(54) Title: GRAPHICAL DISPLAY FOR AN ENERGY MANAGEMENT DEVICE

(57) Abstract

A graphics based display for use with an electronic circuit protection device is taught. Briefly stated, a utility-type electric meter or an electronic circuit protection device has incorporated therewith an LCD display which allows for the graphical display of information. Upon system start-up or key activation, a menu appears which allows for user selection of the information or parameters to be sampled and displayed.

GRAPHICAL DISPLAY FOR AN ENERGY MANAGEMENT DEVICE**FIELD OF THE INVENTION**

5 This invention relates, generally, to graphical displays and more particularly to a graphical display for use in conjunction with utility-type electric meters or electronic circuit protection devices having integral metering functions in order to display power consumption
10 factors, in graphical format.

BACKGROUND OF THE INVENTION

 It is becoming increasingly important that the
15 consumption of electrical power by a load be monitored. The reason for such importance relates to cost of operation, maintenance and keeping equipment on-line for purposes such as production, environmental controls and the like. As such, equipment manufacturers are now
20 routinely supplying or incorporating electronic circuit protection devices thereby forming circuit breaker electronic trip units. These electronic circuit protection devices typically incorporate or have the ability to sample waveforms representative of current,
25 voltage, power factor, harmonics, kilowatt hours, var-hours, va-hours, instantaneous power, phase balance/imbalance, phase loading in relation to historical numbers as well as a percentage of maximum level. Moreover, these values can be stored in order to
30 form an historical database which may also include fault data, etc.

 Unfortunately, such information is generally only available in alpha-numeric displays which are viewed at
35 the power meter or electronic trip unit. Any other form of display may only be accomplished by down loading the

relevant data to another computer either directly or in a network configuration.

Accordingly, it is difficult for an operator to quickly evaluate system performance. It is for this reason that electronic automotive dash boards typically use display graphics information in an analog gauge type format rather than an alphanumeric display. It is known and appreciated that it is quicker and easier to gauge values, performance and the like in a graphics format.

Accordingly, it is an object of the present invention to produce a display for use with energy measurement equipment which will provide information in a graphical rather than alphanumeric format.

It is yet another object of the present invention to produce a display which does not require a central computer for subsequent processing and display.

It is still another object of the present invention to produce a display which may scroll through a variety of values and functions automatically or manually.

Still a further object of the present invention is to produce graphically displayed data which allows the user to select which information or information set will be displayed automatically as well as the order in which it is displayed.

Finally, it is another object of the present invention to produce a graphical display for an AC load control device, comprising a device for monitoring AC electrical load usage of a load and a graphical display device connected to the device for monitoring AC electrical load usage adapted so as to graphically

20365-3682 .

3

display at least one parameter of said AC electrical load usage of the load.

In accordance with the present invention, there is provided a graphical display for an AC load control device, comprising: a circuit protective device for interrupting electrical power to a load; a device for monitoring AC electrical load usage of the load including a first means for controlling said circuit protective device and a second means for producing a plurality of signals representative of at least one of the current, voltage and power related characteristics of the load; and a graphical display device connected to said device for monitoring AC electrical load usage, said graphical display device adapted so as to graphically display a plurality of parameters of the AC electrical load usage of the load in waveform and histogram formats simultaneously, said graphical display device including (1) a metering means connected to said second means for receiving and processing said plurality of signals into a plurality of graphical data signals, for storing the plurality of graphical data signals and for producing graphics related output image signals for display in graphical form, said metering means comprising: an Analog to Digital converter having a sufficient number of bits to receive and process said plurality of signals into a plurality of high resolution graphical data signals; and a microprocessor connected to said Analog to Digital converter for processing the plurality of graphical data signals into the graphics related output image signals, and (2) a display means connected to said metering means and adapted to receive said graphics related output image signals for producing graphic images of the processed signals in

20365-3682 .

3a

waveform and histogram formats which are simultaneously viewable by a user.

In accordance with the present invention, there is further provided a modular display device for an AC load control monitoring device, comprising: a panel; a graphical display device integral to the panel including a connector adapted to be coupled to the AC load control device, comprising: (a) a circuit protective device for interrupting electrical power to a load; (b) a device for monitoring AC electrical load usage of the load including a first means for controlling said circuit protective device and a second means for producing a plurality of signals representative of at least one of the current, voltage and power related characteristics of the load; and (c) a graphical display device connected to said device for monitoring AC electrical load usage, said graphical display device adapted so as to graphically display a plurality of parameters of the AC electrical load usage of the load in waveform and histogram formats simultaneously, said graphical display device including (1) a metering means connected to said second means for receiving and processing said plurality of signals into a plurality of graphical data signals, for storing the plurality of graphical data signals and for producing graphics related output image signals for display in graphical form, said metering means comprising: (i) an Analog to Digital converter having a sufficient number of bits to receive and process said plurality of signals into a plurality of high resolution graphical data signals; and (ii) a microprocessor connected to said Analog to Digital converter for processing the plurality of graphical data signals into the graphics related output image signals, and (2) display means connected to said metering means and adapted to receive said graphics related

20365-3682 .

3b

output image signals for producing graphic images of the processed signals in waveform and histogram formats which are simultaneously viewable by a user; a keypad integral to the panel including a connector adapted to be coupled to the
5 AC load control monitoring device to specify information to be displayed on the graphical display device; and a communications interface integral to the panel including a connector adapted to be coupled to the AC load control monitoring device.

10 In accordance with the present invention, there is further provided a graphical display system having a menu for user selection of power related information for an AC load control device, comprising: a device for monitoring AC electrical load usage of a load; a graphical display device
15 connected to said device for monitoring AC electrical load usage, said graphical display device adapted so as to graphically display indicia and at least one parameter of the AC electrical load usage of the load said parameters being displayed as a waveform; menu means for displaying a
20 plurality of selections on said graphical display device, each of said plurality of selections representing at least one parameter of the AC electrical load usage; and menu selection means for selecting at least one of said plurality of selections so as to cause said graphical display device
25 to graphically present the waveform representing said at least one parameter of the AC electrical load usage associated with said selections.

In accordance with the present invention, there is further provided a graphical display system having a menu
30 for user selection of power related information for an AC load control device, comprising: a device for monitoring AC electrical load usage of a load; a graphical display device connected to said device for monitoring AC electrical load

20365-3682 .

3c

usage, said graphical display device adapted so as to graphically display indicia and at least one parameter of the AC electrical load usage of the load said parameters being displayed as a waveform; menu means for displaying a plurality of selections on said graphical display device, each of said plurality of selections representing at least one parameter of the AC electrical load usage; menu selections means for selecting at least one of said plurality of selections so as to cause said graphical display device to graphically present the waveform representing said at least one parameter of the AC electrical load usage associated with said selections; and a circuit protective device for interrupting electrical power to the load responsive to said at least one parameter of the AC electrical load usage.

In accordance with the present invention, there is further provided a graphical display system having a menu for user selection of power related information for an AC load control device, comprising: a circuit protective device for interrupting electrical power to a load; means for monitoring AC electrical load usage of a load comprising a first means for controlling said circuit protective device and a second means for producing a plurality of signals representative of at least one of the current, voltage and power related characteristics of the load; menu means for displaying a plurality of indicia on a graphical display device, each of said plurality of indicia representing at least one parameter of the AC electrical load usage; menu selection means for selecting at least one of said plurality of indicia so as to cause the graphical display device to graphically present said at least one parameter of the AC electrical load usage associated with said indicia; and a graphical display device connected to said means for

20365-3682 .

3d

monitoring AC electrical load usage and adapted so as to graphically display at least one parameter of the AC electrical load usage of the load as a waveform, said graphical display device comprising a metering means
5 connected to said second means for receiving and processing and storing said plurality of signals and for producing graphics related output image signals, and a display means connected to said metering means and adapted to receive said graphics related output image signal for producing graphic
10 images which are viewable by the user.

In accordance with the present invention, there is further provided a method for graphically displaying a menu for selection and viewing of the load related parameters of a load connected to an AC load control device, comprising
15 the steps of: A. monitoring the load related parameters of the load connected to the AC load control device; B. displaying on a graphical display device a menu of a plurality of indicia representing the monitored load related parameters; C. scrolling through each indicia on said menu;
20 and D. selecting an item from said menu thereby causing the load related parameters relating to the said indicia to appear on said graphical display device as a waveform.

In accordance with the present invention, there is further provided a method for graphically displaying a menu
25 for selection and viewing of the load related parameters of a load connected to an AC load control device, comprising the steps of: A. monitoring the load related parameters of the load connected to the AC load control device; B. displaying on a graphical display device a menu of a
30 plurality of indicia representing the monitored load related parameters; C. scrolling through each indicia on said menu; and D. selecting an item from said menu thereby causing the load related parameters relating to the said indicia to

20365-3682

3e

appear on said graphical display device in waveform and histogram forms simultaneously.

DETAILED DESCRIPTION OF THE FIGURES

Reference may be now had to the accompanying
5 figures, in which:

Fig. 1 is a front view of the display and keypad input as well as the graphical display of the present invention;

Figs. 2a, 2b, 2c, 2d are representative of graphs shown on the display of the present invention; and

10 Fig. 3 is an overview of a circuit breaker display interconnect scheme of the preferred embodiment of the present invention.

Figs. 4A and 4B show a block diagram of the device of Fig. 3.

15 DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Referring now to Figure 1 there is shown the front panel 10 of the present invention indicating exemplary information or indicia. As can be seen, the front panel 10 has disposed thereon a liquid crystal diode (LCD) display
20 12, a key-pad input area 14, status indicators 16, 18, 20, 22, and 24 indicating system status, alarm tripping, system check, protective metering, and communications check respectively. Also evident is a communication port 26 as well as a test connector 28.

20365-3682

3f

Shown on LCD display 12 are phase A display area 13, phase B display area 15, phase C display area 17 and phase N display area 19. It is to be understood that although in the preferred embodiment of the present
5 invention the front panel 10 has numerous functions in a particular order, different indicators or layout may be

utilized without departing from the spirit and scope of the present invention. In this regard, although LCD Display 12 shows four separate display areas 13, 15, 17 and 19, the number of display areas may be increased or
5 decreased as appropriate as well as the use or elimination of numerical indicia thereunder.

In the preferred embodiment of the present invention, LCD Display 12 is at least a 128 by 128 pixel
10 display although other sizes may be utilized as well as the use of color and the like. Further, the LCD display 12 could be electrofluorescent or any other type of suitable display without departing from the spirit and scope of the present invention.

15

It is to be understood that the front panel 10 of the present invention and hence the graphic display taught by the preferred embodiment of the present invention cooperates with an electronic trip unit
20 typically utilized with and part of a circuit breaker. Such trip units, frequently referred to as metering trip units, are readily known and available to one skilled in the art and utilize current transformers and electronic circuitry to measure and if necessary calculate a
25 multitude of parameters relating to power being consumed by the load to which they are attached. Accordingly, a more detailed description will not be given. However, it is to be remembered that the present invention may be utilized with any device which monitors or controls power
30 or a load such as, for example, a utility-type electric meter.

As described more fully below, keypad input 14 is utilized to program and/or command the information to be
35 presented by LCD Display 12. Moreover, communication port 26, which in the preferred embodiment of the present invention presents an RS-232 protocol scheme, may be

utilized to perform bi-directional communications to accomplish this and other functions as described below. However, it is to be understood that other types of ports may be utilized without departing from the spirit and
5 scope of the present inventions.

Similarly, while test connector 28 is utilized to perform interrogation and testing of panel 10 as well as the breaker (not shown) to which it is attached, the
10 connector may be eliminated or modified as appropriate without departing from the spirit and scope of the present invention.

Referring now to Figure 3 it can be seen how the
15 display of the present invention is interconnected with the metering and protective boards of the present invention. As is readily known and available to one skilled in the art, a protective board such as 30, which may be functionally part of a metering trip unit, is used
20 to cooperate directly with a circuit breaker, protective relay and the like (not shown). In the preferred embodiment of the present invention protective board 30 cooperates with a circuit breaker (not shown) and performs housekeeping and monitoring functions such as
25 tripping of the breaker, measuring load values and the like. Further, in the preferred embodiment of the present invention a typical circuit breaker is an 'SB' type circuit breaker manufactured and produced by Siemens Energy & Automation of Atlanta, Georgia although other
30 manufacturers equipment could and may be utilized without departing from the spirit and scope of the present invention.

The metering board 32 which is interconnected
35 through wire interconnects 34, 36 with protective board 30 is utilized to process, accumulate and otherwise monitor the power being consumed by the load (not shown),

for eventual display by LCD display 12. As can be seen, the metering board 32 has interconnected therewith a plurality of components necessary to operate the control panel 10 and hence the display 12 of the present invention. Accordingly, Jack M-J1 at designated numeral 38 functions as the communication port jack which is ultimately connected to communication port 26 as shown in Figure 1. Jack M-J4 which is designated numeral 40 cooperates with and is connected to test connector 28 as also shown in Figure 1. Similarly, terminal M-J2, designated numeral 42 functions as a keypad input jack and cooperates with the keypad 14 as shown in Figure 1 while Jack M-J3, designated numeral 44 cooperates directly with the actual LCD Display 12 as shown in Figure 1.

A typical protective board for the mentioned 'SB' circuit breaker utilizes a microprocessor such as, for example, a 68HC11 which has an integral 8 bit A to D converter and which is suitable for the monitoring, housekeeping and protective functions previously mentioned. However, it has been found that when trying to display information in graphical form, the resolution offered by an 8 bit A to D converter is somewhat lacking. Accordingly, in the preferred embodiment of the present invention, the metering board 32 has an external 12 bit A to D converter which thereafter is interconnected with preferably a 68HC16 microprocessor which is a 16 bit microprocessor.

30

Therefore, with the use of an external 12 bit A to D converter and a 16 bit microprocessor (not shown) the information presented by graphic LCD display 12 may be sufficiently detailed so as to provide accurate, smooth and useful graphics based graphical and alphanumeric information on display 12.

35

Reference may be now had to Figures 2a, 2b, 2c and 2d which indicate exemplary graphical information which may be displayed by LCD Display 12. Accordingly such types of information may include but are not limited to harmonics amongst any of the conductors, phase balance between the three phases, voltage on any of the three phases as well as current among the three phases and of course the neutral conductor parameters may also be viewed.

10

Operation and implementation of LCD Display 12 is relatively simple and will now be described. Although, other types of keypads such as, for example, alphanumeric may be utilized, in the preferred embodiment of the present invention a simple six button keypad input such as 14 having Up, Down, Left, Right, Escape and Enter keys is sufficient. In this regard, keypad input 14 cooperates with the mentioned 68HC16 microprocessor (not shown) contained on metering board 32 and functions in conjunction with software so as to provide a menu style operation for LCD display 12.

Although the LCD display 12 is capable of operating in a "pure" graphics mode thereby allowing access to each individual pixel, in the preferred embodiment of the present invention, rather than having a microprocessor update each pixel during a write command thereby creating a "clunky" or "jagged" screen update, a separate RAM is used. By using a RAM in conjunction with a microprocessor and hence as a buffer area for the LCD display, individual bit manipulations are allowed and done in RAM rather than individual LCD pixel manipulations at the display. This has the advantage of allowing the RAM to be periodically "dumped" to the LCD in a block and thereby making the screen update appear much more smooth. This is found to be much more desirable and convenient from the users standpoint when

the user "toggles" between menus or information on the display.

By use of the term "graphical" display in the present invention, it is specifically meant to mean and include graphics as is presently used and understood in the industry, that is the ability to display information in an 'analog' fashion, and not merely the use of a 'graphics' display capable of only showing alphanumeric characters.

Further, although software is utilized to interact with protective board 30, metering board 32 and hence display 12, it is to be understood that the writing of such software is within the purview of one skilled in the art and therefore a description of the actual code is not included herein. Moreover, the actual code would of course change depending upon the microprocessors and other hardware elements utilized.

As previously recited, the types of information and the format in which it is displayed is selectable by menus which may be created, maintained or prestored. Menus, in the preferred embodiment of the present invention also include housekeeping items such as contrast adjustment for the LCD display. This is accomplished simply by having the appropriate menu appear on the screen and using the Up or Down keys to adjust the contrast. It has been found that adjustable contrast is a necessary and important feature due to the great variety of lighting environments in which equipment of the present invention is installed.

Upon system start-up, in the preferred embodiment of the present invention, a Sign-On screen will display housekeeping items such as the version number of the software, copyright notices, logos and the like.

Thereafter, when any key is pressed the highest level menu choices available will be displayed. These choices are from a category standpoint, Protective, Metering, Communications and logs. The Protective menu has
5 selections for the long time, instantaneous, short-time and ground fault settings. The Metering menu has selections for metered data, alarms, protective relays, and demand period. The Communications menu has
10 selections for EIA-485 settings as well as EIA-232 settings. The log menu has selections for the min-max metering log, the trip log, as well as clearing the min-max log and clearing the trip log.

Further, the metering/metered data menu has
15 selections for the meter screen and graphs while the metering/alarms menu has selections for all the metering alarm settings. Similarly, the metering/protective relay menu has selections for all the metering protective relay settings.

20

The metering/metered data/meter screen will display all the metered data on a single screen in text form while the metering/metered data/graphs menu will have
25 selections to display graphs for items such as total harmonics, phase current loading and balance, phase A, B and C voltage waveforms and phase A, B and C current waveforms (see e.g. Figures 2A-2D).

The log/trip log screen displays the most recent
30 trip event as well as at least two trip events prior to the most recent event also recalled. Additionally, the log/min-max metering log displays a menu of all metered values. Therefore, when a value is selected, LCD Display
12 will produce a screen showing the values min-max with
35 time stamps adjacent thereto. By pressing the up or down keys as appropriate sequential values will be displayed on the screen.

Accordingly, a number of menu items may therefore be produced and simply by pressing the Enter key certain groups contained in the menu may be selected as well as use of the appropriate directional keys to toggle through the various menus displayed. Therefore, other than during start-up as described above, the arrow keys will highlight the category/graph/menu which may be selected. Thereafter, by pressing the Enter key, a particular menu selection will show the sub-menu items or display of an actual graph or data. In this regard, in the preferred embodiment of the present invention, the menu outline is provided in a heirarchichal format as shown below, although this may be changed as required.

Further, by utilization of port 26, communications may be accomplished directly so that information indicating fault readings and the like may be downloaded while the menus available to the user may be modified as appropriate.

Accordingly, the present invention produces a
electronic circuit protection device having an integral
graphical function which provides readily accessible and
useful graphical information along with a convenient
5 mechanism to view or alter that which is seen.

It is to be understood that many variations from the
present invention may be practiced without departing from
the spirit and scope of the present invention. Such
10 variations may include, for example, a different set of
microprocessors, memory devices and the like or the way
in which the display is interconnected with a circuit
protection device. Further, a cursor arrangement
available on the screen may be utilized or a touch
15 operated screen may be utilized. Additionally, screens
having higher or lower resolution may be utilized as well
as larger or smaller screens without departing from the
spirit and scope of the present invention. Further, the
menu choices may be expanded or minimized to reflect user
20 requirements.

Accordingly, the present invention is not to be
limited by the specification but rather by the claims
appended hereto.

13

CLAIMS:

1. A graphical display for an AC load control device, comprising:

a circuit protective device for interrupting
5 electrical power to a load;

a device for monitoring AC electrical load usage of the load including a first means for controlling said circuit protective device and a second means for producing a plurality of signals representative of at least one of the
10 current, voltage and power related characteristics of the load; and

a graphical display device connected to said device for monitoring AC electrical load usage, said graphical display device adapted so as to graphically
15 display a plurality of parameters of the AC electrical load usage of the load in waveform and histogram formats simultaneously, said graphical display device including

(1) a metering means connected to said second means for receiving and processing said plurality of signals
20 into a plurality of graphical data signals, for storing the plurality of graphical data signals and for producing graphics related output image signals for display in graphical form, said metering means comprising:

an Analog to Digital converter having a sufficient
25 number of bits to receive and process said plurality of signals into a plurality of high resolution graphical data signals; and

a microprocessor connected to said Analog to Digital converter for processing the plurality of graphical

20365-3682 .

14

data signals into the graphics related output image signals,
and

(2) a display means connected to said metering means and adapted to receive said graphics related output
5 image signals for producing graphic images of the processed signals in waveform and histogram formats which are simultaneously viewable by a user.

2. A device according to claim 1, wherein said circuit protective device is a circuit breaker.

10 3. A device according to claim 1, wherein said display means comprises a liquid crystal device display.

4. A device according to claim 3, wherein said liquid crystal device display is at least 128 pixels square.

5. A device according to claim 1, further comprising
15 a Random Access Memory (RAM) device connected to said microprocessor for storing the plurality of high resolution graphical data signals.

6. A device according to claim 1, wherein said display means comprises an Electrofluorescent display.

20 7. A device according to claim 1, wherein said display means is comprised of an Electrofluorescent display.

8. A device according to claim 1, wherein the display means simultaneously produces graphic images of the
processed signals representing (1) voltage and (2) current
25 by waveforms, and (3) harmonics and (4) phase balance in histogram format.

9. A modular display device for an AC load control monitoring device, comprising:

20365-3682 .

15

a panel;

a graphical display device integral to the panel including a connector adapted to be coupled to the AC load control device, comprising:

5 (a) a circuit protective device for interrupting electrical power to a load;

(b) a device for monitoring AC electrical load usage of the load including a first means for controlling said circuit protective device and a second means for
10 producing a plurality of signals representative of at least one of the current, voltage and power related characteristics of the load; and

(c) a graphical display device connected to said device for monitoring AC electrical load usage, said
15 graphical display device adapted so as to graphically display a plurality of parameters of the AC electrical load usage of the load in waveform and histogram formats simultaneously, said graphical display device including

(1) a metering means connected to said second
20 means for receiving and processing said plurality of signals into a plurality of graphical data signals, for storing the plurality of graphical data signals and for producing graphics related output image signals for display in graphical form, said metering means comprising:

25 (i) an Analog to Digital converter having a sufficient number of bits to receive and process said plurality of signals into a plurality of high resolution graphical data signals; and

(ii) a microprocessor connected to said Analog to
30 Digital converter for processing the plurality of graphical

20365-3682 .

16

data signals into the graphics related output image signals,
and

(2) display means connected to said metering means and adapted to receive said graphics related output
5 image signals for producing graphic images of the processed signals in waveform and histogram formats which are simultaneously viewable by a user;

a keypad integral to the panel including a connector adapted to be coupled to the AC load control
10 monitoring device to specify information to be displayed on the graphical display device; and

a communications interface integral to the panel including a connector adapted to be coupled to the AC load control monitoring device.

15 10. A graphical display system having a menu for user selection of power related information for an AC load control device, comprising:

a device for monitoring AC electrical load usage of a load;

20 a graphical display device connected to said device for monitoring AC electrical load usage, said graphical display device adapted so as to graphically display indicia and at least one parameter of the AC electrical load usage of the load said parameters being
25 displayed as a waveform;

menu means for displaying a plurality of selections on said graphical display device, each of said plurality of selections representing at least one parameter of the AC electrical load usage; and

20365-3682 .

17

menu selection means for selecting at least one of said plurality of selections so as to cause said graphical display device to graphically present the waveform representing said at least one parameter of the AC electrical load usage associated with said selections.

11. A graphical display system according to claim 10 wherein said menu means displays said plurality of indicia on said graphical display device in a hierarchical format.

12. A graphical display system according to claim 10 wherein said menu selection means comprises a user selectable keypad input for scrolling through said plurality of indicia displayed by said menu means onto said graphical display device, thereby enabling a user to select and view the said at least one parameter of the A/C electrical load usage of a load.

13. A graphical display system according to claim 12 wherein said user selectable keypad input comprises a touch input keypad.

14. A graphical display system according to claim 13 wherein said user selectable keypad input comprises a touch input device overlaid onto said graphical display device.

15. A graphical display system having a menu for user selection of power related information for an AC load control device, comprising:

25 a device for monitoring AC electrical load usage of a load;

a graphical display device connected to said device for monitoring AC electrical load usage, said graphical display device adapted so as to graphically display indicia and at least one parameter of the AC

18

electrical load usage of the load said parameters being displayed as a waveform;

menu means for displaying a plurality of selections on said graphical display device, each of said plurality of selections representing at least one parameter of the AC electrical load usage;

menu selections means for selecting at least one of said plurality of selections so as to cause said graphical display device to graphically present the waveform representing said at least one parameter of the AC electrical load usage associated with said selections; and

a circuit protective device for interrupting electrical power to the load responsive to said at least one parameter of the AC electrical load usage.

15 16. A graphical display system according to claim 15 wherein said circuit protective device is a circuit breaker.

17. A graphical display system according to claim 10 wherein said display means comprises an LCD display.

18. A graphical display system according to claim 8
20 wherein said LCD display is at least 128 pixels square.

19. A graphical display system according to claim 10 wherein said display means comprises an Electrofluorescent display.

20. A graphical display system having a menu for user
25 selection of power related information for an AC load control device, comprising:

a circuit protective device for interrupting electrical power to a load;

20365-3682 .

19

means for monitoring AC electrical load usage of a load comprising a first means for controlling said circuit protective device and a second means for producing a plurality of signals representative of at least one of the current, voltage and power related characteristics of the load;

menu means for displaying a plurality of indicia on a graphical display device, each of said plurality of indicia representing at least one parameter of the AC electrical load usage;

menu selection means for selecting at least one of said plurality of indicia so as to cause the graphical display device to graphically present said at least one parameter of the AC electrical load usage associated with said indicia; and

a graphical display device connected to said means for monitoring AC electrical load usage and adapted so as to graphically display at least one parameter of the AC electrical load usage of the load as a waveform, said graphical display device comprising a metering means connected to said second means for receiving and processing and storing said plurality of signals and for producing graphics related output image signals, and a display means connected to said metering means and adapted to receive said graphics related output image signal for producing graphic images which are viewable by the user.

21. A graphical display system according to claim 10 wherein said display means comprises an LCD display.

22. A graphical display system according to claim 21 wherein said LCD display is at least 128 pixels square.

20365-3682 .

20

23. A graphical display system according to claim 20 wherein said display means comprises an Electrofluorescent display.

24. A method for graphically displaying a menu for
5 selection and viewing of the load related parameters of a load connected to an AC load control device, comprising the steps of:

A. monitoring the load related parameters of the load connected to the AC load control device;

10 B. displaying on a graphical display device a menu of a plurality of indicia representing the monitored load related parameters;

C. scrolling through each indicia on said menu;
and

15 D. selecting an item from said menu thereby causing the load related parameters relating to the said indicia to appear on said graphical display device as a waveform.

25. A graphical display system according to claim 10
20 wherein the graphical display device simultaneously produces multiple corresponding waveforms representing the same parameter for a plurality of different indicia of the AC electrical load usage.

26. A graphical display system according to claim 20
25 wherein the graphical display device simultaneously produces multiple corresponding waveforms representing the same parameter for a plurality of different indicia of the AC electrical load usage.

20365-3682 .

21

27. A graphical display system according to claim 10 wherein the graphical display device simultaneously produces graphic images of the processed signals representing (1) voltage and (2) current by waveforms, and (3) harmonics and
5 (4) phase balance in a histogram format.

28. A graphical display system according to claim 20 wherein the graphical display device simultaneously produces graphic images of the processed signals representing (1) voltage and (2) current by waveforms, and (3) harmonics and
10 (4) phase balance in a histogram format.

29. A method for graphically displaying a menu for selection and viewing of the load related parameters of a load connected to an AC load control device, comprising the steps of:

15 A. monitoring the load related parameters of the load connected to the AC load control device;

B. displaying on a graphical display device a menu of a plurality of indicia representing the monitored load related parameters;

20 C. scrolling through each indicia on said menu;
and

D. selecting an item from said menu thereby causing the load related parameters relating to the said indicia to appear on said graphical display device in
25 waveform and histogram forms simultaneously.
