METABOTROPIC GLUTAMATE RECEPTOR 5 MODULATORS AND METHODS OF USE THEREOF

Related Applications

This application claims priority to U.S. Provisional Patent Application No. 61/490,402, filed May 26, 2011. The entire contents of the foregoing application are hereby incorporated by reference.

Background

The amino acid L-glutamate (which herein is referred to simply as glutamate) is the principal excitatory neurotransmitter in the brain and other elements of the central nervous system of mammals. Glutamate binds to neurons and activates cell surface receptors. Glutamate has significant roles in motor control, cognitive function, sensory perception, and acts as a mediator of persistent changes in the strength of synaptic signaling (synaptic plasticity), thereby modulating long term potentiation (LTP) and long term depression (LTD), which form the basis of learning and memory. Many neurological and neuropsychiatric disorders, including, but not limited to, psychosis spectrum disorders, schizophrenia and other cognitive deficits, are associated with aberrations in the function of (or the regulation by, or the regulation of) glutamate signaling systems.

Glutamate mediates its effect via two distinct types of receptors, the ionotropic receptors and the metabotropic receptors. The family of the metabotropic receptors (mGlu or mGluR) consists of eight different subtypes, which are further classified into three subgroups based on sequence homology, effector coupling and pharmacology. In particular, group I mGlu receptors (mGluR1 and mGluR5) are positively coupled to phospholipase C, while group II mGlu receptors (mGluR2 and mGluR3) and group III receptors (mGluR4, mGluR6, mGluR7, and mGluR8) are negatively coupled to adenylate cyclase (Conn et al. Annu. Rev. Pharmacol. Toxicol. 1997; 37:205-37).

mGluR5, which is widely expressed in the central nervous system, has at least two discrete allosteric binding sites, in addition to the orthosteric site, and has been implicated in a range of physiological functions, including phosphoinositide hydrolysis responses, modulation of potassium and voltage dependent calcium channels, modulation of ligand-gated ion channels and acting as a presynaptic autoreceptor at
glutamatergic synapses, thereby modulating glutamate release (Conn et al., supra). Accordingly, development of therapeutic agents that modulate mGluR5 via direct agonism or antagonism or by positive or negative allosteric modulation may prove useful for treatment of disorders influenced by the foregoing physiological functions, such as neurological disorders, neuropsychiatric disorders, GERD, drug addiction and alcohol addiction.

Summary
The present invention is based, at least in part, on the discovery that the compounds as disclosed herein are allosteric modulators of mGluR5, for example, negative or positive allosteric modulators.

For example, a stereomerically pure composition of a compound having one chiral center will be substantially free of the opposite enantiomer of the compound. A stereomerically pure composition of a compound having two or more chiral centers is substantially free of other diastereomers. A typical stereomerically pure compound comprises greater than about 80% by weight of one stereoisomer, greater than about 90% by weight of one stereoisomer, greater than about 95% by weight of one stereoisomer, greater than about 97% by weight of one stereoisomer, greater than about 99% by weight, greater than 99.5%, or even greater than 99.9% of one stereoisomer.

In describing an optically active compound, the prefixes $R$ and $S$ are used to denote the absolute configuration of the molecule about its chiral center(s). The (+) and (-) notations are used to denote the optical rotation of the compound, that is, the direction in which a plane of polarized light is rotated by the optically active compound. The (+) prefix indicates that the compound is dextrorotatory, that is, the compound rotates the plane of polarized light to the right or counterclockwise. The (-) prefix indicates that the compound is levorotatory, that is, the compound rotates the plane of polarized light to the left or clockwise. However, the sign of optical rotation, (+) and (-), is not related to the absolute configuration of the molecule, $R$ and $S$.

For example, any hydrogen represented by "H" in the formulae herein is intended to represent all isotopic forms of hydrogen (e.g., \(^1\)H, \(^2\)H or D, or \(^3\)H or T) unless otherwise specified; any carbon represented in any of the formulae disclosed herein are intended to represent all isotopic forms of carbon (e.g., \(^1\)C, \(^13\)C, \(^14\)C) unless otherwise specified; similarly, any nitrogen represented by "N" is intended to represent all isotopic forms of nitrogen (e.g., \(^14\)N, \(^18\)N) unless otherwise specified. Enrichment with heavier isotopes, particularly deuterium (i.e., \(^2\)H or D) may afford certain therapeutic advantages including, but not limited to, greater
metabolic stability, for example, increased *in vivo* half-life or reduced dosage requirements or an improvement in therapeutic index. Other examples of isotopes include, but are not limited to, oxygen, sulfur, phosphorous, fluorine, iodine and chlorine, such as $^{18}$F, $^{15}$O, $^{31}$P, $^{32}$P, $^{35}$S, $^{36}$Cl and $^{125}$I. Pain

As used herein, and unless otherwise specified, the term "pain" refers to an unpleasant sensory and emotional experience. The term "pain," as used herein, refers to all categories of pain, including pain that is described in terms of stimulus or nerve response, e.g., somatic pain (normal nerve response to a noxious stimulus) and neuropathic pain (abnormal response of an injured or altered sensory pathway, often without clear noxious input); pain that is categorized temporally, e.g., chronic pain and acute pain; pain that is categorized in terms of its severity, e.g., mild, moderate, or severe; and pain that is a symptom or a result of a disease state or syndrome, e.g., inflammatory pain, cancer pain, carpal tunnel syndrome, AIDS pain, arthropathy,
migraine, trigeminal neuralgia, cardiac ischaemia, neuropathy arising from chronic alcohol use, and diabetic peripheral neuropathic pain (see, e.g., Harrison's Principles of Internal Medicine, pp. 93-98 (Wilson et al., eds., 12th ed. 1991); Williams et al., J. of Med. Chem. 42: 1481-1485 (1999), herein each incorporated by reference in their entirety). "Pain" is also meant to include mixed etiology pain, dual mechanism pain, allodynia, causalgia, central pain, hyperesthesia, hyperpathia, dysesthesia, and hyperalgesia. In addition, the term "pain" includes pain resulting from dysfunction of the nervous system: organic pain states that share clinical features of neuropathic pain and possible common pathophysiology mechanisms, but are not initiated by an identifiable lesion in any part of the nervous system.

The term "somatic pain," as used herein, refers to a normal nerve response to a noxious stimulus such as injury or illness, e.g., trauma, burn, infection, inflammation, or disease process such as cancer, and includes both cutaneous pain (e.g., skin, muscle or joint derived) and visceral pain (e.g., organ derived).

The term "neuropathic pain," as used herein, refers to a heterogeneous group of neurological conditions that result from damage to the nervous system. The term also refers to pain resulting from injury to or dysfunctions of peripheral and/or central sensory pathways, and from dysfunctions of the nervous system, where the pain often occurs or persists without an obvious noxious input. This includes pain related to peripheral neuropathies as well as central neuropathic pain. Common types of peripheral neuropathic pain include diabetic neuropathy (also called diabetic peripheral neuropathic pain, or DN, DPN, or DPNP), post-herpetic neuralgia (PHN), and trigeminal neuralgia (TON). Central neuropathic pain, involving damage to the brain or spinal cord, can occur following stroke, spinal cord injury, and as a result of multiple sclerosis, and is also encompassed by the term. Other types of pain that are meant to be included in the definition of neuropathic pain include, but are not limited to, pain from neuropathic cancer pain, HIV/AIDS induced pain, phantom limb pain, and complex regional pain syndrome.

The term also encompasses the common clinical features of neuropathic pain including, but not limited to, sensory loss, allodynia (non-noxious stimuli produce pain), hyperalgesia and hyperpathia (delayed perception, summation, and painful after sensation). Pain is often a combination of nociceptive and neuropathic types, for example, mechanical spinal pain and radiculopathy or myelopathy.
As used herein, and unless otherwise specified, the term "acute pain" refers to the normal, predicted physiological response to a noxious chemical, thermal or mechanical stimulus typically associated with invasive procedures, trauma and disease. It is generally time-limited, and may be viewed as an appropriate response to a stimulus that threatens and/or produces tissue injury. The term also refers to pain which is marked by short duration or sudden onset.

As used herein, and unless otherwise specified, the term "chronic pain" encompasses the pain occurring in a wide range of disorders, for example, trauma, malignancies and chronic inflammatory diseases such as rheumatoid arthritis. Chronic pain may last more than about six months. In addition, the intensity of chronic pain may be disproportionate to the intensity of the noxious stimulus or underlying process. The term also refers to pain associated with a chronic disorder, or pain that persists beyond resolution of an underlying disorder or healing of an injury, and that is often more intense than the underlying process would predict. It may be subject to frequent recurrence.

As used herein, and unless otherwise specified, the term "inflammatory pain" is pain in response to tissue injury and the resulting inflammatory process. Inflammatory pain is adaptive in that it elicits physiologic responses that promote healing. However, inflammation may also affect neuronal function. Inflammatory mediators, including PGE2 induced by the COX2 enzyme, bradykinins, and other substances, bind to receptors on pain-transmitting neurons and alter their function, increasing their excitability and thus increasing pain sensation. Much chronic pain has an inflammatory component. The term also refers to pain which is produced as a symptom or a result of inflammation or an immune system disorder.

As used herein, and unless otherwise specified, the term "visceral pain" refers to pain which is located in an internal organ.

As used herein, and unless otherwise specified, the term "mixed etiology pain" refers to pain that contains both inflammatory and neuropathic components.

As used herein, and unless otherwise specified, the term "dual mechanism pain" refers to pain that is amplified and maintained by both peripheral and central sensitization.

As used herein, and unless otherwise specified, the term "causalgia" refers to a syndrome of sustained burning, allodynia, and hyperpathia after a traumatic nerve
lesion, often combined with vasomotor and sudomotor dysfunction and later trophic changes.

As used herein, and unless otherwise specified, the term "central pain" refers to pain initiated by a primary lesion or dysfunction in the central nervous system.

As used herein, and unless otherwise specified, the term "hyperesthesia" refers to increased sensitivity to stimulation, excluding the special senses.

As used herein, and unless otherwise specified, the term "hyperpathia" refers to a painful syndrome characterized by an abnormally painful reaction to a stimulus, especially a repetitive stimulus, as well as an increased threshold. It may occur with allodynia, hyperesthesia, hyperalgesia, or dysesthesia.

As used herein, and unless otherwise specified, the term "dysesthesia" refers to an unpleasant abnormal sensation, whether spontaneous or evoked. In certain embodiments, dysesthesia include hyperalgesia and allodynia.

As used herein, and unless otherwise specified, the term "hyperalgesia" refers to an increased response to a stimulus that is normally painful. It reflects increased pain on suprathreshold stimulation.

As used herein, and unless otherwise specified, the term "allodynia" refers to pain due to a stimulus that does not normally provoke pain.

As used herein, and unless otherwise specified, the term "Diabetic Peripheral Neuropathic Pain" (DPNP), also called diabetic neuropathy, DN or diabetic peripheral neuropathy), refers to chronic pain caused by neuropathy associated with diabetes mellitus. The classic presentation of DPNP is pain or tingling in the feet that can be described not only as "burning" or "shooting" but also as severe aching pain. Less commonly, patients may describe the pain as itching, tearing, or like a toothache. The pain may be accompanied by allodynia and hyperalgesia and an absence of symptoms, such as numbness.

As used herein, and unless otherwise specified, the term "Post-Herpetic Neuralgia", also called "Postherpetic Neuralgia (PHN)", refers to a painful condition affecting nerve fibers and skin. Without being limited by a particular theory, it is a complication of shingles, a second outbreak of the varicella zoster virus (VZV), which initially causes chickenpox.

As used herein, and unless otherwise specified, the term "neuropathic cancer pain" refers to peripheral neuropathic pain as a result of cancer, and can be caused
directly by infiltration or compression of a nerve by a tumor, or indirectly by cancer treatments such as radiation therapy and chemotherapy (chemotherapy-induced neuropathy).

As used herein, and unless otherwise specified, the term "HIV/AIDS peripheral neuropathy" or "HIV/AIDS related neuropathy" refers to peripheral neuropathy caused by HIV/AIDS, such as acute or chronic inflammatory demyelinating neuropathy (AIDP and CIDP, respectively), as well as peripheral neuropathy resulting as a side effect of drugs used to treat HIV/AIDS.

As used herein, and unless otherwise specified, the term "Phantom Limb Pain" refers to pain appearing to come from where an amputated limb used to be. Phantom limb pain can also occur in limbs following paralysis (e.g. following spinal cord injury). "Phantom Limb Pain" is usually chronic in nature.

As used herein, and unless otherwise specified, the term "Trigeminal Neuralgia (TN)" refers to a disorder of the fifth cranial (trigeminal) nerve that causes episodes of intense, stabbing, electric-shock-like pain in the areas of the face where the branches of the nerve are distributed (lips, eyes, nose, scalp, forehead, upper jaw, and lower jaw). It is also known as the "suicide disease".

As used herein, and unless otherwise specified, the term "Complex Regional Pain Syndrome (CRPS)," formerly known as Reflex Sympathetic Dystrophy (RSD), refers to a chronic pain condition whose key symptom is continuous, intense pain out of proportion to the severity of the injury, which gets worse rather than better over time. The term encompasses type 1 CRPS, which includes conditions caused by tissue injury other than peripheral nerve, and type 2 CRPS, in which the syndrome is provoked by major nerve injury, and is sometimes called causalgia.

As used herein, and unless otherwise specified, the term "fibromyalgia" refers to a chronic condition characterized by diffuse or specific muscle, joint, or bone pain, along with fatigue and a range of other symptoms. Previously, fibromyalgia was known by other names such as fibrositis, chronic muscle pain syndrome, psychogenic rheumatism and tension myalgias.

As used herein, and unless otherwise specified, the term "convulsion" refers to a neurological disorder and is used interchangeably with "seizure," although there are many types of seizure, some of which have subtle or mild symptoms instead of convulsions. Seizures of all types may be caused by disorganized and sudden electrical
activity in the brain. In some embodiments, convulsions are a rapid and uncontrollable shaking during which the muscles contract and relax repeatedly.

**Pharmaceutical Compositions**

In some embodiments, the present invention provides a pharmaceutical composition comprising a compound as disclosed herein and a pharmaceutically acceptable carrier.

The term "pharmaceutically acceptable carrier" includes any and all solvents, dispersion media, coatings, surfactants, antioxidants, preservatives (*e.g.*, antibacterial agents, antifungal agents), isotonic agents, absorption delaying agents, salts, preservatives, drugs, drug stabilizers, binders, excipients, disintegration agents, lubricants, sweetening agents, flavoring agents, dyes, such like materials and combinations thereof, as would be known to one of ordinary skill in the art (*see, for example, Remington’s Pharmaceutical Sciences*, 18th Ed. Mack Printing Company, 1990, pp. 1289-1329). Except insofar as any conventional carrier is incompatible with the active ingredient, its use in the therapeutic or pharmaceutical compositions is contemplated by the invention.

The pharmaceutical composition may be formulated for particular routes of administration such as oral, intravenous, intraperitoneal, parenteral, enteral, sublingual, vaginal, subcutaneous, transdermal, transmucosal, sublabial, buccal, intracerebral, intracerebroventricular, intramuscular, intranasal, intrathecal, inhalation, topical, or rectal administration, etc. In addition, the pharmaceutical compositions of the present invention may be in a solid form including capsules, tablets, pills, granules, powders, thin film, or suppositories, or in a liquid form including solutions, suspensions, gels, creams, or emulsions. The pharmaceutical compositions may be subjected to conventional pharmaceutical operations such as sterilization and/or can contain conventional inert diluents, lubricating agents or buffering agents, as well as adjuvants, such as preservatives, stabilizers, wetting agents, emulsifiers and buffers.

In some embodiments, the pharmaceutical compositions are tablets or gelatin capsules comprising the active ingredient together with a) diluents, (*e.g.*, lactose, dextrose, sucrose, mannitol, sorbitol, cellulose and/or glycine); b) lubricants, (*e.g.*, silica, talcum, stearic acid, its magnesium or calcium salt and/or polyethyleneglycol); c) binders, (*e.g.*, magnesium aluminum silicate, starch paste, gelatin, tragacanth,

Suitable compositions for oral administration include an effective amount of a compound as disclosed herein in the form of tablets, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsion, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use are prepared according to any method known in the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from sweetening agents, flavoring agents, coloring agents and preservatives. Tablets generally contain the active ingredient(s) in admixture with nontoxic pharmaceutically acceptable excipients that are suitable for the manufacture of tablets. These excipients are, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example, starch, gelatin or acacia; and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. Formulations for oral use may be presented as hard gelatin capsules in which the active ingredient(s) are mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example, peanut oil, liquid paraffin or olive oil.

Certain injectable compositions are aqueous isotonic solutions or suspensions, and suppositories may be prepared from fatty emulsions or suspensions. Such compositions may be sterilized and/or contain adjuvants, such as preserving, stabilizing, wetting or emulsifying agents, solution promoters, salts for regulating the osmotic pressure and/or buffers. In addition, they may also contain other therapeutic agents. Such compositions may be prepared according to conventional mixing, granulating or
coating methods, respectively, and contain about 0.1-75%, or contain about 1-50%, of the active ingredient.

Suitable compositions for transdermal application include an effective amount of a compound as disclosed herein with a carrier. Carriers include absorbable pharmacologically acceptable solvents to assist passage through the skin of the subject. For example, transdermal devices may be in the form of a bandage comprising a backing member, a reservoir containing the compound optionally with carriers, optionally a rate controlling barrier to deliver the compound of the skin of the host at a controlled and predetermined rate over a prolonged period of time, and means to secure the device to the skin.

Such topical compositions may contain solubilizers, stabilizers, tonicity enhancing agents, buffers and preservatives.

Topical application may also pertain to an inhalation or to an intranasal application. Such compositions may be delivered in the form of a dry powder (either alone, as a mixture, for example, a dry blend with lactose, or a mixed component particle, for example with phospholipids) from a dry powder inhaler or an aerosol spray presentation from a pressurized container, pump, spray, atomizer or nebuliser, with or without the use of a suitable propellant.

The present invention further provides anhydrous pharmaceutical compositions and dosage forms comprising a compound as disclosed herein as active ingredient(s), since water may facilitate the degradation of certain compounds. Anhydrous pharmaceutical compositions and dosage forms of the invention may be prepared using anhydrous or low moisture containing ingredients and low moisture or low humidity conditions. An anhydrous pharmaceutical composition may be prepared and stored such that its anhydrous nature is maintained. Accordingly, anhydrous compositions are preferably packaged using materials known to prevent exposure to water such that they can be included in suitable formulary kits. Examples of suitable packaging include hermetically sealed foils, plastics, unit dose containers (e.g. vials), blister packs, and strip packs.

The invention further provides pharmaceutical compositions and dosage forms that comprise one or more agents that reduce the rate by which a compound as disclosed
herein will decompose. Such agents, referred to herein as "stabilizers," include antioxidants such as ascorbic acid, pH buffers, or salt buffers, etc.

The pharmaceutical composition or combination of the present invention may be present in a unit dosage in an amount of about 0.001 mg -10 g, 0.01-500 mg or about 0.01-250 mg or about 0.01-150 mg or about 0.01-100 mg, or about 0.01-50 mg of active ingredient for a subject of about 50-70 kg. The therapeutically effective dosage of a compound, the pharmaceutical composition, or the combinations thereof, is dependent on the species of the subject, the body weight, age and individual condition, the disorder or disease or the severity thereof being treated. A physician, clinician or veterinarian of ordinary skill can readily determine the effective amount of each of the active ingredients necessary to prevent, treat or inhibit the progress of the disorder or disease.

A therapeutically effective amount in vivo may range depending on the route of administration, between about 0.0001-500 mg/kg, or between about 0.0001-100 mg/kg, or between about 0.0003-10 mg/kg.

EXAMPLES

Certain embodiments are illustrated by the following non-limiting examples.

Synthesis of Compounds

In the examples below, unless otherwise indicated, all temperatures are set forth in degrees Celsius and all parts and percentages are by weight. Reagents may be purchased from commercial suppliers, such as Sigma-Aldrich Chemical Company, and may be used without further purification unless otherwise indicated. Reagents may also be prepared following standard literature procedures known to those skilled in the art. Solvents may be purchased from Aldrich in Sure-Seal bottles and used as received. All solvents may be purified using standard methods known to those skilled in the art, unless otherwise indicated.

The reactions set forth below were done generally at ambient temperature, unless otherwise indicated. The reaction flasks were fitted with rubber septa for introduction of substrates and reagents via syringe. Analytical thin layer chromatography (TLC) was performed using glass-backed silica gel pre-coated plates (Merck Art 5719) and eluted with appropriate solvent ratios (v/v). Reactions were assayed by TLC or LCMS, and terminated as judged by the consumption of starting material. Visualization of the TLC plates was done with UV light (254 wavelength) or with an appropriate TLC visualizing solvent, such as basic aqueous KMnO₄ solution activated with heat. Flash column chromatography (See, e.g., Still et al., J. Org. Chem., 43: 2923 (1978)) was performed using silica gel 60 (Merck Art 9385) or various MPLC systems.

The compound structures in the examples below were confirmed by one or more of the following methods: proton magnetic resonance spectroscopy, mass spectroscopy, and melting point. Proton magnetic resonance (^1H NMR) spectra were determined using an NMR spectrometer operating at 400 MHz field strength. Chemical shifts are reported in the form of delta (δ) values given in parts per million (ppm) relative to an internal standard, such as tetramethylsilane (TMS). Alternatively, ^1H NMR spectra were referenced to signals from residual protons in deuterated solvents as follows: CDC1₃ = 7.25 ppm; DMSO-d₆ = 2.49 ppm; C₆D₆ = 7.16 ppm; CD₃OD = 3.30 ppm. Peak multiplicities are designated as follows: s, singlet; d, doublet; dd, doublet of doublets; t, triplet; dt, doublet of triplets; q, quartet; br, broadened; and m, multiplet.
Coupling constants are given in Hertz (Hz). Mass spectra (MS) data were obtained using a mass spectrometer with APCI or ESI ionization.

### Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. □ Claims Nos.:
   - because they relate to subject matter not required to be searched by this Authority, namely:

2. □ Claims Nos.: 1-18, 22-33 (all partially)
   - because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
     - The initial phase of the search revealed a very large number of documents relevant to novelty for the subject-matter of claims 1-18. Therefore it is impossible to determine which parts of claims 1-18 may be said to define subject-matter for which protection might legitimately be sought (Article 5 and 6 PCT). Present claims 1-18 relate to an extremely large number of possible compounds due to the huge breadth of radicals' definitions. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of compounds, i.e. L is only \(-\mathrm{C}=\mathrm{C}-\), \(R^1\) and \(R^3\) have the meanings of aryl, heteroaryl, heterocyclalkyls with specific number of C atoms and heteroatoms, type of heteroatoms having specific radical meanings.
   - For these reasons a meaningful search over the whole of the claimed scope is impossible.

3. □ Claims Nos.:
   - because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. □ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. □ As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.

3. □ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. □ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

- □ The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- □ The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- □ No protest accompanied the payment of additional search fees.
