NITROGEN-CONTAINING HETEROCYCLIC COMPOUNDS AND METHODS OF USE THEREOF

Field of the Invention

The present invention relates to nicotinic acid receptor agonist compounds useful for treating metabolic syndrome, dyslipidemia, cardiovascular diseases, disorders of the peripheral and central nervous system, hematological diseases, cancer, inflammation, respiratory diseases, gastroenterological diseases, diabetes, and non-alcoholic fatty liver disease; pharmaceutical compositions comprising such compounds; pharmaceutical compositions comprising nicotinic acid receptor agonist compounds in combination with other therapeutic agents; and methods of treatment using the compounds and compositions to treat conditions such as metabolic syndrome, dyslipidemia, cardiovascular diseases, disorders of the peripheral and central nervous system, hematological diseases, cancer, inflammation, respiratory diseases, gastroenterological diseases, diabetes, hepatic steatosis and non-alcoholic fatty liver disease.

15

Background of the Invention

Nicotinic acid has been used to treat metabolic syndrome and dyslipidemia. However, nicotinic acid has undesirable side effects such as flushing and diarrhea. It is therefore desirable to provide improved nicotinic acid receptor agonists with improved efficacy at treating metabolic syndrome and dyslipidemia, yet without the undesirable side effects. The compounds of the present invention provide such improved nicotinic acid receptor agonists.

15 (e.g., chromatography, recrystallization and the like) , in sufficient purity to be characterizable by standard analytical techniques described herein or well known to the skilled artisan.

20 sufficient number of hydrogen atom(s) to satisfy the valences.

When a functional group in a compound is termed "protected", this means that the group is in modified form to preclude undesired side reactions at the protected site when the compound is subjected to a reaction. Suitable protecting groups will be recognized by those with ordinary skill in the art as well as by reference to standard
25 textbooks such as, for example, T. W. Greene *et al*, *Protective Groups in organic Synthesis* (1991), Wiley, New York.

When any variable (e.g., aryl, heterocycle, R², etc.) occurs more than one time in any constituent or in Formula I, its definition on each occurrence is independent of its definition at every other occurrence.

As used herein, the term "composition" is intended to encompass a product
30 comprising the specified ingredients in the specified amounts, as well as any product

which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

Prodrugs and solvates of the compounds of the invention are also contemplated herein. A discussion of prodrugs is provided in T. Higuchi and V. Stella, *Pro-drugs as Novel Delivery Systems* (1987) 14 of the A.C.S. Symposium Series, and in *Bioreversible Carriers in Drug Design*, (1987) Edward B. Roche, ed., American Pharmaceutical Association and Pergamon Press. The term "prodrug" means a compound (e.g, a drug precursor) that is transformed *in vivo* to yield a compound of Formula (I) or a pharmaceutically acceptable salt, hydrate or solvate of the compound. The transformation may occur by various mechanisms (e.g., by metabolic or chemical processes), such as, for example, through hydrolysis in blood. A discussion of the use of prodrugs is provided by T. Higuchi and W. Stella, "Pro-drugs as Novel Delivery Systems," Vol. 14 of the A.C.S. Symposium Series, and in *Bioreversible Carriers in Drug Design*, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987.

For example, if a compound of Formula (I) or a pharmaceutically acceptable salt, hydrate or solvate of the compound contains a carboxylic acid functional group, a prodrug can comprise an ester formed by the replacement of the hydrogen atom of the acid group with a group such as, for example, (C₁-C₈)alkyl, (C₂-C₁₂)alkanoyloxymethyl, 1-(alkanoyloxy)ethyl having from 4 to 9 carbon atoms, 1-methyl-1-(alkanoyloxy)-ethyl having from 5 to 10 carbon atoms, alkoxycarbonyloxymethyl having from 3 to 6 carbon atoms, 1-(alkoxycarbonyloxy)ethyl having from 4 to 7 carbon atoms, 1-methyl-1-(alkoxycarbonyloxy)ethyl having from 5 to 8 carbon atoms, N-(alkoxycarbonyl)aminomethyl having from 3 to 9 carbon atoms, 1-(N-(alkoxycarbonyl)amino)ethyl having from 4 to 10 carbon atoms, 3-phthalidyl, 4-crotonolactonyl, gamma-butyrolacton-4-yl, di-N,N-(C₁-C₂)alkylamino(C₂-C₃)alkyl (such as β-dimethylaminoethyl), carbamoyl-(C₁-C₂)alkyl, N,N-di (C₁-C₂)alkylcarbamoyl-(C₁-C₂)alkyl and piperidino-, pyrrolidino- or morpholino(C₂-C₃)alkyl, and the like.

Similarly, if a compound of Formula (I) contains an alcohol functional group, a prodrug can be formed by the replacement of the hydrogen atom of the alcohol group with a group such as, for example, (C₁-C₆)alkanoyloxymethyl, 1-((C₁-C₆)alkanoyloxy)ethyl, 1-methyl-1-((C₁-C₆)alkanoyloxy)ethyl, (C₁-

C₆)alkoxycarbonyloxymethyl, N-(C₁-C₆)alkoxycarbonylaminomethyl, succinoyl, (C₁-C₆)alkanoyl, α -amino(C₁-C₄)alkanyl, arylacyl and α -aminoacyl, or α -aminoacyl- α -aminoacyl, where each α -aminoacyl group is independently selected from the naturally occurring L-amino acids, P(O)(OH)₂, -P(O)(O(C₁-C₆)alkyl)₂ or glycosyl (the radical
5 resulting from the removal of a hydroxyl group of the hemiacetal form of a carbohydrate), and the like.

If a compound of Formula (I) incorporates an amine functional group, a prodrug can be formed by the replacement of a hydrogen atom in the amine group with a group such as, for example, R-carbonyl, RO-carbonyl, NRR'-carbonyl where R and R'
10 are each independently (C₁-C₁₀)alkyl, (C₃-C₇) cycloalkyl, benzyl, or R-carbonyl is a natural α -aminoacyl or natural α -aminoacyl, —C(OH)C(O)OY¹ wherein Y¹ is H, (C₁-C₆)alkyl or benzyl, —C(OY²)Y³ wherein Y² is (C₁-C₄) alkyl and Y³ is (C₁-C₆)alkyl, carboxy (C₁-C₆)alkyl, amino(C₁-C₄)alkyl or mono-N— or di-N,N-(C₁-C₆)alkylaminoalkyl, —C(Y⁴)Y⁵ wherein Y⁴ is H or methyl and Y⁵ is mono-N— or di-N,N-(C₁-C₆)alkylamino
15 morpholino, piperidin-1-yl or pyrrolidin-1-yl, and the like.

One or more compounds of the invention may exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like, and it is intended that the invention embrace both solvated and unsolvated forms. "Solvate" means a physical association of a compound of this invention with
20 one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolatable solvates. Non-limiting examples of suitable
25 solvates include ethanolates, methanolates, and the like. "Hydrate" is a solvate wherein the solvent molecule is H₂O.

One or more compounds of the invention may optionally be converted to a solvate. Preparation of solvates is generally known. Thus, for example, M. Caira *et al*, *J. Pharmaceutical Sci.*, 93(3), 601-611 (2004) describe the preparation of the solvates
30 of the antifungal fluconazole in ethyl acetate as well as from water. Similar preparations of solvates, hemisolvate, hydrates and the like are described by E. C. van Tonder *et al*, *AAPS PharmSciTech.*, 5(1), article 12 (2004); and A. L. Bingham *et*

al, Chem. Commun., 603-604 (2001). A typical, non-limiting, process involves dissolving the inventive compound in desired amounts of the desired solvent (organic or water or mixtures thereof) at a higher than ambient temperature, and cooling the solution at a rate sufficient to form crystals which are then isolated by standard methods. Analytical techniques such as, for example I. R. spectroscopy, show the presence of the solvent (or water) in the crystals as a solvate (or hydrate).

"Effective amount" or "therapeutically effective amount" is meant to describe an amount of compound or a composition of the present invention effective in inhibiting the above-noted diseases and thus producing the desired therapeutic, ameliorative, inhibitory or preventative effect.

The compounds of Formula I can form salts which are also within the scope of this invention. Reference to a compound of Formula I herein is understood to include reference to salts thereof, unless otherwise indicated. The term "salt(s)", as employed herein, denotes acidic salts formed with inorganic and/or organic acids, as well as basic salts formed with inorganic and/or organic bases. In addition, when a compound of Formula I contains both a basic moiety, such as, but not limited to a pyridine or imidazole, and an acidic moiety, such as, but not limited to a carboxylic acid, zwitterions ("inner salts") may be formed and are included within the term "salt(s)" as used herein. Pharmaceutically acceptable (i.e., non-toxic, physiologically acceptable) salts are preferred, although other salts are also useful. Salts of the compounds of the Formula I may be formed, for example, by reacting a compound of Formula I with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salt precipitates or in an aqueous medium followed by lyophilization.

Exemplary acid addition salts include acetates, ascorbates, benzoates, benzenesulfonates, bisulfates, borates, butyrates, citrates, camphorates, camphorsulfonates, fumarates, hydrochlorides, hydrobromides, hydroiodides, lactates, maleates, methanesulfonates, naphthalenesulfonates, nitrates, oxalates, phosphates, propionates, salicylates, succinates, sulfates, tartarates, thiocyanates, toluenesulfonates (also known as tosylates,) and the like. Additionally, acids which are generally considered suitable for the formation of pharmaceutically useful salts from basic pharmaceutical compounds are discussed, for example, by P. Stahl *et al*, Camille G. (eds.) *Handbook of Pharmaceutical Salts. Properties, Selection and Use*.

(2002) Zurich: Wiley-VCH; S. Berge *et al*, *Journal of Pharmaceutical Sciences* (1977) 66(1) 1-19; P. Gould, *International J. of Pharmaceutics* (1986) 33 201-217; Anderson *et al*, *The Practice of Medicinal Chemistry* (1996), Academic Press, New York; and in *The Orange Book* (Food & Drug Administration, Washington, D.C. on their website).

5 These disclosures are incorporated herein by reference thereto.

Exemplary basic salts include ammonium salts, alkali metal salts such as sodium, lithium, and potassium salts, alkaline earth metal salts such as calcium and magnesium salts, salts with organic bases (for example, organic amines) such as dicyclohexylamines, t-butyl amines, and salts with amino acids such as arginine,
10 lysine and the like. Basic nitrogen-containing groups may be quarternized with agents such as lower alkyl halides (e.g. methyl, ethyl, and butyl chlorides, bromides and iodides), dialkyl sulfates (e.g. dimethyl, diethyl, and dibutyl sulfates), long chain halides (e.g. decyl, lauryl, and stearyl chlorides, bromides and iodides), aralkyl halides (e.g. benzyl and phenethyl bromides), and others.

15 All such acid salts and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

Pharmaceutically acceptable esters of the present compounds include the
20 following groups: (1) carboxylic acid esters obtained by esterification of the hydroxy groups, in which the non-carbonyl moiety of the carboxylic acid portion of the ester grouping is selected from straight or branched chain alkyl (for example, acetyl, n-propyl, t-butyl, or n-butyl), alkoxyalkyl (for example, methoxymethyl), aralkyl (for example, benzyl), aryloxyalkyl (for example, phenoxymethyl), aryl (for example,
25 phenyl optionally substituted with, for example, halogen, C₁₋₄alkyl, or C₁₋₄alkoxy or amino); (2) sulfonate esters, such as alkyl- or aralkylsulfonyl (for example, methanesulfonyl); (3) amino acid esters (for example, L-valyl or L-isoleucyl); (4) phosphonate esters and (5) mono-, di- or triphosphate esters. The phosphate esters may be further esterified by, for example, a C₁₋₂₀ alcohol or reactive derivative thereof,
30 or by a 2,3-di (C₆₋₂₄)acyl glycerol.

Compounds of Formula I, and salts, solvates, esters and prodrugs thereof, may exist in their tautomeric form (for example, as an amide or imino ether). All such tautomeric forms are contemplated herein as part of the present invention.

The compounds of Formula (I) may contain asymmetric or chiral centers, and, therefore, exist in different stereoisomeric forms. It is intended that all stereoisomeric forms of the compounds of Formula (I) as well as mixtures thereof, including racemic mixtures, form part of the present invention. In addition, the present invention embraces all geometric and positional isomers. For example, if a compound of Formula (I) incorporates a double bond or a fused ring, both the cis- and trans-forms, as well as mixtures, are embraced within the scope of the invention.

Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods well known to those skilled in the art, such as, for example, by chromatography and/or fractional crystallization. Enantiomers can be separated by converting the enantiomeric mixture into a diastereomeric mixture by reaction with an appropriate optically active compound (e.g., chiral auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the diastereomers and converting (e.g., hydrolyzing) the individual diastereomers to the corresponding pure enantiomers. Also, some of the compounds of Formula (I) may be atropisomers (e.g., substituted biaryls) and are considered as part of this invention. Enantiomers can also be separated by use of chiral HPLC column.

It is also possible that the compounds of Formula (I) may exist in different tautomeric forms, and all such forms are embraced within the scope of the invention. Also, for example, all keto-enol and imine-enamine forms of the compounds are included in the invention.

All stereoisomers (for example, geometric isomers, optical isomers and the like) of the present compounds (including those of the salts, solvates, esters and prodrugs of the compounds as well as the salts, solvates and esters of the prodrugs), such as those which may exist due to asymmetric carbons on various substituents, including enantiomeric forms (which may exist even in the absence of asymmetric carbons), rotameric forms, atropisomers, and diastereomeric forms, are contemplated within the scope of this invention, as are positional isomers (such as, for example, 4-pyridyl and

3-pyridyl). (For example, if a compound of Formula (I) incorporates a double bond or a fused ring, both the cis- and trans-forms, as well as mixtures, are embraced within the scope of the invention. Also, for example, all keto-enol and imine-enamine forms of the compounds are included in the invention.).

5 Individual stereoisomers of the compounds of the invention may, for example, be substantially free of other isomers, or may be admixed, for example, as racemates or with all other, or other selected, stereoisomers. The chiral centers of the present invention can have the S or R configuration as defined by the *IUPAC* 1974
10 Recommendations. The use of the terms "salt", "solvate", "ester", "prodrug" and the like, is intended to equally apply to the salt, solvate, ester and prodrug of enantiomers, stereoisomers, rotamers, tautomers, positional isomers, racemates or prodrugs of the inventive compounds.

The present invention also embraces isotopically-labelled compounds of the present invention which are identical to those recited herein, but for the fact that one
15 or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine and chlorine, such as ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , ^{17}O , ^{31}P , ^{32}P , ^{35}S , ^{18}F , and ^{36}Cl , respectively.

20 Certain isotopically-labelled compounds of Formula (I) (e.g., those labeled with ^3H and ^{14}C) are useful in compound and/or substrate tissue distribution assays. Tritiated (i.e., ^3H) and carbon-14 (i.e., ^{14}C) isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium (i.e., ^2H) may afford certain therapeutic advantages resulting from
25 greater metabolic stability (e.g., increased in vivo half-life or reduced dosage requirements) and hence may be preferred in some circumstances. Isotopically labelled compounds of Formula (I) can generally be prepared by following procedures analogous to those disclosed in the Schemes and/or in the Examples hereinbelow, by substituting an appropriate isotopically labelled reagent for a non-isotopically labelled
30 reagent.

Polymorphic forms of the compounds of Formula I, and of the salts, solvates, esters and prodrugs of the compounds of Formula I, are intended to be included in the present invention.

The term "pharmaceutical composition" is also intended to encompass both the
5 bulk composition and individual dosage units comprised of more than one (e.g., two) pharmaceutically active agents such as, for example, a compound of the present invention and an additional agent selected from the lists of the additional agents described herein, along with any pharmaceutically inactive excipients. The bulk composition and each individual dosage unit can contain fixed amounts of the afore-
10 said "more than one pharmaceutically active agents". The bulk composition is material that has not yet been formed into individual dosage units. An illustrative dosage unit is an oral dosage unit such as tablets, pills and the like. Similarly, the herein-described method of treating a patient by administering a pharmaceutical composition of the present invention is also intended to encompass the administration of the afore-said
15 bulk composition and individual dosage units.

The compounds of Formula (I), or pharmaceutically acceptable salts, solvates, or esters thereof, can be administered orally or parenterally, including intravenous, intramuscular, interperitoneal, subcutaneous, rectal, or topical routes of administration, or if so selected, by a combination of one or more of the above-shown
30 methods.

Oral compositions may be prepared by any conventional pharmaceutical method, and may also contain sweetening agents, flavoring agents, coloring agents, and preserving agents.

The amount of compound of Formula (I), or a pharmaceutically acceptable salt, solvate, ester, or tautomer thereof, administered to a patient can be determined by a physician based on the age, weight, and response of the patient, as well as by the severity of the condition treated. For example, the amount of compound of Formula I, or a pharmaceutically acceptable salt, solvate, ester, or tautomer thereof, administered to the patient can range from about 0.1 mg/kg body weight per day to about 60 mg/kg/d. In one embodiment, the amount is from about 0.5 mg/kg/d to about 40 mg/kg/d. In another embodiment, the amount is from about 0.5 mg/kg/d to about 10 mg/kg/d. In a specific embodiment, the amount is about 1 mg/kg/d. In another specific embodiment, the amount is about 3 mg/kg/d. In another specific embodiment, the amount is about 5 mg/kg/d. In another specific embodiment, the amount is about 7 mg/kg/d. In still another specific embodiment, the amount is about 10 mg/kg/d.

After cooling to room temperature, the acetic acid was removed in *vacuo* and hot water was added to remove excess barbituric acid. The procedure was repeated a few times until no starting material was left. It was followed by washing with ether. The product **216** was dried and needed no further purification.

The starting material for the preparation of example **203** is as follows.

Preparative example 203

20

Step A:

165

To a solution of ethylphenylacetate (8.2g, 0.05 mol) in THF at -78°C was added LHMDS (1M in THF, 100 ml, 0.10 mol) and stirred for 20 min. Propionic anhydride (6.5 ml, 0.05 mol) was added rapidly. The mixture was allowed to warm up to 0°C and stirred for 30 min. It was quenched with NH_4Cl (aq.) and extracted with EtOAc. Usual work up afforded the crude material which was chromatographed on silica gel to obtain product.

Step B:

Preparative example 699

- 5 Compound **699a** (0.925 g, 3.53 mmol) was taken in DMF (10 mL) in a round bottomed flask equipped with a magnetic stirring bar. *N*-Iodosuccinimide (1.59 g, 7.05 mmol) was added portionwise and the reaction mixture was heated to 50°C overnight. After cooling to ambient temperature, H₂O (25 mL) was added. The product was filtered, washed with water followed by ether to give a white powdery mixture (> 95% yield). The product **699b** was used as such for the next step without any further purification.
- 10

- 15 Compound **699b** (0.1 g, 0.258 mmol) was taken in 5 mL DME/H₂O (4:1) in a 10 mL round bottomed flask. PdCl₂(PPh₃)₂ (0.018 g, 0.0258 mmol), Na₂CO₃ (0.082 g, 0.774 mmol), and phenylboronic acid (0.057 g, 0.464 mmol) was added, and the reaction mixture was allowed to reflux (80 °C) for 6 h. After cooling, the mixture was concentrated and purified by flash chromatography (CH₂Cl₂ to 5% MeOH/CH₂Cl₂) to yield compound **699**.

5

Step1:

To a solution of 4-pentenoic acid (**834A**, 60 g, 0.594 mol) and benzyl alcohol (56 mL, 0.54 mol) in dichloromethane (1 L) was added EDC (207 g, 1.08 mol) at 0°C and the reaction was stirred until homogeneous (~5 min). DMAP (6.7 g, 0.054 mol) was then added and reaction mixture was allowed to warm to room temperature, then stirred under nitrogen for an additional 2 hours. The reaction mixture was washed with 1N HCl (aq.), then saturated NaHCO₃ (aq.), then dried over sodium sulfate and concentrated *in vacuo* to provide compound **834B** in nearly quantitative yield (>95%).

10 Step2:

To a solution of compound **834B** (2.3 g, 0.012 mol) and 4% osmium tetroxide in water (3 mL, 0.04 eq) in 3:1 (v/v) THF/H₂O (45 mL:15 mL) was added sodium periodate (7.7 g, 0.036 mol) and the resulting reaction was stirred under nitrogen at room temperature overnight. Sodium periodate was then added and a precipitate formed from the resulting exotherm. The reaction mixture was filtered, dried over sodium sulfate and concentrated *in vacuo*. The resulting residue was purified using flash column chromatography on silica gel (0-20% EtOAc/Hexane) to provide compound **834C** (1.6 g, 0.083 mol, 67%).

Step 3:

25

To a solution of hexamethyl phosphorous triamide (25.4 g, 0.156 mol) in THF (300 mL) at -78°C was added dibromodifluoromethane (16.4 g, 0.078 mol) and the resulting suspension was allowed to warm to room temperature. Compound **834C** (7.5 g, 0.039 mol) was added and RM refluxed at 66°C under nitrogen overnight. The

30

reaction mixture was filtered, dried over sodium sulfate and concentrated *in vacuo*. The resulting residue was purified using flash column chromatography on silica gel (0-10% EtOAc/Hexane) to provide compound **834D** (5.5 g, 0.024 mol, 62 %).

5 Step 4:

To a solution of compound **834D** (5.5 g, 0.024 mol) in EtOAc (120 mL) was added 10% Pd/C (1.3 g, 0.05 eq) and the resulting solution was placed on Parr shaker under 50 psi hydrogen gas overnight. The reaction mixture was then filtered and the filtrate was concentrated *in vacuo* to provide compound **834E** (3.3 g, 0.024 mol, >99%).

15 Step 5

To solution of compound **834E** (6 g, 0.0434 mol) in THF (150 mL) was added CDI (8.5 g, 1.2 eq) and the resulting reaction was stirred at room temperature under nitrogen for 1 hour. MgCl₂ (4.1 g, 1 eq) and monomethyl malonate potassium salt (10.2 g, 1.5 eq) were then added and the resulting reaction was stirred at room temperature under nitrogen overnight. The reaction mixture was then partitioned between 1N HCl (aq.) (200 mL) and EtOAc (200 mL). The aqueous layer was collected and extracted with EtOAc (3 x 100 mL) and the combined organic layers were washed with brine (50 mL), dried over sodium sulfate, filtered and concentrated *in vacuo*. The crude residue obtained was purified using flash chromatography on silica gel (0-20% EtOAc/Hexane) to provide compound **834F** (6.7 g, 0.0347, 80%)

30 Step 6:

238

To a solution of barbituric acid (7 g, 1.1 eq) and compound **834F** (9.7 g, 0.05 mol) in EtOEtOH (15 mL) was added sulfamic acid (2.4 g, 0.5 eq) and the resulting reaction was stirred at 147°C for 4 hours. The reaction mixture was concentrated *in vacuo* and the resulting residue triturated with hot water three times to provide compound **834** (2 g, 0.007 mol, 15 %).

10

Preparative Example 835

15 N-cyclobutyl barbituric acid (782, 4.3 mmol) and compound **834F** (1 g, 1.2 eq) were heated at 140°C for 2 hours in the presence of sulfamic acid (417 mg, 1 eq). The mixture was suspended in 10 mL DMF and the suspension was then filtered. The filtrate was injected into a Gilson HPLC in twenty injections and purified on a C18 column eluted with 0.1% TFA in water/acetonitrile (gradient 10-100% water/acetonitrile at a flow rate of 25 mL/min) to provide compound **835** (retention time: 10.1 min; 120 mg, 0.037 mmol, 9%).

20

Preparative Example 836

**836**

5

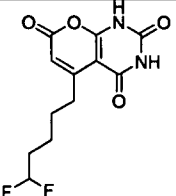

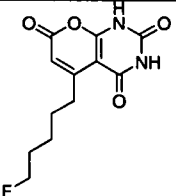

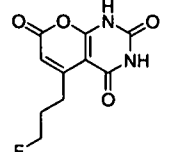

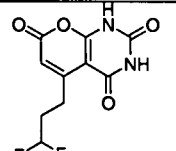

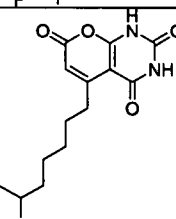

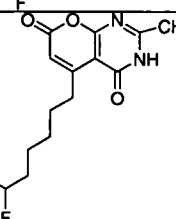

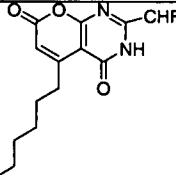

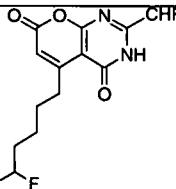

To a mixture of difluorobarbituric acid (1 g) and compound **834F** (1 g) in a 15 mL microwave vial was added acetic acid (3 mL). The vial was sealed and the resulting solution was microwaved at 180 °C for 20 minutes. The reaction mixture was then concentrated *in vacuo* and purified using flash chromatography on silica gel (gradient elution of 0-80% EtOAc/Hexane). The blue UV band that eluted off the column was collected and concentrated *in vacuo* and the resulting residue was purified using preparative TLC (2:1 EtOAc/Hexane) to provide compound **836** (40 mg, 3%).

15

Using the methods described above in Preparative Examples **834-836** with the appropriate difluoro β -keto ester and barbituric acid or barbituric acid derivative, Compounds **837-844** were prepared:

Nicotinic Acid Receptor Assay

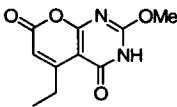

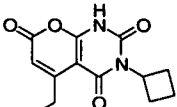

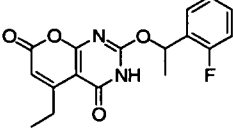

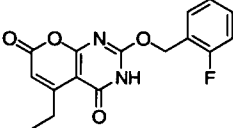

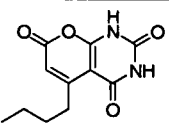

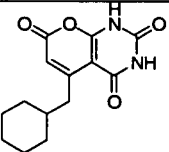

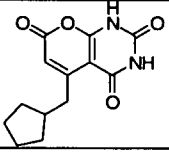

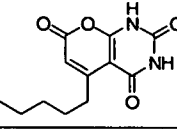

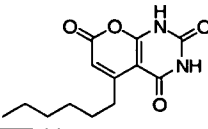

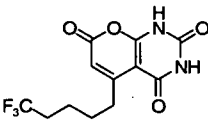

The nicotinic acid receptor agonist activity of the inventive compounds was determined by following the inhibition of forskolin-stimulated cAMP accumulation in cells using the MesoScale Discovery cAMP detection kit following the manufacturer's protocol. Briefly, Chinese Hamster Ovary (CHO) cells expressing recombinant human nicotinic acid receptor (NAR) were harvested enzymatically, washed 1X in phosphate buffered saline (PBS) and resuspended in PBS containing 0.5 mM IBMX at 3×10^6 cells/mL. Ten μL of cell suspension was added to each well of a 384-well plate which contained 10 μL of test compounds. Test compounds were diluted with PBS containing 6 μM of forskolin. Plates were incubated for 30 minutes at room temperature after the addition of cells. Lysis buffer containing cAMP-Tag was added to each well (10 μL /well) as per the manufacturer's protocol. Plates were then incubated from 45 minutes to overnight. Prior to reading, 10 μL of read buffer was added to each well, and the plate was read in a Sector 6000 plate imager. The signal was converted to cAMP concentration using a standard curve run on each plate. Compound EC_{50} values were determined from concentration gradients of test compounds.

Compounds of Formula (I) of the present invention, and salts, solvates, or esters thereof, have cAMP EC_{50} values of less than about 10,000 nM, preferably about 1000 nM or less, more preferably about 500 nM or less, even more preferably about 100 nM or less.

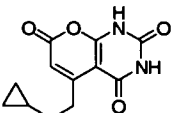

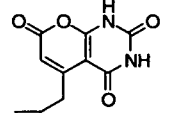

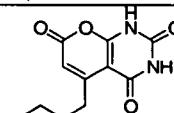

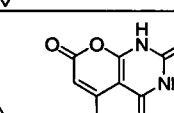

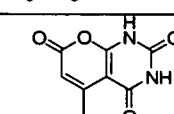

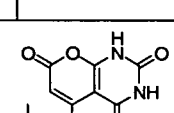

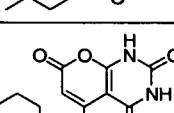

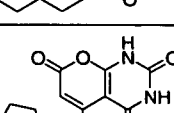

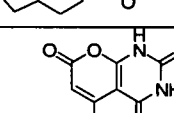

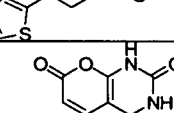

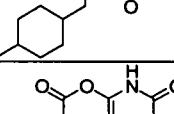

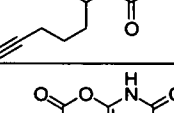

Examples 1, 5, 10, 29, 39, 71, 101-116, and 118-135 have cAMP EC_{50} values of 100 nM or less.

The activity of selected illustrative compounds of the invention as determined using the above-described assay is presented in the following Table:
