2,354,402

COMBINED PENCIL AND FIRST-AID KIT

Max J. Petruccione and Alfred L. Petruccione,
New York, N. Y.

Application April 23, 1941, Serial No. 390,016

1 Claim. (Cl. 206—38)

The present invention relates to new and useful improvements in pencils and has for its primary object to provide a mechanical feed pencil having a plurality of compartments formed therein adapted for receiving various articles necessary for rendering first aid, such as bandages, antiseptic solutions, medicinal preparations and the like, the compartments being arranged as separate sections adapted for assembling as a unit to form the complete kit.

A still further object is to provide a device of this character of simple and practical construction, which is neat and attractive in appearance, relatively inexpensive to manufacture and otherwise well adapted for the purposes for which the same is intended.

Other objects and advantages reside in the details of construction as more fully hereinafter described and claimed, reference being had to the accompanying drawing forming part hereof, wherein like numerals refer to like parts throughout, and in which

Figure 1 is a side elevational view,

Figure 2 is a longitudinal sectional view taken substantially on a line 2—2 of Figure 1,

Figure 3 is an end elevational view,

Figure 4 is a transverse sectional view taken substantially on a line 4—4 of Figure 1, and

Figure 5 is a fragmentary longitudinal sectional view showing a modified form of connecting the compartment sections.

Referring now to the drawing in detail, and with particular reference to Figures 1 to 4 inclusive, the numeral 5 designates the barrel of the pencil generally which is composed of an upper section 6, a plurality of intermediate sections 7 and a lower section 8.

Each of the sections is of hollow construction closed at one end to form a chamber therein, the lower section 8 having its closed end tapering as shown at 9 and formed with an internal, upwardly extending tubular housing 10 which is closed at its upper end and communicates with a passage 11 in which the spiral feed member 12 of a mechanical pencil 13 is positioned, the mechanical feed pencil being of conventional construction and adapted for operation by a conical cap 14 positioned at the lower end of the section 8. The interior of the section 8 is adapted to contain a supply of lead 15.

The upper open end of the section 8 is internally threaded and adapted for threadedly receiving the externally threaded reduced lower end 16 of one of the intermediate sections 7. The intermediate section is closed at its bottom and adapted to contain bandages 17 and the upper open end of the lower intermediate section 7 is threadedly connected to the lower end of the upper intermediate section in a similar manner. The upper intermediate section 7 is adapted to contain tablets indicated at 18 or other medicinal preparations.

The upper section 6 is provided with a reduced extension 19 at its lower end, likewise threadedly engaged in the open end of the section 7, the inner end of the section 6 being closed and having a threaded neck 20 at its outer end adapted for threadedly receiving a cap 21. The section 6 is adapted to contain iodine or other antiseptic solution and projecting downwardly from the cap 21 is an applicator 22.

The cap 21 has an eraser 23 fitted therein and also serves to secure a clip 24 about the neck 20.

In the form of the invention illustrated in Figure 5 the external threads on the reduced lower end of the sections 25 are omitted, the extension having a snug telescopic fit in the open end of the adjacent section.

The several sections forming the kit may be constructed of any suitable material and the several compartments may be utilized for carrying any desired medical supplies.

It is believed the details of construction, advantages and manner of use of the device will be readily understood from the foregoing without further detailed explanation.

What we claim is:

A container comprising a barrel formed of a plurality of detachable hollow cylindrical sections, said sections including an end section having an externally threaded neck at its outer end, a cap threaded on said neck, and a clip having a ring at one end threaded on said neck under the cap.

ALFRED J. PETRUCCIONE.
