with cDNA encoding the human GRIN1/GRIN2A genes. Stable transfectants were selected using G418 and Zeocin-resistance genes incorporated into the expression plasmid and selection pressure maintained with G418 and Zeocin in the medium. Cells were cultured in Dulbecco's Modified Eagle Medium/Nutrient Mixture (D-MEM/F-12) supplemented with 10% fetal bovine serum, 100 µg/ml penicillin G sodium, 100 µg/ml streptomycin sulphate, 100 µg/ml Zeocin, 5 µg/ml blasticidin and 500 µg/ml G418.

Test article effects were evaluated in 8-point concentration-response format (4 replicate wells/concentration). All test and control solutions contained 0.3% DMSO and 0.01% Kolliphor® EL (C5135, Sigma). The test article formulations were loaded in a 384-well compound plate using an automated liquid handling system (SciClone ALH3000, Caliper LifeSciences). The measurements were perfomed using IonWorks Barracuda platform following this procedure:

Electrophysiological Procedures:

Intracellular solution (mM): 50 mM CsCl, 90 mM CsF, 2 mM MgCl₂, 5 mM EGTA, 10 mM HEPES. Adjust to pH 7.2 with CsOH.

Extracellular solution, HB-PS (composition in mM): NaCl, 137; KCl, 1.0; CaCl₂, 5; HEPES, 10; Glucose, 10; pH adjusted to 7.4 with NaOH (refrigerated until use).

Holding potential: -70 mV, potential during agonist/PAM application: -40 mV.

Recording procedure:
Extracellular buffer is loaded into the PPC plate wells (11 µL per well). Cell suspension will be pipetted into the wells (9 µL per well) of the PPC planar electrode.

Whole-cell recording configuration is established via patch perforation with membrane currents recorded by on-board patch clamp amplifiers.

Two recordings (scans) are performed. First, during pre-application of test article alone (duration of pre-application - 5 min) and second, during test articles and agonist (EC$_{50}$ L-glutamate and 30 µM glycine) co-application to detect positive modulatory effects of the test article.

Test Article Administration: The first pre-application consists of the addition of 20 µL of 2X concentrated test article solution and, second, of 20 µL of IX concentrated test article and agonist at 10 µE/s (2 second total application time).

All test and control solutions contained 0.3% DMSO and 0.01% Kolliphor® EL (C5135, Sigma). The test article formulations were loaded in a 384-well compound plate using an automated liquid handling system (SciClone ALH3000, Caliper LifeSciences). The measurements were performed using Ion Works Barracuda platform following this procedure:

Electrophysiological Procedures:

a) Intracellular solution (mM): 50 mM CsCl, 90 mM CsF, 2 mM MgCl$_2$, 5 mM EGTA, 10 mM HEPES. Adjust to pH 7.2 with CsOH.
b) Extracellular solution, HB-PS (composition in mM): NaCl, 137; KCl, 1.0; CaCl₂, 5; HEPES, 10; Glucose, 10; pH adjusted to 7.4 with NaOH (refrigerated until use).

c) Holding potential: -70 mV, potential during agonist/PAM application: -40 mV.

Recording procedure:

1. a) Extracellular buffer will be loaded into the PPC plate wells (11 µL per well). Cell suspension will be pipetted into the wells (9 µL per well) of the PPC planar electrode.

Potentiating effect of positive allosteric modulators (PAM) on the channel

Potentiating effect of positive allosteric modulators (PAM) on the channel will be calculated as

\[
\text{% activation} = \left( \frac{I_{\text{PAM}}}{I_{\text{EC}_{20}}} \right) \times 100\% - 100\%
\]

where \( I_{\text{PAM}} \) will be the L-glutamate \( \text{EC}_{20} \) elicited current in presence of various concentrations of test articles and \( I_{\text{EC}_{20}} \) will be the mean current elicited with L-glutamate \( \text{EC}_{20} \).

PAM concentration-response data will be fitted to an equation of the form:

\[
\text{% Activation} = \% \text{L-glutamate EC}_{20} + \left( \frac{\left( \text{MAX} - \% \text{L-glutamate EC}_{20} \right)}{1 + \left( \frac{[\text{Test}]}{\text{EC}_{50}} \right)^N} \right)
\]

where [Test] will be the concentration of PAM (test article), \( \text{EC}_{50} \) will be the concentration of PAM producing half-maximal activation, \( \text{N} \) will be the Hill coefficient, \% L-glutamate \( \text{EC}_{20} \) will be the percentage of the current elicited with L-glutamate \( \text{EC}_{20} \), \% MAX is the percentage of the current activated with the highest dose of PAM co-admitted with L-glutamate \( \text{EC}_{20} \) and \% Activation will be the percentage of the current elicited with L-glutamate \( \text{EC}_{4,30} \) at each PAM concentration.

The maximal amplitude of the evoked currents are measured and defined as Peak Current Amplitude (PCA).
Automated patch-clamp system (QPatch HTX):

In this study, HEK 293 cells stably transfected with glutamate-activated channels of the GRIN1/2A subtype will be used together with submaximal NMDA concentrations (300 µM NMDA, co-application with 8 µM Glycine) to investigate the negative allosteric modulation of the test compounds.

**Test Compound Concentrations**

Dose levels are in terms of test compounds, as supplied. Vehicle will be added to achieve a stock concentration of 10 mM (storage at -10°C to -30°C). A further stock solutions of 1.0 mM will be prepared in DMSO. Details of stock solution usage (thawing, dose formulations) will be
documented in the raw data. The time period of stock solution usage will be detailed in the report.

One test concentration of 1.0 μM will be tested.

All test solutions will be prepared by diluting the stock solutions with either Mg-free bath solution only or Mg-free bath solution containing NMDA (300 μM) and glycine (8.0 μM) shortly prior to the electrophysiological experiments and kept at room temperature (19°C to 30°C) when in use. 0.1% DMSO will be used as vehicle.

Frequency of preparation: For each test concentration, fresh solutions of test compounds will be prepared every day.

Stability of dose formulation: All preparation times will be documented in the raw data. Any observations regarding instability of test compounds will be mentioned in the raw data.

Storage of dose formulation: On the day of experimentation dose formulations will be maintained at room temperature (19°C to 30°C) when in use.

Bath Solutions

For preparing the experiments and for formation of the giga-ohm-seal, the following standard bath solution will be used:

Sodium Chloride: 137 mM; Potassium Chloride: 4 mM; Calcium Chloride: 1.8 mM; Magnesium Chloride: 1 mM; HEPES: 10 mM; D-Glucose: 10 mM; Cremophor: 0.02%; pH (NaOH): 7.4

The 1x bath solution will be prepared by diluting 10x bath solution without Glucose and 100x Glucose solution with water at least every 7 days. Both stock solutions have been prepared prior to the experimental start of the present study and stored at 1°C to 9°C (10x bath solution) or -10°C to -30°C (100x Glucose solution). The batch number(s) of the bath solution(s) used in the experiments will be documented in the raw data. When in use, the 1x bath solution will be kept at room temperature (19°C to 30°C). When not in use, the 1x bath solution will be stored at 1°C to 9°C.

After the giga-seal was formed the following Mg-free bath solution will be used:

Sodium Chloride: 137 mM; Potassium Chloride: 4 mM; Calcium Chloride: 2.8 mM; HEPES: 10 mM; D-Glucose: 10 mM; Cremophor: 0.02%; pH (NaOH): 7.4

This Mg-free bath solution will be prepared as a 1x solution and stored at 1°C to 9°C. It will be prepared freshly at least every 10 days.
**Intracellular Solution**

The 1x intracellular solution will be thawed every day out of a frozen 1x intracellular solution, which has been prepared prior to the experimental start of the present study, aliquotted and stored at -10°C to -30°C. When in use, the 1x intracellular solution will kept at room temperature (19°C to 30°C). Remaining 1x intracellular solution will be stored in the fridge (1°C to 9°C). The 1x intracellular solution will include the components outlined below:

Potassium Chloride: 130 mM; Magnesium Chloride: 1 mM; Mg-ATP: 5 mM; HEPES: 10 mM; EGTA: 5 mM; pH (KOH): 7.2

**Cell Treatment**

For this study, cells will continuously be perfused with NMDA/Glycine, Test Compound or Test Compound/NMDA/Glycine.

In every case, at least 30-second prewash steps with a test compound will be performed in between applications. For details see Table A below.

Each experiment type will be analyzed in at least n=3 isolated cells. The NMDA and Glycine stock solutions will be prepared prior to the experimental start of the present study, stored frozen (-10°C to -30°C) until the day of experimentation. Shortly prior to the electrophysiological experiments, frozen stock solutions will be thawed and diluted.

Control: The effect of vehicle (0.1% DMSO) and D-(-)-2-Amino-5-phosphonopentanoic acid (AP-5) (100 µM) will be measured at three cells every second week, in order to assure successful expression of NMDA receptors.

The 50 mM stock solution of AP-5 has been prepared prior to the experimental start of the present study, aliquotted and stored frozen (-10°C to -30°C) until the day of experimentation. Shortly prior to the electrophysiological experiments the frozen stock solution will be thawed and then diluted in Mg-free bath solution containing NMDA (300 µM) and glycine (8.0 µM), to give a final perfusion concentration of 100 µM.

**Experimental Procedure**

Cells are transferred as suspension in serum-free medium to the QPatch HTX system and kept in the cell storage tank / stirrer during experiments. All solutions applied to cells including the intracellular solution will be maintained at room temperature (19°C to 30°C).

During the sealing process **standard bath solution** described above will be used. All solutions applied to cells including the pipette solution will be maintained at room temperature (19°C to 30°C).
30°C). After formation of a Gigaohm seal between the patch electrodes and transfected individual HEK293 cells only Mg-free bath solution will be perfused and the cell membrane will be ruptured to assure electrical access to the cell interior (whole-cell patch-configuration).. Inward currents will be measured upon application of 300 μM NMDA (and 8.0 μM Glycine) to patch-clamped cells for 5 sec. During the entire experiment the cells will be voltage-clamped at a holding potential of -80 mV.

For the analysis of test compounds, NMDA receptors will be stimulated by 300 μM NMDA and 8.0 μM Glycine and test compound combinations described below. Thirty-second prewash steps with a test compound will be performed in between applications.

**EXAMPLE 3. Synthesis of Compound 1.**

![Chemical diagrams showing steps of the synthesis process]

**Step 1.** To a mixture of MePPh₃Br (1.28 kg, 3.6 mol) in THF (4.5 L) was added t-BuOK (404 g, 3.6 mol) at 15°C under N₂. The resulting mixture was stirred at 50°C for 30 mins. Pregnenolone (950 g, 2.9 mol) was added in portions below 65°C. The reaction mixture was stirred at 50°C for 1 hour. The combined mixture was quenched with saturated NH₄Cl aqueous (1 L) at 15°C. THF layer was separated. The aqueous was extracted with EtOAc (2 x 2 L). The
combined organic phase was concentrated under vacuum to give a solid. The solid was further purified by trituration with MeOH/H$_2$O (1:1, 15 L) at reflux to give A-1 (940 g, 99%) as a solid.

**H NMR** (400 MHz, CDCl$_3$) δ 5.40-5.32 (m, 1H), 4.85 (s, 1H), 4.71 (s, 1H); 3.58-3.46 (m, 1H), 2.36-2.16 (m, 2H), 2.08-1.94 (m, 2H), 1.92-1.62 (m, 9H), 1.61-1.39 (m, 6H), 1.29-1.03 (m, 4H), 1.01 (s, 3H), 0.99-0.91 (m, 1H), 0.59 (s, 3H).

**Step 2.** To a solution of A-1 (800 g, 2.54 mol) in DCM (8 L) was added DMP (2.14 kg, 5.08 mol) in portions at 35°C. The reaction mixture was stirred at 35°C for 20 mins. The reaction mixture was filtered. The filtered cake was washed with DCM (3 x 1 L). The combined organic phase was washed with saturated Na$_2$S$_2$O$_3$ saturated NaHC0$_3$ aqueous (3:1, 2 x 1.5 L), brine (1.5 L), dried over Na$_2$SO$_4$, filtered and concentrated under vacuum to give A-2 (794 g, crude) as a solid, which was used for next step directly.

**Step 3.** To a solution of TBAF (3.04 mL, 1 M in THF, 3.04 mmol, Aldrich) in THF (100 mL) was added TMSCF$_3$ (25.8 g, 182 mmol) followed by a solution of A-2 (19 g, 60.8 mmol) in THF (100 mL) dropwise at 0°C. The mixture was stirred at 0°C for 30 mins. To the mixture was added TBAF (200 mL, 1 M in THF, 200 mmol) at 0°C. The mixture was stirred at 0°C for another 30 mins. To the mixture was added saturated aqueous NH$_4$Cl (100 mL) and the mixture was concentrated in vacuum. To the residue was added PE/EtOAc (400 mL, 1:1), the organic layer was separated, which was combined with other two batches (2 x 10 g of A-2). The combined organic layer was washed with water (300 mL), brine (300 mL), dried over Na$_2$SO$_4$, filtered and concentrated in vacuum to give an oil. The residue was dissolved in DCM (150 mL) and diluted with PE (750 mL). The solution was poured into a silica gel column (500 g, 100-200 mesh) and eluted with PE:DCM:EtoAc = 5:1:0.05 to 5:1:0.1 to give A-4 (12 g, 17% yield) as an oil and impure A-3. The impure A-3 was re-crystallized from MeCN (250 mL) to give purified A-3 (6.5 g) as a solid. A-3 recovered from the MeCN filtrate was subjected to silica gel chromatography (PE:DCM:EtoAc = 50:1 to 20:1) to give a crude product which was re-crystallized from MeCN (20 mL) to give purified A-3 (1 g, 16% total yield) as a solid.

**Note:** A-3 and A-4 were identified from $^3_{13C}$ (FDCS). (J. Org. Chem. 2015, 80, 1754.)

A-3: **H NMR** (400 MHz, CDCl$_3$) δ 5.43-5.33 (m, 1H), 4.85 (s, 1H), 4.71 (s, 1H); 2.49 (s, 2H); 2.11-1.97 (m, 4H), 1.95-1.32 (m, 14H), 1.30-0.98 (m, 7H), 0.59 (s, 3H).

A-4: **H NMR** (400 MHz, CDCl$_3$) δ 5.54-5.41 (m, 1H), 4.86 (s, 1H), 4.72 (s, 1H); 2.78-2.65 (m, 1H); 2.18-1.97 (m, 3H), 1.95-1.35 (m, 16H), 1.32-0.98 (m, 7H), 0.59 (s, 3H).

**Step 4.** To a solution of A-3 (8 g, 20.9 mmol) in THF (80 mL) was added 9-BBN dimer (5.85 g, 24 mmol). The mixture was stirred at 40°C for 1 h. The mixture was cooled to 0°C. To the mixture was added EtOH (12 mL), NaOH (41.8 mL, 5 M, aq.) and H$_2$O$_2$ (20.9 mL, 10 M, aq.) dropwise. The mixture was stirred at 50°C for 1 h and then cooled. To the
mixture was added Na₂SO₃ (100 mL, 25%, aq.). The mixture was extracted with EtOAc (300 mL). The organic layer was separated, purified by silica gel column (PE:EtOAc = 10:1 to 5:1) to give A-5 (7.1 g, 85%) as a solid.

EXAMPLE 54: Synthesis of Compound 154
Step 1: To a solution of A154 (2 g, 5.01 mmol) (see WO2014/160480 for synthesis) and Pd/C (200 mg, 10%) in THF (30 mL) was hydrogenated under 15 psi of hydrogen at 25°C for 3 h. The mixture was filtered through a pad of celite and the filtrate was concentrated in vacuum to afford crude A254 (1.8 g) as a solid.

Step 2: To a solution of A254 (1.8 g, 4.47 mmol) in THF (25 mL) was added a solution LiAlH₄ (339 mg, 8.94 mmol) in THF (5 mL) drop wise below 15°C. The solution was stirred at 15°C for 2 h. The reaction was quenched by the addition of saturated aqueous NH₄Cl (20 mL) at 0°C. The resulting mixture was extracted with EtOAc (2 x 50 mL). The combined organic layer was washed with brine (2 x 30 mL) and concentrated in vacuum to afford crude A354 (1.6 g) as a solid.

Step 3: A mixture of A354 (1.6 g, 4.27 mmol) in DCM (10 mL) and THF (10 mL) was added PCC (2.27 g, 10.6 mmol) at 25°C. The reaction was stirred at 25°C for 3 hrs. The solution was filtered and the filter cake was washed with DCM (25 mL). The combined filtrate was concentrated in vacuum. The residue was purified by silica gel column, eluting with PE/EtOAc = 8/1 to give A454 (0.9 g, 54%) as a solid.

Step 4

Step 4a: Generation of 4-pyridylmagnesium chloride solution

To a suspension of 4-bromopyridine hydrochloride (1 g, 5.14 mmol) in THF (4 mL) was added isopropylmagnesium chloride (5.1 mL, 2 M in THF, 10.2 mmol) at 0°C. The mixture was stirred at 15°C for 1 h. The 4-pyridylmagnesium chloride solution (ca. 0.5 M in THF) was used directly.

Step 4b: To a solution of A454 (100 mg, 0.268 mmol) in THF (1 mL) was added freshly prepared 4-pyridylmagnesium chloride (5.36 mL, ca. 0.5 M in THF, 2.68 mmol) at 0°C. The mixture was stirred at 15°C for 1 h. To the mixture was added NH₄Cl (2 mL, 10% aq.). The mixture was extracted with EtOAc (10 mL). The organic layer was separated, purified by prep-TLC (DCM:MeOH = 15:1), re-crystallized from MeCN (2 mL) and dried in vacuum to give Compound 154 (31 mg, 26%) as a solid.
**EXAMPLE 55. Synthesis of Compound 255.**

To a solution of 3-bromopyridine (423 mg, 2.68 mmol) in THF (10 mL) under N₂ was added i-PrMgCl (1.34 mL, 2.68 mmol, 2M) dropwise at 15°C. The reaction was stirred at 15°C for 30 min. A solution of A455 (100 mg, 0.268 mmol) was added. The reaction was stirred at 15°C for 2 h. The reaction was quenched with saturated NH₄Cl (20 mL), extracted with EtOAc (3 x 20 mL). The combined organic phase was washed with brine (50 mL), dried over Na₂SO₄, filtered and concentrated. The residue was purified by column chromatography (MeOH in DCM gradient, 0%-10%) to afford crude product (50 mg), which was then recrystallized from MeCN (15 mL) to afford **Compound 255** (8 mg, 7% yield) as a solid.

Step 1. To freshly prepared liquid ammonia (1.0 L) was added lithium (12.7 g, 1.82 mol) in portions at -70 °C. The mixture became deep blue. After stirring at -70°C for 1 h, a solution of A175 (50 g, 183 mmol) and t-butanol (26.9 g, 364 mmol) in dry THF (600 mL) was added to this mixture with strong stirring, and the temperature was maintained below -60°C. The resultant mixture was stirred at -70°C for 2 hrs. Ammonium chloride (150 g) was added to reaction mixture. The mixture was warmed to 25°C and stirred for 16 hrs. The reaction mixture was neutralized with aq. HCl (2.5 M, 1000 mL) and filtered. The filtrate was extracted with EtOAc.
(1 Lx2), washed with brine (1 L), dried over anhydrous Na\textsubscript{2}SO\textsubscript{4}, filtered and concentrated to afford A\textsubscript{2} (45 g, crude) as a solid.

Example 94. Synthesis of Compound 194.
Step 1: t-BuOH (350 mL) was charged into a three-neck round bottom flask under nitrogen at 35°C and stirred under nitrogen gas bubbling for 10 mins. t-BuOK (90.5 g, 807 mmol) was added to the mixture and stirred under nitrogen gas bubbling for 15 mins. A194 (20 g, 73.4 mmol) was added to the above mixture and stirred under nitrogen gas bubbling at 35°C for 1.5 hrs. The reaction mixture was poured into 10% aqueous acetic acid (500 mL) and stirred for 15 mins below 35°C. Water (500 mL) was added to the reaction and stirred for 30 mins. The pH of the mixture was adjusted to 7-8 with sodium bicarbonate (500 mL). The mixture was stirred for 30 mins. The mixture was extracted with PE (2 x 500 mL). The organic layer was separated, washed with brine (500 mL), dried over anhydrous sodium sulfate, filtered and concentrated below 35°C to give A294 (17 g, crude) as an oil. The crude residue was used directly for the next step.

Step 2: To a solution of 2, 6-di-tert-butyl-4-methylphenol (100 g, 453 mmol) in toluene (300 mL) was added drop-wise AlMe₃ (113 mL, 226 mmol, 2 M in toluene) at 0°C. The mixture was stirred at 25°C for 1 h. A solution of A294 (10 g, 36.7 mmol) in toluene (50 mL) was added dropwise at -70°C and after stirring at -70°C for 1 h, EtMgBr (36.6 ml, 110 mmol, 3M in ethyl ether) was added drop wise at -70°C. The resulting solution was stirred at -70°C for 1 hr. The reaction mixture was quenched by saturated citric acid (400 ml) at -70°C. After stirring at 25°C for 10 min, the resulting mixture was filtered and washed with EtOAc (2 x 200 ml). The

[Chemical structures and reaction scheme]

**Step 1.** To a solution of S,S-cat (2 g, 3.65 mmol) in anhydrous DCM (30 mL) was added a solution of cobalt(II) acetate (775 mg, 4.38 mmol) in MeOH (30 mL) under
nitrogen at 20°C. The mixture was stirred for 30 mins at 20°C and at 0°C for 1 h. The precipitated solid was filtered, washed with cold MeOH (2 x 30 mL) and dried in vacuum to give Co-S,S-cat (1.6 g, 73%) as a solid.

[00705] **Step 2.** To a solution of Co-S,S-cat (1.07 g, 1.78 mmol) in toluene (30 mL) was added AcOH (1.12 g, 18.7 mmol). The mixture was stirred at 20°C for 30 mins. The solution was concentrated in vacuum to give a crude solid. The resulting catalyst residue was dissolved in neat A-0 (100 g, 892 mmol) at 20°C, the reaction mixture was cooled to 0°C, and water (8.82 g, 490 mmol) was added dropwise. The mixture was warmed to 20°C and stirred for 48 hrs. A-l (44 g) was isolated by distillation from the reaction mixture.

[00706] **1H NMR** (400 MHz, DMSCW6) δ 3.96 (s, 1H), 3.11-2.98 (m, 2H).

The e.e. of A-l was determined by opening the epoxide with benzylamine. A-l (200 mg, 1.78 mmol) was added to dry benzylamine (190 mg, 1.78 mmol), and the mixture was stirred at 20°C for 2 hrs. A solid precipitated, which was triturated from petroleum ether to afford the product (260 mg, 67%) as a solid. The e.e. of this product was determined to be 100% by chiral HPLC. (Column: CD-PH 250*4.6mm I.D., 5um; Mobile phase: from 10% to 80% of B in A (A:Water with 0.069% TFA B:Acetonitrile); Flow rate: 0.8mL/min; Column Temperature : 30°C).

**EXAMPLE 112. Synthesis of Compound 112.**
Step 1. To a mixture of MePPh$_3$Br (1.28 kg, 3.6 mol) in THF (4.5 L) was added t-BuOK (404 g, 3.6 mol) at 15°C under N$_2$. The resulting mixture was stirred at 50°C for 30 min. Pregnenolone (950 g, 2.9 mol) was added in portions below 65°C. The reaction mixture was stirred at 50°C for 1 hour. The combined mixture was quenched with saturated NH$_4$Cl aqueous (1 L) at 15°C. THF layer was separated. The aqueous was extracted with EtOAc (2 x 2 L). The combined organic phase was concentrated under vacuum to give a solid. The solid was further purified by trituration with MeOH/H$_2$O (1:1, 15 L) at reflux to give B-1C (940 g, 99%) as a solid.

The organic phase was washed with brine (200 mL x 2) and dried over Na$_2$SO$_4$, and the solvent was evaporated to afford desired product (35 g, crude), which was used in the next step without further purification.

To a solution of MAD (0.42 mol, 3.0 eq) in toluene, freshly prepared by addition of a solution of Me$_3$Al (210 mL, 0.42 mmol, 2 M in hexane) to a stirred solution of 2,6-di-feri-butyl-4-methylphenol (185 g, 0.84 mol) in toluene (200 mL) followed by stirring for 1 h at room temperature, was added dropwise a solution of compound 5 (54 g, 0.14 mol, 1.0 eq) in toluene (200 mL) at -78 °C under nitrogen. Then the reaction mixture was stirred for 30 min, a solution of MeMgBr (140 mL, 0.42 mol, 3.0 eq, 3 M in ether) was added dropwise at -78 °C. The reaction mixture was warmed to -40 °C and stirred at this temperature for 3 h. TLC (PE: EA = 3:1) showed that the starting material was consumed completely. The mixture was poured into aqueous saturated NH$_4$Cl solution (100 mL) and extracted with EtOAc (300 mL x 2). The combined organic phases were dried over Na$_2$SO$_4$, and the solvent was evaporated to afford crude product. The crude product was purified on silica gel chromatography eluted with PE: EA = 10:1 to give the pure target (30 g, 53%) as powder.
