and/or physiologically acceptable salts thereof for the preparation of a medicament for the treatment of osteoporosis, tumours, tumour metastases, atherosclerosis, rheumatoid arthritis, multiple sclerosis, diabetes mellitus, ulcerative colitis and AIDS.

The invention had the object of finding novel uses of the compounds of the formulae I, in particular those which can lead to the preparation of medicaments.

It has been found that the compounds of the formulae I and their salts have very valuable pharmacological properties and are well tolerated.

In particular, they exhibit selective phosphodiesterase IV inhibition combined with an intracellular increase in cAMP (N. Sommer et al., Nature Medicine, 1, 244-248 (1995)).

The PDE IV inhibition can be demonstrated, for example, analogously to C.W. Davis in Biochim. Biophys. Acta 797, 354-362 (1984).
The compounds according to the invention can be employed for the treatment of asthmatic diseases. The antiasthmatic action of PDE IV inhibitors has been described, for example, by T.J. Torphy et al. in Thorax, 46, 512-523 (1991) and can be determined, for example, by the method of T. Olsson, Acta allergologica 26, 438-447 (1971).

Since cAMP inhibits bone-degrading cells and stimulates bone-forming cells (S. Kasugai et al., M 681 and K. Miyamoto, M 682, in Abstracts of the American Society for Bone and Mineral Research, 18th Annual Meeting, 1996), the compounds according to the invention can be employed for the treatment of osteoporosis.

In addition, the compounds exhibit an inhibiting action to the formation of TNF (tumour necrosis factor) and are therefore suitable for the treatment of allergic and inflammatory illnesses, autoimmune diseases and transplant rejection reactions. They can be employed for the treatment of memory disorders, tumours, tumour metastases, atherosclerosis, rheumatoid arthritis, multiple sclerosis, Crohn's disease, atopic dermatitis, diabetes mellitus, ulcerative colitis and AIDS.

The action of PDE IV inhibitors in the treatment of asthma, inflammatory diseases, diabetes mellitus, atopic dermatitis, psoriasis, AIDS, tumour growth or tumour metastases is described, for example in EP 779 291.

The antiinflammatory action of the substances according to the invention and their efficacy for the treatment of, for example, autoimmune diseases, multiple sclerosis or rheumatoid arthritis, can be determined analogously to the methods of N. Sommer et al., Nature Medicine 1, 244-248 (1995) or L. Sekut et al., Clin. Exp. Immunol. 100, 126-132 (1995).
The action of PDE IV inhibitors in the treatment of tumours is described, for example, in WO 95/35281, WO 95/17399 and WO 96/00215.

Surprisingly, it has been found that the compounds of the formula I are suitable for the treatment of cancer.

The invention furthermore relates to the use of the compounds of the formulae I and their physiologically acceptable salts and/or solvates for the preparation of a medicament for inhibiting the growth of neoplastic cells.

The term neoplastic cells is taken to mean cancer cells.

The invention relates in particular to the use of the compounds of the formulae I and their physiologically acceptable salts and/or solvates for the preparation of a medicament for the treatment and/or prophylaxis of cancer diseases.

The invention furthermore relates to the use of the compounds of the formulae I and their physiologically acceptable salts and/or solvates for the preparation of a medicament for the treatment of neoplastic damage.

The invention furthermore relates to the use of the compounds of the formulae I and their physiologically acceptable salts and/or solvates for the preparation of a medicament for the treatment of precancerogenic damage.

The term precancerogenic damage is taken to mean, for example, benign tumours in the intestine which could lead to intestinal cancer.

The term precancerogenic damage is taken to mean, in particular, the lesions mentioned in US 5,948,911 in column 4, lines 49-60.
Irregularities in apoptosis (cell death) play a part in the formation of pre-cancerogenic damage.

It is also known that the regulation of apoptosis plays an important role in diseases connected with abnormal cell growth, such as, for example, benign prostate hyperplasia, neurodegenerative diseases, such as, for example, Parkinson’s, autoimmune diseases, including multiple sclerosis, and rheumatoid arthritis, or infection diseases, such as AIDS.

The compounds of the formulae I modulate apoptosis and are used in the treatment or prophylaxis of cancer diseases.

The invention thus relates to the use of the compounds of the formulae I and their physiologically acceptable salts and/or solvates for the preparation of a medicament for the regulation of apoptosis in human cells.

The compounds of the formulae I can be employed as medicament active ingredients in human and veterinary medicine. They can furthermore be employed as intermediates for the preparation of further medicament active ingredients.

The compounds of the formulae I can have a chiral centre and can therefore occur in a plurality of stereoisomeric forms. All these forms (for example R and S forms) and mixtures thereof (for example the R,S forms) are included in the formulae I.

These compounds of the formulae I can be used as medicaments in human or veterinary medicine. Suitable excipients are organic or inorganic substances which are suitable for enteral (for example oral), parenteral or topical administration and do no react with the novel compounds, for example water, vegetable oils, benzyl alcohols, alkylene glycols, polyethylene glycols, glycerol triacetate, gelatine, carbohydrates, such as
lactose or starch, magnesium stearates, talc or vaseline. Suitable for oral administration are, in particular, tablets, pills, coated tablets, capsules, powders, granules, syrups, juices or drops, suitable for rectal administration are suppositories, suitable for parenteral administration are solutions, preferably oil-based or aqueous solutions, furthermore suspensions, emulsions or implants, and suitable for topical application are ointments, creams or powders. The novel compounds may also be lyophilised and the resultant lyophilisates used, for example, for the preparation of injection preparations. The preparations indicated may be sterilised and/or comprise assistants, such as lubricants, preservatives, stabilisers and/or wetting agents, emulsifiers, salts for modifying the osmotic pressure, buffer substances, colorants and flavours and/or one or more further active ingredients, for example one or more vitamins.

The compounds of the formulae I and their physiologically acceptable salts can be employed for combating illnesses in which an increase in the cAMP (cycloadenosine monophosphate) level results in inflammation inhibition or prevention and muscle relaxation.

The compounds according to the invention can be used, in particular, in the treatment osteoporosis, tumours, tumour metastases, asthma, chronic bronchitis, atopic dermatitis, psoriasis and skin diseases and autoimmune diseases.
Thus, in one aspect, the invention relates to use of a) compounds of the formula:

The substances according to the invention are in general preferably administered in doses of between about 1 and 500 mg, in particular between 5 and 100 mg per dosage unit. The daily dose is preferably between about 0.02 and 10 mg/kg of body weight. However, the specific dose for each patient depends on a wide variety of factors, for example on the efficacy of the specific compound employed, on the age, body weight, general state of health, sex, on the diet, on the time and method of administration, on the excretion rate, medicament combination and severity of the
particular illness to which the therapy applies. Oral administration is preferred.

Compounds of the formulae I can have one or more centres of asymmetry. In this case, they are usually in racemic form. Racemates obtained can be separated into their enantiomers mechanically or chemically by methods known per se. Diastereomers are preferably formed from the racemic mixtures by reaction with an optically active resolving agent.

The invention relates, in particular, to the use of a) compounds, disclosed in EP 0 738 715 A2, selected from the group consisting of
