UNITED STATES PATENT OFFICE.

LUISE FROMMANN, GERO MACHTANZ, OF FRANKFORT-ON-THE-MAIN, GERMANY.

HAIR AND CURL PIN.

1,372,285.

Specification of Letters Patent. Patented Mar. 22, 1921.

Application filed November 2, 1920. Serial No. 421,394.

To all whom it may concern:

Be it known that I, LUISE FROMMANN, geborn MACHTANZ, a subject of Germany, and residing at Schwarzwaldstrasse 29, Niederrad, Frankfort-on-the-Main, Germany, have invented certain new and useful Improvements in and Relating to Hair and Curl Pins, of which the following is a specification.

This invention relates to a hair and curl-pin, the object of the invention being to provide such a construction that the pin will completely be prevented from sliding out of the hair.

Various forms of construction of hair-pins have hitherto been proposed for attaining this object, but none of these previous forms of construction attained the same in the perfect manner attained according to the present invention.

The essence of the invention consists in that the two legs of the hair-pin are arranged cross-wise over one another and that the hair-pin has a spring action in its bent part, so that the two legs remain in the position they have once assumed. In order further to prevent the sliding of the hair-pin out of the hair, one of the legs may be split and the other be provided with undulations.

A mode of carrying the invention into effect is illustrated by way of example in the accompanying drawing, in which:—

Figures 1 and 2 show a hair pin constructed in accordance with my invention and having its legs crossed and provided with a cooperating split portion and undulations.

Figs. 3 and 4 are respectively an elevation and a plan view of the same, the legs of the pin in these views being shown uncrossed for the purpose of illustration.

The two legs 1 of the hair-pin are cross-wise superposed. In its bent part 2 the

hair-pin possesses spring action, whereby the legs are kept in their position.

The mode of using the new hair and curl-pin is as follows:—

The pin is pushed into the hair in the same manner as the known hair-pins and is turned around once, whereby it is attained that the portion of the hair that is to be secured in position first of all lies before the crossing of the legs 1 and after the turning of the pin comes to lie in the loop 3 formed by the crossing, thus completely insuring that the hair-pin shall not slip out by itself.

The pulling out of the hair-pin, however, is just as simple as in the ordinary forms of construction.

The legs 1 of the hair-pin may also be provided with any desired number of undulations 4 and the latter be displaced relatively to one another in different directions. Further, the legs 1 may be split so as to form a slit 5 and such split parts may also be formed with undulations as shown in the drawing.

Having now described my invention, what I claim as new and desire to secure by Letters Patent is:—

1. A hair-pin having legs superposed cross-wise and a bent portion between the legs which possesses spring action, the crossed portions of the legs being provided with undulations and one leg being split at the point of crossing.

2. A hair-pin of the kind defined by claim 1 in which the undulations of one leg are arranged at right angles to the axis of the split in the other leg.

In testimony whereof I have signed my name to this specification.

Frau LUISE FROMMANN, geb. MACHTANZ.
