PHOSPHATE-SUBSTITUTED QUINOLIZINE DERIVATIVES USEFUL AS HIV INTEGRASE INHIBITORS

FIELD OF THE INVENTION

The present invention relates to Phosphate-Substituted Quinolizine Derivatives, compositions comprising at least one Phosphate-Substituted Quinolizine Derivative, and methods of using the Phosphate-Substituted Quinolizine Derivatives for treating or preventing HIV infection in a subject.

BACKGROUND OF THE INVENTION

A retrovirus designated human immunodeficiency virus (HIV), particularly the strains known as HIV type-1 (HIV-1) virus and type-2 (HIV-2) virus, is the etiological agent of the complex disease that includes progressive destruction of the immune system (acquired immune deficiency syndrome; AIDS) and degeneration of the central and peripheral nervous system. A common feature of retrovirus replication is the insertion by virally-encoded integrase of proviral DNA into the host cell genome, a required step in HIV replication in human T-lymphoid and monocytoid cells. Integration is believed to be mediated by integrase in three steps: assembly of a stable nucleoprotein complex with viral DNA sequences; cleavage of two nucleotides from the 3' termini of the linear proviral DNA and covalent joining of the recessed 3' OH termini of the proviral DNA at a staggered cut made at the host target site. The fourth step in the process, repair synthesis of the resultant gap, may be accomplished by cellular enzymes.

Nucleotide sequencing of HIV shows the presence of a pol gene in one open reading frame [Ratner, L. et al., Nature, 313, 277(1985)]. Amino acid sequence homology provides evidence that the pol sequence encodes reverse transcriptase, integrase and an HIV protease [Tohours, H. et al., EMBO J. 4, 1267 (1985); Power, M.D. et al., Science, 231, 1567 (1986); Pearl, L.H. et al., Nature, 329, 351 (1987)]. All three enzymes have been shown to be essential for the replication of HIV.

It is known that some antiviral compounds which act as inhibitors of HIV replication are effective agents in the treatment of AIDS and similar diseases, including reverse transcriptase inhibitors such as azidothymidine (AZT) and efavirenz and protease inhibitors such as indinavir and nelfinavir. The compounds of this invention are inhibitors of HIV integrase and inhibitors of HIV replication.

In another embodiment, a heteroaryl group comprises a 5- to 6-membered monocyclic heteroaryl group fused to a benzene ring. Unless otherwise indicated, a heteroaryl group is unsubstituted.

The term "heterocycloalkyl," as used herein, refers to a non-aromatic saturated monocyclic or multicyclic ring system comprising 3 to about 11 ring atoms, wherein from 1 to 4 of the ring atoms are independently O, S, N or Si, and the remainder of the ring atoms are carbon atoms. A heterocycloalkyl group can be joined via a ring carbon, ring silicon atom or ring nitrogen atom. In one embodiment, a heterocycloalkyl group is monocyclic and has from about 3 to about 7 ring atoms. In another embodiment, a heterocycloalkyl group is monocyclic and has from about 5 to about 8 ring atoms. In one embodiment, a heterocycloalkyl group is monocyclic. In another embodiment, a heterocycloalkyl group is bicyclic. There are no adjacent oxygen and/or sulfur atoms present in the ring system. Any -NH group in a heterocycloalkyl
ring may exist protected such as, for example, as an -N(BOC), -N(Cbz), -N(Tos) group and the like; such protected heterocycloalkyl groups are considered part of this invention. The term "heterocycloalkyl" also encompasses a heterocycloalkyl group, as defined above, which is fused to an aryl (e.g., benzene) or heteroaryl ring. A heterocycloalkyl group can be optionally substituted by one or more "ring system substituents" which may be the same or different, and are as defined herein below. ![Heterocycloalkyl Group Example](image)

In one embodiment, a heterocycloalkyl group is a 5-membered monocyclic heterocycloalkyl. In another embodiment, a heterocycloalkyl group is a 6-membered monocyclic heterocycloalkyl. The term "heterocycloalkenyl," as used herein, refers to an heterocycloalkyl group, as defined above, which is non-aromatic and contains at least one endocyclic double bond between two adjacent ring atoms. A heterocycloalkenyl group can be joined via a ring carbon, ring silicon atom or ring nitrogen atom. In still another embodiment, a heterocycloalkenyl group is monocyclic and has 5 or 6 ring atoms.

In one embodiment, a heterocycloalkenyl group is monocyclic. In another embodiment, a heterocycloalkenyl group is bicyclic. There are no adjacent oxygen and/or sulfur atoms present
in the ring system. Any -NH group in a heterocycloalkenyl ring may be substituted or may exist protected such as, for example, as an -N(BOC), -N(Cbz), -N(Tos) group and the like; such protected heterocycloalkenyl groups are considered part of this invention. The term "heterocycloalkenyl" also encompasses a heterocycloalkenyl group, as defined above, which is fused to an aryl (e.g., benzene) or heteroaryl ring. A heterocycloalkenyl group can be optionally substituted by one or more "ring system substituents" which may be the same or different, and are as defined herein below. The nitrogen or sulfur atom of the heterocycloalkenyl can be optionally oxidized to the corresponding N-oxide, S-oxide or S,S-dioxide.

A ring carbon atom of a heterocycloalkenyl group may be functionalized as a carbonyl group. An illustrative example of such a heterocycloalkenyl group is:

In one embodiment, a heterocycloalkenyl group is a 5-membered monocyclic heterocycloalkenyl. In another embodiment, a heterocycloalkenyl group is a 6-membered monocyclic heterocycloalkenyl. The term "8 to 11-membered bicyclic heterocycloalkenyl" refers to a bicyclic heterocycloalkenyl group having from 8 to 11 ring atoms. Unless otherwise indicated, a heterocycloalkenyl group is unsubstituted.

"Ring system substituent" may also mean a single moiety which simultaneously replaces two available hydrogens on two adjacent carbon atoms (one H on each carbon) on a ring system. Examples of such moiety are methylenedioxy, ethylenedioxy, -C(CH₃)₂ and the like which form moieties such as, for example:

![Methylenedioxy example](image)

The term "substituted" means that one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency under the existing circumstances is not exceeded, and that the substitution results in a stable compound. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds. By "stable compound" or "stable structure" is meant a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

The term "in substantially purified form," as used herein, refers to the physical state of a compound after the compound is isolated from a synthetic process (e.g., from a reaction mixture), a natural source, or a combination thereof. The term "in substantially purified form," also refers to the physical state of a compound after the compound is obtained from a purification process or processes described herein or well-known to the skilled artisan (e.g., chromatography, recrystallization and the like), in sufficient purity to be characterizable by standard analytical techniques described herein or well-known to the skilled artisan.

It should also be noted that any carbon as well as heteroatom with unsatisfied valences in the text, schemes, examples and tables herein is assumed to have the sufficient number of hydrogen atom(s) to satisfy the valences.

When a functional group in a compound is termed "protected", this means that the group is in modified form to preclude undesired side reactions at the protected site when the compound is subjected to a reaction. Suitable protecting groups will be recognized by those with ordinary skill in the art as well as by reference to standard textbooks such as, for example, T. W. Greene et al, *Protective Groups in Organic Synthesis* (1991), Wiley, New York.
When any substituent or variable (e.g., m, Ci-C₆ alkyl, R⁷, R¹¹, etc.) occurs more than one time in any constituent or in Formula (I), its definition on each occurrence is independent of its definition at every other occurrence, unless otherwise indicated.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results from combination of the specified ingredients in the specified amounts.

Prodrugs and solvates of the compounds of the invention are also contemplated herein. A discussion of prodrugs is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems (1987) 1-4 of the A.C.S. Symposium Series, and in Bioreversible Carriers in Drug Design, (1987) Edward B. Roche, ed., American Pharmaceutical Association and Pergamon Press. The term "prodrug" means a compound (e.g., a drug precursor) that is transformed in vivo to provide a Phosphate-Substituted Quinolizine Derivative or a pharmaceutically acceptable salt of the compound. The transformation may occur by various mechanisms (e.g., by metabolic or chemical processes), such as, for example, through hydrolysis in blood. For example, if a Phosphate-Substituted Quinolizine Derivative or a pharmaceutically acceptable salt, hydrate or solvate of the compound contains a carboxylic acid functional group, a prodrug can comprise an ester formed by the replacement of the hydrogen atom of the acid group with a group such as, for example, (Ci-C₈)alkyl, (C₂-C₆)alkanoyloxyethyl, 1-(alkanoyloxy)ethyl having from 4 to 9 carbon atoms, 1-methyl-1-(alkanoyloxy)-ethyl having from 5 to 10 carbon atoms, alkoxycarbonyloxyethyl having from 3 to 6 carbon atoms, 1-(alkoxycarbonyloxy)ethyl having from 4 to 7 carbon atoms, 1-methyl-1-(alkoxycarbonyloxy)ethyl having from 5 to 8 carbon atoms, N-(alkoxycarbonyl)aminomethyl having from 3 to 9 carbon atoms, 1-(N-(alkoxycarbonyl)amino)ethyl having from 4 to 10 carbon atoms, 3-phthalidyl, 4-crotonolactonyl, gamma-butyrolacton-4-yl, di-N,N-(Ci-C₆)alkylamino(C₂-C₆)alkyl (such as β-dimethylaminomethyl), carbamoyl-(Ci-C₂)alkyl, N,N-di (Ci-C₂)alkylcarbamoyl-(Ci-C₂)alkyl and piperidino-, pyrrolidino- or morpholino(C₂-C₃)alkyl, and the like.

Similarly, if a Phosphate-Substituted Quinolizine Derivative contains an alcohol functional group, a prodrug can be formed by the replacement of one or more of the hydrogen atoms of the alcohol groups with a group such as, for example, (Ci-C₆)alkanoyloxyethyl, 1-((Ci-C₆)alkanoyloxy)ethyl, 1-methyl-1-((Ci-C₆)alkanoyloxy)ethyl, (Ci-C₂)alkoxycarbonyloxyethyl, N-(Ci-C₆)alkoxycarbonylaminomethyl, succinyl, (Ci-C₆)alkanoyl, a-amino(Ci-C₄)alkyl, a-amino(Ci-C₄)alkylene-aryl, arylacyl and a-aminoacyl, or a-aminoacyl-a-aminoacyl, where each a-aminoacyl group is independently selected from the
naturally occurring L-amino acids, or glycosyl (the radical resulting from the removal of a hydroxyl group of the hemiacetal form of a carbohydrate).

If a Phosphate-Substituted Quinolizine Derivative incorporates an amine functional group, a prodrug can be formed by the replacement of a hydrogen atom in the amine group with a group such as, for example, R-carbonyl-, RO-carbonyl-, NRR'-carbonyl- wherein R and R' are each independently (Ci-Cio)alkyl, (C3-C7)cycloalkyl, benzyl, a natural a-aminoacyl, -C(OH)(C(0)OY)1 wherein Y1 is H, (Ci-C6)alkyl or benzyl, -C(OY2)Y3 wherein Y2 is (C1-C4)alkyl and Y3 is (Ci-C6)alkyl; carboxy (Ci-C6)alkyl; amino(Ci-C4)alkyl or mono-N- or di-N,N-(C1-C6)alkylaminoalkyl; -C(Y4)Y5 wherein Y4 is H or methyl and Y5 is mono-N- or di-N,N-(C1-C6)alkylamino morpholino; piperidin-l-yl or pyrrolidin-l-yl, and the like.

Pharmacologically acceptable esters of the present compounds include the following groups: (1) carboxylic acid esters obtained by esterification of the hydroxy group of a hydroxyl compound, in which the non-carbonyl moiety of the carboxylic acid portion of the ester grouping is selected from straight or branched chain alkyl (e.g., methyl, ethyl, n-propyl, isopropyl, t-butyl, sec-butyl or n-butyl), alkoxyalkyl (e.g., methoxymethyl), aralkyl (e.g., benzyl), aryloxyalkyl (for example, phenoxyethyl), aryl (e.g., phenyl optionally substituted with, for example, halogen, C14alkyl, -O-(C14alkyl) or amino); (2) sulfonate esters, such as alkyl- or aralkyl sulfoneryl for example, methanesulfonyl); (3) amino acid esters, including those corresponding to both natural and non-natural amino acids (e.g., L-valyl or L-isoleucyl); (4) phosphonate esters and (5) mono-, di- or triphosphate esters. The phosphate esters may be further esterified by, for example, a C12 20 alcohol or reactive derivative thereof, or by a 2,3-di(C6-24)acyl glycerol.

One or more compounds of the invention may exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like, and it is intended that the invention embrace both solvated and unsolvated forms. "Solvate" means a physical association of a compound of this invention with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolatable solvates. Non-limiting examples of solvates include ethanolates, methanolates, and the like. A "hydrate" is a solvate wherein the solvent molecule is water.

One or more compounds of the invention may optionally be converted to a solvate. Preparation of solvates is generally known. Thus, for example, M. Caira et al, J.
Pharmaceutical Sci., 93(3), 601-611 (2004) describe the preparation of the solvates of the antifungal fluconazole in ethyl acetate as well as from water. Similar preparations of solvates, hemisolvates, hydrates and the like are described by E. C. van Tonder et al, AAPS PharmSciTech, 5(1), article 12 (2004); and A. L. Bingham et al, Chem. Commun., 603-604 (2001). A typical, non-limiting, process involves dissolving the inventive compound in desired amounts of the desired solvent (organic or water or mixtures thereof) at a higher than room temperature, and cooling the solution at a rate sufficient to form crystals which are then isolated by standard methods. Analytical techniques such as, for example IR spectroscopy, show the presence of the solvent (or water) in the crystals as a solvate (or hydrate).

The Phosphate-Substituted Quinolizine Derivatives can form salts which are also within the scope of this invention. Reference to a Phosphate-Substituted Quinolizine Derivative herein is understood to include reference to salts thereof, unless otherwise indicated. The term "salt(s)", as employed herein, denotes acidic salts formed with inorganic and/or organic acids, as well as basic salts formed with inorganic and/or organic bases. In addition, when a Phosphate-Substituted Quinolizine Derivative contains both a basic moiety, such as, but not limited to a pyridine or imidazole, and an acidic moiety, such as, but not limited to a carboxylic acid, zwitterions ("inner salts") may be formed and are included within the term "salt(s)" as used herein. In one embodiment, the salt is a pharmaceutically acceptable (i.e., non-toxic, physiologically acceptable) salt. In another embodiment, the salt is other than a pharmaceutically acceptable salt. Salts of the Compounds of Formula (I) may be formed, for example, by reacting a Phosphate-Substituted Quinolizine Derivative with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salt precipitates or in an aqueous medium followed by lyophilization.

Exemplary acid addition salts include acetates, ascorbates, benzoates, benzenesulfonates, bisulfates, borates, butyrates, citrates, camphorates, camphorsulfonates, fumarates, hydrochlorides, hydrobromides, hydroiodides, lactates, maleates, methanesulfonates, naphthalenesulfonates, nitrates, oxalates, phosphates, propionates, salicylates, succinates, sulfates, tartarates, thiocyanates, toluenesulfonates (also known as tosylates) and the like. Additionally, acids which are generally considered suitable for the formation of pharmaceutically useful salts from basic pharmaceutical compounds are discussed, for example, by P. Stahl et al, Camille G. (eds.) Handbook of Pharmaceutical Salts. Properties, Selection and Use. (2002) Zurich: Wiley-VCH; S. Berge et al, Journal of Pharmaceutical Sciences (1977) 66(1) 1-19; P. Gould, International J. of Pharmaceutics (1986) 33 201-217; Anderson et al, The Practice of Medicinal Chemistry (1996), Academic Press, New York; and in The Orange Book.
(Food & Drug Administration, Washington, D.C. on their website). These disclosures are incorporated herein by reference thereto.

Exemplary basic salts include ammonium salts, alkali metal salts such as sodium, lithium, and potassium salts, alkaline earth metal salts such as calcium and magnesium salts, salts with organic bases (for example, organic amines) such as dicyclohexylamine, t-butyl amine, choline, and salts with amino acids such as arginine, lysine and the like. Basic nitrogen-containing groups may be quaternized with agents such as lower alkyl halides (e.g., methyl, ethyl, and butyl chlorides, bromides and iodides), dialkyl sulfates (e.g., dimethyl, diethyl, and dibutyl sulfates), long chain halides (e.g., decyl, lauryl, and stearyl chlorides, bromides and iodides), arylalkyl halides (e.g., benzyl and phenethyl bromides), and others.

All such acid salts and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods well-known to those skilled in the art, such as, for example, by chromatography and/or fractional crystallization. Enantiomers can be separated by converting the enantiomeric mixture into a diastereomeric mixture by reaction with an appropriate optically active compound (e.g., chiral auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the diastereomers and converting (e.g., hydrolyzing) the individual diastereomers to the corresponding pure enantiomers. Stereochemically pure compounds may also be prepared by using chiral starting materials or by employing salt resolution techniques. Also, some of the Phosphate-Substituted Quinolizine Derivatives may be atropisomers (e.g., substituted biaryl)s and are considered as part of this invention. Enantiomers can also be directly separated using chiral chromatographic techniques.

It is also possible that the Phosphate-Substituted Quinolizine Derivatives may exist in different tautomeric forms, and all such forms are embraced within the scope of the invention. For example, all keto-enol and imine-enamine forms of the compounds are included in the invention.

All stereoisomers (for example, geometric isomers, optical isomers and the like) of the present compounds (including those of the salts, solvates, hydrates, esters and prodrugs of the compounds as well as the salts, solvates and esters of the prodrugs), such as those which may exist due to asymmetric carbons on various substituents, including enantiomeric forms (which may exist even in the absence of asymmetric carbons), rotameric forms, atropisomers, and diastereomeric forms, are contemplated within the scope of this invention. If a Phosphate-
Substituted Quinolizine Derivative incorporates a double bond or a fused ring, both the cis- and trans-forms, as well as mixtures, are embraced within the scope of the invention.

Individual stereoisomers of the compounds of the invention may, for example, be substantially free of other isomers, or may be admixed, for example, as racemates or with all other, or other selected, stereoisomers. The chiral centers of the present invention can have the S or R configuration as defined by the IUPAC 1974 Recommendations. The use of the terms "salt", "solvate", "ester", "prodrug" and the like, is intended to apply equally to the salt, solvate, ester and prodrug of enantiomers, stereoisomers, rotamers, tautomers, racemates or prodrugs of the inventive compounds.

In the Compounds of Formula (I), the atoms may exhibit their natural isotopic abundances, or one or more of the atoms may be artificially enriched in a particular isotope having the same atomic number, but an atomic mass or mass number different from the atomic mass or mass number predominantly found in nature. The present invention is meant to include all suitable isotopic variations of the compounds of generic Formula (I). For example, different isotopic forms of hydrogen (H) include protium (1H) and deuterium (2H). Protium is the predominant hydrogen isotope found in nature. Enriching for deuterium may afford certain therapeutic advantages, such as increasing in vivo half-life or reducing dosage requirements, or may provide a compound useful as a standard for characterization of biological samples.

Isotopically-enriched Compounds of Formula (I) can be prepared without undue experimentation by conventional techniques well known to those skilled in the art or by processes analogous to those described in the Schemes and Examples herein using appropriate isotopically-enriched reagents and/or intermediates. In one embodiment, a Compound of Formula (I) has one or more of its hydrogen atoms replaced with deuterium.

The Phosphate-Substituted Quinolizine Derivatives may be useful in human and veterinary medicine for treating or preventing HIV infection in a subject. In one embodiment, the Phosphate-Substituted Quinolizine Derivatives can be inhibitors of HIV viral replication. In a specific embodiment, the Phosphate-Substituted Quinolizine Derivatives are inhibitors of HIV-1. Accordingly, the Phosphate-Substituted Quinolizine Derivatives may be useful for treating HIV infections and AIDS. In accordance with the invention, the Phosphate-Substituted Quinolizine Derivatives can be administered to a subject in need of treatment or prevention of HIV infection.

Accordingly, in one embodiment, the invention provides methods for treating HIV infection in a subject comprising administering to the subject an effective amount of at least one Phosphate-Substituted Quinolizine Derivative or a pharmaceutically acceptable salt thereof.
In a specific embodiment, the present invention provides methods for treating AIDS in a subject comprising administering to the subject an effective amount of at least one Phosphate-Substituted Quinolizine Derivative or a pharmaceutically acceptable salt thereof.

Tri n-butyl dimethylvinyl tin can be reacted with pyridyl compound Int-1a in the presence of tin chloride to provide intermediate Int-lb. Protection of the hydroxyl group of Int-lb as its MOM derivative to provide Int-lc, followed by alkene oxidation using osmium tetraoxide provides diol Int-Id. Ring closure of Int-Id via tosylate formation and displacement provides Int-le which can then be oxidized to ketone Int-lf using for example, the Dess-Martin periodinane. Oxime formation to provide Int-lg followed by reduction provides amine Int-lh, which can then be protected as its N-Boc derivative Int-li. In the methods for preparing compounds of the present invention set forth in the foregoing schemes, functional groups in various moieties and substituents (in addition to those already explicitly noted in the foregoing schemes) may be sensitive or reactive under the reaction conditions employed and/or in the presence of the reagents employed. Such sensitivity/reactivity...
can interfere with the progress of the desired reaction to reduce the yield of the desired product,
or possibly even preclude its formation. Accordingly, it may be necessary or desirable to protect
sensitive or reactive groups on any of the molecules concerned. Protection can be achieved by
means of conventional protecting groups, such as those described in Protective Groups in
dition, 1991. The protecting groups may be removed at a convenient subsequent stage using
methods known in the art. Alternatively the interfering group can be introduced into the
molecule subsequent to the reaction step of concern.

One skilled in the art of organic synthesis will recognize that the synthesis of
compounds with multiple reactive functional groups, such as -OH and NH₂, may require
protection of certain functional groups (i.e., derivatization for the purpose of chemical
compatibility with a particular reaction condition). Suitable protecting groups for the various
functional groups of these compounds and methods for their installation and removal are well-
known in the art of organic chemistry. A summary of many of these methods can be found in

One skilled in the art of organic synthesis will also recognize that one route for
the synthesis of the Compounds of Formula (I) may be more desirable depending on the choice
of appendage substituents. Additionally, one skilled in the relevant art will recognize that in
some cases the order of reactions may differ from that presented herein to avoid functional group
incompatibilities and thus adjust the synthetic route accordingly.

The starting materials used and the intermediates prepared using the methods set
forth in Schemes 1-15 above and in the Examples below may be isolated and purified if desired
using conventional techniques, including but not limited to filtration, distillation, crystallization,
chromatography and alike. Such materials can be characterized using conventional means,
including physical constants and spectral data.

**EXAMPLES**

**General Methods**

The following examples serve only to illustrate the invention and its practice.
The examples are not to be construed as limitations on the scope or spirit of the invention. In
these examples, all temperatures are degrees Celsius unless otherwise noted, and "room
temperature" refers to a temperature in a range of from about 20 °C to about 25 °C. Reactions
sensitive to moisture or air were performed under nitrogen using anhydrous solvents and
reagents. The progress of reactions was determined by either analytical thin layer chromatography (TLC) performed with E. Merck precoated TLC plates, silica gel 60F-254, layer thickness 0.25 mm or liquid chromatography-mass spectrum (LC-MS). For FIPLC/MS data, two HPLC conditions used were as follows: 1) LCI (SHFMADZU C18 Xtimate 3um 2.1x30 mm column with gradient 10:90-80:20 v/v CH3CN/H2O + v 0.0375 % TFA over 0.9 min then hold at 80:20 v/v CH3CN/H2O + v 0.0375% TFA for 0.6 min; flow rate 1.2 mL/min, UV wavelength 220 & 254 nm); 2) LC2 (Agilent C18 Xtimate 3um 2.1x30 mm column with gradient 10:90-80:20 v/v CH3CN/H2O + v 0.0375 % TFA over 3.0 min then hold at 80:20 v/v CH3CN/H2O + v 0.0375 % TFA for 0.5 min; flow rate 0.8 mL/min, UV wavelength 220 & 254 nm). Mass analysis was performed with electrospray ionization in positive ion detection mode. \(^1\)H NMR spectra were recorded on Varian or Bruker instruments at 400-500 MHz. Concentration of solutions was carried out on a rotary evaporator under reduced pressure or by lyophilization. Flash chromatography was performed on pre-packed silica gel columns using a commercial MPLC system. Compound Int-1 and compound Int-18a were prepared using the method described in Patent Publication No. WO2015048363(Al).

Preparation of Compound 109

Step A—Synthesis of Compound Int-29A
To a mixture of compound **Int-261** (20 mg, 0.029 mmol) and 2,6-lutidine (0.037 mL, 0.322 mmol) in acetonitrile (0.2 mL), was added a solution of bromotrimethylsilane (44.8 mg, 0.293 mmol) in acetonitrile (0.2 mL). The mixture was allowed to stir at 50 °C for 45 minutes. The solvent was removed under vacuum to provide crude compound **Int-29A** as a solid. **MS**: w/z=628.2 (M + 1). This material was used in the next step without further purification.

**Step B—Synthesis of Compound **Int-29B**

To a solution of compound **Int-29A** (15 mg, 0.024 mmol) in ACN (0.4 mL) was added N-ethyl-N-isopropylpropan-2-amine (61.8 mg, 0.478 mmol) and the mixture was allowed to stir at 23 °C for 10 min. Tetrabutylammonium bromide (7.71 mg, 0.024 mmol) was then added and the mixture was allowed to stir at the same temperature for additional 5 min. To the mixture was added dropwise chloromethyl isopropyl carbonate (36.5 mg, 0.239 mmol). The reaction mixture was allowed to stir at 60 °C for 24 hours. The resulting mixture was purified using a preparative TLC plate eluting with EtOAc to provide compound **Int-29B** as a solid. **MS**: w/z=860.1 (M + 1).

**Step C—Synthesis of Compound **109**

To a solution of compound **Int-29B** (11 mg, 0.013 mmol) in acetonitrile (0.2 mL) was added magnesium bromide (47.1 mg, 0.256 mmol) and the mixture was allowed to stir at 23 °C for 12 hours. The mixture was diluted with DCM (5 mL) and filtered, the filtrate was concentrated in vacuo. The residue was then dissolved in DCM (0.3 mL), and TFA (0.1 mL, 1.298 mmol) was then added. The mixture was allowed to stir at 23 °C for 4 hours. The solvent was removed under vacuum and the residue was purified using a prep-HPLC (Column: Phenomenex Synergi C18 150 * 30 mm * 4 urn; Condition: 0.1% TFA-ACN; Gradient: 15% to 45%; B, 2 - 8 min. FlowRate: 30 mL/min) to provide compound **109** as a red solid. **H NMR** (400 MHz, MeOD): δ 8.55 (s, 1H), 7.35-7.43 (m, 1H), 6.91-6.99 (m, 2H), 5.60-5.68 (m, 4H), 4.62-4.88 (m, 6H), 3.71 (br, 1H), 3.12-3.30 (m, 2H), 2.01-2.08 (m, 4H), 1.48 (s, 3H), 1.41 (s, 3H), 1.29 (s, 6H), 1.28 (s, 6H). **MS**: m/z = 746.2 (M + 1).

**EXAMPLE 30**

**Preparation of Compound **110**

![Compound 110]
Compound 110 was prepared using the method described in Example 29, except replacing compound Int-261 with compound Int-26J.

Compound 110: H NMR (400 MHz, MeOD): δ 8.54 (s, 1H), 7.35-7.43 (m, 1H), 6.91-6.99 (m, 2H), 5.60-5.69 (m, 4H), 4.62-4.88 (m, 6H), 3.71 (br, 1H), 3.12-3.30 (m, 2H), 2.01-2.08 (m, 4H), 1.48 (s, 3H), 1.41 (s, 3H), 1.29 (s, 6H), 1.28 (s, 6H). MS: m/z=746A (M + 1).

Assay for inhibition of HIV replication

This assay is useful for assessing the ability of a compound of the present invention to inhibit HIV replication. The assay is a kinetic assay that employs a reporter cell line (MT4-gag-GFP) to quantify the number of new cells infected in each round of replication.

MT4-GFP cells (250,000 cells/ml) are bulk-infected with HIV-1 (NL4-3 strain) at low multiplicity of infection (MOI) in RPMI + 10% FBS for 24 hours. Cells are then washed once in RPMI + 10% FBS and resuspended in RPMI + 0% or 10% or 100% normal human serum (NHS). Test compounds are serial-diluted in DMSO using an ECHO liquid handler. The infected MT4-GFP cells are added to a 384-well poly-D-lysine coated black plate with clear bottom in which the diluted test compounds are placed. The cells are seeded at 8,000 cells per well and the final DMSO concentration is adjusted to 0.4%. The infected cells (Green GFP cells) are then quantified at both 24 and 48 hours post incubation using Acumen eX3. Viral reproductive ratio (R0) is determined using the number of infected cells at 48 hours divided by the number of infected cells at 24 hours. Percent viral growth inhibition is calculated by [1-(R0tripiedrug)/(R0DMSO-Rtripiedrug)]*100. Compound potency IP or IC50 can be determined using a 4-parameter dose response curve analysis.

The table below provides data for illustrative compounds of the present invention that were tested using this assay protocol.

Treatment or Prevention of HIV Infection

The Phosphate-Substituted Quinolizine Derivatives may be useful in the inhibition of HIV, the inhibition of HIV integrase, the treatment of HIV infection and/or reduction of the likelihood or severity of symptoms of HIV infection and the inhibition of HIV viral replication and/or HIV viral production in a cell-based system. For example, the Phosphate-Substituted Quinolizine Derivatives may be useful in treating infection by HIV after suspected past exposure to HIV by such means as blood transfusion, exchange of body fluids, bites, accidental needle stick, or exposure to subject blood during surgery or other medical procedures.

Accordingly, in one embodiment, the invention provides methods for treating HIV infection in a subject, the methods comprising administering to the subject an effective amount of at least one Phosphate-Substituted Quinolizine Derivative or a pharmaceutically acceptable salt or prodrug thereof. In a specific embodiment, the amount administered is effective to treat or prevent infection by HIV in the subject.

In another embodiment, the amount administered is effective to inhibit HIV viral replication and/or viral production in the subject.

In one embodiment, the HIV infection has progressed to AIDS.

The Phosphate-Substituted Quinolizine Derivatives are also useful in the preparation and execution of screening assays for antiviral compounds. For example the Phosphate-Substituted Quinolizine Derivatives may be useful for identifying resistant HIV cell lines harboring mutations, which are excellent screening tools for more powerful antiviral compounds. Furthermore, the Phosphate-Substituted Quinolizine Derivatives may be useful in establishing or determining the binding site of other antivirals to the HIV Integrase.
The compositions and combinations of the present invention can be useful for treating a subject suffering from infection related to any HIV genotype.

**Combination Therapy**

In another embodiment, the present methods for treating or preventing HIV infection can further comprise the administration of one or more additional therapeutic agents which are not Phosphate-Substituted Quinolizine Derivatives.

In one embodiment, the additional therapeutic agent is an antiviral agent. In another embodiment, the additional therapeutic agent is an immunomodulatory agent, such as an immunosuppressive agent.

Accordingly, in one embodiment, the present invention provides methods for treating a viral infection in a subject, the method comprising administering to the subject: (i) at least one Phosphate-Substituted Quinolizine Derivative (which may include two or more different Phosphate-Substituted Quinolizine Derivatives), or a pharmaceutically acceptable salt or prodrug thereof, and (ii) at least one additional therapeutic agent that is other than a Phosphate-Substituted Quinolizine Derivative, wherein the amounts administered are together effective to treat or prevent a viral infection.

When administering a combination therapy of the invention to a subject, therapeutic agents in the combination, or a pharmaceutical composition or compositions comprising therapeutic agents, may be administered in any order such as, for example, sequentially, concurrently, together, simultaneously and the like. The amounts of the various actives in such combination therapy may be different amounts (different dosage amounts) or same amounts (same dosage amounts). Thus, for non-limiting illustration purposes, a Phosphate-Substituted Quinolizine Derivative and an additional therapeutic agent may be present in fixed amounts (dosage amounts) in a single dosage unit (e.g., a capsule, a tablet and the like).

In one embodiment, at least one Phosphate-Substituted Quinolizine Derivative is administered during a time when the additional therapeutic agent(s) exert their prophylactic or therapeutic effect, or vice versa.

In another embodiment, at least one Phosphate-Substituted Quinolizine Derivative and the additional therapeutic agent(s) are administered in doses commonly employed when such agents are used as monotherapy for treating a viral infection.

In another embodiment, at least one Phosphate-Substituted Quinolizine Derivative and the additional therapeutic agent(s) are administered in doses lower than the doses commonly employed when such agents are used as monotherapy for treating a viral infection.
In still another embodiment, at least one Phosphate-Substituted Quinolizine Derivative and the additional therapeutic agent(s) act synergistically and are administered in doses lower than the doses commonly employed when such agents are used as monotherapy for treating a viral infection.

In one embodiment, at least one Phosphate-Substituted Quinolizine Derivative and the additional therapeutic agent(s) are present in the same composition. In one embodiment, this composition is suitable for oral administration. In another embodiment, this composition is suitable for intravenous administration. In another embodiment, this composition is suitable for subcutaneous administration. In still another embodiment, this composition is suitable for parenteral administration.

Viral infections and virus-related disorders that can be treated or prevented using the combination therapy methods of the present invention include, but are not limited to, those listed above.

In one embodiment, the viral infection is HIV infection.

In another embodiment, the HIV infection has progressed to AIDS.

The at least one Phosphate-Substituted Quinolizine Derivative and the additional therapeutic agent(s) can act additively or synergistically. A synergistic combination may allow the use of lower dosages of one or more agents and/or less frequent administration of one or more agents of a combination therapy. A lower dosage or less frequent administration of one or more agents may lower toxicity of therapy without reducing the efficacy of therapy.

In one embodiment, the administration of at least one Phosphate-Substituted Quinolizine Derivative and the additional therapeutic agent(s) may inhibit the resistance of a viral infection to these agents.

As noted above, the present invention is also directed to use of a compound of Formula I with one or more anti-HIV agents. An "anti-HIV agent" is any agent which is directly or indirectly effective in the inhibition of HIV reverse transcriptase or another enzyme required for HIV replication or infection, the treatment or prophylaxis of HIV infection, and/or the treatment, prophylaxis or delay in the onset or progression of AIDS. It is understood that an anti-HIV agent is effective in treating, preventing, or delaying the onset or progression of HIV infection or AIDS and/or diseases or conditions arising therefrom or associated therewith. For example, the compounds of this invention may be effectively administered, whether at periods of pre-exposure and/or post-exposure, in combination with effective amounts of one or more anti-HIV agents selected from HIV antiviral agents, immunomodulators, antiinfectives, or vaccines
useful for treating HIV infection or AIDS. Suitable HIV antivirals for use in combination with
the compounds of the present invention include, for example, those listed in Table A as follows:

Some of the drugs listed in the table are used in a salt form; e.g., abacavir sulfate, indinavir sulfate, atazanavir sulfate, nelfinavir mesylate.

In one embodiment, one or more anti-HIV drugs are selected from, lamivudine, abacavir, ritonavir, darunavir, atazanavir, emtricitabine, tenofovir, rilpivirine and lopinavir. In another embodiment, the compound of formula (I) is used in combination with lamivudine. In another embodiment, the compound of formula (I) is used in combination with abacavir. In still another embodiment, the compound of formula (I) is used in combination with atazanavir. In another embodiment, the compound of formula (I) is used in combination with darunavir. In another embodiment, the compound of formula (I) is used in combination with rilpivirine. In yet another embodiment, the compound of formula (I) is used in combination with lamivudine and abacavir. In another embodiment, the compound of formula (I) is used in combination with emtricitabine and tenofovir. In another embodiment, the compound of formula (I) is used in combination with ritonavir and lopinavir.
In one embodiment, the present invention provides pharmaceutical compositions comprising (i) a compound of formula (I) or a pharmaceutically acceptable salt or prodrug thereof; (ii) a pharmaceutically acceptable carrier; and (iii) one or more additional anti-HIV agents selected from lamivudine, abacavir, ritonavir and lopinavir, or a pharmaceutically acceptable salt or prodrug thereof, wherein the amounts present of components (i) and (iii) are together effective for the treatment or prophylaxis of infection by HIV or for the treatment, prophylaxis, or delay in the onset or progression of AIDS in the subject in need thereof.

In another embodiment, the present invention provides a method for the treatment or prophylaxis of infection by HIV or for the treatment, prophylaxis, or delay in the onset or progression of AIDS in a subject in need thereof, which comprises administering to the subject (i) a compound of formula (I) or a pharmaceutically acceptable salt or prodrug thereof and (ii) one or more additional anti-HIV agents selected from lamivudine, abacavir, ritonavir and lopinavir, or a pharmaceutically acceptable salt or prodrug thereof, wherein the amounts administered of components (i) and (ii) are together effective for the treatment or prophylaxis of infection by HIV or for the treatment, prophylaxis, or delay in the onset or progression of AIDS in the subject in need thereof.

It is understood that the scope of combinations of the compounds of this invention with anti-HIV agents is not limited to the HIV antivirals listed in Table A, but includes in principle any combination with any pharmaceutical composition useful for the treatment or prophylaxis of AIDS. The HIV antiviral agents and other agents will typically be employed in these combinations in their conventional dosage ranges and regimens as reported in the art, including, for example, the dosages described in the Physicians' Desk Reference, Thomson PDR, Thomson PDR, 57th edition (2003), the 58th edition (2004), the 59th edition (2005), and the like. The dosage ranges for a compound of the invention in these combinations are the same as those set forth above.

The doses and dosage regimen of the other agents used in the combination therapies of the present invention for the treatment or prevention of HIV infection can be determined by the attending clinician, taking into consideration the approved doses and dosage regimen in the package insert; the age, sex and general health of the subject; and the type and severity of the viral infection or related disease or disorder. When administered in combination, the Phosphate-Substituted Quinolizine Derivative(s) and the other agent(s) can be administered simultaneously (i.e., in the same composition or in separate compositions one right after the other) or sequentially. This is particularly useful when the components of the combination are given on different dosing schedules, e.g., one component is administered once daily and another
component is administered every six hours, or when the pharmaceutical compositions are different, e.g., one is a tablet and one is a capsule. A kit comprising the separate dosage forms is therefore advantageous.

**Compositions and Administration**

When administered to a subject, the Phosphate-Substituted Quinolizine Derivatives can be administered as a component of a composition that comprises a pharmaceutically acceptable carrier or vehicle. The present invention provides pharmaceutical compositions comprising an effective amount of at least one Phosphate-Substituted Quinolizine Derivative and a pharmaceutically acceptable carrier. In the pharmaceutical compositions and methods of the present invention, the active ingredients will typically be administered in admixture with suitable carrier materials suitably selected with respect to the intended form of administration, i.e., oral tablets, capsules (either solid-filled, semi-solid filled or liquid filled), powders for constitution, oral gels, elixirs, dispersible granules, syrups, suspensions, and the like, and consistent with conventional pharmaceutical practices. For example, for oral administration in the form of tablets or capsules, the active drug component may be combined with any oral non-toxic pharmaceutically acceptable inert carrier, such as lactose, starch, sucrose, cellulose, magnesium stearate, dicalcium phosphate, calcium sulfate, talc, mannitol, ethyl alcohol (liquid forms) and the like. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. Powders and tablets may be comprised of from about 0.5 to about 95 percent inventive composition. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration.

Moreover, when desired or needed, suitable binders, lubricants, disintegrating agents and coloring agents may also be incorporated in the mixture. Suitable binders include starch, gelatin, natural sugars, corn sweeteners, natural and synthetic gums such as acacia, sodium alginate, carboxymethylcellulose, polyethylene glycol and waxes. Among the lubricants there may be mentioned for use in these dosage forms, boric acid, sodium benzoate, sodium acetate, sodium chloride, and the like. Disintegrants include starch, methylcellulose, guar gum, and the like. Sweetening and flavoring agents and preservatives may also be included where appropriate.

Liquid form preparations include solutions, suspensions and emulsions and may include water or water-propylene glycol solutions for parenteral injection.

Liquid form preparations may also include solutions for intranasal administration.
Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

For preparing suppositories, a low melting wax such as a mixture of fatty acid glycerides or cocoa butter is first melted, and the active ingredient is dispersed homogeneously therein as by stirring. The molten homogeneous mixture is then poured into convenient sized molds, allowed to cool and thereby solidify.

Additionally, the compositions of the present invention may be formulated in sustained release form to provide the rate controlled release of any one or more of the components or active ingredients to optimize therapeutic effects, i.e., antiviral activity and the like. Suitable dosage forms for sustained release include layered tablets containing layers of varying disintegration rates or controlled release polymeric matrices impregnated with the active components and shaped in tablet form or capsules containing such impregnated or encapsulated porous polymeric matrices.

In one embodiment, the one or more Phosphate-Substituted Quinolizine Derivatives are administered orally.

In another embodiment, the one or more Phosphate-Substituted Quinolizine Derivatives are administered intravenously.

In one embodiment, a pharmaceutical preparation comprising at least one Phosphate-Substituted Quinolizine Derivative is in unit dosage form. In such form, the preparation is subdivided into unit doses containing effective amounts of the active components.

Compositions can be prepared according to conventional mixing, granulating or coating methods, respectively, and the present compositions can contain, in one embodiment, from about 0.1% to about 99% of the Phosphate-Substituted Quinolizine Derivative(s) by weight or volume.
