A composition includes specific amounts of a poly(phenylene ether), a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, an organophosphorus ester, and compound that improves adhesion to potting silicone sealant. The adhesion promoter can be a phenolic compound, a hydroxysilyl-terminated polydiorganosiloxane, or a combination thereof. The composition is particularly useful for molding parts of photovoltaic junction boxes that utilize potting silicone sealant as an internal electrical insulator.
BACKGROUND OF THE INVENTION

[0001] Photovoltaic junction boxes are generally rectangular, low-profile plastic housings that protect electrical connections against the rigorous challenges of the outdoor environment at various points within a photovoltaic installation, from individual solar energy collection panels into power collection circuits and power management equipment for delivery to a local electrical load circuit or outgoing power transmission lines. These junction boxes may contain a varying number of wiring compartments and may be provided with wiring terminals, connectors, or leads to accommodate current-carrying conductors in a secure manner to assure that reliable and reproducible connections can readily be accomplished in the field.

[0002] Photovoltaic junction boxes must therefore be manufactured to exacting tolerances to provide a durable weather-resistant housing for electrical connections that maintains its protective integrity while withstanding challenges such as impacts from objects, wind-driven rain, and exposure to extreme heat, damaging ultraviolet radiation, and fire. Therefore, polymeric materials used for the manufacture of photovoltaic junction boxes must simultaneously meet several property requirements relating to moldability, flame retardancy, heat resistance, and ductility. In addition, the polymeric materials must have good oxidation resistance to retain useful properties for an extended period of time in outdoor use.

[0003] Some poly(phenylene ether)-based resins are currently used for photovoltaic junction boxes and connectors. These compositions provide a desirable property balance of the properties described above. However, particularly when the photovoltaic junction box is constructed from potting silicone sealant as well as the poly(phenylene ether) composition, known poly(phenylene ether) compositions can provide inadequate adhesion to the potting silicone sealant. There is therefore a need for poly(phenylene ether) compositions with improved adhesion to potting silicone sealant.

BRIEF SUMMARY OF EMBODIMENTS OF THE INVENTION

[0004] One embodiment is a composition comprising, based on the total weight of the composition: 61 to 89 weight percent of a poly(phenylene ether); 3 to 10 weight percent of a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer having a polystyrene content of 20 to 40 weight percent and a weight average molecular weight of 200,000 to 400,000 daltons; 6 to 12 weight percent of a flame retardant comprising an organophosphate
ester; and 2 to 17 weight percent of an adhesion promoter selected from the group consisting of (a) phenolic compounds having a molecular weight of 94 to 18,000 daltons; (b) hydroxysilyl-terminated polydiorganosiloxanes of the formula

\[
\begin{array}{c}
\text{HO}^- \quad \text{Si} \quad \text{O} \quad \text{H} \\
\text{R}^1 \\
\text{m}
\end{array}
\]

wherein m is 2 to 50, and each occurrence of \(\text{R}^1\) is independently \(\text{C}_1\text{C}_{12}\) hydrocarbyl, provided that 5 to 60 mole percent of the occurrences of \(\text{R}^1\) are independently \(\text{C}_6\text{C}_{12}\) aryl; and (c) combinations of the (a) phenolic compounds and the (b) hydroxysilyl-terminated polydiorganosiloxanes.

[0005] Another embodiment is an article comprising an injection molded part, and a cured potting silicone sealant in contact with a surface of the injection molded part; wherein the injection molded part comprises a composition comprising 61 to 89 weight percent of a poly(phenylene ether); 3 to 10 weight percent of a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer having a polystyrene content of 20 to 40 weight percent and a weight average molecular weight of 200,000 to 400,000 daltons; 6 to 12 weight percent of a flame retardant comprising an organophosphate ester; and 2 to 17 weight percent of an adhesion promoter selected from the group consisting of (a) phenolic compounds having a molecular weight of 94 to 18,000 daltons; (b) hydroxysilyl-terminated polydiorganosiloxanes of the formula

\[
\begin{array}{c}
\text{HO}^- \quad \text{Si} \quad \text{O} \quad \text{H} \\
\text{R}^1 \\
\text{m}
\end{array}
\]

wherein m is 2 to 50, and each occurrence of \(\text{R}^1\) is independently \(\text{C}_1\text{C}_{12}\) hydrocarbyl, provided that 5 to 60 mole percent of the occurrences of \(\text{R}^1\) are independently \(\text{C}_6\text{C}_{12}\) aryl; and (c) combinations of the (a) phenolic compounds and the (b) hydroxysilyl-terminated polydiorganosiloxanes.

[0006] These and other embodiments are described in detail below.

**BRIEF DESCRIPTION OF THE DRAWINGS**

[0007] Referring now to the drawings wherein like elements are numbered alike in several FIGURES:

[0008] Figure 1 is an elevated view of a photovoltaic junction box;
[0009] Figure 2 is a cross-section of the photovoltaic junction box through plane AA shown in Figure 1.

DETAILED DESCRIPTION OF THE INVENTION

[0010] The present inventors have determined that improved adhesion to potting silicone sealant is exhibited by a poly(phenylene ether) composition containing an adhesion promoter that is a relatively low molecular weight phenol, or a hydroxysilyl-terminated polydiorganosiloxane.

[0011] One embodiment is a composition comprising, based on the total weight of the composition: 61 to 89 weight percent of a poly(phenylene ether); 3 to 10 weight percent of a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer having a polystyrene content of 20 to 40 weight percent and a weight average molecular weight of 200,000 to 400,000 daltons; 6 to 12 weight percent of a flame retardant comprising an organophosphate ester; and 2 to 17 weight percent of an adhesion promoter selected from the group consisting of (a) phenolic compounds having a molecular weight of 94 to 18,000 daltons; (b) hydroxysilyl-terminated polydiorganosiloxanes of the formula

$$\text{HO} - \text{Si} - \text{O} - \text{H}$$

wherein m is 2 to 50, and each occurrence of $R^1$ is independently $C_1$-$C_{12}$ hydrocarbyl, provided that 5 to 60 mole percent of the occurrences of $R^1$ are independently $C_6$-$C_{12}$ aryl; and (c) combinations of the (a) phenolic compounds and the (b) hydroxysilyl-terminated polydiorganosiloxanes.

[0012] The composition comprises a poly(phenylene ether). Poly(phenylene ether)s include those comprising repeating structural units having the formula

$$\text{Z}^2 \text{Z}^1$$

wherein each occurrence of $Z^1$ is independently halogen, unsubstituted or substituted $C_1$-$C_{12}$ hydrocarbyl provided that the hydrocarbyl group is not tertiary hydrocarbyl, $C_1$-$C_{12}$ hydrocarbylthio,
C1-C12 hydrocarbyloxy, or C2-C12 halohydrocarbyloxy wherein at least two carbon atoms separate the halogen and oxygen atoms; and each occurrence of Z^2 is independently hydrogen, halogen, unsubstituted or substituted C1-C12 hydrocarbyl provided that the hydrocarbyl group is not tertiary hydrocarbyl, C1-C12 hydrocarbylthio, C1-C12 hydrocarbyloxy, or C2-C12 halohydrocarbyloxy wherein at least two carbon atoms separate the halogen and oxygen atoms. As used herein, the term "hydrocarbyl", whether used by itself, or as a prefix, suffix, or fragment of another term, refers to a residue that contains only carbon and hydrogen. The residue can be aliphatic or aromatic, straight-chain, cyclic, bicyclic, branched, saturated, or unsaturated. It can also contain combinations of aliphatic, aromatic, straight chain, cyclic, bicyclic, branched, saturated, and unsaturated hydrocarbon moieties. However, when the hydrocarbyl residue is described as substituted, it may, optionally, contain heteroatoms over and above the carbon and hydrogen members of the substituent residue. Thus, when specifically described as substituted, the hydrocarbyl residue can also contain one or more carbonyl groups, amino groups, hydroxyl groups, or the like, or it can contain heteroatoms within the backbone of the hydrocarbyl residue. As one example, Z^1 can be a di-n-butylaminomethyl group formed by reaction of a terminal 3,5-dimethyl-l,4-phenyl group with the di-n-butylamine component of an oxidative polymerization catalyst.

[0013] The poly(phenylene ether) can comprise molecules having aminoalkyl-containing end group(s), typically located in a position ortho to the hydroxyl group. Also frequently present are tetramethyldiphenoquinone (TMDQ) end groups, typically obtained from 2,6-dimethylphenol-containing reaction mixtures in which tetramethyldiphenoquinone by-product is present. The poly(phenylene ether) can be in the form of a homopolymer, a copolymer, a graft copolymer, an ionomer, or a block copolymer, as well as combinations thereof.

[0014] In some embodiments, the poly(phenylene ether) comprises a poly(phenylene ether)-polysiloxane block copolymer. As used herein, the term "poly(phenylene ether)-polysiloxane block copolymer" refers to a block copolymer comprising at least one poly(phenylene ether) block and at least one polysiloxane block.

[0015] In some embodiments, the poly(phenylene ether)-polysiloxane block copolymer is prepared by an oxidative copolymerization method. In this method, the poly(phenylene ether)-polysiloxane block copolymer is the product of a process comprising oxidatively copolymerizing a monomer mixture comprising a monohydric phenol and a hydroxyaryl-terminated polysiloxane. In some embodiments, the monomer mixture comprises 70 to 99 parts by weight of the monohydric phenol and 1 to 30 parts by weight of the hydroxyaryl-terminated polysiloxane, based on the total weight of the monohydric phenol and the hydroxyaryl-terminated polysiloxane. The hydroxyaryl-diterminated polysiloxane can comprise a plurality of repeating units having the
wherein each occurrence of $R^8$ is independently hydrogen, C1-C12 hydrocarbyl or C1-C12 halohydrocarbyl; and two terminal units having the structure

$$\begin{array}{c}
\text{HO} \\
\text{Y} \\
\text{(CH}_2\text{)}_3 \\
\text{Si} \\
\text{R}^9
\end{array}$$

wherein Y is hydrogen, C1-C12 hydrocarbyl, C1-C12 hydroxy, or halogen, and wherein each occurrence of $R^9$ is independently hydrogen, C1-C12 hydrocarbyl or C1-C12 halohydrocarbyl. In a very specific embodiment, each occurrence of $R^8$ and $R^9$ is methyl, and Y is methoxyl.

[0016] In some embodiments, the monohydric phenol comprises 2,6-dimethylphenol, and the hydroxyaryl-terminated polysiloxane has the structure

wherein n is, on average, 5 to 100, specifically 30 to 60.

[0017] The oxidative copolymerization method produces poly(phenylene ether)-polysiloxane block copolymer as the desired product and poly(phenylene ether) (without an incorporated polysiloxane block) as a by-product. It is not necessary to separate the poly(phenylene ether) from the poly(phenylene ether)-polysiloxane block copolymer. The poly(phenylene ether)-polysiloxane block copolymer can thus be utilized as a "reaction product" that includes both the poly(phenylene ether) and the poly(phenylene ether)-polysiloxane block copolymer. Certain isolation procedures, such as precipitation from isopropanol, make it possible to assure that the reaction product is essentially free of residual hydroxyaryl-terminated polysiloxane starting material. In other words, these isolation procedures assure that the polysiloxane content of the reaction product is essentially all in the form of poly(phenylene ether)-polysiloxane block copolymer.

[0018] In some embodiments, the poly(phenylene ether) has an intrinsic viscosity of 0.25 to 1 deciliter per gram measured by Ubbelohde viscometer at 25°C in chloroform. Within this range, the poly(phenylene ether) intrinsic viscosity can be 0.3 to 0.65 deciliter per gram, more specifically 0.3 to 0.5 deciliter per gram, even more specifically 0.35 to 0.5 deciliter per gram.

[0019] In some embodiments, the poly(phenylene ether) comprises a homopolymer or copolymer of monomers selected from the group consisting of 2,6-dimethylphenol, 2,3,6-trimethylphenol, and combinations thereof. In some embodiments, the poly(phenylene ether) comprises a poly(phenylene ether)-polysiloxane block copolymer. In these embodiments, the poly(phenylene ether)-polysiloxane block copolymer can, for example, contribute 0.05 to 2 weight percent, specifically 0.1 to 1 weight percent, more specifically 0.2 to 0.8 weight percent, of siloxane groups to the composition as a whole.

[0020] The composition comprises the poly(phenylene ether) in an amount of 61 to 89 weight percent, based on the total weight of the composition. Within this range, the poly(phenylene ether) amount can be 65 to 85 weight percent, specifically 70 to 81 weight percent.

[0021] In addition to the poly(phenylene ether), the composition comprises a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer. The polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer has a polystyrene content of 20 to 40 weight percent, based on the weight of the triblock copolymer. Polystyrene content can be determined by 1H or 13C nuclear magnetic resonance spectroscopy. The polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer has a weight average molecular weight of 200,000 to 400,000 daltons. Weight average molecular weight can be determined by gel permeation chromatography using polystyrene standards. Methods for preparing polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymers are known in the art, and such copolymers are also commercially available. A polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer meeting the present requirements is available as KRATONTM G1651 from Kraton Performance Polymers, Inc.

[0022] The composition comprises the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer in an amount of 3 to 10 weight percent, based on the total weight of the composition. Within this range, the triblock copolymer amount can be 4 to 8 weight percent.

[0023] In addition to the poly(phenylene ether) and the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, the composition comprises a flame retardant. The flame retardant comprises an organophosphate ester. Exemplary organophosphate ester flame retardants include
phosphate esters comprising phenyl groups, substituted phenyl groups, or a combination of phenyl groups and substituted phenyl groups, bis-aryl phosphate esters based upon resorcinol such as, for example, resorcinol bis(diphenyl phosphate), as well as those based upon bisphenols such as, for example, bisphenol A bis(diphenyl phosphate). In some embodiments, the organophosphate ester is selected from tris(alkylphenyl) phosphates (for example, CAS Reg. No. 89492-23-9 or CAS Reg. No. 78-33-1), resorcinol bis(diphenyl phosphate) (CAS Reg. No. 57583-54-7), bisphenol A bis(diphenyl phosphate) (CAS Reg. No. 181028-79-5), triphenyl phosphate (CAS Reg. No. 115-86-6), tris(isopropylphenyl) phosphates (for example, CAS Reg. No. 68937-41-7), t-butylphenyl diphenyl phosphates (CAS Reg. No. 56803-37-3), bis(t-butylphenyl) phenyl phosphates (CAS Reg. No. 65652-41-7), tris(t-butylphenyl) phosphates (CAS Reg. No. 78-33-1), and combinations thereof.

[0024] In some embodiments the organophosphate ester comprises a bis-aryl phosphate having the formula

![Chemical Structure](image)

wherein R is independently at each occurrence a C1-C12 alkylene group; R⁶ and R⁷ are independently at each occurrence a C1-C5 alkyl group; R², R³, and R⁵ are independently a C1-C12 hydrocarbyl group; R⁴ is independently at each occurrence a C1-C12 hydrocarbyl group; n is 1 to 25; and s¹ and s² are independently an integer equal to 0, 1, or 2. In some embodiments OR², OR³, OR⁴ and OR⁵ are independently derived from phenol, a monoalkylphenol, a dialkylphenol, or a trialkylphenol.

[0025] As readily appreciated by one of ordinary skill in the art, the bis-aryl phosphate is derived from a bisphenol. Exemplary bisphenols include 2,2-bis(4-hydroxyphenyl)propane (bisphenol A), 2,2-bis(4-hydroxy-3-methylphenyl)propane, bis(4-hydroxyphenyl)methane, bis(4-hydroxy-3,5-dimethylphenyl)methane and 1,1-bis(4-hydroxyphenyl)ethane. In some embodiments, the bisphenol comprises bisphenol A.

[0026] The flame retardant can, optionally, comprise one or more flame retardants in addition to the organophosphate ester. Such optional flame retardants include metal dialkylphosphinates (such as aluminum tris(diethyl phosphinate)), nitrogen-containing flame retardants (including melamine phosphate, melamine pyrophosphate, melamine polyphosphate, and melamine cyanurate), metal hydroxides (such as magnesium hydroxide, aluminum hydroxide, and
cobalt hydroxide), and combinations thereof.

[0027] In some embodiments, the flame retardant consists of the organophosphate ester.

[0028] The composition comprises the flame retardant in an amount of 6 to 12 weight percent, based on the total weight of the composition. Within this range, the flame retardant amount can be 7 to 11 weight percent.

[0029] In addition to the poly(phenylene ether), the polystyrene-poly(ethylene/butylene)-polystyrene triblock copolymer, and the flame retardant, the composition comprises an adhesion promoter to promote adhesion between cured potting silicone sealant and articles molded from the composition. The adhesion promoter can be a phenolic compound, a hydroxysilyl-terminated polydiorganosiloxane, or a combination thereof.

[0030] The phenolic compound has a molecular weight (or number average molecular weight in the case of an oligomer or polymer) of 94 to 18,000. In some embodiments, the phenolic compound comprises a monomeric phenol (such as phenol itself), a monomeric diphenol (such as 4,4’-diphenol, 3,4’-diphenol, 3,3’-diphenol, bisphenol A, and 2,2-bis(3,5-dimethyl-4-hydroxyphenyl)propane), a monomeric triphenol (such as tris(4-hydroxyphenyl)methane, and 1,1,1-tris(4-hydroxyphenyl)ethane), as well as monomeric polyphenols.

[0031] In some embodiments, the phenolic compound is oligomeric or polymeric. For example, in some embodiments, the phenolic compound comprises a polycarbonate having a number average molecular weight of 450 to 18,000 daltons, and a hydroxyaryl content of 450 to 35,000 parts per million by weight calculated as the weight of hydroxyl groups divided by the total weight of the phenolic compound. For example, for a polycarbonate having a number average molecular weight of 5,000 daltons and two hydroxyl groups, each hydroxyl group being directly bound to an aryl group, the hydroxyaryl content would be 2(17.01)/5,000 =6.80x10^{-3} or 6,800 parts per million by weight. In some embodiments, the polycarbonate has a hydroxyaryl content of 450 to 2,000 parts per million by weight.

[0032] The adhesion promoter can be hydroxysilyl-terminated polydiorganosiloxane. The hydroxysilyl-terminated polydiorganosiloxane can have the formula

\[
\text{HO-Si-O-H} \quad \text{[R}^1_{\text{m}} \text{]} \\
\text{R}^1_{\text{m}}\]

wherein m is 2 to 50, specifically 5 to 40, more specifically 10 to 40, and each occurrence of \( R^1 \) is independently \( C_1-C_{12} \) hydrocarbyl, provided that 5 to 60 mole percent, specifically 10 to 50 mole
percent, of the occurrences of \( R^1 \) are independently \( C_6-C_{12} \) aryl. In some embodiments, the hydroxysilyl-terminated polydiorganosiloxane comprises a hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane).

[0033] As the adhesion promoter, the composition can comprise a combination of the phenolic compound and the hydroxysilyl-terminated polydiorganosiloxane.

[0034] The composition comprises the adhesion promoter in an amount of 2 to 17 weight percent, based on the total weight of the composition. Within this range, the adhesion promoter amount can be 2 to 10 weight percent.

[0035] The composition can, optionally, further comprise atactic homopolystyrene. When present, the atactic polystyrene can be used in an amount of 0.5 to 10 weight percent, based on the total weight of the composition. Within this range, the atactic homopolystyrene amount can be 1 to 5 weight percent, specifically 1 to 3 weight percent.

[0036] The composition can, optionally, further comprise one or more additives known in the thermoplastics art. For example, the composition can, optionally, further comprise an additive selected from the group consisting of stabilizers, mold release agents, lubricants, processing aids, drip retardants, nucleating agents, UV blockers, dyes, pigments, antioxidants, anti-static agents, mineral oil, metal deactivators, and combinations thereof. When present, such additives are typically used in a total amount of less than or equal to 5 weight percent, specifically less than or equal to 3 weight percent, more specifically less than or equal to 2 weight percent, based on the total weight of the composition.

[0037] The composition can, optionally, exclude components not described herein as required or optional. For example, in some embodiments, the composition excludes one or more of polyamides, polyesters, and polyolefins.

[0038] In a very specific embodiment of the composition, the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; the organophosphate ester comprises resorcinol bis(diphenyl phosphate); the adhesion promoter is the phenolic compound, and wherein the phenolic compound comprises a polycarbonate having a number average molecular weight of 450 to 18,000 daltons, and a hydroxyaryl content of 450 to 35,000 parts per million by weight based the weight of hydroxyl groups and the total weight of the composition; and the composition comprises 70 to 80 weight percent of the poly(phenylene ether), 4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, 7 to 11 weight percent of the flame retardant, and 4 to 12 weight percent of the adhesion promoter.

[0039] In another very specific embodiment of the composition, the poly(phenylene ether)
comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; the organophosphate ester comprises resorcinol bis(diphenyl phosphate); the adhesion promoter is the hydroxysilyl-terminated polydiorganosiloxane, and wherein the hydroxysilyl-terminated polydiorganosiloxane comprises a hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane); and the composition comprises 70 to 80 weight percent of the poly(phenylene ether), 4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, 7 to 11 weight percent of the flame retardant, and 1 to 6 weight percent of the adhesion promoter.

[0040] The composition can be prepared by melt-blending or melt-kneading the components of the composition. The melt-blending or melt-kneading can be performed using common equipment such as ribbon blenders, HENSCHEL™ mixers, BANBURY™ mixers, drum tumblers, single-screw extruders, twin-screw extruders, multi-screw extruders, co-kneaders, and the like. For example, the present composition can be prepared by melt-blending the components in a twin-screw extruder at a temperature of 280 to 320 °C, specifically 290 to 310 °C.

[0041] The invention includes articles molded from the composition of the invention. Suitable methods of forming such articles include single layer and multilayer sheet extrusion, injection molding, blow molding, film extrusion, profile extrusion, pultrusion, compression molding, thermoforming, pressure forming, hydroforming, vacuum forming, and the like. Combinations of the foregoing article fabrication methods can be used.

[0043] One embodiment is an article comprising an injection molded part and a cured potting silicone sealant in contact with a surface of the injection molded part; wherein the injection molded part comprises a composition comprising 61 to 89 weight percent of a poly(phenylene ether); 3 to 10 weight percent of a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer having a polystyrene content of 20 to 40 weight percent and a weight average molecular weight of 200,000 to 400,000 daltons; 6 to 12 weight percent of a flame retardant comprising an organophosphate ester; and 2 to 17 weight percent of an adhesion promoter selected from the group consisting of (a) phenolic compounds having a molecular weight of 94 to 18,000 daltons; (b) hydroxysilyl-terminated polydiorganosiloxanes of the formula
wherein m is 2 to 50, and each occurrence of R\(^1\) is independently C\(_1\)-C\(_{12}\) hydrocarbyl, provided that 5 to 60 mole percent of the occurrences of R\(^1\) are independently C\(_6\)-C\(_{12}\) aryl; and (c) combinations of the (a) phenolic compounds and the (b) hydroxysilyl-terminated polydiorganosiloxanes.

[0044] The cured potting silicone sealant can be the product of curing an uncured potting silicone sealant comprising a first polysiloxane comprising Si-H groups, a second polysiloxane comprising -CH=CH\(_2\) groups, and a catalyst effective to catalyze a reaction of the Si-H groups and the -CH=CH\(_2\) groups.

[0045] Figure 1 is an elevated view of a photovoltaic junction box 10, which includes a base cover 20, two electrical cables 30, and top cover 50.

[0046] Figure 2 is a cross-section of the photovoltaic junction box 10 through plane AA shown in Figure 1. The cross-sectional view of the photovoltaic junction box 10 includes a base cover 20, a top cover 50, an electrical cable 30 that includes an electrical conductor 60, a diode holder 70, a diode 80, and cured potting silicone sealant 90.

[0047] All of the compositional variables described above apply as well to the composition as it is used in the injection molded part.

[0048] In a very embodiment of the article, the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; the organophosphate ester comprises resorcinol bis(diphenyl phosphate); the adhesion promoter is the phenolic compound, and wherein the phenolic compound comprises a polycarbonate having a number average molecular weight of 450 to 18,000 daltons, and a hydroxyaryl content of 450 to 35,000 parts per million by weight based the weight of hydroxyl groups and the total weight of the composition; and the composition comprises 70 to 80 weight percent of the poly(phenylene ether), 4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, 7 to 11 weight percent of the flame retardant, and 4 to 12 weight percent of the adhesion promoter.

[0049] In another very specific embodiment of the article, the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; the organophosphate ester comprises resorcinol bis(diphenyl phosphate); the adhesion promoter is the hydroxysilyl-terminated
polydiorganosiloxane, and wherein the hydroxysilyl-terminated polydiorganosiloxane comprises a hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane); and the composition comprises 70 to 80 weight percent of the poly(phenylene ether), 4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, 7 to 11 weight percent of the flame retardant, and 2 to 6 weight percent of the adhesion promoter.

[0050] The invention includes at least the following embodiments.

[0051] Embodiment 1: A composition comprising, based on the total weight of the composition: 61 to 89 weight percent of a poly(phenylene ether); 3 to 10 weight percent of a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer having a polystyrene content of 20 to 40 weight percent and a weight average molecular weight of 200,000 to 400,000 daltons; 6 to 12 weight percent of a flame retardant comprising an organophosphate ester; and 2 to 17 weight percent of an adhesion promoter selected from the group consisting of (a) phenolic compounds having a molecular weight of 94 to 18,000 daltons; (b) hydroxysilyl-terminated polydiorganosiloxanes of the formula

\[
\begin{array}{c}
\text{HO-} \\
\text{Si-O-} \\
\text{H}
\end{array}
\]

wherein m is 2 to 50, and each occurrence of \( R^1 \) is independently \( C_1-C_{12} \) hydrocarbyl, provided that 5 to 60 mole percent of the occurrences of \( R^1 \) are independently \( C_6-C_{12} \) ary; and (c) combinations of the (a) phenolic compounds and the (b) hydroxysilyl-terminated polydiorganosiloxanes.

[0052] Embodiment 2: The composition of embodiment 1, wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform.

[0053] Embodiment 3: The composition of embodiment 1, wherein the poly(phenylene ether) comprises a combination of a poly(phenylene ether) homopolymer and a poly(phenylene ether)-polysiloxane block copolymer, the combination having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform.

[0054] Embodiment 4: The composition of any one of embodiments 1-3, wherein the adhesion promoter is the phenolic compound, and wherein the phenolic compound comprises a polycarbonate having a number average molecular weight of 450 to 18,000 daltons, and a hydroxyaryl content of 450 to 35,000 parts per million by weight based the weight of hydroxyl groups and the total weight of the composition.
[0055] Embodiment 5: The composition of embodiment 4, wherein the polycarbonate has a hydroxyaryl content of 450 to 2,000 parts per million by weight.

[0056] Embodiment 6: The composition of any one of embodiments 1-3, wherein the adhesion promoter is the hydroxysilyl-terminated polydiorganosiloxane.

[0057] Embodiment 7: The composition of embodiment 6, wherein the hydroxysilyl-terminated polydiorganosiloxane comprises a hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane).

[0058] Embodiment 8: The composition of embodiment 1, wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; wherein the organophosphate ester comprises resorcinol bis(diphenyl phosphate); wherein the adhesion promoter is the phenolic compound, and wherein the phenolic compound comprises a polycarbonate having a number average molecular weight of 450 to 18,000 daltons, and a hydroxyaryl content of 450 to 35,000 parts per million by weight based on the weight of hydroxyl groups and the total weight of the composition; and wherein the composition comprises 70 to 80 weight percent of the poly(phenylene ether), 4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, 7 to 11 weight percent of the flame retardant, and 4 to 12 weight percent of the adhesion promoter.

[0059] Embodiment 9: The composition of embodiment 1, wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; wherein the organophosphate ester comprises resorcinol bis(diphenyl phosphate); wherein the adhesion promoter is the hydroxysilyl-terminated polydiorganosiloxane, and wherein the hydroxysilyl-terminated polydiorganosiloxane comprises a hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane); and wherein the composition comprises 70 to 80 weight percent of the poly(phenylene ether), 4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, 7 to 11 weight percent of the flame retardant, and 1 to 6 weight percent of the adhesion promoter.

[0060] Embodiment 10: An article comprising, an injection molded part, and a cured potting silicone sealant in contact with a surface of the injection molded part; wherein the injection molded part comprises a composition comprising 61 to 89 weight percent of a poly(phenylene ether); 3 to 10 weight percent of a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer having a polystyrene content of 20 to 40 weight percent and a weight average molecular weight of 200,000 to 400,000 daltons; 6 to 12 weight percent of a flame retardant comprising an organophosphate ester; and 2 to 17 weight percent of an adhesion promoter selected from the group consisting of (a) phenolic compounds having a molecular weight of 94 to 18,000 daltons; (b)
hydroxysilyl-terminated polydiorganosiloxanes of the formula

\[
\begin{array}{c}
\text{HO-Si-O} \\
R^1 \\
\end{array}
\]

wherein \(m\) is 2 to 50, and each occurrence of \(R^1\) is independently \(C_1-C_{12}\) hydrocarbyl, provided that 5 to 60 mole percent of the occurrences of \(R^1\) are independently \(C_6-C_{12}\) aryl; and (c) combinations of the (a) phenolic compounds and the (b) hydroxysilyl-terminated polydiorganosiloxanes.

[0061] Embodiment 11: The article of embodiment 10, wherein the cured potting silicone sealant is the product of curing an uncured potting silicone sealant comprising a first polysiloxane comprising Si-H groups, a second polysiloxane comprising -CH=CH₂ groups, and a catalyst effective to catalyze a reaction of the Si-H groups and the -CH=CH₂ groups.

[0062] Embodiment 12: The article of embodiment 10 or 11, wherein the article is a photovoltaic junction box.

[0063] Embodiment 13: The article of embodiment 10, wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; wherein the organophosphate ester comprises resorcinol bis(diphenyl phosphate); wherein the adhesion promoter is the phenolic compound, and wherein the phenolic compound comprises a polycarbonate having a number average molecular weight of 450 to 18,000 daltons, and a hydroxyaryl content of 450 to 35,000 parts per million by weight based the weight of hydroxyl groups and the total weight of the composition; and wherein the composition comprises 70 to 80 weight percent of the poly(phenylene ether), 4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, 7 to 11 weight percent of the flame retardant, and 4 to 12 weight percent of the adhesion promoter.

[0064] Embodiment 14: The article of embodiment 10, wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; wherein the organophosphate ester comprises resorcinol bis(diphenyl phosphate); wherein the adhesion promoter is the hydroxysilyl-terminated polydiorganosiloxane, and wherein the hydroxysilyl-terminated polydiorganosiloxane comprises a hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane); and wherein the composition comprises 70 to 80 weight percent of the poly(phenylene ether), 4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, 7 to 11 weight percent of the flame retardant, and 2 to 6 weight percent of the adhesion promoter.
All ranges disclosed herein are inclusive of the endpoints, and the endpoints are independently combinable with each other. Each range disclosed herein constitutes a disclosure of any point or sub-range lying within the disclosed range.

The invention is further illustrated by the following non-limiting examples.

EXAMPLE 1

Components used to form the compositions are summarized in Table 1.

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPE</td>
<td>Poly(2,6-dimethyl-1,4-phenylene ether), CAS Reg. No. 24938-67-8, having an intrinsic viscosity of about 0.40 deciliter per gram as measured in chloroform at 25°C; obtained as PPO 640 from SABIC Innovative Plastics.</td>
</tr>
<tr>
<td>RDP</td>
<td>Resorcinol bis(diphenyl phosphate), CAS Reg. No. 57583-54-7; obtained as RDP from Jiangsu Yoke Technology Co., Ltd.</td>
</tr>
<tr>
<td>SEBS</td>
<td>Polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer, CAS Reg. No. 66070-58-4, having a polystyrene content of about 30 to 33 weight percent and a weight average molecular weight of about 240,000 to 301,000 atomic mass units; obtained as KRATON™ G1651 from Kraton Performance Polymers Inc.</td>
</tr>
<tr>
<td>PS</td>
<td>Atactic polystyrene, CAS Reg. No. 9003-53-6, having a melt flow index of about 2.0-2.8 grams per 10 minutes measured at 200 °C and 5 kilogram load; obtained as 686E from Styron.</td>
</tr>
<tr>
<td>PDMDPS</td>
<td>Hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane), CAS Reg. No. 68083-14-7; having a viscosity of about 40-80 millipascal-seconds determined by Brookfield Viscometer at 25 °C; obtained as SF1023 from Momentive Performance Materials.</td>
</tr>
<tr>
<td>Melt PC</td>
<td>Phenoxy-terminated bisphenol A polycarbonate, CAS Reg. No. 25929-04-8, synthesized by melt polymerization and having a number average molecular weight of about 18,000 daltons and a hydroxyl group content of 1728 parts per million by weight; obtained as LEXAN™ 5832C Resin from Sabic Innovative Plastics.</td>
</tr>
<tr>
<td>Interfacial PC</td>
<td>p-Cumylphenol-terminated bisphenol A polycarbonate, CAS Reg. No. 111211-39-3, synthesized by interfacial polymerization and having a number average molecular weight of about 18,000 daltons and a hydroxyl group</td>
</tr>
</tbody>
</table>
Compositions were compounded using a Toshiba TEM-37BS co-rotating twin-screw extruder with a length to internal diameter ratio (L/D) of 40.5, an internal diameter 37 millimeters, a barrel temperature setting of at 290°C from zones 2 to 12, a die temperature setting of 300°C, a screw rotation rate of 400 rotations per minute, and throughput of about 40 kilograms/hour. The liquid flame retardant RDP was fed to the extruder via a liquid feeder between barrels 2 and 3. Components in pellet or powder form were typically dry-blended in a plastic bag manually or using a super floater (Kawata SFC-50) prior to being introduced to the extruder at the feed throat. The resulting extruded strands were cooled by passing them through a water bath, then they were chopped into pellets. The pellets were dried for three hours at 110 °C prior to use for injection molding.

Articles for property testing were molded by single-shot injection molding. Molding conditions are summarized in Table 2.

[0070] Cohesive failure was measured according to GB/T 16997-1997 to judge the failure mode. The potting sealant used was a two-component type sealant obtained as TONSAN™ 1521 from Tonsan Adhesive Co., Ltd. Before pouring the sealant on the part, the two components were mixed together in the required ratio. The curable composition so formed was poured onto the molded part, and cured for 7 days at 23 °C. To determine the failure mode, the cured sealant was torn from the molded part surface. A failure mode of "cohesive failure" means that the cured sealant tears within itself and remains fully bonded to the substrate. A failure mode of "adhesive failure" means that the cured sealant releases from the substrate. 100% cohesive failure is desirable, because it indicates that the strength of adhesion to the molded part is greater than the strength of cohesion of the cured sealant to itself.

[0071] Curing time was measured according to sealant producer’s method. After the potting sealant was poured into the part, the curing was started. Generally a photovoltaic junction box manufacturer will check the adhesion performance after curing for 7 days at ambient temperature. If parts exhibit 0% cohesive failure after curing 7 days, it will be difficult to achieve good adhesion between the sealant and the molded part, because the sealant will have cured completely. For the Results in Table 3, sealant was placed on molded parts in the form of flat chips, and the adhesion status was checked each day. The curing time was the shorter of seven days or the number of days needed to achieve 100% cohesive failure.

[0072] Compositions and properties are summarized in Table 3, where component amounts are expressed in weight percent based on the total weight of the composition.
Example 1 illustrates the effect of adding hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane) to the Comparative Example 1 composition, the addition being compensated by proportional decreases in the contents of all other components. The hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane), added at slightly less than 3 weight percent, greatly improved cohesion between the molded part and the potting silicone sealant.

Example 2 illustrates the effects of adding a low molecular weight melt polycarbonate to the Comparative Example 1 composition, the addition being compensated by proportional decreases in the contents of all other components. The low molecular weight melt polycarbonate, added at slightly less than 5 weight percent, substantially improved cohesion between the molded part and the potting silicone sealant.

Example 3 includes a higher concentration of the low molecular weight melt polycarbonate (9 weight percent), which is compensated by proportional decreases in the contents of all other components. At the higher concentration, the low molecular weight melt polycarbonate greatly improves cohesion between the molded part and the potting silicone sealant.

Example 4 illustrates the effect of adding a low molecular weight interfacial polycarbonate to the Comparative Example 1 composition, the addition being compensated by proportional decreases in the contents of all other components. The low molecular weight interfacial polycarbonate, added at slightly less than 5 weight percent, exhibits slightly improved cohesion between the molded part and the potting silicone sealant.

Example 5 includes a higher concentration of the low molecular weight interfacial polycarbonate (9 weight percent), which is compensated by proportional decreases in the contents of all other components. At the higher concentration, the low molecular weight interfacial polycarbonate exhibits improved cohesion between the molded part and the potting silicone sealant.

CLAIMS

1. A composition comprising, based on the total weight of the composition:
   61 to 89 weight percent of a poly(phenylene ether);
   3 to 10 weight percent of a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer having a polystyrene content of 20 to 40 weight percent and a weight average molecular weight of 200,000 to 400,000 daltons;
   6 to 12 weight percent of a flame retardant comprising an organophosphate ester; and
   2 to 17 weight percent of an adhesion promoter selected from the group consisting of
      (a) phenolic compounds having a molecular weight of 94 to 18,000 daltons;
      (b) hydroxysilyl-terminated polydiorganosiloxanes of the formula

\[
\text{HO-Si(OH)}_{m}
\]

wherein \( m \) is 2 to 50, and each occurrence of \( R^1 \) is independently \( C_1-C_{12} \) hydrocarbyl, provided that 5 to 60 mole percent of the occurrences of \( R^1 \) are independently \( C_6-C_2 \) aryl; and
      (c) combinations of the (a) phenolic compounds and the (b) hydroxysilyl-terminated polydiorganosiloxanes.

2. The composition of claim 1, wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform.

3. The composition of claim 1, wherein the poly(phenylene ether) comprises a combination of a poly(phenylene ether) homopolymer and a poly(phenylene ether)-polysiloxane block copolymer, the combination having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform.

4. The composition of any one of claims 1-3, wherein the adhesion promoter is the phenolic compound, and wherein the phenolic compound comprises a polycarbonate having a number average molecular weight of 450 to 18,000 daltons, and a hydroxyaryl content of 450 to 35,000 parts per million by weight based the weight of hydroxyl groups and the total weight of the composition.

5. The composition of claim 4, wherein the polycarbonate has a hydroxyaryl content of 450 to 2,000 parts per million by weight.
6. The composition of any one of claims 1-3, wherein the adhesion promoter is the hydroxysilyl-terminated polydiorganosiloxane.

7. The composition of claim 6, wherein the hydroxysilyl-terminated polydiorganosiloxane comprises a hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane).

8. The composition of claim 1, wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; wherein the organophosphate ester comprises resorcinol bis(diphenyl phosphate); wherein the adhesion promoter is the phenolic compound, and wherein the phenolic compound comprises a polycarbonate having a number average molecular weight of 450 to 18,000 daltons, and a hydroxyaryl content of 450 to 35,000 parts per million by weight based the weight of hydroxyl groups and the total weight of the composition; and wherein the composition comprises

70 to 80 weight percent of the poly(phenylene ether),
4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer,
7 to 11 weight percent of the flame retardant, and
4 to 12 weight percent of the adhesion promoter.

9. The composition of claim 1, wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform; wherein the organophosphate ester comprises resorcinol bis(diphenyl phosphate); wherein the adhesion promoter is the hydroxysilyl-terminated polydiorganosiloxane, and wherein the hydroxysilyl-terminated polydiorganosiloxane comprises a hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane); and wherein the composition comprises

70 to 80 weight percent of the poly(phenylene ether),
4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer,
7 to 11 weight percent of the flame retardant, and
1 to 6 weight percent of the adhesion promoter.

10. An article comprising,
an injection molded part, and
a cured potting silicone sealant in contact with a surface of the injection molded part;
wherein the injection molded part comprises a composition comprising

61 to 89 weight percent of a poly(phenylene ether);
3 to 10 weight percent of a polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer having a polystyrene content of 20 to 40 weight percent and a weight average molecular weight of 200,000 to 400,000 daltons;
6 to 12 weight percent of a flame retardant comprising an organophosphate ester; and
2 to 17 weight percent of an adhesion promoter selected from the group consisting of
(a) phenolic compounds having a molecular weight of 94 to 18,000 daltons;
(b) hydroxysilyl-terminated polydiorganosiloxanes of the formula

\[
\begin{array}{c}
\text{H} \\
\text{O} \\
\text{Si} \quad \text{O} \\
\text{H}
\end{array}
\]

wherein \( m \) is 2 to 50, and each occurrence of \( R^1 \) is independently \( C_1 \text{C}_{12} \) hydrocarbyl, provided that 5 to 60 mole percent of the occurrences of \( R^1 \) are independently \( C_6 \text{C}_{12} \) aryl; and
(c) combinations of the (a) phenolic compounds and the (b) hydroxysilyl-terminated polydiorganosiloxanes.

11. The article of claim 10, wherein the cured potting silicone sealant is the product of curing an uncured potting silicone sealant comprising a first polysiloxane comprising \( \text{Si}-\text{H} \) groups, a second polysiloxane comprising \( -\text{CH}=\text{CH}_2 \) groups, and a catalyst effective to catalyze a reaction of the \( \text{Si}-\text{H} \) groups and the \( -\text{CH}=\text{CH}_2 \) groups.

12. The article of claim 10 or 11, wherein the article is a photovoltaic junction box.

13. The article of claim 10,

wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-l,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform;
wherein the organophosphate ester comprises resorcinol bis(diphenyl phosphate);
wherein the adhesion promoter is the phenolic compound, and wherein the phenolic compound comprises a polycarbonate having a number average molecular weight of 450 to 18,000 daltons, and a hydroxyaryl content of 450 to 35,000 parts per million by weight based the weight of hydroxyl groups and the total weight of the composition; and

wherein the composition comprises

70 to 80 weight percent of the poly(phenylene ether).
4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer,
7 to 11 weight percent of the flame retardant, and
4 to 12 weight percent of the adhesion promoter.

14. The article of claim 10,
wherein the poly(phenylene ether) comprises a poly(2,6-dimethyl-1,4-phenylene ether) having an intrinsic viscosity of 0.3 to 0.5 deciliter per gram, measured at 25°C in chloroform;
wherein the organophosphate ester comprises resorcinol bis(diphenyl phosphate);
wherein the adhesion promoter is the hydroxysilyl-terminated polydiorganosiloxane, and wherein the hydroxysilyl-terminated polydiorganosiloxane comprises a hydroxysilyl-terminated poly(dimethylsiloxane-co-diphenylsiloxane); and
wherein the composition comprises
70 to 80 weight percent of the poly(phenylene ether),
4 to 8 weight percent of the polystyrene-poly(ethylene-butylene)-polystyrene triblock copolymer,
7 to 11 weight percent of the flame retardant, and
2 to 6 weight percent of the adhesion promoter.
