BILE ACID SALTS OF METALS WITH PHYSIOLOGICAL ACTION AND THE USE THEREOF IN THERAPY

The present invention relates to therapeutically interesting bile acid metal salts.

The invention also relates to pharmaceutical and veterinary compositions containing said salts.

5 A number of metal cations exist playing a physiological role: in addition to iron, which is a component of hemoglobin, varying amounts of zinc, copper, selenium, molybdenum, cobalt, manganese etc., known as oligoelements, are necessary for a correct
10 function of the enzyme and physiological systems. These elements are usually absorbed through the diet, but pathological or alimentary deficiency conditions exist in which a pharmacological supply or the dietary supplement through the administration of suitable salts
15 or complexes is desired.

The problem is particularly felt in the case of iron, the administration of which is often required for the treatment of iron-deficiency anemias. For this purpose, salts such as ferrous gluconate or sulfate or
20 complexes of iron with succinylated proteins are used at present.

Now it has been found that the above cited bile acid metal salts provide a high, gradual absorption of the metal cation which can selectively be carried into
25 the entero-hepatic circle.

The use of the bile acids as carriers for iron or for oligoelements turned out to be particularly advantageous and allowed to overcome some of the drawbacks affecting the compounds of the prior art.

2

Bile acids, in fact, acting as intestinal barrier permeation factors, provide a higher bioavailability also thanks to their recycle effect through the entero-hepatic circle, thereby assuring a gradual absorption kinetics. Moreover, particularly in the case of the iron salts, the typical side-effects of the oral administration of these compounds, such as constipation, gastroenteral intolerance, meteorism, epigastralgiias, are avoided.

The salts of the invention can be prepared according to conventional methods, reacting natural bile acids or the derivatives thereof with metal hydroxides, or by interchange reactions between suitable metal salts and bile acid alkali or alkaline-earth salts.

Examples of natural bile acids comprise cholic, deoxycholic, chenodeoxycholic, chenocholeic,ursocholic, ursodeoxycholic, hyodeoxycholic acids and the corresponding tauro- and glyco- conjugates.

The natural bile acids can optionally be derivatized introducing further salifiable acid groups, for example by reaction with anhydrides of di- or polycarboxylic acids, such as succinic, glutaric, cyclohexanedicarboxylic acids.

Some of said derivatives are known and can anyway be prepared according to conventional methods, such as those described in Italian Patent n. 1.163.090.

A different approach is the ketalization of the keto groups present in the bile acid molecule with tartaric acid, and of hyocholic acid with ketomalonic acid.

The presence of more salifiable groups per bile

acid molecule provides an increase in the metal cation/bile acid molar ratio, when this is desirable for therapeutical and application purposes.

5 Natural or semisynthetic bile acids can be salified according to the invention with metals selected from the group consisting of iron (II), iron (III), copper (I), copper (II), zinc, cobalt, molybdenum, platinum, gold, manganese, vanadium, selenium, tin, nickel.

10 Particularly preferred are ferrous or ferric salts, particularly the ferric ones, which can be used for the treatment of iron deficiencies in man and animals.

15 For the envisaged therapeutical uses or for further uses, the salts of the invention can be formulated in pharmaceutical compositions, according to conventional techniques and excipients such as those described in Remington's Pharmaceutical Sciences Handbook, Mack. Pub., N.Y., U.S.A.

20 Examples of said compositions comprise capsules, tablets, syrups or drinkable solutions, gastric and/or controlled release forms and the like. The daily dosage will depend of course on the type of cation: in the case of iron, the salts of the invention can be administered in doses varying from 100 mg to 3 g, one to four times daily.

25 The salts of the invention can moreover be present in the composition of dietetic or alimentary formulations for the human or veterinary use, optionally in combination with other components with a complementary or anyway useful activity.

3a

In one particular embodiment there is provided the ferric salt of bis-hemisuccinyl-ursodeoxycholic acid.

5 The following examples further illustrate the invention.

4

EXAMPLE 1

Preparation of bile acid iron (II) salts

PREPARATION

10 g of acid are dissolved in 7.5 volumes of water
 5 with the minimum amount of sodium hydroxide (= 10%, 20%
 for the emisuccinate), at pH 8.

When dissolution is complete, the mixture is added
 at 35°C, under stirring, with a FeCl₃ 6 H₂O aqueous
 solution previously prepared dissolving 2.42 g
 10 (stoichiometric + 10% excess to cholic or dehydrocholic
 acid), 2.53 g (stoichiometric + 10% excess to deoxy
 cheno and ursodeoxy acids), or 5.02 g (stoichiometric +
 10% excess to emisuccinate) of ferric salt slowly
 dissolved in 25 ml of water.

15 The mixture is stirred to complete precipitation,
 then the precipitate is washed until chlorides
 disappear. Yield: above 95%.

In the following, the characteristics of the
 obtained salts are reported.

20	<u>Salt</u>	<u>M.p.</u>	<u>Iron content</u>
	Ferric cholate	237-239° C	4.07-4.67
	ferric (3a, 7a, 12a trihydroxide 5β-cholanate)		
25	Ferric deoxycholate	218-219°C	4.24-4.84
	ferric (3a, 12a dihydroxy-5β- cholanate)		
	Ferric dehydrocholate	216-218°C	4.13-4.73
30	iron (3, 7, 12, 5β triketocholanate)		

		5	
	Ferric chenodeoxycholate	214-218°C	4.24-4.84
	ferric (3a, 7a- dihydroxy-5β- cholanate)		
5	Ferric ursodeoxycholic	200°C	4.24-4.84
	ferric (3a, 7a- dihydroxy-5-β- cholanate)		
	Ferric hyodeoxycholate	193°C	4.24-4.84
10	ferric (3a, 6a- dihydroxy-5-β		
	Disuccinyl ursodeoxy-	268-270°C	8.05-9.25
	cholate		
	(ferric bio-emisuccina-		
15	te 3a, 7a-dihydroxy-		
	5β- cholanate)		

EXAMPLE 2

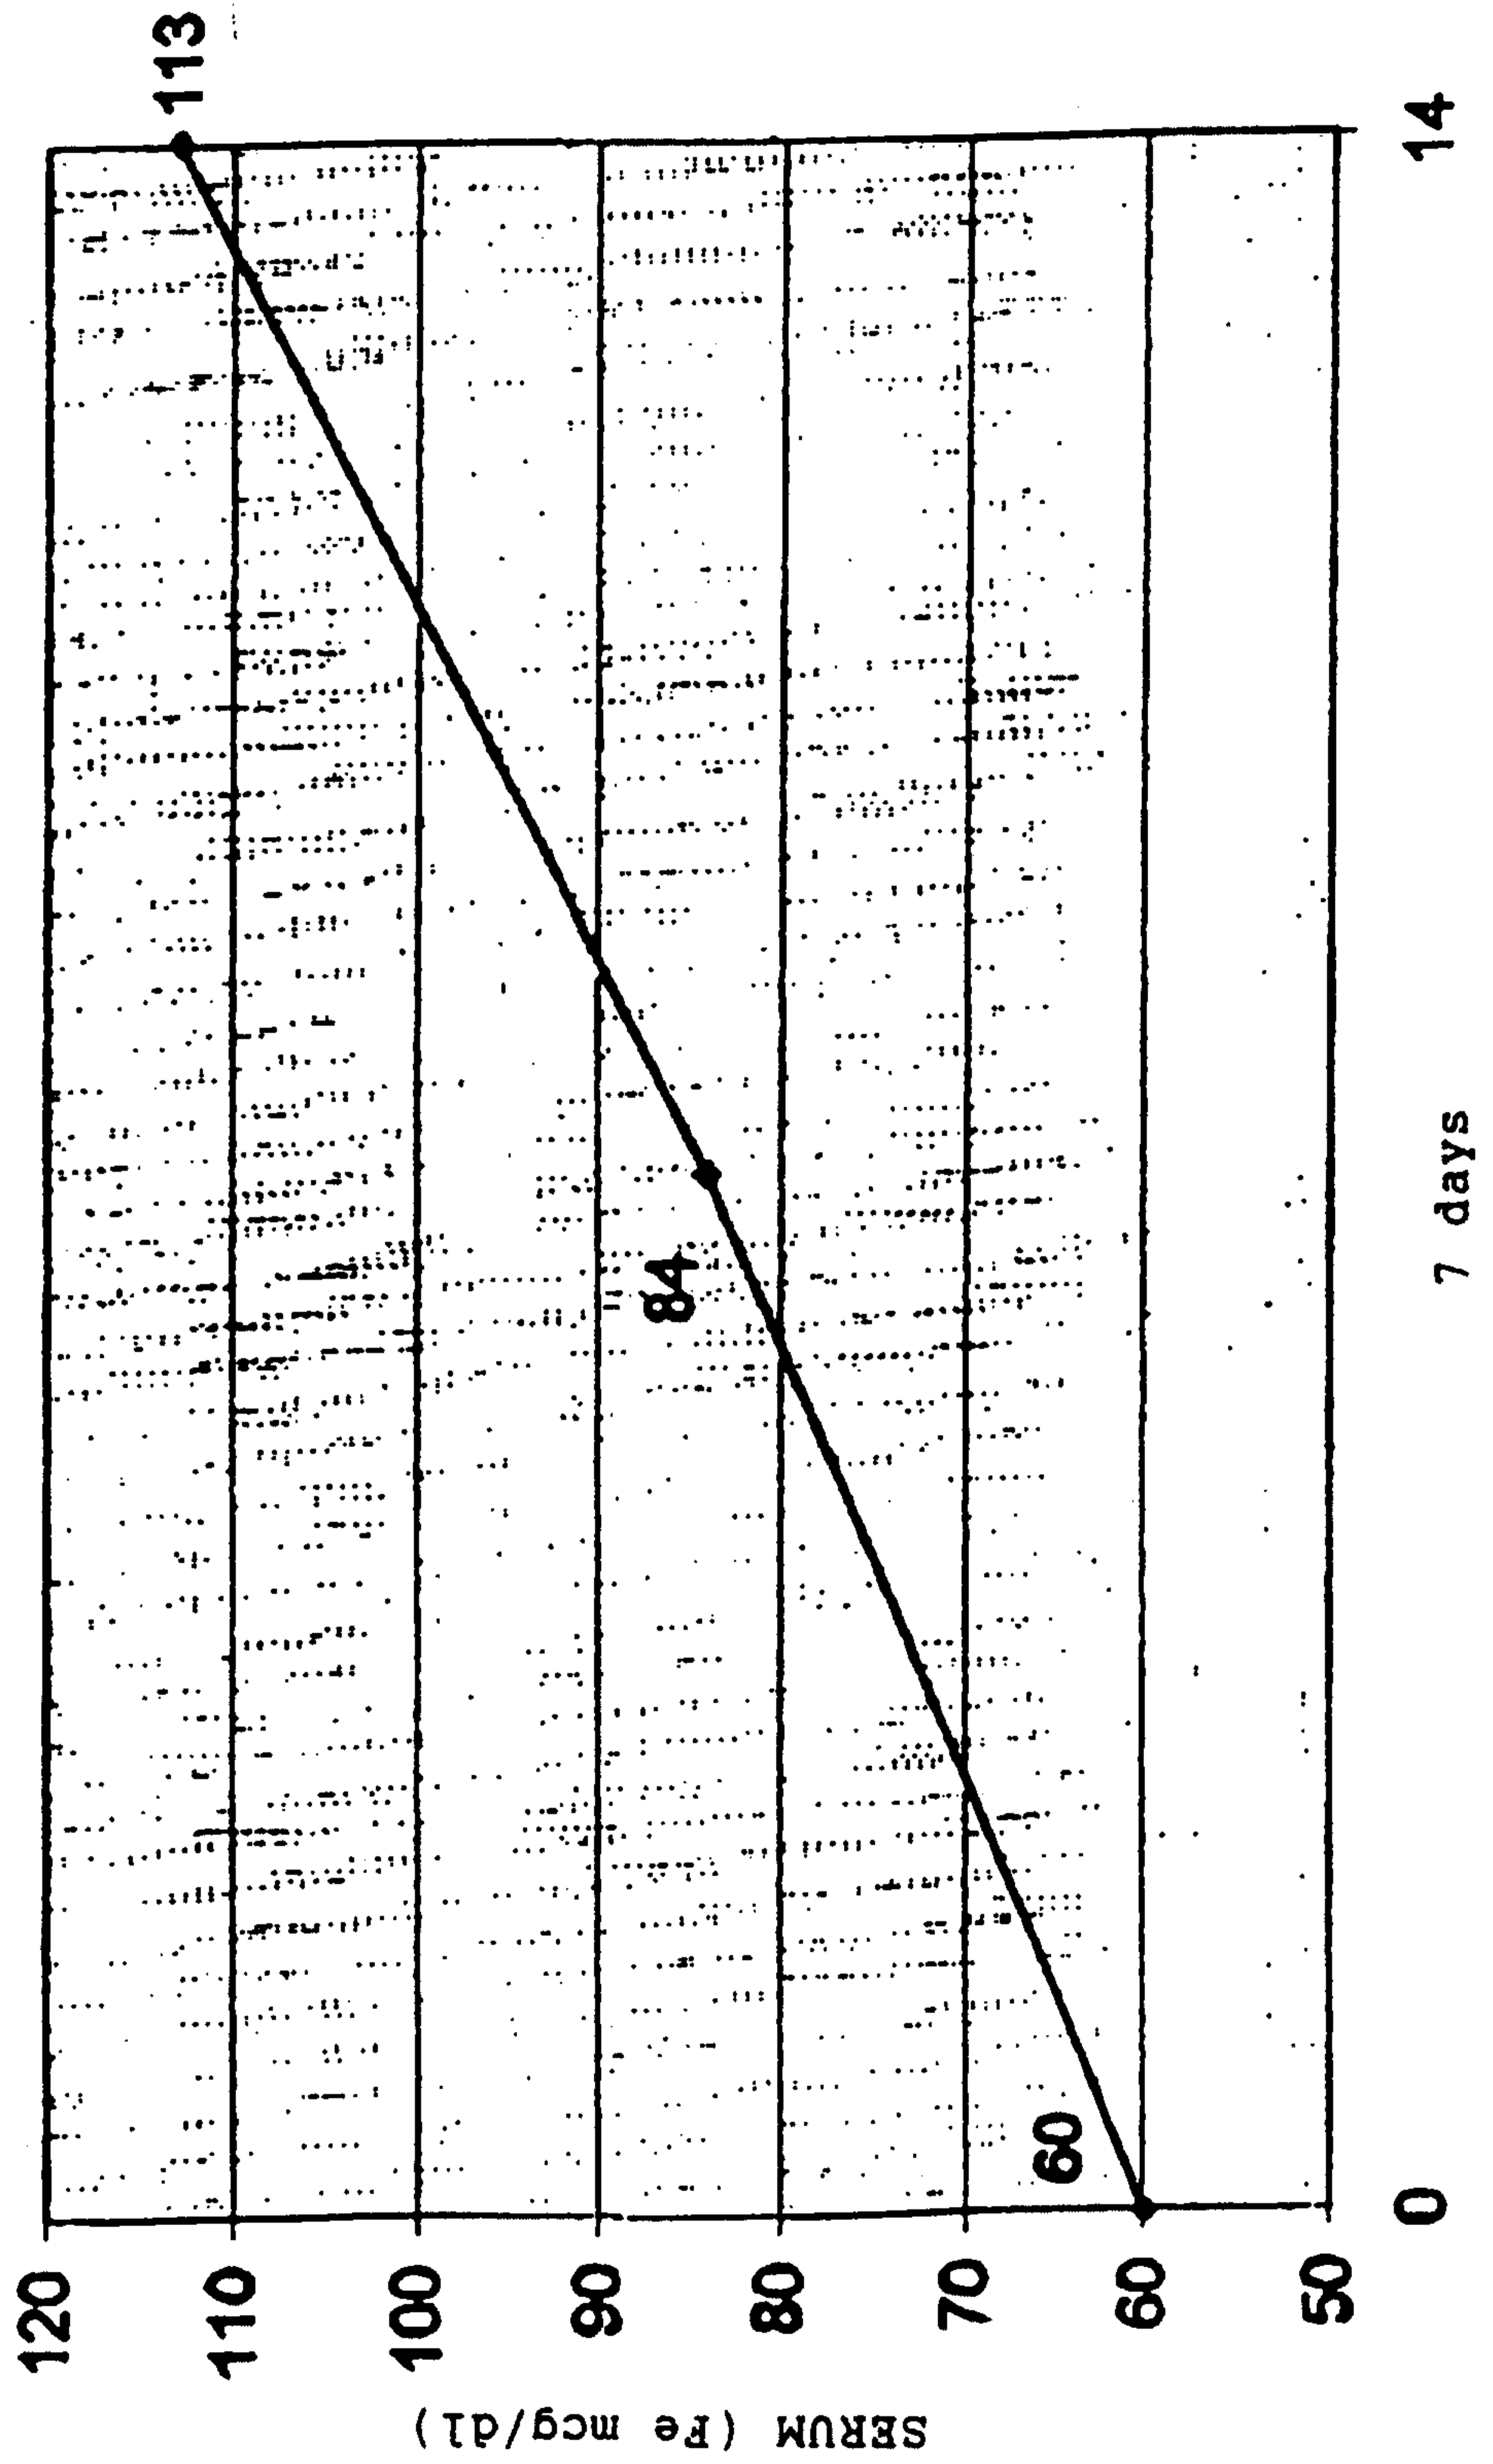

Fig. 1 and 2 show the results of serum Fe obtained after administration of 19.2 mg Fe/day in the form of ferric ursodeoxycholate to two Fe-deficient patients.

CLAIMS

1. The ferric salt of bis-hemisuccinyl-ursodeoxycholic acid.
5
2. A pharmaceutical or veterinary composition comprising an effective amount of the ferric salt of bis-hemisuccinyl-ursodeoxycholic acid in admixture with a pharmaceutically acceptable carrier or diluent.
10
3. A dietary supplement composition comprising the ferric salt of bis-hemisuccinyl-ursodeoxycholic acid in admixture with a carrier or excipient.
- 15 4. Use of an effective amount of the ferric salt of bis-hemisuccinyl-ursodeoxycholic acid to treat iron deficiency.
- 20 5. The use of claim 4 wherein the dose is from 100 mg to 3 grams one to four times daily.
- 25 6. Use of an effective amount of the ferric salt of bis-hemisuccinyl-ursodeoxycholic acid to deliver metal cations selectively into the entero-hepatic circle of a human or of an animal.
