[57] **ABSTRACT**

A method for the prophylaxis or direct treatment of inflammation in a mammal which comprises administering an effective amount of alpha 1-antichymotrypsin, its salts or derivatives, and compositions thereof.

6 Claims, No Drawings

TREATMENT OF INFLAMMATION USING ALPHA 1-ANTICHYMOTRYPSIN

RELATED APPLICATION

This application is a continuation-in-part of application Ser. No. 445,005 filed Dec. 4, 1989, now U.S. Pat. No. 5,008,242 is a continuation-in-part of application of application Ser. No. 181,707 filed Apr. 14, 1989, now abandoned and application Ser. No. 242,735 filed Sep. 9, 1988, now abandoned, which are continuations-in-part of application Ser. No. 946,445 filed Dec. 24, 1986, now abandoned.

FIELD OF THE INVENTION

The present invention relates to a method and composition for treating mammals afflicted with a certain inflammatory disease. More particularly, the present invention relates to the direct or prophylaxis treatment of certain inflammatory conditions in mammals by administering alpha 1-antichymotrypsin α_1 -Ach, its salts or derivatives thereof. There is particularly provided compositions for treating the symptoms of rheumatoid arthritis and in treatment of optic and otic diseases.

BACKGROUND OF THE INVENTION

Inflammation leading to tissue damage is regulated by numerous phlogistic mediators. Since phagocytic leukocytes mast cells contain large numbers and amounts of proteases, they appear to be implicated both in the regulation of inflammation and in the damage incurred during inflammation. Essentially any connective tissue can be degraded by one or more proteases.

Human neutrophils utilize a variety of destructive enzymes during the process of phagocytosis. The major enzymes have been determined to be elastase, cathepsin G, myeloperoxidase and lysozyme.

Rheumatoid arthritis appears to be a disease in which elastase and cathepsin G play a major role in its development. It has now been found that controlling the amount of the destructive enzymes at the site of inflammation can prevent proliferation of the disease and to prevent further associated tissue damage. It has also been found that the administration of alpha 1-antichymotrypsin alone provides a major control of the symptoms of the disease. However, since the cause of disease may be a result of more than one factors, the use of more than one protease inhibitor provides a better chance of success for early remission of the symptoms and for a prophylactic control of the symptoms associated with the disease. Alpha 1-antichymotrypsin when administered with alpha 1-antitrypsin and/or C reactive protein (CRP) provides a reduction in swelling, pain and stiffness.

For chronic cases of rheumatoid arthritis, one form of treatment is that the joint is first flushed with a suitable pharmacological solution such as a saline solution, and then a cocktail of protease inhibitors is administered at the site of inflammation. However, it should be understood that the combination of protease inhibitors can be administered in a single composition or separate individual compositions. The alpha 1-antichymotrypsin being the fastest acting provides the quickest relief of some of the symptoms associated with the disease.

Alpha 1-antichymotrypsin is a naturally occurring protein. As disclosed by Meister P. Nathrath W, "Immunohistochemical Characterization of Histiocytic Tumors" *Design Histopathol*, 1981; 4:79-87, alpha 1-anti-

chymotrypsin is present within malignant macrophages and has been proposed as a useful immunohistochemical marker for cells of the monocyte/macrophage series.

Chandra et al in their paper entitled, "Sequence Homology Between Human Alpha 1-Antichymotrypsin, Alpha 1-Antitrypsin, and Antithrombin III", *Biochemistry*, Vol. 22, No. 22, Oct. 25, 1983, p. 5055-5061, which is incorporated herein by reference, discloses one method for the preparation of recombinant of alpha 1-antichymotrypsin for use in the invention.

Alpha 1-antichymotrypsin is a plasma protease inhibitor synthesized in the liver. It is a single glycopeptide chain of approximately 68,000 daltons and belongs to a class of serine protease inhibitors with an apparent affinity toward chymotrypsin-like enzymes. Alpha 1-antichymotrypsin is structurally related to alpha 1-antitrypsin.

Belgian Patent No. 830,629 (1975), which is herewith incorporated by reference, discloses and claims immunologically active compositions characterized by an immunologically effective agent incorporated in a negatively charged liposome. Some of the agents thus encapsulated include virus antigens, bacterial antigens, and the like.

U.S. Pat. No. 4,356,167 to L. A. Kelly, which is incorporated herein by reference, discloses liposome drug delivery systems which may be used in connection with the present invention.

U.S. Pat. No. 4,239,754 to Sache et al, which is incorporated herein by reference, discloses liposome compositions for oral administration.

SUMMARY OF THE INVENTION

The present invention relates to a method for treating inflammatory conditions in mammals including humans by the administration of alpha 1-antichymotrypsin or derivatives thereof alone or in combination with one or more other serine protease inhibitors in a suitable pharmaceutical composition.

Among the inflammatory conditions which may be treated with alpha 1-antichymotrypsin, there are included the inflammatory bone and joint diseases, inflammatory pulmonary and bowel diseases, burns, inflammatory skin diseases or dermatological conditions, optic and otic inflammations, diseases of the pancreas and kidneys, peritonitis, and the like.

The use of alpha 1-antichymotrypsin has been especially useful in the treatment of the various arthritic conditions including those which are induced by autoimmune disease, virus and bacterial infections. Rheumatoid arthritis can be effectively treated, with quick relief of its associated symptoms, with alpha 1-antichymotrypsin. The compositions have also been found to cause vasoconstriction which in inflammation decreases swelling and redness.

Among the other inflammatory conditions which may also be treated are optic and otic inflammatory conditions. Such conditions include those associated with conjunctival and corneal injuries including corneal abrasions, blepharitis, conjunctivitis, external otitis, inflammation of the tympanic membrane, and the like.

The use of alpha 1-antichymotrypsin has been especially useful in the treatment of the various inflammatory conditions of the eyes and ears including those which are induced by virus and bacterial infections and autoimmune diseases.

Alpha 1-antitrypsin has also been found useful in the treatment of topical inflammatory conditions because of its association with elastase. However, it is preferably used in combination with alpha 1-antichymotrypsin.

The drug of the invention may be prepared by cloning, by conventional techniques utilizing an oligonucleotide probe or antibody probe, and the like. Antisera against Cl-esterase inhibitor or alpha 1-antichymotrypsin may be used as the probe. An oligonucleotide probe or antibody probe against α 1-Ach is preferable. It has been found that the α 1-achymotrypsin is not cross-reactive with any other native proteins in human serum as examined by immunodiffusion assays. The recombinant gene product of the invention is especially useful since it is free of contaminating viruses when produced.

The activity of alpha 1-antichymotrypsin as an anti-inflammatory agent was determined by Enzyme Kinetic Analysis using association and competitive experiments. When run against Mast Cell Chymase, the subject drug was noted as being at least 30-90% active. When tested against Cathepsin-G, there was an association constant of 6×10^7 . In a competitive test against Mast Cell Chymase there was an association constant of 3×10^7 .

The salts and derivatives may be formed utilizing conventional techniques associated with other proteins without effecting the utility of the compound. There may be prepared the alkali metal salts, acid-addition salts, and esters similar to other proteins or peptides.

Some inflammation conditions are not immediately identifiable as to source and the factors which are involved to produce the different symptoms are not readily apparent. Therefore, it is desirable to administer in some case a combination or cocktail of serine protease inhibitors to provide a broad spectrum of drugs which can provide rapid relief of the different symptoms of inflammation. The most effective combination is alpha 1-antichymotrypsin and one or both of alpha 1-antitrypsin and C-reactive protein. Preferably, the combination is administered in a ratio of 1:1:1 to 3:2:1: either in a single unit or in separate dosage form.

When topically applied, alpha 1-antichymotrypsin in suitable composition form is useful in the treatment of burns and inflammatory skin diseases which include psoriasis, eczema, acne, and the like. It has been found that the compound will inhibit human skin mast cells chymase and cathepsin-G. Surprisingly, treatment with alpha 1-antichymotrypsin together with α 1-antitrypsin has reduced pain when applied to skin lesions.

The use of a non-aqueous lipid miscible carrier, for example, such as prepared with liposomes are particularly advantageous since they provided improved activity at the treatment sites.

It is therefore an object of the invention to provide an anti-inflammatory composition which can relieve the swelling and redness associated with inflammatory conditions.

It is a further object of the invention to provide an anti-inflammatory composition which is well tolerated by the human body and is free of side effects.

It is a yet still further object of the invention to provide a method and a composition for treating inflammatory conditions. It is another object of the invention to provide a direct or prophylaxis treatment of optic and otic inflammatory conditions.

DETAILED DESCRIPTION OF THE PRESENT INVENTION

The objects of the present invention can be achieved by the administration of purified alpha 1-antichymotrypsin alone or in combination with other serine protease inhibitors in suitable pharmaceutical form to patients suffering from inflammatory conditions.

The compositions of the invention include those in a form adapted for oral, topical or parenteral use and may be used for the treatment of the inflammation in mammals including humans.

The present invention provides a pharmaceutical composition which comprises the compound of this invention and a pharmaceutically acceptable carrier. The compound may be used alone or in combination with other serine protease inhibitors to provide a broad spectrum of treatment. Preferably, alpha 1-antitrypsin is utilized in the combination.

The above-described compounds may be effectively utilized when applied topically to the eye in a concentration of from about 0.05% to 5% by weight daily until the symptoms disappear. The compounds may be incorporated into various types of ophthalmic formulations according to known techniques. Ophthalmic solutions and suspensions are the preferred dosage forms. Typically such dosage forms are adjusted to isotonicity with sodium chloride. Thickening agents such as carboxymethylcellulose, or carbopol may also be employed to enhance delivery. The pH of such dosage forms is typically adjusted to be within the range of 6.0 to 8.0 with HCl or NaOH.

Unit dose compositions comprising a compound of this invention adapted for oral administration form a further suitable composition aspect of this invention. Orally administrable composition are of use as synergistically effective blood levels can be expected at high doses and at lower doses such compositions may be used to treat inflammations in the uveal tract.

Suitably the weight of the compound of this invention in a unit dosage form of this invention for oral administered will be from 50 to 500 mg and more suitably from 50 to 250 mg.

In general, the total quantity of anti-inflammatory agent present in a composition of this invention for oral administered will not be greater than 1500 mg and will usually be between 100 and 1000 mg.

Normally between 500 and 3000 mg of the compositions of the invention will be administered each day of treatment (to an average 70 kg adult). Similar amounts may be administered to prevent the occurrence of the condition.

In the treatment of chronic cases of inflammatory of the uveal tract and posterior uveitis, such as in the case of anterior or posterior uveitis, the patient is typically administered intravenously 15 to 90 mg of alpha 1-antichymotrypsin compound per kilogram of body weight weekly at a rate of 2 mg per kilogram per minute together with eye drops.

It has been particularly advantageous to administer the alpha 1-antichymotrypsin compound in liposomes. When the drug is administered by intravenous injection in liposome form there is a more rapid intake infusion. Such compositions may contain conventional pharmaceutically acceptable materials such as diluents, binders, preservatives, disintegrant and the like in accordance with conventional pharmaceutical practice in the man-

ner well understood by those skilled in the art of formulating antibiotics.

Injectable or infusible compositions of a compound of the invention are particularly suitable as high blood levels of the compound can occur after administration by injection or infusion. Thus, one preferred composition aspect of this invention comprises a compound of the invention in sterile form.

The injectable solution of the compound of this invention may be made up in a sterile pyrogen-free liquid such as water, aqueous ethanol, albumin or the like.

An alternative approach to administering the compounds of this invention is to utilize an injectable suspension. Such suspensions may be made up in sterile water; sterile saline or the like and may also contain suspending agents such as polyvinylpyrrolidone, lecithin or the like (for example in the manner described in Belgian Patent No. 839109). Alternatively, such compositions may be prepared in an acceptable oily suspending agent such as arachis oil or its equivalent.

Unit dose compositions comprising a compound of this invention adapted for oral administration form a further suitable composition aspect of this invention. Orally administrable compositions are of use as synergistically effective blood levels can be expected at high doses and at lower doses. Such compositions may be used to treat inflammations localized in the gastro-intestinal tract.

It has been particularly advantageous to administer the drug in combination in liposomes. When the drug is administered by intravenous injection in liposome form there is a more rapid intake of the drug in the liver and spleen as well as the skeletal muscle. This rapid intake is particularly useful in connection with liver inflammations and for treatment at the site of the arthritis.

The drug in liposomes can be administered orally in order to transgress the gastric barrier and prevent disintegration in the stomach. The liposome form also provides a delay effect so as to provide prolonged activity.

Any non-toxic physiologically acceptable metabolizable lipid capable of forming liposomes may be used for carrying out the invention. The liposomes may be prepared as disclosed by W. R. Hargreaves and D. W. Deamer, "Conference on Liposomes and Their Uses in Biology and Medicine", Sep. 14-16, 1977, N.Y. Academy of Sciences, which is herein incorporated by reference.

The following examples further illustrate the practice of this invention, but are not intended to be limiting thereof. It will be appreciated that the selection of actual amounts of specific alpha 1-antichymotrypsin or other serine protease inhibitors to be administered to any individual patient (human or animal) will fall within the discretion of the attending physician and will be prescribed in a manner commensurate with the appropriate dosages will depend on the patient's age, weight, sex, stage of disease and like factors uniquely within the purview of the attending physician. The compositions can be administered via the G.I. tract, parenternally, e.g., by i.v. infusion, and by injection depending on the condition to be treated.

EXAMPLE I

Following the procedure of U.S. Pat. No. 4,239,754, a lipid phase made up of the three components lecithin, cholesterol and dicetyl-phosphate in a molar ratio of 7:2:1 is prepared with 2.6 g of lecithin, 0.04.4 g of cholesterol and 0.31 g dicetylphosphate by dissolving in 50

ml of chloroform and the solution evaporated, 4.0 g of alpha 1-antichymotrypsin is dissolved in 50 ml of an acid buffer (citric acid) pH7.5-8.0 and added to the phospholipids. The mixture is then subjected to sonification for 10 seconds.

In place of cholesterol, any sterol capable of forming liposomes may be utilized, such as, desmosterol, estradiol, B-sitosterol, and the like.

The composition is effective for treating systemic disorders.

EXAMPLE II

Pills are prepared as follows:

Alpha 1-antichymotrypsin	216 mg
Phospholipon 100	400 mg
aerosil	50 mg
Na-carboxymethylcellulose	16 mg
Cuttina H	12 mg
microcrystalline cellulose	150 mg

The substances listed above are mixed and the items so pressed are coated in a manner known per se with 20 mg of hydroxypropylmethylcellulosephthalate in a coating drum.

EXAMPLE III

Capsules are prepared as follows:

Alpha 1-antitrypsin	54 mg
Alpha 1-antichymotrypsin	54 mg
Phospholipon 80	200 mg
talcum	3 mg
magnesiumstearate	3 mg
microcrystalline cellulose	100 mg
aerosil	25 mg

The substances listed above are granulated and filled into capsules (500 mg hard-gelatin capsules).

In place of alpha 1-antichymotrypsin there may be used any one of its water-soluble salts thereof.

An equal amount of C reactive protein may be added to form a ratio of 1:1:1 of the active ingredients.

EXAMPLE IV

An ophthalmic and otic solution of a boric acid-sodium borate solution is prepared and neutralized to a pH of between 6 and 8 with sodium hydroxide. Alpha 1-antichymotrypsin is added to make a 0.5% solution.

The solution can be used in the treatment of conjunctivitis and "swimmer's ear".

If desired other serine protease inhibitors may be added, for example, alpha 1-antitrypsin to provide a broad spectrum of treatment.

EXAMPLE V

A topical cream was prepared as follows:

A. The following mixture was prepared:

Active principal	1.0 g
Olive oil	5.0 g
Cetanol	2.0 g
Stearic acid	5.0 g
Glycerin aliphatic acid ester	12.0 g
Tween 60	5.0 g

B. The following mixture was also prepared:

Propylene glycol	5.0 g
Methyl paraben	0.1 g
Propyl paraben	0.02
Purified water	to 100 g

in total

The mixture of parts A and B were blended together by conventional means to give a total of 100 g. of 100% by weight topical cream which could be utilized for treatment of acne, eczema, psoriasis, or other inflammatory dermatological conditions.

EXAMPLE VI

An olegenuous anhyrous ointment was prepared with the following composition:

Composition	%
Active principal	1.0
Soy phosphatide	4.0
Plastibase 50W	94.975
Buylated hydroxytoluene	0.025
	100.00

If desired, in lieu of alpha 1-antichymotrypsin as the active principal, there may utilized the combination of alpha 1-antichymotrypsin and alpha 1-antitrypsin. Other non-aqueous lipid miscible carriers may also be utilized.

EXAMPLE VII

1000 mg of PROLASTIN, a composition comprising about 70% α1-antitrypsin and about 10-18% α1-antichymotrypsin was dissolved in 40 ml of saline solution.

A patient suffering from atropic dermatitis with swelling and open lesions of the hand was treated by immersing the hand in the solution. Pain disappeared within 6-10 minutes of treatment. The redness and swelling disappeared after 1 hour. Twenty four hours after the treatment the lesions were healing without treatment with any other drugs.

I claim:

1. A method for the treatment of inflammation in a patient in which mast cells and neutrophils are implicated which comprises administering an effective amount of alpha 1-antichymotrypsin, its salts or derivatives to control elastase and cathepsin G at the site of the inflammation.

2. The method of claim 1 wherein said alpha 1-antichymotrypsin is recombinant.

3. A method for treating the symptoms of inflammation in rheumatoid arthritis in a patient resulting from excess elastase and cathepsin G which comprises administering an effective amount of alpha 1-antichymotrypsin, the derivatives or salts thereof to said patient at the site of the inflammation to control said elastase and cathepsin G.

4. The method of claim 3 wherein the alpha 1-antichymotrypsin is administered by injection or infusion.

5. The method of claim 3 wherein said alpha 1-antichymotrypsin is recombinant.

6. A method of the treatment of inflammation in a patient in which elastase and Cathepsin G are implicated which comprises administering an effective amount of alpha 1-antichymotrypsin, its salts or derivatives to control elastase and Cathepsin G at the site of the inflammation.
