(54) Title: PLANT REGULATORY ELEMENTS AND USES THEREOF

(57) Abstract: The invention provides DNA molecules and constructs, and their nucleotide sequences, useful for modulating gene expression in plants, and for specifying intracellular or extracellular localization of a gene product of interest. Transgenic plants, plant cells, plant parts, and seeds, comprising the DNA molecules operably linked to heterologous transcribable polynucleotides are also provided.

TITLE OF THE INVENTION**PLANT REGULATORY ELEMENTS AND USES THEREOF****REFERENCE TO RELATED APPLICATIONS**

This application claims the benefit of United States provisional application Nos. 5 61/295,160 filed January 14, 2010; 61/295,162 filed January 14, 2010; 61/339,057 filed February 26, 2010; 61/308,919 filed February 27, 2010; 61/308,921 filed February 27, 2010; and 61/331,924 filed May 6, 2010, all herein incorporated by reference in their entirety.

INCORPORATION OF SEQUENCE LISTING

The sequence listing that is contained in the file named "MONS279WO_ST25.txt", 10 which is 1,194 KB (as measured in Microsoft Windows®) and was created on January 11, 2011, is filed herewith by electronic submission and is incorporated by reference herein.

FIELD OF THE INVENTION

The invention relates to the field of plant molecular biology and plant genetic engineering and DNA molecules useful for modulating gene expression in plants, and for 15 specifying intracellular or extracellular localization of a gene product.

BACKGROUND

Regulatory elements are genetic elements that regulate gene activity by modulating the transcription of an operably linked transcribable polynucleotide molecule. Such elements include promoters, leaders, introns, and 3' untranslated regions and are useful in the field of 20 plant molecular biology and plant genetic engineering.

SUMMARY OF THE INVENTION

The present invention provides novel gene regulatory elements and transit peptide encoding sequences for use in plants. The present invention also provides DNA constructs comprising the regulatory elements and transit peptide encoding sequences. The present 25 invention also provides transgenic plant cells, plants, and seeds comprising the regulatory elements and/or the transit peptide encoding sequences, operably linked to a transcribable polynucleotide molecule. The present invention also provides methods of making and using the regulatory elements, the DNA constructs comprising the regulatory elements, and the

transgenic plant cells, plants, and seeds comprising the regulatory elements operably linked to a transcribable polynucleotide molecule.

Thus, in one aspect, the present invention provides a DNA molecule comprising a DNA sequence selected from the group consisting of a) a sequence with at least 85 percent sequence identity to any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924; b) a sequence of any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924; and c) a fragment of any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924; wherein the fragment has gene regulatory activity or wherein the encoded peptide functions to localize an operably linked polypeptide within a cell; and wherein said sequence is operably linked to a heterologous transcribable polynucleotide molecule. In one embodiment, the sequence has at least 90 percent sequence identity to a DNA sequence selected from the group consisting of: SEQ ID NOS: 1-323 and SEQ ID NOS: 352-924. In another embodiment, the sequence has at least 95 percent sequence identity to a DNA sequence selected from the group consisting of: SEQ ID NOS: 1-323 and SEQ ID NOS: 352-924. In certain embodiments of the DNA molecule, the DNA sequence comprises a regulatory element. In some embodiments the regulatory element comprises a promoter. In particular embodiments, the heterologous transcribable polynucleotide molecule comprises a gene of agronomic interest, a gene capable of providing herbicide resistance in plants, or a gene capable of providing plant pest control in plants.

The invention also provides a plant cell comprising a DNA construct comprising a sequence of any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924, or a fragment or variant thereof, wherein said sequence is operably linked to a heterologous transcribable polynucleotide molecule. In certain embodiments, the transgenic plant cell is a monocotyledonous plant cell. In other embodiments, the transgenic plant cell is a dicotyledonous plant cell.

Also included is a transgenic plant, or part thereof, comprising a DNA molecule comprising a DNA sequence selected from the group consisting of: a) a sequence with at least 85 percent sequence identity to any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924; b) a sequence of any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924; and c) a fragment of any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924; wherein the fragment has gene regulatory activity or wherein the encoded peptide functions to localize an operably linked polypeptide within a cell; and wherein said sequence is operably linked to a heterologous transcribable polynucleotide molecule. In some embodiments a progeny plant of any generation of such a

transgenic plant, or a part thereof, is provided. Further, a transgenic seed, wherein the seed comprises such a DNA molecule is also provided.

In another aspect, the invention provides a DNA molecule comprising a DNA sequence encoding a chloroplast transit peptide, wherein the protein sequence of the encoded 5 transit peptide is selected from the group consisting of: a) a transit peptide protein sequence of any of SEQ ID NOs: 324-350; and b) a transit peptide protein sequence with at least 95 percent sequence identity to any of SEQ ID NOs: 324-350; wherein the chloroplast transit peptide-encoding DNA molecule is operably linked to a heterologous transcribable polynucleotide molecule. In some embodiments, such a DNA molecule comprises a DNA 10 sequence encoding a chloroplast transit peptide, wherein the DNA sequence is selected from the group consisting of SEQ ID NOs: 277-284, 289-293, 296, 301-304 and 307-316. The present invention thus provides a DNA construct encoding such a chloroplast transit peptide.

Also provided by the invention is a transgenic plant cell comprising a DNA sequence 15 encoding a chloroplast transit peptide, wherein the sequence of the chloroplast transit peptide is selected from the group consisting of SEQ ID NOs: 324-350. In some embodiments, the transgenic plant cell is a monocotyledonous plant cell. In other embodiments, the transgenic plant cell is a dicotyledonous plant cell. A transgenic plant, or part thereof, comprising the DNA molecule is also contemplated by the invention, as well as a progeny transgenic plant of any generation, or part thereof, of the transgenic plant; and a transgenic seed, each 20 comprising the DNA molecule.

BRIEF DESCRIPTION OF THE FIGURES

FIGS. 1a- 1c depict alignment of size variants corresponding to SEQ ID NOs:24-25 for the Foxtail Millet Actin 8 promoter.

25 **FIGS. 2a- 2c** depict alignment of size variants corresponding to SEQ ID NOs:28-29 for the Foxtail Millet Alc1 promoter.

FIGS. 3a- 3f depict alignment of size variants corresponding to SEQ ID NOs:45-46 for the Foxtail Millet Cys promoter.

30 **FIGS. 4a- 4f** depict alignment of size variants corresponding to SEQ ID NOs:47-48 for the Foxtail Millet Dzs promoter.

FIGS. 5a- 5c depict alignment of size variants corresponding to SEQ ID NOs:58-59 for the Foxtail Millet Gst promoter.

FIGS. 6a- 6C depict alignment of size variants corresponding to SEQ ID NOs:60-61 for the Foxtail Millet Ifr promoter.

FIGS. 7a- 7d depict alignment of size variants corresponding to SEQ ID NOs:64-65 for the Foxtail Millet Nrt2 promoter.

5 **FIGS. 8a- 8e** depict alignment of size variants corresponding to SEQ ID NOs:74-75 for the Foxtail Millet Ppc promoter.

FIGS. 9a- 9f depict alignment of size variants corresponding to SEQ ID NOs:82-83 for the Foxtail Millet Prx3 promoter.

10 **FIGS. 10a- 10f** depict alignment of size variants corresponding to SEQ ID NOs:88-91 for the Foxtail millet Rcc3 promoter.

FIGS. 11a- 11b depict alignment of size variants corresponding to SEQ ID NOs:93-94 for the Foxtail Millet Ssp1 promoter.

FIGS. 12a- 12d depict alignment of size variants corresponding to SEQ ID NOs:96-97 for the Foxtail Millet Tip promoter.

15 **FIGS. 13a- 13d** depict alignment of size variants corresponding to SEQ ID NOs:98-99 for the Foxtail Millet TubA2-1 promoter.

FIGS. 14a- 14c depict alignment of size variants corresponding to SEQ ID NOs:102-103 for the Foxtail Millet Ubq1 promoter.

FIG. 15 depicts transgene cassette configurations of the present invention.

20 DETAILED DESCRIPTION OF THE INVENTION

The invention disclosed herein provides polynucleotide molecules having beneficial gene regulatory or other activity from foxtail millet, *Setaria italica*. The design, construction, and use of these polynucleotide molecules are one object of this invention. The nucleotide sequences of these polynucleotide molecules are provided among SEQ ID NO: 1 through 25 SEQ ID NO:323 and SEQ ID NO:352 through SEQ ID NO:1060. These polynucleotide molecules are, for instance, capable of affecting the expression of an operably linked transcribable polynucleotide molecule in plant tissues, or of effecting localization of an encoded gene product, and therefore can selectively regulate gene expression, or activity of an encoded gene product, in transgenic plants. The present invention also provides methods 30 of modifying, producing, and using the same. The invention also includes compositions, transformed host cells, transgenic plants, and seeds containing the promoters and/or other disclosed *S. italica* nucleotide sequences, and methods for preparing and using the same.

The following definitions and methods are provided to better define the present invention and to guide those of ordinary skill in the art in the practice of the present invention. Unless otherwise noted, terms are to be understood according to conventional usage by those of ordinary skill in the relevant art.

5 DNA Molecules

As used herein, the term “DNA” or “DNA molecule” refers to a double-stranded DNA molecule of genomic or synthetic origin, *i.e.* a polymer of deoxyribonucleotide bases or a polynucleotide molecule, read from the 5’ (upstream) end to the 3’ (downstream) end. As used herein, the term “DNA sequence” refers to the nucleotide sequence of a DNA molecule.

- 10 The nomenclature used herein is that required by Title 37 of the United States Code of Federal Regulations § 1.822 and set forth in the tables in WIPO Standard ST.25 (1998), Appendix 2, Tables 1 and 3.

As used herein, the term “isolated DNA molecule” refers to a DNA molecule at least partially separated from other molecules normally associated with it in its native or natural

- 15 state. In one embodiment, the term “isolated” refers to a DNA molecule that is at least partially separated from the nucleic acids which normally flank the DNA molecule in its native or natural state. Thus, DNA molecules fused to regulatory or coding sequences with which they are not normally associated, for example as the result of recombinant techniques, are considered isolated herein. Such molecules are considered isolated even when integrated
20 into the chromosome of a host cell or present in a nucleic acid solution with other DNA molecules.

Any number of methods well known to those skilled in the art can be used to isolate and manipulate a DNA molecule, or fragment thereof, disclosed in the present invention. For example, PCR (polymerase chain reaction) technology can be used to amplify a particular

- 25 starting DNA molecule and/or to produce variants of the original molecule. DNA molecules, or fragment thereof, can also be obtained by other techniques such as by directly synthesizing the fragment by chemical means, as is commonly practiced by using an automated oligonucleotide synthesizer.

As used herein, the term “sequence identity” refers to the extent to which two optimally aligned polynucleotide sequences or two optimally aligned polypeptide sequences are identical. An optimal sequence alignment is created by manually aligning two sequences, *e.g.* a reference sequence and another sequence, to maximize the number of nucleotide matches in the sequence alignment with appropriate internal nucleotide insertions, deletions,

or gaps. As used herein, the term “reference sequence” refers to a sequence provided as the polynucleotide sequences of SEQ ID NOS: 1 through 323 and 352 through 924 or the polypeptide sequences of SEQ ID NOS: 324 through 350.

As used herein, the term “percent sequence identity” or “percent identity” or “% identity” is the identity fraction times 100. The “identity fraction” for a sequence optimally aligned with a reference sequence is the number of nucleotide matches in the optimal alignment, divided by the total number of nucleotides in the reference sequence, *e.g.* the total number of nucleotides in the full length of the entire reference sequence. Thus, one embodiment of the invention is a DNA molecule comprising a sequence that when optimally aligned to a reference sequence, provided herein as SEQ ID NOS: 1 through 323 and 352 through 924, has about 85 percent identity or higher, about 90 percent identity or higher, about 95 percent identity or higher, or at least 96 percent identity, 97 percent identity, 98 percent identity, or 99 percent identity to the reference sequence and has gene regulatory activity.

15 **Regulatory Elements**

A regulatory element is a DNA molecule having gene regulatory activity, *i.e.* one that has the ability to affect the transcription and/or translation of an operably linked transcribable polynucleotide molecule. The term “gene regulatory activity” thus refers to the ability to affect the expression pattern of an operably linked transcribable polynucleotide molecule by affecting the transcription and/or translation of that operably linked transcribable polynucleotide molecule. Gene regulatory activity may be positive and/or negative and the effect may be characterized by its temporal, spatial, developmental, tissue, environmental, physiological, pathological, cell cycle, and/or chemically responsive qualities as well as by quantitative or qualitative indications.

25 Regulatory elements such as promoters, leaders, introns, and transcription termination regions are DNA molecules that have gene regulatory activity and play an integral part in the overall expression of genes in living cells. The term “regulatory element” refers to a DNA molecule having gene regulatory activity, *i.e.* one that has the ability to affect the transcription and/or translation of an operably linked transcribable polynucleotide molecule.

30 Isolated regulatory elements, such as promoters and leaders, that function in plants are therefore useful for modifying plant phenotypes through the methods of genetic engineering.

Regulatory elements may be characterized by their expression pattern, *i.e.* as constitutive and/or by their temporal, spatial, developmental, tissue, environmental,

physiological, pathological, cell cycle, and/or chemically responsive expression pattern, and any combination thereof, as well as by quantitative or qualitative indications. A promoter is useful as a regulatory element for modulating the expression of an operably linked transcribable polynucleotide molecule.

5 As used herein, a “gene expression pattern” is any pattern of transcription of an operably linked DNA molecule into a transcribed RNA molecule. Expression may be characterized by its temporal, spatial, developmental, tissue, environmental, physiological, pathological, cell cycle, and/or chemically responsive qualities as well as by quantitative or qualitative indications. The transcribed RNA molecule may be translated to produce a
10 protein molecule or may provide an antisense or other regulatory RNA molecule, such as a dsRNA, a tRNA, an rRNA, a miRNA, and the like.

As used herein, the term “protein expression” is any pattern of translation of a transcribed RNA molecule into a protein molecule. Protein expression may be characterized by its temporal, spatial, developmental, or morphological qualities as well as by quantitative
15 or qualitative indications.

As used herein, the term “promoter” refers generally to a DNA molecule that is involved in recognition and binding of RNA polymerase II and other proteins (trans-acting transcription factors) to initiate transcription. A promoter may be initially isolated from the 5’ untranslated region (5’ UTR) of a genomic copy of a gene. Alternately, promoters may be
20 synthetically produced or manipulated DNA molecules. Promoters may also be chimeric, that is a promoter produced through the fusion of two or more heterologous DNA molecules. Promoters useful in practicing the present invention include SEQ ID NOS: 23 through 105 and SEQ ID NOS: 353 through 536 or fragments or variants thereof.

In one embodiment, fragments are provided of a promoter sequence disclosed herein.
25 Promoter fragments may exhibit promoter activity, and may be useful alone or in combination with other promoters and promoter fragments, such as in constructing chimeric promoters. In specific embodiments, fragments of a promoter are provided comprising at least about 50, 95, 150, 250, 500, or about 750 contiguous nucleotides of a polynucleotide molecule having promoter activity disclosed herein.

30 A promoter or promoter fragment may also be analyzed for the presence of known promoter elements, *i.e.* DNA sequence characteristics, such as a TATA-box and other known transcription factor binding site motifs. Identification of such known promoter elements may be used by one of skill in the art to design variants of the promoter having a similar expression pattern to the original promoter.

As used herein, the term “enhancer” or “enhancer element” refers to a cis-acting transcriptional regulatory element, a.k.a. cis-element, which confers an aspect of the overall expression pattern, but is usually insufficient alone to drive transcription, of an operably linked polynucleotide sequence. Unlike promoters, enhancer elements do not usually include

5 a transcription start site (TSS) or TATA box. A promoter may naturally comprise one or more enhancer elements that affect the transcription of an operably linked polynucleotide sequence. An isolated enhancer element may also be fused to a promoter to produce a chimeric promoter.cis-element, which confers an aspect of the overall modulation of gene expression. A promoter or promoter fragment may comprise one or more enhancer elements

10 that effect the transcription of operably linked genes. Many promoter enhancer elements are believed to bind DNA-binding proteins and/or affect DNA topology, producing local conformations that selectively allow or restrict access of RNA polymerase to the DNA template or that facilitate selective opening of the double helix at the site of transcriptional initiation. An enhancer element may function to bind transcription factors that regulate

15 transcription. Some enhancer elements bind more than one transcription factor, and transcription factors may interact with different affinities with more than one enhancer domain. Enhancer elements can be identified by a number of techniques, including deletion analysis, *i.e.* deleting one or more nucleotides from the 5' end or internal to a promoter; DNA binding protein analysis using DNase I footprinting, methylation interference, electrophoresis

20 mobility-shift assays, *in vivo* genomic footprinting by ligation-mediated PCR, and other conventional assays; or by DNA sequence similarity analysis using known cis-element motifs or enhancer elements as a target sequence or target motif with conventional DNA sequence comparison methods, such as BLAST. The fine structure of an enhancer domain can be further studied by mutagenesis (or substitution) of one or more nucleotides or by other

25 conventional methods. Enhancer elements can be obtained by chemical synthesis or by isolation from regulatory elements that include such elements, and they can be synthesized with additional flanking nucleotides that contain useful restriction enzyme sites to facilitate subsequence manipulation. Thus, the design, construction, and use of enhancer elements according to the methods disclosed herein for modulating the expression of operably linked

30 transcribable polynucleotide molecules are encompassed by the present invention.

As used herein, the term “leader” refers to a DNA molecule isolated from the untranslated 5' region (5' UTR) of a genomic copy of a gene and defined generally as a nucleotide segment between the transcription start site (TSS) and the protein coding sequence start site. Alternately, leaders may be synthetically produced or manipulated DNA elements.

A leader can be used as a 5' regulatory element for modulating expression of an operably linked transcribable polynucleotide molecule. Leader molecules may be used with a heterologous promoter or with their native promoter. Promoter molecules of the present invention may thus be operably linked to their native leader or may be operably linked to a 5 heterologous leader. Leaders useful in practicing the present invention include SEQ ID NOS: 106 through 171 and SEQ ID NOS: 537 through 588 or fragments or variants thereof.

As used herein, the term "chimeric" refers to a single DNA molecule produced by fusing a first DNA molecule to a second DNA molecule, where neither first nor second DNA molecule would normally be found in that configuration, *i.e.* fused to the other. The chimeric 10 DNA molecule is thus a new DNA molecule not otherwise normally found in nature. As used herein, the term "chimeric promoter" refers to a promoter produced through such manipulation of DNA molecules. A chimeric promoter may combine two or more DNA fragments; an example would be the fusion of a promoter to an enhancer element. Thus, the design, construction, and use of chimeric promoters according to the methods disclosed 15 herein for modulating the expression of operably linked transcribable polynucleotide molecules are encompassed by the present invention.

As used herein, the term "variant" refers to a second DNA molecule that is in composition similar, but not identical to, a first DNA molecule and yet the second DNA molecule still maintains the general functionality, *i.e.* same or similar expression pattern, of 20 the first DNA molecule. A variant may be a shorter or truncated version of the first DNA molecule and/or an altered version of the sequence of the first DNA molecule, such as one with different restriction enzyme sites and/or internal deletions, substitutions, and/or insertions. A "variant" can also encompass a regulatory element having a nucleotide sequence comprising a substitution, deletion and/or insertion of one or more nucleotides of a 25 reference sequence, wherein the derivative regulatory element has more or less or equivalent transcriptional or translational activity than the corresponding parent regulatory molecule. The regulatory element "variants" will also encompass variants arising from mutations that naturally occur in bacterial and plant cell transformation. In the present invention, a polynucleotide sequence provided as SEQ ID NOS: 1 through 325 and 352 through 924 may 30 be used to create variants that are in composition similar, but not identical to, the polynucleotide sequence of the original regulatory element, while still maintaining the general functionality, *i.e.* same or similar expression pattern, of the original regulatory element. Production of such variants of the present invention is well within the ordinary skill of the art in light of the disclosure and is encompassed within the scope of the present

invention. Chimeric regulatory element “variants” comprise the same constituent elements as a reference sequence but the constituent elements comprising the chimeric regulatory element may be operatively linked by various methods known in the art such as, restriction enzyme digestion and ligation, ligation independent cloning, modular assembly of PCR products 5 during amplification, or direct chemical synthesis of the regulatory element as well as other methods known in the art. The resulting chimeric regulatory element “variant” can be comprised of the same, or variants of the same, constituent elements of the reference sequence but differ in the sequence or sequences that comprise the linking sequence or sequences which allow the constituent parts to be operatively linked. In the present 10 invention, a polynucleotide sequence provided as SEQ ID NOS: 1 through 323 and 352 through 924 provide a reference sequence wherein the constituent elements that comprise the reference sequence may be joined by methods known in the art and may comprise substitutions, deletions and/or insertions of one or more nucleotides or mutations that naturally occur in bacterial and plant cell transformation.

15 Constructs

As used herein, the term “construct” means any recombinant polynucleotide molecule such as a plasmid, cosmid, virus, autonomously replicating polynucleotide molecule, phage, or linear or circular single-stranded or double-stranded DNA or RNA polynucleotide molecule, derived from any source, capable of genomic integration or autonomous 20 replication, comprising a polynucleotide molecule where one or more polynucleotide molecule has been linked in a functionally operative manner, *i.e.* operably linked. As used herein, the term “vector” means any recombinant polynucleotide construct that may be used for the purpose of transformation, *i.e.* the introduction of heterologous DNA into a host cell.

As used herein, the term “operably linked” refers to a first molecule joined to a 25 second molecule, wherein the molecules are so arranged that the first molecule affects the function of the second molecule. The two molecules may or may not be part of a single contiguous molecule and may or may not be adjacent. For example, a promoter is operably linked to a transcribable polynucleotide molecule if the promoter modulates transcription of the transcribable polynucleotide molecule of interest in a cell.

30 The constructs of the present invention are generally double Ti plasmid border DNA constructs that have the right border (RB or AGRtu.RB) and left border (LB or AGRtu.LB) regions of the Ti plasmid isolated from *Agrobacterium tumefaciens* comprising a T-DNA, that along with transfer molecules provided by the *A. tumefaciens* cells, permit the integration

of the T-DNA into the genome of a plant cell (*see, for example, US Patent 6,603,061*). The constructs may also contain the plasmid backbone DNA segments that provide replication function and antibiotic selection in bacterial cells, for example, an *Escherichia coli* origin of replication such as *ori*322, a broad host range origin of replication such as *ori*V or *ori*Ri, and
5 a coding region for a selectable marker such as Spec/Strp that encodes for Tn7 aminoglycoside adenylyltransferase (*aadA*) conferring resistance to spectinomycin or streptomycin, or a gentamicin (Gm, Gent) selectable marker gene. For plant transformation, the host bacterial strain is often *A. tumefaciens* ABI, C58, or LBA4404; however, other strains known to those skilled in the art of plant transformation can function in the present
10 invention.

Methods are known in the art for assembling and introducing constructs into a cell in such a manner that the transcribable polynucleotide molecule is transcribed into a functional mRNA molecule that is translated and expressed as a protein product. For the practice of the present invention, conventional compositions and methods for preparing and using constructs
15 and host cells are well known to one skilled in the art, *see, for example, Molecular Cloning: A Laboratory Manual, 3rd edition Volumes 1, 2, and 3* (2000) J.F. Sambrook, D.W. Russell, and N. Irwin, Cold Spring Harbor Laboratory Press. Methods for making recombinant vectors particularly suited to plant transformation include, without limitation, those described in U.S. Patent No. 4,971,908; 4,940,835; 4,769,061; and 4,757,011 in their entirety. These
20 types of vectors have also been reviewed in the scientific literature (*see, for example, Rodriguez, et al., Vectors: A Survey of Molecular Cloning Vectors and Their Uses*, Butterworths, Boston, (1988) and Glick, et al., *Methods in Plant Molecular Biology and Biotechnology*, CRC Press, Boca Raton, FL. (1993)). Typical vectors useful for expression of nucleic acids in higher plants are well known in the art and include vectors derived from
25 the tumor-inducing (Ti) plasmid of *Agrobacterium tumefaciens* (Rogers, et al., *Methods in Enzymology* 153: 253-277 (1987)). Other recombinant vectors useful for plant transformation, including the pCaMVCN transfer control vector, have also been described in the scientific literature (*see, for example, Fromm, et al., Proc. Natl. Acad. Sci. USA* 82: 5824-5828 (1985)).

30 Various regulatory elements may be included in a construct. Any such regulatory elements may be provided in combination with other regulatory elements. Such combinations can be designed or modified to produce desirable regulatory features. Constructs of the present invention would typically comprise at least one regulatory element

operably linked to a transcribable polynucleotide molecule operably linked to a 3' transcription termination molecule.

Constructs of the present invention may include any promoter or leader known in the art. For example, a promoter of the present invention may be operably linked to a heterologous non-translated 5' leader such as one derived from a heat shock protein gene (see, for example, U.S. Patent No. 5,659,122 and 5,362,865). Alternatively, a leader of the present invention may be operably linked to a heterologous promoter such as the Cauliflower Mosaic Virus 35S transcript promoter (see, U.S. Patent No. 5,352,605).

As used herein, the term "intron" refers to a DNA molecule that may be isolated or identified from the genomic copy of a gene and may be defined generally as a region spliced out during mRNA processing prior to translation. Alternately, an intron may be a synthetically produced or manipulated DNA element. An intron may contain elements enhancer elements that effect the transcription of operably linked genes. An intron may be used as a regulatory element for modulating expression of an operably linked transcribable polynucleotide molecule. A DNA construct may comprise an intron, and the intron may or may not be heterologous with respect to the transcribable polynucleotide molecule sequence. Examples of introns in the art include the rice actin intron (U.S. Patent No. 5,641,876) and the corn HSP70 intron (U.S. Patent No. 5,859,347). Introns useful in practicing the present invention include SEQ ID NOS: 172 through 267, SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778.

As used herein, the term "3' transcription termination molecule" or "3' UTR" refers to a DNA molecule that is used during transcription to produce the 3' untranslated region (3' UTR) of an mRNA molecule. The 3' untranslated region of an mRNA molecule may be generated by specific cleavage and 3' polyadenylation, a.k.a. polyA tail. A 3' UTR may be operably linked to and located downstream of a transcribable polynucleotide molecule and may include polynucleotides that provide a polyadenylation signal and other regulatory signals capable of affecting transcription, mRNA processing, or gene expression. PolyA tails are thought to function in mRNA stability and in initiation of translation. Examples of 3' transcription termination molecules in the art are the nopaline synthase 3' region (see, Fraley, et al., *Proc. Natl. Acad. Sci. USA*, 80: 4803-4807 (1983)); wheat hsp17 3' region; pea rubisco small subunit 3' region; cotton E6 3' region (U.S. Patent 6,096,950); 3' regions disclosed in WO0011200A2; and the coixin 3' UTR (U.S. Patent No. 6,635,806). Sequences of 3' UTR regions useful in practicing the present invention are provided as SEQ ID NOS: 268 through 276 and SEQ ID NOS: 779 through 924.

3' UTRs are a basic prerequisite for the recombinant expression of specific genes. In animal systems, a machinery of 3' UTRs has been well defined (e.g. Zhao *et al.*, *Microbiol Mol Biol Rev* 63:405–445 (1999); Proudfoot, *Nature* 322:562-565 (1986); Kim *et al.*, *Biotechnology Progress* 19:1620-1622 (2003); Yonaha and Proudfoot, *EMBO J.* 19:3770-3777 (2000); Cramer *et al.*, *FEBS Letters* 498:179-182 (2001); Kuerstem and Goodwin, *Nature Reviews Genetics* 4:626-637 (2003)). Effective termination of RNA transcription is required to prevent unwanted transcription of trait- unrelated (downstream) sequences, which may interfere with trait performance (see below for more details). Arrangement of multiple gene expression cassettes in local proximity to one another (e.g. within one T- DNA) may cause suppression of gene expression of one or more genes in said construct in comparison to independent insertions (Padidam and Cao, *BioTechniques* 31:328-334 (2001)). This may interfere with achieving adequate levels of expression, for instance in cases where strong gene expression from all cassettes is desired.

In plants, clearly defined polyadenylation signal sequences are not known. Hasegawa *et al.*, *Plant J.* 33:1063-1072, (2003)) were not able to identify conserved polyadenylation signal sequences in both *in vitro* and *in vivo* systems in *Nicotiana sylvestris* and to determine the actual length of the primary (non-polyadenylated) transcript. A weak 3' UTR has the potential to generate read-through, which may affect the expression of the genes located in the neighboring expression cassettes (Padidam and Cao, *BioTechniques* 31:328-334 (2001)). Appropriate control of transcription termination can prevent read-through into sequences (e.g. other expression cassettes) localized downstream and can further allow efficient recycling of RNA polymerase, to improve gene expression. Efficient termination of transcription (release of RNA Polymerase II from the DNA) is pre-requisite for re-initiation of transcription and thereby directly affects the overall transcript level. Subsequent to transcription termination, the mature mRNA is released from the site of synthesis and template to the cytoplasm. Eukaryotic mRNAs are accumulated as poly(A) forms *in vivo*, so that it is difficult to detect transcriptional termination sites by conventional methods. However, prediction of functional and efficient 3' UTRs by bioinformatics methods is difficult in that there are no conserved sequences which would allow easy prediction of an effective 3' UTR.

From a practical standpoint, it is preferred that a 3' UTR used in a transgene cassette possesses the following characteristics. The 3' UTR must be able to efficiently and effectively terminate transcription of the transgene and prevent read-through of the transcript into any neighboring DNA sequence which can be comprised of another transgene cassette as in the case of multiple cassettes residing in one T-DNA, or the neighboring chromosomal

DNA into which the T-DNA has inserted. The 3' UTR should not cause a reduction in the transcriptional activity imparted by the promoter, leader and introns that are used to drive expression of the transgene. In plant biotechnology, the 3' UTR is often used for priming of amplification reactions of reverse transcribed RNA extracted from the transformed plant and
5 used to (1) assess the transcriptional activity or expression of the transgene cassette once integrated into the plant chromosome; (2) assess the copy number of insertions within the plant DNA; and (3) assess zygosity of the resulting seed after breeding. The 3' UTR is also used in amplification reactions of DNA extracted from the transformed plant to characterize the intactness of the inserted cassette.

10 3' UTRs useful in providing expression of a transgene in plants are identified based upon the expression of expressed sequence tags (ESTs) in cDNA libraries made from messenger RNA isolated from seed, flower and other tissues derived from Foxtail millet (*Setaria italica* (L.) Beauv). Libraries of cDNA are made from tissues isolated from *S. italica* using methods known to those skilled in the art from flower tissue, seed, leaf and root. The
15 resulting cDNAs are sequenced using various sequencing methods known in the art. The resulting ESTs are assembled into clusters using bioinformatics software such as clc_ref_assemble_complete version 2.01.37139 (CLC bio USA, Cambridge, Massachusetts 02142). Transcript abundance of each cluster is determined by counting the number of cDNA reads for each cluster. The identified 3' UTRs may be comprised of sequence derived
20 from cDNA sequence as well as sequence derived from genomic DNA. The cDNA sequence is used to design primers, which are then used with GenomeWalkerTM (Clontech Laboratories, Inc, Mountain View, CA) libraries constructed following the manufacturer's protocol to clone the 3' region of the corresponding genomic DNA sequence to provide a longer termination sequence. Analysis of relative transcript abundance either by direct
25 counts or normalized counts of observed sequence reads for each tissue library can be used to infer properties about patterns of expression. For example, some 3' UTRs may be found in transcripts seen in higher abundance in root tissue as opposed to leaf. This is suggestive that the transcript is highly expressed in root and that the properties of root expression may be attributable to the transcriptional regulation of the promoter, the lead, the introns or the 3'
30 UTR. Empirical testing of 3' UTRs identified by the properties of expression within specific organs, tissues or cell types can result in the identification of 3' UTRs that enhance expression in those specific organs, tissues or cell types.

Constructs and vectors may also include a transit peptide coding sequence that expresses a linked peptide that is useful for targeting of a protein product, particularly to a

chloroplast, leucoplast, or other plastid organelle; mitochondria; peroxisome; vacuole; or an extracellular location. For descriptions of the use of chloroplast transit peptides, see U.S. Patent No. 5,188,642 and U.S. Patent No. 5,728,925. Many chloroplast-localized proteins are expressed from nuclear genes as precursors and are targeted to the chloroplast by a 5 chloroplast transit peptide (CTP). Examples of such isolated chloroplast proteins include, but are not limited to, those associated with the small subunit (SSU) of ribulose-1,5,-bisphosphate carboxylase, ferredoxin, ferredoxin oxidoreductase, the light-harvesting complex protein I and protein II, thioredoxin F, enolpyruvyl shikimate phosphate synthase (EPSPS), and transit peptides described in U.S. Patent No. 7,193,133. It has been 10 demonstrated *in vivo* and *in vitro* that non-chloroplast proteins may be targeted to the chloroplast by use of protein fusions with a heterologous CTP and that the CTP is sufficient to target a protein to the chloroplast. Incorporation of a suitable chloroplast transit peptide such as the *Arabidopsis thaliana* EPSPS CTP (CTP2) (See, Klee *et al.*, *Mol. Gen. Genet.* 210:437-442 (1987)) or the *Petunia hybrida* EPSPS CTP (CTP4) (See, della-Cioppa *et al.*, 15 *Proc. Natl. Acad. Sci. USA* 83:6873-6877 (1986)) has been show to target heterologous EPSPS protein sequences to chloroplasts in transgenic plants (See, U.S. Patent Nos. 5,627,061; 5,633,435; and 5,312,910 and EP 0218571; EP 189707; EP 508909; and EP 924299). Sequences encoding transit peptides useful for the present invention are provided 20 as SEQ ID NOS: 277 through 316. Protein sequences of transit peptides useful for the present invention are provided as SEQ ID NOS: 324 through 350.

Transcribable polynucleotide molecules

As used herein, the term “transcribable polynucleotide molecule” refers to any DNA molecule capable of being transcribed into a RNA molecule, including, but not limited to, those having protein coding sequences and those having sequences useful for gene suppression. A “transgene” refers to a transcribable polynucleotide molecule heterologous to 25 a host cell and/or a transcribable polynucleotide molecule artificially incorporated into a host cell’s genome.

A promoter of the present invention may be operably linked to a transcribable polynucleotide molecule that is heterologous with respect to the promoter molecule. As used 30 herein, the term “heterologous” refers to the combination of two or more polynucleotide molecules when such a combination would not normally be found in nature. For example, the two molecules may be derived from different species and/or the two molecules may be derived from different genes, *e.g.* different genes from the same species or the same genes

from different species. A promoter is thus heterologous with respect to an operably linked transcribable polynucleotide molecule if such a combination is not normally found in nature, *i.e.* that transcribable polynucleotide molecule is not naturally occurring operably linked in combination with that promoter molecule.

5 The transcribable polynucleotide molecule may generally be any DNA molecule for which expression of an RNA transcript is desired. Such expression of an RNA transcript may result in translation of the resulting mRNA molecule and thus protein expression. Alternatively, a transcribable polynucleotide molecule may be designed to ultimately cause decreased expression of a specific gene or protein. This may be accomplished by using a
10 transcribable polynucleotide molecule that is oriented in the antisense direction. One of ordinary skill in the art is familiar with using such antisense technology. Briefly, as the antisense transcribable polynucleotide molecule is transcribed, the RNA product hybridizes to and sequesters a complimentary RNA molecule inside the cell. This duplex RNA molecule cannot be translated into a protein by the cell's translational machinery and is
15 degraded in the cell. Any gene may be negatively regulated in this manner.

Thus, one embodiment of the invention is a regulatory element of the present invention, such as those provided as SEQ ID NOS: 1 through 276, SEQ ID NOS: 317 through 323 and 352 through 924, operably linked to a transcribable polynucleotide molecule so as to modulate transcription of the transcribable polynucleotide molecule at a desired level or in a
20 desired pattern upon introduction of said construct into a plant cell. In one embodiment, the transcribable polynucleotide molecule comprises a protein-coding region of a gene, and the promoter affects the transcription of an RNA molecule that is translated and expressed as a protein product. In another embodiment, the transcribable polynucleotide molecule comprises an antisense region of a gene, and the promoter affects the transcription of an
25 antisense RNA molecule or other similar inhibitory RNA molecule in order to inhibit expression of a specific RNA molecule of interest in a target host cell.

Genes of Agronomic Interest

Transcribable polynucleotide molecules may be genes of agronomic interest. As used herein, the term "gene of agronomic interest" refers to a transcribable polynucleotide molecule that when expressed in a particular plant tissue, cell, or cell type provides a desirable characteristic associated with plant morphology, physiology, growth, development, yield, product, nutritional profile, disease or pest resistance, and/or environmental or chemical tolerance. Genes of agronomic interest include, but are not limited to, those

encoding a yield protein, a stress resistance protein, a developmental control protein, a tissue differentiation protein, a meristem protein, an environmentally responsive protein, a senescence protein, a hormone responsive protein, an abscission protein, a source protein, a sink protein, a flower control protein, a seed protein, an herbicide resistance protein, a disease resistance protein, a fatty acid biosynthetic enzyme, a tocopherol biosynthetic enzyme, an amino acid biosynthetic enzyme, a pesticidal protein, or any other agent such as an antisense or RNAi molecule targeting a particular gene for suppression. The product of a gene of agronomic interest may act within the plant in order to cause an effect upon the plant physiology or metabolism or may be act as a pesticidal agent in the diet of a pest that feeds on the plant.

In one embodiment of the invention, a promoter of the present invention is incorporated into a construct such that the promoter is operably linked to a transcribable polynucleotide molecule that is a gene of agronomic interest. The expression of the gene of agronomic interest is desirable in order to confer an agronomically beneficial trait. A beneficial agronomic trait may be, for example, but not limited to, herbicide tolerance, insect control, modified yield, fungal disease resistance, virus resistance, nematode resistance, bacterial disease resistance, plant growth and development, starch production, modified oils production, high oil production, modified fatty acid content, high protein production, fruit ripening, enhanced animal and human nutrition, biopolymers, environmental stress resistance, pharmaceutical peptides and secretable peptides, improved processing traits, improved digestibility, enzyme production, flavor, nitrogen fixation, hybrid seed production, fiber production, and biofuel production. Examples of genes of agronomic interest known in the art include those for herbicide resistance (U.S. Patent No. 6,803,501; 6,448,476; 6,248,876; 6,225,114; 6,107,549; 5,866,775; 5,804,425; 5,633,435; and 5,463,175), increased yield (U.S. Patent Nos. USRE38,446; 6,716,474; 6,663,906; 6,476,295; 6,441,277; 6,423,828; 6,399,330; 6,372,211; 6,235,971; 6,222,098; and 5,716,837), insect control (U.S. Patent Nos. 6,809,078; 6,713,063; 6,686,452; 6,657,046; 6,645,497; 6,642,030; 6,639,054; 6,620,988; 6,593,293; 6,555,655; 6,538,109; 6,537,756; 6,521,442; 6,501,009; 6,468,523; 6,326,351; 6,313,378; 6,284,949; 6,281,016; 6,248,536; 6,242,241; 6,221,649; 6,177,615; 6,156,573; 6,153,814; 6,110,464; 6,093,695; 6,063,756; 6,063,597; 6,023,013; 5,959,091; 5,942,664; 5,942,658; 5,880,275; 5,763,245; and 5,763,241), fungal disease resistance (U.S. Patent Nos. 6,653,280; 6,573,361; 6,506,962; 6,316,407; 6,215,048; 5,516,671; 5,773,696; 6,121,436; 6,316,407; and 6,506,962), virus resistance (U.S. Patent Nos. 6,617,496; 6,608,241; 6,015,940; 6,013,864; 5,850,023; and 5,304,730), nematode resistance (U.S.

Patent No. 6,228,992), bacterial disease resistance (U.S. Patent No. 5,516,671), plant growth and development (U.S. Patent Nos. 6,723,897 and 6,518,488), starch production (U.S. Patent Nos. 6,538,181; 6,538,179; 6,538,178; 5,750,876; 6,476,295), modified oils production (U.S. Patent Nos. 6,444,876; 6,426,447; and 6,380,462), high oil production (U.S. Patent Nos. 5 6,495,739; 5,608,149; 6,483,008; and 6,476,295), modified fatty acid content (U.S. Patent Nos. 6,828,475; 6,822,141; 6,770,465; 6,706,950; 6,660,849; 6,596,538; 6,589,767; 6,537,750; 6,489,461; and 6,459,018), high protein production (U.S. Patent No. 6,380,466), fruit ripening (U.S. Patent No. 5,512,466), enhanced animal and human nutrition (U.S. Patent Nos. 6,723,837; 6,653,530; 6,5412,59; 5,985,605; and 6,171,640), biopolymers (U.S. Patent 10 Nos. USRE37,543; 6,228,623; and 5,958,745, and 6,946,588), environmental stress resistance (U.S. Patent No. 6,072,103), pharmaceutical peptides and secretable peptides (U.S. Patent Nos. 6,812,379; 6,774,283; 6,140,075; and 6,080,560), improved processing traits (U.S. Patent No. 6,476,295), improved digestibility (U.S. Patent No. 6,531,648) low raffinose (U.S. Patent No. 6,166,292), industrial enzyme production (U.S. Patent No. 5,543,576), 15 improved flavor (U.S. Patent No. 6,011,199), nitrogen fixation (U.S. Patent No. 5,229,114), hybrid seed production (U.S. Patent No. 5,689,041), fiber production (U.S. Patent Nos. 6,576,818; 6,271,443; 5,981,834; and 5,869,720) and biofuel production (U.S. Patent No. 5,998,700).

Alternatively, a gene of agronomic interest can affect the above mentioned plant 20 characteristic or phenotype by encoding a RNA molecule that causes the targeted modulation of gene expression of an endogenous gene, for example via antisense (see e.g. US Patent 5,107,065); inhibitory RNA (“RNAi”, including modulation of gene expression via miRNA-, siRNA-, trans-acting siRNA-, and phased sRNA-mediated mechanisms, e.g. as described in published applications US 2006/0200878 and US 2008/0066206, and in US patent 25 application 11/974,469); or cosuppression-mediated mechanisms. The RNA could also be a catalytic RNA molecule (e.g. a ribozyme or a riboswitch; see e.g. US 2006/0200878) engineered to cleave a desired endogenous mRNA product. Thus, any transcribable polynucleotide molecule that encodes a transcribed RNA molecule that affects an 30 agronomically important phenotype or morphology change of interest may be useful for the practice of the present invention. Methods are known in the art for constructing and introducing constructs into a cell in such a manner that the transcribable polynucleotide molecule is transcribed into a molecule that is capable of causing gene suppression. For example, posttranscriptional gene suppression using a construct with an anti-sense oriented transcribable polynucleotide molecule to regulate gene expression in plant cells is disclosed

in U.S. Patent Nos. 5,107,065 and 5,759,829, and posttranscriptional gene suppression using a construct with a sense-oriented transcribable polynucleotide molecule to regulate gene expression in plants is disclosed in U.S. Patent Nos. 5,283,184 and 5,231,020. Expression of a transcribable polynucleotide in a plant cell can also be used to suppress plant pests feeding 5 on the plant cell, for example, compositions isolated from coleopteran pests (U.S. Patent Publication No. US20070124836) and compositions isolated from nematode pests (U.S. Patent Publication No. US20070250947). Plant pests include, but are not limited to arthropod pests, nematode pests, and fungal or microbial pests. Exemplary transcribable polynucleotide molecules for incorporation into constructs of the present invention include, 10 for example, DNA molecules or genes from a species other than the target species or genes that originate with or are present in the same species, but are incorporated into recipient cells by genetic engineering methods rather than classical reproduction or breeding techniques. The type of polynucleotide molecule can include, but is not limited to, a polynucleotide molecule that is already present in the plant cell, a polynucleotide molecule from another 15 plant, a polynucleotide molecule from a different organism, or a polynucleotide molecule generated externally, such as a polynucleotide molecule containing an antisense message of a gene, or a polynucleotide molecule encoding an artificial, synthetic, or otherwise modified version of a transgene.

Selectable Markers

20 As used herein the term “marker” refers to any transcribable polynucleotide molecule whose expression, or lack thereof, can be screened for or scored in some way. Marker genes for use in the practice of the present invention include, but are not limited to transcribable polynucleotide molecules encoding β -glucuronidase (GUS described in U.S. Patent No. 5,599,670), green fluorescent protein and variants thereof (GFP described in U.S. Patent No. 25 5,491,084 and 6,146,826), proteins that confer antibiotic resistance, or proteins that confer herbicide tolerance. Useful antibiotic resistance markers, including those encoding proteins conferring resistance to kanamycin (*nptII*), hygromycin B (*aph IV*), streptomycin or spectinomycin (*aad*, *spec/strep*) and gentamycin (*aac3* and *aacC4*) are known in the art. Herbicides for which transgenic plant tolerance has been demonstrated and the method of the 30 present invention can be applied, include, but are not limited to: amino-methyl-phosphonic acid, glyphosate, glufosinate, sulfonylureas, imidazolinones, bromoxynil, delapon, dicamba, cyclohezanedione, protoporphyrinogen oxidase inhibitors, and isoxasflutole herbicides. Transcribable polynucleotide molecules encoding proteins involved in herbicide tolerance are

known in the art, and include, but are not limited to, a transcribable polynucleotide molecule encoding 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS for glyphosate tolerance described in U.S. Patent No. 5,627,061; 5,633,435; 6,040,497; and 5,094,945); a transcribable polynucleotide molecule encoding a glyphosate oxidoreductase and a glyphosate-N-acetyl transferase (GOX described in U.S. Patent No. 5,463,175; GAT described in U.S. Patent publication No. 20030083480, and dicamba monooxygenase U.S. Patent publication No. 20030135879); a transcribable polynucleotide molecule encoding bromoxynil nitrilase (*Bxn* for Bromoxynil tolerance described in U.S. Patent No. 4,810,648); a transcribable polynucleotide molecule encoding phytoene desaturase (*crtI*) described in Misawa, *et al.*, 10 *Plant Journal* 4:833-840 (1993) and Misawa, *et al.*, *Plant Journal* 6:481-489 (1994) for norflurazon tolerance; a transcribable polynucleotide molecule encoding acetohydroxyacid synthase (AHAS, aka ALS) described in Sathasiivan, *et al.*, *Nucl. Acids Res.* 18:2188-2193 (1990) for tolerance to sulfonylurea herbicides; and the *bar* gene described in DeBlock, *et al.*, 15 *EMBO Journal* 6:2513-2519 (1987) for glufosinate and bialaphos tolerance. The promoter molecules of the present invention can express linked transcribable polynucleotide molecules that encode for phosphinothricin acetyltransferase, glyphosate resistant EPSPS, aminoglycoside phosphotransferase, hydroxyphenyl pyruvate dehydrogenase, hygromycin phosphotransferase, neomycin phosphotransferase, dalapon dehalogenase, bromoxynil resistant nitrilase, anthranilate synthase, aryloxyalkanoate dioxygenases, acetyl CoA 20 carboxylase, glyphosate oxidoreductase, and glyphosate-N-acetyl transferase.

Included within the term “selectable markers” are also genes which encode a secretable marker whose secretion can be detected as a means of identifying or selecting for transformed cells. Examples include markers that encode a secretable antigen that can be identified by antibody interaction, or even secretable enzymes which can be detected 25 catalytically. Selectable secreted marker proteins fall into a number of classes, including small, diffusible proteins which are detectable, (e.g. by ELISA), small active enzymes which are detectable in extracellular solution (e.g. alpha-amylase, beta-lactamase, phosphinothricin transferase), or proteins which are inserted or trapped in the cell wall (such as proteins which include a leader sequence such as that found in the expression unit of extension or tobacco 30 pathogenesis related proteins also known as tobacco PR-S). Other possible selectable marker genes will be apparent to those of skill in the art and are encompassed by the present invention.

Cell Transformation

The invention is also directed to a method of producing transformed cells and plants which comprise a promoter operably linked to a transcribable polynucleotide molecule.

The term “transformation” refers to the introduction of nucleic acid into a recipient host. As used herein, the term “host” refers to bacteria, fungi, or plant, including any cells, tissue, organs, or progeny of the bacteria, fungi, or plant. Plant tissues and cells of particular interest include protoplasts, calli, roots, tubers, seeds, stems, leaves, seedlings, embryos, and pollen.

As used herein, the term “transformed” refers to a cell, tissue, organ, or organism into which a foreign polynucleotide molecule, such as a construct, has been introduced. The introduced polynucleotide molecule may be integrated into the genomic DNA of the recipient cell, tissue, organ, or organism such that the introduced polynucleotide molecule is inherited by subsequent progeny. A “transgenic” or “transformed” cell or organism also includes progeny of the cell or organism and progeny produced from a breeding program employing such a transgenic organism as a parent in a cross and exhibiting an altered phenotype resulting from the presence of a foreign polynucleotide molecule. The term “transgenic” refers to a bacteria, fungi, or plant containing one or more heterologous polynucleic acid molecules.

There are many methods for introducing polynucleic acid molecules into plant cells. The method generally comprises the steps of selecting a suitable host cell, transforming the host cell with a recombinant vector, and obtaining the transformed host cell. Suitable methods include bacterial infection (*e.g.* *Agrobacterium*), binary bacterial artificial chromosome vectors, direct delivery of DNA (*e.g.* via PEG-mediated transformation, desiccation/inhibition-mediated DNA uptake, electroporation, agitation with silicon carbide fibers, and acceleration of DNA coated particles, *etc.* (reviewed in Potrykus, *et al.*, *Ann. Rev. Plant Physiol. Plant Mol. Biol.* 42: 205 (1991)).

Technology for introduction of a DNA molecule into cells is well known to those of skill in the art. Methods and materials for transforming plant cells by introducing a plant DNA construct into a plant genome in the practice of this invention can include any of the well-known and demonstrated methods including, but not limited to:

- (1) chemical methods (Graham and Van der Eb, *Virology* 54:536-539 (1973) and Zatloukal, *et al.*, *Ann. N.Y. Acad. Sci.* 660: 136-153 (1992));
- (2) physical methods such as microinjection (Capecchi, *Cell* 22:479-488 (1980)), electroporation (Wong and Neumann, *Biochim. Biophys. Res. Commun.*, 107:584-

587 (1982); Fromm, *et al.*, *Proc. Natl. Acad. Sci. USA* 82:5824-5828 (1985); U.S. Patent No. 5,384,253) particle acceleration (Johnston and Tang, *Methods Cell Biol.* 43(A):353-365 (1994); Fynan, *et al.*, *Proc. Natl. Acad. Sci. USA* 90:11478-11482 (1993)); and microprojectile bombardment (as illustrated in U.S. Patent No. 5,015,580; 5,550,318; 5,538,880; 6,160,208; 6,399,861; and 6,403,865);

10 (3) viral vectors (Clapp, *Clin. Perinatol.* 20:155-168 (1993); Lu, *et al.*, *J. Exp. Med.* 178:2089-2096 (1993); Eglitis and Anderson, *Biotechniques* 6:608-614 (1988));

15 (4) receptor-mediated mechanisms (Curiel *et al.*, *Hum. Gen. Ther.* 3:147-154 (1992) and Wagner, *et al.*, *Proc. Natl. Acad. Sci. USA* 89:6099-6103 (1992); (5) bacterial mediated mechanisms such as *Agrobacterium*-mediated transformation (as illustrated in U.S. Patent No. 5,824,877; 5,591,616; 5,981,840; and 6,384,301); direct introduction into pollen by injecting a plant's reproductive organs (Zhou, *et al.*, *Methods in Enzymology* 101:433, (1983); Hess, *Intern Rev. Cytol.* 107:367 (1987); Luo, *et al.*, *Plant Mol Biol. Reporter* 6:165 (1988); Pena, *et al.*, *Nature* 325:274 (1987));

15 (7) protoplast transformation (as illustrated in U.S. Patent No. 5,508,184); and

20 (8) injection into immature embryos (Neuhaus, *et al.*, *Theor. Appl. Genet.* 75:30 (1987)).

Any of the above described methods may be utilized to transform a host cell with one

25 or more promoters and/or constructs of the present. Host cells may be any cell or organism such as a plant cell, algae cell, algae, fungal cell, fungi, bacterial cell, or insect cell. Preferred hosts and transformed cells include cells from: plants, *Aspergillus*, yeasts, insects, bacteria and algae.

30 Methods for transforming dicotyledonous plants, primarily by use of *Agrobacterium tumefaciens* and obtaining transgenic plants have been published for cotton (U.S. Patent No. 5,004,863; 5,159,135; and 5,518,908); soybean (U.S. Patent No. 5,569,834 and 5,416,011; *see also*, McCabe, *et al.*, *Biotechnology* 6:923 (1988) and Christou *et al.*, *Plant Physiol.* 87:671-674 (1988)); *Brassica* (U.S. Patent No. 5,463,174); peanut (Cheng *et al.*, *Plant Cell Rep.* 15:653-657 (1996) and McKently *et al.*, *Plant Cell Rep.* 14:699-703 (1995)); papaya; and pea (Grant *et al.*, *Plant Cell Rep.* 15:254-258 (1995)).

Transformations of monocotyledon plants using electroporation, particle bombardment, and *Agrobacterium* have also been reported. Transformation and plant regeneration have been achieved in asparagus (Bytebier, *et al.*, *Proc. Natl. Acad. Sci. (USA)* 84:5354 (1987); barley (Wan and Lemaux, *Plant Physiol.* 104:37 (1994)); maize (Rhodes, *et*

al., *Science* 240:204 (1988), Gordon-Kamm, et al., *Plant Cell* 2:603-618 (1990), Fromm, et al., *Bio/Technology*, 8:833 (1990), Koziel et al., *Bio/Technology* 11:194 (1993), and Armstrong, et al., *Crop Science* 35:550-557 (1995)); oat (Somers, et al., *Bio/Technology* 10:1589 (1992)); orchard grass (Horn, et al., *Plant Cell Rep.* 7:469 (1988)); rye (De la Pena, et al., *Nature*, 325:274 (1987)); sugarcane (Bower and Birch, *Plant Journal* 2:409 (1992)); tall fescue (Wang, et al., *Bio/Technology* 10:691 (1992)); and wheat (Vasil, et al., *Bio/Technology* 10:667 (1992) and U.S. Patent No. 5,631,152).

The regeneration, development, and cultivation of plants from transformed plant protoplast or explants is well known in the art (see, for example, Weissbach and Weissbach, 10 *Methods for Plant Molecular Biology*, (Eds.), Academic Press, Inc., San Diego, CA (1988) and Horsch et al., *Science* 227:1229-1231 (1985)). Transformed cells are generally cultured in the presence of a selective media, which selects for the successfully transformed cells and induces the regeneration of plant shoots and roots into intact plants (Fraley, et al., *Proc. Natl. Acad. Sci. U.S.A.* 80: 4803 (1983)). Transformed plants are typically obtained within two to 15 four months.

The regenerated transgenic plants are self-pollinated to provide homozygous transgenic plants. Alternatively, pollen obtained from the regenerated transgenic plants may be crossed with non-transgenic plants, preferably inbred lines of agronomically important species. Descriptions of breeding methods that are commonly used for different traits and 20 crops can be found in one of several reference books, see, for example, Allard, *Principles of Plant Breeding*, John Wiley & Sons, NY, U. of CA, Davis, CA, 50-98 (1960); Simmonds, *Principles of crop improvement*, Longman, Inc., NY, 369-399 (1979); Sneep and Hendriksen, Plant breeding perspectives, Wageningen (ed), Center for Agricultural Publishing and Documentation (1979); Fehr, *Soybeans: Improvement, Production and Uses*, 2nd Edition, 25 Monograph, 16:249 (1987); Fehr, *Principles of variety development, Theory and Technique*, (Vol. 1) and *Crop Species Soybean* (Vol 2), Iowa State Univ., Macmillan Pub. Co., NY, 360-376 (1987). Conversely, pollen from non-transgenic plants may be used to pollinate the regenerated transgenic plants.

The transformed plants may be analyzed for the presence of the genes of interest and 30 the expression level and/or profile conferred by the regulatory elements of the present invention. Those of skill in the art are aware of the numerous methods available for the analysis of transformed plants. For example, methods for plant analysis include, but are not limited to Southern blots or northern blots, PCR-based approaches, biochemical analyses, phenotypic screening methods, field evaluations, and immunodiagnostic assays. The

expression of a transcribable polynucleotide molecule can be measured using TaqMan® (Applied Biosystems, Foster City, CA) reagents and methods as described by the manufacturer and PCR cycle times determined using the TaqMan® Testing Matrix. Alternatively, the Invader® (Third Wave Technologies, Madison, WI) reagents and methods 5 as described by the manufacturer can be used transgene expression.

The seeds of the plants of this invention can be harvested from fertile transgenic plants and be used to grow progeny generations of transformed plants of this invention including hybrid plant lines comprising the construct of this invention and expressing a gene of agronomic interest.

10 The present invention also provides for parts of the plants of the present invention. Plant parts, without limitation, include leaves, stems, roots, tubers, seeds, endosperm, ovule, and pollen. The invention also includes and provides transformed plant cells which comprise a nucleic acid molecule of the present invention.

15 The transgenic plant may pass along the transgenic polynucleotide molecule to its progeny. Progeny includes any regenerable plant part or seed comprising the transgene derived from an ancestor plant. The transgenic plant is preferably homozygous for the transformed polynucleotide molecule and transmits that sequence to all offspring as a result of sexual reproduction. Progeny may be grown from seeds produced by the transgenic plant. These additional plants may then be self-pollinated to generate a true breeding line of plants.
20 The progeny from these plants are evaluated, among other things, for gene expression. The gene expression may be detected by several common methods such as western blotting, northern blotting, immuno-precipitation, and ELISA.

Having now generally described the invention, the same will be more readily understood through reference to the following examples which are provided by way of 25 illustration, and are not intended to be limiting of the present invention, unless specified. It should be appreciated by those of skill in the art that the techniques disclosed in the following examples represent techniques discovered by the inventors to function well in the practice of the invention. However, those of skill in the art should, in light of the present disclosure, appreciate that many changes can be made in the specific embodiments that are disclosed and 30 still obtain a like or similar result without departing from the spirit and scope of the invention, therefore all matter set forth or shown in the accompanying drawings is to be interpreted as illustrative and not in a limiting sense.

EXAMPLES

Regulatory elements useful to drive expression of an operably linked transcribable polynucleotide in transgenic plants were isolated, and the expression pattern of these regulatory elements operably linked to a transcribable polynucleotide molecule was analyzed
5 in transgenic soy plants.

Example 1: Identification and Cloning of Novel Regulatory Elements: Promoters, Leaders and Introns.

Regulatory elements were identified and isolated from genomic DNA of the monocot
10 species, Foxtail millet (*Setaria italica* (L.) Beauv). Proprietary genomic and EST and public genomic and EST sequence was used to design primers, which were then used with GenomeWalker™ (Clontech Laboratories, Inc, Mountain View, CA) libraries constructed following the manufacturer's protocol to clone the 5' region of the corresponding genomic DNA sequence. In the case of promoters leaders and introns, this cloned region comprised
15 the 5'transciptional regulatory, 5' UTR and if present, intron sequence upstream of the protein-coding region for each gene from *S. italica*. Using this sequence, regulatory elements were bioinformatically identified within the 5' region for each gene. Bioinformatic analysis was used to identify the transcriptional start site (TSS) and any bi-directionality, introns, or upstream coding sequence present in the sequence. Using the results of this analysis,
20 regulatory elements were defined within the 5' sequence upstream of the coding sequence of the gene. Primers were then designed to amplify the regulatory elements. The corresponding DNA molecule for each regulatory element was amplified using standard polymerase chain reaction conditions with primers containing unique restriction enzyme sites and genomic DNA isolated from *S. italica*. The resulting DNA fragments were ligated into a base plant
25 expression vector using standard restriction enzyme digestion of compatible restriction sites and DNA ligation methods.

Sequences of regulatory elements, transit peptide encoding elements and transit peptide protein sequences identified from *S. italica* are listed in Table 1 below. Sequences of the regulatory elements identified from *S. italica* are provided herein as SEQ ID NOS: 1 through 276, SEQ ID NOS: 317 through 323 and 352 through 924. Transcriptional regulatory element groups (EXP) comprised of a promoter, leader and intron operably linked or a promoter, leader, intron and leader operably linked are provided herein as SEQ ID NOS: 1 through 22. Promoter sequences are provided herein as SEQ ID NOS: 23 through 105 and

SEQ ID NOS: 353 through 536. Leader sequences are provided herein as SEQ ID NOS: 106 through 171 and SEQ ID NOS: 537 through 588. Intron sequences are provided as SEQ ID NOS: 172 through 267, SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778. Sequences comprising 3' UTRs are provided herein as SEQ ID NOS: 268 through 276 and 5 SEQ ID NOS: 779 through 924. Sequences encoding transit peptides are provided herein as SEQ ID NOS: 277 through 316. The genomic DNA encoding some of the transit peptides also are comprised by introns presented as SEQ ID NOS: 317 through 323. Transit peptide protein sequences are provided herein as SEQ ID NOS: 324 through 350. An enhancer element is provided as SEQ ID NO: 352.

10 **Table 1. Regulatory elements and corresponding promoters, leaders and introns; and transit (localization) sequences.**

Two size variants of the Foxtail millet Act8 (Actin 8) promoter are presented in Table 1.

1. Alignment of the size variants for the Actin 8 promoter is provided in Figures 1a through 1c. The promoter, P-SETit.Act8-1:1:5 (SEQ ID NO: 24) is 1419 nucleotides in length. The 5 promoter, P-SETit.Act8-1:1:6 (SEQ ID NO: 25) is comprised of a 5' deletion of P-SETit.Act8-1:1:5 (SEQ ID NO: 24) and is 902 nucleotides in length.

Two size variants of the Foxtail millet Alc1 promoter are presented in Table 1. Alignment of the size variants for the Alc1 promoter is provided in Figures 2a through 2c. The promoter, P-SETit.Alc1-1:1:1 (SEQ ID NO: 28) is 1577 nucleotides in length. The

promoter, P-SETit.Alc1-1:1:2 (SEQ ID NO: 29) is comprised of a 5' deletion of P-SETit.Alc1-1:1:1 (SEQ ID NO: 28) and is 412 nucleotides in length.

Two size variants of the Foxtail millet Cys promoter are presented in Table 1. Alignment of the size variants for the Cys promoter is provided in Figures 3a through 3f. The 5 promoter, P-SETit.Cys-1:1:2 (SEQ ID NO: 45) is 3277 nucleotides in length. The promoter, P-SETit.Cys-1:1:3 (SEQ ID NO: 46) is comprised of a 5' deletion of P-SETit.Cys-1:1:2 (SEQ ID NO: 45) and is 2020 nucleotides in length.

Two size variants of the Foxtail millet Dzs promoter are presented in Table 1. Alignment of the size variants for the Dzs promoter is provided in Figures 4a through 4f. The 10 promoter, P-SETit.Dzs-1:1:4 (SEQ ID NO: 47) is 3508 nucleotides in length. The promoter, P-SETit.Dzs-1:1:5 (SEQ ID NO: 48) is comprised of a 5' deletion of P-SETit.Dzs-1:1:4 (SEQ ID NO: 47) and is 1008 nucleotides in length.

Two size variants of the Foxtail millet Gst promoter are presented in Table 1. Alignment of the size variants for the Gst promoter is provided in Figures 5a through 5c. The 15 promoter, P-SETit.Gst-1:1:1 (SEQ ID NO: 58) is 1681 nucleotides in length. The promoter, P-SETit.Gst-1:1:2 (SEQ ID NO: 59) is comprised of a 5' deletion of P-SETit.Gst-1:1:1 (SEQ ID NO: 58) and is 428 nucleotides in length.

Two size variants of the Foxtail millet Ifr promoter are presented in Table 1. Alignment of the size variants for the Ifr promoter is provided in Figures 6a through 6c. The 20 promoter, P-SETit.Ifr-1:1:2 (SEQ ID NO: 60) is 1280 nucleotides in length. The promoter, P-SETit.Ifr-1:1:3 (SEQ ID NO: 61) is comprised of a 5' deletion of P-SETit.Ifr-1:1:2 (SEQ ID NO: 60) and is 275 nucleotides in length.

Two size variants of the Foxtail millet Nrt2 promoter are presented in Table 1. Alignment of the size variants for the Nrt2 promoter is provided in Figures 7a through 7d. The 25 promoter, P-SETit.Nrt2-1:1:2 (SEQ ID NO: 64) is 1866 nucleotides in length. The promoter, P-SETit.Nrt2-1:1:3 (SEQ ID NO: 65) is comprised of a 5' deletion of P-SETit.Nrt2-1:1:2 (SEQ ID NO: 64) and is 382 nucleotides in length.

Two size variants of the Foxtail millet Ppc promoter are presented in Table 1. Alignment of the size variants for the Ppc promoter is provided in Figures 8a through 8e. The 30 promoter, P-SETit.Ppc-1:1:3 (SEQ ID NO: 74) is 2722 nucleotides in length. The promoter, P-SETit.Ppc-1:1:4 (SEQ ID NO: 75) is comprised of a 5' deletion of P-SETit.Ppc-1:1:3 (SEQ ID NO: 74) and is 1882 nucleotides in length.

Two size variants of the Foxtail millet Prx3 promoter are presented in Table 1. Alignment of the size variants for the Prx3 promoter is provided in Figures 9a through 9f.

The promoter, P-SETit.Prx3-1:1:4 (SEQ ID NO: 83) is 3354 nucleotides in length. The promoter, P-SETit.Prx3-1:1:3 (SEQ ID NO: 82) is comprised of a 5' deletion of P-SETit.Prx3-1:1:4 (SEQ ID NO: 83) and is 1908 nucleotides in length.

Three size variants of the Foxtail millet Rcc3 promoter are presented in Table 1.

- 5 Alignment of the size variants for the Rcc3 promoter is provided in Figures 10a through 10f. The promoter, P-SETit.Rcc3-1:1:1 (SEQ ID NO: 88) is 2062 nucleotides in length. The promoter, P-SETit.Rcc3-1:1:16 (SEQ ID NO: 91) is comprised of a 5' deletion of P-SETit.Rcc3-1:1:1 (SEQ ID NO: 88) and is 2024 nucleotides in length. The promoter, P-SETit.Rcc3-1:1:10 (SEQ ID NO: 89) is comprised of a 5' deletion of P-SETit.Rcc3-1:1:1 (SEQ ID NO: 88) and is 1563 nucleotides in length. The promoter, P-SETit.Rcc3-1:1:11 (SEQ ID NO: 90) is comprised of a 5' deletion of P-SETit.Rcc3-1:1:1 (SEQ ID NO: 88) and is 915 nucleotides in length.

Two size variants of the Foxtail millet Ssp1 promoter are presented in Table 1.

- Alignment of the size variants for the Ssp1 promoter is provided in Figures 11a through 11b. 15 The promoter, P-SETit.Ssp1-1:1:1 (SEQ ID NO: 93) is 1128 nucleotides in length. The promoter, P-SETit.Ssp1-1:1:2 (SEQ ID NO: 94) is comprised of a 5' deletion of P-SETit.Ssp1-1:1:1 (SEQ ID NO: 93) and is 479 nucleotides in length.

Two size variants of the Foxtail millet Tip promoter are presented in Table 1.

- Alignment of the size variants for the Tip promoter is provided in Figures 12a through 12d. 20 The promoter, P-SETit.Tip-1:1:4 (SEQ ID NO: 97) is 2108 nucleotides in length. The promoter, P-SETit.Tip-1:1:1 (SEQ ID NO: 96) is comprised of a 5' deletion of P-SETit.Tip-1:1:4 (SEQ ID NO: 97) and is 917 nucleotides in length.

Two size variants of the Foxtail millet TubA2-1 promoter are presented in Table 1.

- Alignment of the size variants for the TubA2-1 promoter is provided in Figures 13a through 25 13d. The promoter, P-SETit.TubA2-1-1:1:2 (SEQ ID NO: 98) is 1593 nucleotides in length. The promoter, P-SETit.TubA2-1-1:1:3 (SEQ ID NO: 99) is comprised of a 5' deletion of P-SETit.TubA2-1-1:1:2 (SEQ ID NO: 98) and is 856 nucleotides in length.

Two size variants of the Foxtail millet Ubq1 promoter are presented in Table 1.

- Alignment of the size variants for the Ubq1 promoter is provided in Figures 14a through 14c. 30 The promoter, P-SETit.Ubq1-1:1:1 (SEQ ID NO: 102) is 1492 nucleotides in length. The promoter, P-SETit.Ubq1-1:1:3 (SEQ ID NO: 103) is comprised of a 5' deletion of P-SETit.Ubq1-1:1:1 (SEQ ID NO: 102) and is 680 nucleotides in length.

Compositions derived from any of the promoters presented as SEQ ID NOS: 23 through 105 and SEQ ID NOS: 353 through 536 comprised of internal or 5' deletions can be

built using methods known in the art to improve expression, by removing elements that have either positive or negative effects on expression; or duplicating elements that have either positive or negative effects on expression; or duplicating or removing elements that have tissue or cell specific effects on expression. Compositions derived from any of the promoters
5 presented as SEQ ID NOS: 23 through 105 and SEQ ID NOS: 353 through 536 comprised of 3' deletions in which the TATA box element or equivalent sequence thereof and downstream sequence is removed can be used to make enhancer elements. Further deletions can be made to remove any elements that have either positive or negative; or tissue specific; or cell specific; or timing specific (such as, but not limited to, circadian rhythms) effects on
10 expression. Any of the promoters presented as SEQ ID NOS: 23 through 105 and SEQ ID NOS: 353 through 536 and the fragments or enhancers derived there from can be used to make chimeric transcriptional regulatory element compositions comprised of any of the promoters presented as SEQ ID NOS: 23 through 105 and SEQ ID NOS: 353 through 536 and the fragments or enhancers derived there from operably linked to other enhancers and
15 promoters. The efficacy of the modifications, duplications or deletions described above on the desired expression aspects of a particular transgene are tested empirically in stable and transient plant assays, since the effect of such alterations to the native promoter composition are not readily predictable and require empirical testing to validate such effects.

The leader sequences (5' UTR) presented as SEQ ID NOS: 106 through 171 and SEQ
20 ID NOS: 537 through 588 may be comprised of regulatory elements or may adopt secondary structures that can have an effect on transcription or translation of a transgene. The leader sequences presented as SEQ ID NOS: 106 through 171 and SEQ ID NOS: 537 through 588 can be used to make chimeric regulatory elements that affect transcription or translation of a transgene. In addition, the leader sequences presented as SEQ ID NOS: 106 through 171 and
25 SEQ ID NOS: 537 through 588 can be used to make chimeric leader sequences which affect transcription or translation of a transgene.

Compositions derived from any of the introns presented as SEQ ID NOS: 172 through
267, SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778 can be comprised of internal deletions or duplications of cis regulatory elements; or alterations of the 5' and 3'
30 sequences comprising the intron/exon splice junctions, can be used to improve expression or specificity of expression when operably linked to a promoter + leader or chimeric promoter + leader and coding sequence. Alterations of the 5' and 3' regions comprising the intron/exon splice junction can also be made to reduce the potential for introduction of false start and stop codons begin produced in the resulting transcript after processing and splicing of the

messenger RNA. The introns are tested empirically as described below to determine the intron's effect on expression of a transgene.

Example 2: Analysis of Regulatory Elements driving GUS in Transgenic Corn

Corn plants were transformed with plant expression vectors containing the test
5 regulatory elements driving expression of the β -glucuronidase (GUS) transgene, and the resulting plants were analyzed for GUS protein expression.

Corn plants were transformed with the plant GUS expression constructs, listed in Table 2, below. Regulatory elements and chimeric regulatory elements presented in example 1 were cloned into a base plant expression vector using standard methods known in the art.
10 The resulting plant expression vectors contained a right border region from *Agrobacterium tumefaciens*, a first transgene cassette to test the regulatory or chimeric regulatory element comprised of, a regulatory or chimeric regulatory element, operably linked to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably linked to a coding sequence for β -glucuronidase (GUS) that either possessed
15 a processable intron (GUS-2, SEQ ID NO: 1091) or no intron (GUS-1, SEQ ID NO: 1090), operably linked to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088) or the 3' termination region from the rice lipid transfer protein gene (T-Os.LTP-1:1:1, SEQ ID NO: 1089); a second transgene selection cassette used for selection of transformed plant cells that conferred resistance to the herbicide
20 glyphosate (driven by the rice Actin 1 transcriptional regulatory element group, SEQ ID NO: 1098), or alternatively, the antibiotic kanamycin (driven by the rice Actin 1 transcriptional regulatory element group, SEQ ID NO: 1098) and a left border region from *A. tumefaciens*. The resulting plasmids, pMON109728, pMON112215, pMON116789, pMON116816,
pMON116818, pMON116820, pMON116829, pMON120698, pMON120699,
25 pMON120700, pMON120701, pMON120702, pMON120703, pMON120704,
pMON120705, pMON120706, pMON120709, pMON120710, pMON120711,
pMON120712, pMON120713, pMON127440, pMON127441, pMON127442,
pMON127443, pMON127444, pMON127445, pMON127446, pMON127447,
pMON127448, pMON127449 and pMON132037 were used to transform corn plants.

Table 2. Binary Plant Transformation Constructs, Regulatory or chimeric regulatory elements, GUS and 3' UTRs.

Construct	Regulatory Elements	GUS	3' UTR
pMON109728	EXP-FMV.35S-SETit.Tip (SEQ ID NO: 8) E-FMV.35S-1:1:2 (SEQ ID NO: 351) P-SETit.Tip-1:1:1 (SEQ ID NO: 96) L-SETit.Tip-1:1:1 (SEQ ID NO: 165)	GUS-1	T-AGRtu.nos-1:1:13

The plant transformation vector, pMON109728 is comprised of the transcriptional regulatory element group, EXP-FMV.35S-SETit.Tip (SEQ ID NO: 8), which is further comprised of the enhancer element, E-FMV.35S-1:1:2 (SEQ ID NO: 351), operably linked 5' to the promoter element, P-SETit.Tip-1:1:1 (SEQ ID NO: 96), operably linked 5' to the leader element, L-SETit.Tip-1:1:1 (SEQ ID NO: 165). The plant transformation vector, pMON112215 is comprised of the promoter element, P-SETit.Rcc3-1:1:1 (SEQ ID NO: 88), operably linked 5' to the leader element, L-SETit.Rcc3-1:1:1 (SEQ ID NO: 161). The plant transformation vector, pMON116789 is comprised of the promoter element, P-SETit.Rcc3-1:1:11 (SEQ ID NO: 90), operably linked 5' to the leader element, L-SETit.Rcc3-1:1:2 (SEQ ID NO: 162). The plant transformation vector, pMON116816 is comprised of the promoter element, P-SETit.Rcc3-1:1:11 (SEQ ID NO: 90), operably linked 5' to the leader element, L-SETit.Rcc3-1:1:2 (SEQ ID NO: 162). The plant transformation vector, pMON116818 is

comprised of the promoter element, P-SETit.Pox-1:1:1 (SEQ ID NO: 73), operably linked 5' to the leader element, L-SETit.Pox-1:1:1 (SEQ ID NO: 147). The plant transformation vector, pMON116820 is comprised of the promoter element, P-SETit.Gst-1:1:1 (SEQ ID NO: 58), operably linked 5' to the leader element, L-SETit.Gst-1:1:1 (SEQ ID NO: 135). The 5 plant transformation vector, pMON116829 is comprised of the promoter element, P-SETit.Rcc3-1:1:10 (SEQ ID NO: 89), operably linked 5' to the leader element, L-SETit.Rcc3-1:1:2 (SEQ ID NO: 162). The plant transformation vector, pMON120698 is comprised of the transcriptional regulatory element group, EXP-FMV.35S-SETit.Rcc3:a (SEQ ID NO: 6), which is further comprised of the enhancer element, E-FMV.35S-1:1:2 (SEQ ID NO: 351), 10 operably linked 5' to the promoter element, P-SETit.Rcc3-1:1:10 (SEQ ID NO: 89), operably linked 5' to the leader element, L-SETit.Rcc3-1:1:2 (SEQ ID NO: 162). The plant transformation vector, pMON120699 is comprised of the transcriptional regulatory element group, EXP-FMV.35S-SETit.Gst:a (SEQ ID NO: 2), which is further comprised of the enhancer element, E-FMV.35S-1:1:2 (SEQ ID NO: 351), operably linked 5' to the promoter 15 element, P-SETit.Gst-1:1:1 (SEQ ID NO: 58), operably linked 5' to the leader element, L-SETit.Gst-1:1:1 (SEQ ID NO: 135). The plant transformation vector, pMON120700 is comprised of the transcriptional regulatory element group, EXP-FMV.35S-SETit.Rcc3:b (SEQ ID NO: 7), which is further comprised of the enhancer element, E-FMV.35S-1:1:2 (SEQ ID NO: 351), operably linked 5' to the promoter element, P-SETit.Rcc3-1:1:11 (SEQ 20 ID NO: 90), operably linked 5' to the leader element, L-SETit.Rcc3-1:1:2 (SEQ ID NO: 162). The plant transformation vector, pMON120701 is comprised of the transcriptional regulatory element group, EXP-FMV.35S-SETit.Pox (SEQ ID NO: 5), which is further comprised of the enhancer element, E-FMV.35S-1:1:2 (SEQ ID NO: 351), operably linked 5' to the promoter element, P-SETit.Pox-1:1:1 (SEQ ID NO: 73), operably linked 5' to the leader element, L- 25 SETit.Pox-1:1:1 (SEQ ID NO: 147). The plant transformation vector, pMON120702 is comprised of the promoter element, P-SETit.Ccoamt-1:1:2 (SEQ ID NO: 35), operably linked 5' to the leader element, L-SETit.Ccoamt-1:1:2 (SEQ ID NO: 116). The plant transformation vector, pMON120703 is comprised of the transcriptional regulatory element group, EXP-FMV.35S-SETit.Ccoamt (SEQ ID NO: 1), which is further comprised of the enhancer 30 element, E-FMV.35S-1:1:2 (SEQ ID NO: 351), operably linked 5' to the promoter element, P-SETit.Ccoamt-1:1:2 (SEQ ID NO: 35), operably linked 5' to the leader element, L-SETit.Ccoamt-1:1:2 (SEQ ID NO: 116). The plant transformation vector, pMON120704 is comprised of the promoter element, P-SETit.Gst-1:1:2 (SEQ ID NO: 59), operably linked 5' to the leader element, L-SETit.Gst-1:1:1 (SEQ ID NO: 135). The plant transformation

vector, pMON120705 is comprised of the transcriptional regulatory element group, EXP-FMV.35S-SETit.Gst:b (SEQ ID NO: 3), which is further comprised of the enhancer element, E-FMV.35S-1:1:2 (SEQ ID NO: 351), operably linked 5' to the promoter element, P-SETit.Gst-1:1:2 (SEQ ID NO: 59), operably linked 5' to the leader element, L-SETit.Gst-1:1:1 (SEQ ID NO: 135). The plant transformation vector, pMON120706 is comprised of the transcriptional regulatory element group, EXP-FMV.35S-SETit.Ifr (SEQ ID NO: 4), which is further comprised of the enhancer element, E-FMV.35S-1:1:2 (SEQ ID NO: 351), operably linked 5' to the promoter element, P-SETit.Ifr-1:1:3 (SEQ ID NO: 61), operably linked 5' to the leader element, L-SETit.Ifr-1:1:1 (SEQ ID NO: 136). The plant transformation vector, pMON120709 is comprised of the promoter element, P-SETit.Nrt2-1:1:3 (SEQ ID NO: 65), operably linked 5' to the leader element, L-SETit.Nrt2-1:1:2 (SEQ ID NO: 139). The plant transformation vector, pMON120710 is comprised of the promoter element, P-SETit.Nrt2-1:1:2 (SEQ ID NO: 64), operably linked 5' to the leader element, L-SETit.Nrt2-1:1:2 (SEQ ID NO: 139). The plant transformation vector, pMON120711 is comprised of the promoter element, P-SETit.Pip2-1:1:3 (SEQ ID NO: 71), operably linked 5' to the leader element, L-SETit.Pip2-1:1:1 (SEQ ID NO: 145). The plant transformation vector, pMON120712 is comprised of the promoter element, P-SETit.Ifr-1:1:2 (SEQ ID NO: 60), operably linked 5' to the leader element, L-SETit.Ifr-1:1:1 (SEQ ID NO: 136). The plant transformation vector, pMON120713 is comprised of the promoter element, P-SETit.Ifr-1:1:3 (SEQ ID NO: 61), operably linked 5' to the leader element, L-SETit.Ifr-1:1:1 (SEQ ID NO: 136). The plant transformation vector, pMON127440 is comprised of the promoter element, P-SETit.Ppc-1:1:3 (SEQ ID NO: 74), operably linked 5' to the leader element, L-SETit.Ppc-1:1:1 (SEQ ID NO: 148). The plant transformation vector, pMON127441 is comprised of the promoter element, P-SETit.Ppc-1:1:4 (SEQ ID NO: 75), operably linked 5' to the leader element, L-SETit.Ppc-1:1:1 (SEQ ID NO: 148). The plant transformation vector, pMON127442 is comprised of the promoter element, P-SETit.Gapdh2-1:1:3 (SEQ ID NO: 55), operably linked 5' to the leader element, L-SETit.Gapdh2-1:1:1 (SEQ ID NO: 133). The plant transformation vector, pMON127443 is comprised of the transcriptional regulatory element group, EXP-SETit.Ppdk:1:1 (SEQ ID NO: 14), promoter element, P-SETit.Ppdk-1:1:1 (SEQ ID NO: 76), operably linked 5' to the leader element, L-SETit.Ppdk-1:1:4 (SEQ ID NO: 150), operably linked 5' to the intron element, I-SETit.Ppdk-1:1:1 (SEQ ID NO: 175), operably linked 5' to the leader element, L-SETit.Ppdk-1:1:2 (SEQ ID NO: 149). The plant transformation vector, pMON127444 is comprised of the promoter element, P-SETit.CP29-1:1:4 (SEQ ID NO: 42), operably linked 5' to the leader element, L-SETit.CP29-1:1:1 (SEQ ID NO: 151).

ID NO: 124). The plant transformation vector, pMON127445 promoter element, P-SETit.Cab3-1:1:3 (SEQ ID NO: 33), operably linked 5' to the leader element, L-SETit.Cab3-1:1:1 (SEQ ID NO: 114). The plant transformation vector, pMON127446 is comprised of the promoter element, P-SETit.PSI-4a-1:1:1 (SEQ ID NO: 86), operably linked 5' to the leader element, L-SETit.PSI-4a-1:1:1 (SEQ ID NO: 159). The plant transformation vector, pMON127447 is comprised of the promoter element, P-SETit.Rbcs-1:1:1 (SEQ ID NO: 87), operably linked 5' to the leader element, L-SETit.Rbcs-1:1:1 (SEQ ID NO: 160). The plant transformation vector, pMON127448 is comprised of the promoter element, P-SETit.Cab1-1:1:1 (SEQ ID NO: 32), operably linked 5' to the leader element, L-SETit.Cab1-1:1:1 (SEQ ID NO: 113). The plant transformation vector, pMON127449 is comprised of the promoter element, P-SETit.Fba-1:1:1 (SEQ ID NO: 51), operably linked 5' to the leader element, L-SETit.Fba-1:1:1 (SEQ ID NO: 131). The plant transformation vector, pMON132037 is comprised of the transcriptional regulatory element group, EXP-SETit.Ubq1:1:1 (SEQ ID NO: 20), which is further comprised of the promoter element, P-SETit.Ubq1-1:1:1 (SEQ ID NO: 102), operably linked 5' to the leader element, L-SETit.Ubq1-1:1:1 (SEQ ID NO: 169), operably linked 5' to the intron element, I-SETit.Ubq1-1:1:1 (SEQ ID NO: 177).

Corn plants were transformed with plant GUS expression constructs, pMON109728, pMON112215, pMON116829, pMON120702, pMON120709, pMON127440, pMON127445, pMON116789, pMON120698, pMON120703, pMON120710, pMON127441, pMON116816, pMON120699, pMON120704, pMON127442, pMON120700, pMON120705, pMON120711, pMON127443, pMON120706, pMON120712, pMON120713, pMON127444, pMON127449 and pMON132037.

Plants were transformed using *Agrobacterium*-mediated transformations known to those skilled in the art. Briefly, LH244 corn seed embryos are extracted from surface-sterilized, developing corn kernels approximately 9 to 13 days after pollination. The embryos are co-cultured with *Agrobacterium tumefaciens*, transformed with the GUS expression constructs for 18 to 28 hours in the dark. The embryos are then transferred to selective media and cultured in the dark for approximately 3 weeks to induce the formation of callus. Following callus induction, the embryo-derived callus tissue is transferred to new media and cultured under light for 5 to 10 days. The callus tissue is then transferred to new media to induce the formation of shoots. After 2 to 3 weeks, the transformed shoots are transferred to rooting medium and cultured to permit the formation of roots. Once sufficient root formation

has occurred, the transformed plants are transferred to soil and transferred to the greenhouse. Events containing one or two copies of the transgene cassette are selected for study using real-time PCR methods known to those skilled in the art.

Histochemical GUS analysis was used for qualitative expression analysis of 5 transformed plants. Whole tissue sections were incubated with GUS staining solution X-Gluc (5-bromo-4-chloro-3-indolyl-β-glucuronide) (1 milligram/milliliter) for an appropriate length of time, rinsed, and visually inspected for blue coloration. GUS activity was qualitatively determined by direct visual inspection or inspection under a microscope using selected plant organs and tissues. The R₀ plants were inspected for expression in the roots 10 and leaves.

For quantitative analysis, total protein was extracted from selected tissues of transformed corn plants. One microgram of total protein was used with the fluorogenic substrate 4-methyleumbelliferyl-β-D-glucuronide (MUG) in a total reaction volume of 50 microliters. The reaction product, 4-methlyumbelliferone (4-MU), is maximally fluorescent 15 at high pH, where the hydroxyl group is ionized. Addition of a basic solution of sodium carbonate simultaneously stops the assay and adjusts the pH for quantifying the fluorescent product. Fluorescence was measured with excitation at 365 nm, emission at 445 nm using a Fluoromax-3 with Micromax Reader, with slit width set at excitation 2 nm and emission 3nm.

The average R₀ GUS expression observed for each transformation is presented in 20 Table 3 and 4 below.

Table 3. Average R₀ GUS Leaf and Root expression in transgenic corn plants, transformed with listed construct.

The average level of GUS expression in the seed and reproductive tissues varied amongst the constructs. Highest levels of anther expression at VT stage were observed for pMON116789 ((P-SETit.Rcc3-1:1:11 (SEQ ID NO: 90) + L-SETit.Rcc3-1:1:2 (SEQ ID NO: 162)); pMON127441 ((P-SETit.Ppc-1:1:4 (SEQ ID NO: 75) + L-SETit.Ppc-1:1:1 (SEQ ID NO: 148)); pMON120705 ((EXP-FMV.35S-SETit.Gst:b (SEQ ID NO: 3) comprised of E-FMV.35S-1:1:2 (SEQ ID NO: 179) + P-SETit.Gst-1:1:2 (SEQ ID NO: 59) + L-SETit.Gst-1:1:1 (SEQ ID NO: 135)); pMON132037 ((EXP-SETit.Ubq1:1:1 (SEQ ID NO: 20) comprised of P-SETit.Ubq1-1:1:1 (SEQ ID NO: 102) + L-SETit.Ubq1-1:1:1 (SEQ ID NO: 169) + I-SETit.Ubq1-1:1:1 (SEQ ID NO: 177)); pMON127447 ((P-SETit.Rbcs-1:1:1 (SEQ ID NO: 87) + L-SETit.Rbcs-1:1:1 (SEQ ID NO: 160)); pMON127444 ((P-SETit.CP29-1:1:4 (SEQ ID NO: 42) + L-SETit.CP29-1:1:1 (SEQ ID NO: 124)) and pMON120706 ((EXP-FMV.35S-SETit.Ifr (SEQ ID NO: 4) comprised of E-FMV.35S-1:1:2 (SEQ ID NO: 179) + P-SETit.Ifr-1:1:3 (SEQ ID NO: 61) + L-SETit.Ifr-1:1:1 (SEQ ID NO: 136)).

The highest levels of average GUS expression in the silk was observed in plants transformed with pMON120706 ((EXP-FMV.35S-SETit.Ifr (SEQ ID NO: 4) comprised of E-FMV.35S-1:1:2 (SEQ ID NO: 179) + P-SETit.Ifr-1:1:3 (SEQ ID NO: 61) + L-SETit.Ifr-1:1:1 (SEQ ID NO: 136)); pMON127446 ((P-SETit.PSI-4a-1:1:1 (SEQ ID NO: 86) + L-SETit.PSI-4a-1:1:1 (SEQ ID NO: 159)); pMON120709 ((P-SETit.Nrt2-1:1:3 (SEQ ID NO: 65) + L-SETit.Nrt2-1:1:2 (SEQ ID NO: 139)); pMON127447 ((P-SETit.Rbcs-1:1:1 (SEQ ID NO: 87) + L-SETit.Rbcs-1:1:1 (SEQ ID NO: 160)) and pMON132037 ((EXP-SETit.Ubq1:1:1 (SEQ ID NO: 20) comprised of P-SETit.Ubq1-1:1:1 (SEQ ID NO: 102) + L-SETit.Ubq1-1:1:1 (SEQ ID NO: 169) + I-SETit.Ubq1-1:1:1 (SEQ ID NO: 177)). Average GUS expression in the developing embryo 21 DAP was observed in plants transformed with pMON127442 ((P-SETit.Gapdh2-1:1:3 (SEQ ID NO: 55) + L-SETit.Gapdh2-1:1:1 (SEQ ID NO: 133)); pMON120709 ((P-SETit.Nrt2-1:1:3 (SEQ ID NO: 65) + L-SETit.Nrt2-1:1:2 (SEQ ID NO: 139)); pMON132037 ((EXP-SETit.Ubq1:1:1 (SEQ ID NO: 20) comprised of P-SETit.Ubq1-1:1:1 (SEQ ID NO: 102) + L-SETit.Ubq1-1:1:1 (SEQ ID NO: 169) + I-SETit.Ubq1-1:1:1

(SEQ ID NO: 177)); pMON120705 ((EXP-FMV.35S-SETit.Gst:b (SEQ ID NO: 3) comprised of E-FMV.35S-1:1:2 (SEQ ID NO: 179) + P-SETit.Gst-1:1:2 (SEQ ID NO: 59) + L-SETit.Gst-1:1:1 (SEQ ID NO: 135)) and pMON120699 ((EXP-FMV.35S-SETit.Gst:a (SEQ ID NO: 2) comprised of E-FMV.35S-1:1:2 (SEQ ID NO: 179) + P-SETit.Gst-1:1:1 (SEQ ID NO: 58) + L-SETit.Gst-1:1:1 (SEQ ID NO: 135)). Average GUS expression was also highest in plants transformed with pMON127442 ((P-SETit.Gapdh2-1:1:3 (SEQ ID NO: 55) + L-SETit.Gapdh2-1:1:1 (SEQ ID NO: 133)) and pMON120709 ((P-SETit.Nrt2-1:1:3 (SEQ ID NO: 65) + L-SETit.Nrt2-1:1:2 (SEQ ID NO: 139))

Plants transformed with the GUS expression vectors, pMON112215 ((P-SETit.Rcc3-1:1:1 (SEQ ID NO: 88) + L-SETit.Rcc3-1:1:1 (SEQ ID NO: 161)) were crossed with non-transformed LH244 plants to produce an F1 population of transformants. GUS expression levels were measured in selected tissues over the course of development. The F1 tissues used for this study included: imbibed seed embryo, imbibed seed endosperm, root (3 days after germination), coleoptiles (3 days after germination), V3 root, V3 leaf, V7 root, V7 mature leaf, VT (at tasseling, prior to reproduction) seminal root, VT internode, VT cob, VT anther, VT pollen, VT silk, kernel 7 days after pollination, embryo 21 days after pollination, endosperm 21 days after pollination, embryo 35 days after pollination, endosperm 35 days after pollination.

Drought stress was induced in R₀ V3 plants and in F1 V3 plants by withholding watering for 4 days allowing the water content to be reduced by at least 50% of the original water content of the fully watered plant. The drought protocol was comprised essentially of the following steps. V3 stage plants were deprived of water. As a corn plant experiences drought, the shape of the leaf will change from the usual healthy and unfolded appearance to a leaf demonstrating folding at the mid-rib vascular bundle and appearing V-shaped when viewed from the leaf tip to the stem. This change in morphology usually began to occur by about 2 days after the cessation of watering and was shown in earlier experiments to be associated with water loss of around 50% as measured by weight of pots prior to cessation of watering and weight of pots when the leaf curl morphology was observed in un-watered plants. Plants were considered to be under drought conditions, when the leaves showed wilting as evidenced by an inward curling (V-shape) of the leaf. This level of stress is considered to be a form of sub-lethal stress. Control leaf samples were taken from each plant for GUS testing prior to the induction of drought. Drought (indicated as "Des" in Table 5 below) was then induced and once each plant demonstrated drought induction as defined above, the plant was destroyed to acquire both root and leaf samples. GUS expression levels

in the leaves were compared to the control tissue samples from the same plants prior to drought. For R₀ generation plants, fourteen plants for each vector were used. For F1 analysis, eight plants for each vector were used and GUS measures taken as described above. Four of the F1 plants were destroyed for tissue sampling for GUS assay (Des) after drought-induction. The other two F1 plants were allowed to recover and then destructively sampled to determine if the pattern of GUS expression under recovery was the same as that before drought was imposed.

In addition to drought, F1 germinating seedlings and F1 V3 stage plants transformed with the vectors presented in Table 2 were also exposed to conditions of cold to determine if the regulatory elements and chimeric regulatory elements demonstrated cold-induced expression of GUS. Sixty seeds, comprised of 6 seeds from each of 10 transformation events for each regulatory element or chimeric regulatory element, were tested for induction of gene expression under cold conditions. The seeds were germinated in petri plates on water saturated filter paper. Three days after germination, the seedlings were exposed to cold stress by placing the Petri dishes containing the germinated seedlings in a dark growth chamber set to 10 degrees Celsius for 24 hours. At the end of the 24 hour period, the root and coleoptiles tissues were sampled for quantitative GUS expression as described above. Whole plants were tested for induction of GUS expression under cold stress at V3 stage. Twenty V3 stage corn plants, comprised of 2 plants from each of 10 transformation events for each regulatory element or chimeric regulatory element, were exposed to a temperature of 12 degrees Celsius in a growth chamber for 24 hours. Plants in the growth chamber were grown under a white light fluence of 800 micro moles per meter squared per second with a light cycle of ten hours of white light and fourteen hours of darkness. After cold exposure, leaf and root tissues were sampled for quantitative GUS exposure as described above. Table 5 below shows the level of GUS expression in selected tissues in F1 plants transformed with pMON112215.

Table 5. F1 GUS expression in transgenic corn plants, transformed with pMON112215.

F1 corn plants, transformed with pMON112215 ((P-SETit.Rcc3-1:1:1 (SEQ ID NO: 88) + L-SETit.Rcc3-1:1:1 (SEQ ID NO: 161)) demonstrated high levels of expression in VT anther tissue. Expression in pollen was also observed to be higher than in tissues other than anther. Expression was observed to be around background levels in developing embryo and endosperm, VT silk, VT seminal root and VT internode. Using more sensitive assay methods such as ELISA of TIC809 expression, the SETit.Rcc3 promoter and leader has been shown previously to drive expression of a transgene in stably transformed, corn root tissues (WO 2009/126470).

10

Example 3: Analysis of Regulatory Elements driving GUS in Transgenic Corn

Corn root and leaf tissue from 12 to 13 day old seedlings is bombarded with plant GUS expression and control vectors to determine the capacity of transcriptional regulatory elements derived from *Setaria italica* to drive expression of a transgene, GUS.

15 Corn plant tissues were transformed with the plant GUS expression constructs, listed in Table 6, below. Regulatory elements presented in example 1 were cloned into a base plant expression vector using standard methods known in the art. The resulting plant expression vectors contained a right border region from *Agrobacterium tumefaciens*, a first transgene

cassette to test the regulatory or chimeric regulatory element comprised of, a regulatory or chimeric regulatory element, operably linked to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably linked to a coding sequence for β-glucuronidase (GUS) that possessed a processable intron (GUS-2, SEQ ID NO: 1091), operably linked to the 3' termination region from the rice lipid transfer protein gene (T-Os.LTP-1:1:1, SEQ ID NO: 1089); a second transgene selection cassette used for selection of transformed plant cells that conferred resistance to the herbicide glyphosate (driven by the rice Actin 1 transcriptional regulatory element group, SEQ ID NO: 1098), and a left border region from *A. tumefaciens*. The resulting plasmids, pMON129227, 5 pMON129228, pMON129229, pMON129230, pMON129231, pMON129232, pMON129233, pMON129234, pMON129235, pMON129236, pMON129237, pMON129238, pMON129239, pMON129240, pMON129241, pMON129242, pMON129243, pMON129244, pMON129245, pMON129246, pMON129247, pMON129248, pMON129249, pMON129250, pMON129251, pMON129252, 10 pMON129253, pMON129254, pMON129255, pMON129256, pMON129257, pMON129258 and pMON129259 were used to transform corn plant tissue using particle bombardment. 15

The plant transformation vector, pMON129227 is comprised of the promoter element, P-SETit.Cyp-1-1:1:1 (SEQ ID NO: 43), operably linked 5' to the leader element, L-SETit.Cyp-1-1:1:1 (SEQ ID NO: 125). The plant transformation vector, pMON129228 is comprised of the promoter element, P-SETit.Cyp78a-1:1:2 (SEQ ID NO: 44), operably linked 5' to the leader element, L-SETit.Cyp78a-1:1:1 (SEQ ID NO: 126). The plant transformation vector, pMON129229 is comprised of the promoter element, P-SETit.OMT2.1-1:1:2 (SEQ ID NO: 66), operably linked 5' to the leader element, L-SETit.OMT2.1-1:1:1 (SEQ ID NO: 140). The plant transformation vector, pMON129230 is comprised of the promoter element, P-SETit.OMT2.2-1:1:2 (SEQ ID NO: 67), operably linked 5' to the leader element, L-SETit.OMT2.2-1:1:2 (SEQ ID NO: 142). The plant transformation vector, pMON129231 is comprised of the promoter element, P-SETit.OMT2.3-1:1:1 (SEQ ID NO: 68), operably linked 5' to the leader element, L-SETit.OMT2.2-1:1:1 (SEQ ID NO: 141). The plant

transformation vector, pMON129232 is comprised of the promoter element, P-SETit.Grcw2-1:1:1 (SEQ ID NO: 56), operably linked 5' to the leader element, L-SETit.Grcw2-1:1:1 (SEQ ID NO: 134). The plant transformation vector, pMON129233 is comprised of the promoter element, P-SETit.Prx2-1:1:3 (SEQ ID NO: 81), operably linked 5' to the leader element, L-SETit.Prx2-1:1:2 (SEQ ID NO: 155). The plant transformation vector, pMON129234 is comprised of the promoter element, P-SETit.Srp-1:1:2 (SEQ ID NO: 92), operably linked 5' to the leader element, L-SETit.Srp-1:1:1 (SEQ ID NO: 163). The plant transformation vector, pMON129235 is comprised of the promoter element, P-SETit.LaDo-1:1:2 (SEQ ID NO: 62), operably linked 5' to the leader element, L-SETit.LaDo-1:1:1 (SEQ ID NO: 137).

5 The plant transformation vector, pMON129236 is comprised of the promoter element, P-SETit.Aip-1:1:1 (SEQ ID NO: 27), operably linked 5' to the leader element, L-SETit.Aip-1:1:1 (SEQ ID NO: 109). The plant transformation vector, pMON129237 is comprised of the promoter element, P-SETit.Prx-1:1:1 (SEQ ID NO: 79), operably linked 5' to the leader element, L-SETit.Prx-1:1:1 (SEQ ID NO: 153). The plant transformation vector,

10 pMON129238 is comprised of the promoter element, P-SETit.Cbl7-1:1:1 (SEQ ID NO: 34), operably linked 5' to the leader element, L-SETit.Cbl7-1:1:1 (SEQ ID NO: 115). The plant transformation vector, pMON129239 is comprised of the promoter element, P-SETit.Fst-1:1:1 (SEQ ID NO: 54), operably linked 5' to the leader element, L-SETit.Fst-1:1:1 (SEQ ID NO: 132). The plant transformation vector, pMON129240 is comprised of the promoter

15 element, P-SETit.Cda-1:1:1 (SEQ ID NO: 36), operably linked 5' to the leader element, L-SETit.Cda-1:1:1 (SEQ ID NO: 117). The plant transformation vector, pMON129241 is comprised of the promoter element, P-SETit.Prx3-1:1:4 (SEQ ID NO: 83), operably linked 5' to the leader element, L-SETit.Prx3-1:1:1 (SEQ ID NO: 156). The plant transformation vector, pMON129242 is comprised of the promoter element, P-SETit.Prx3-1:1:3 (SEQ ID

20 NO: 82), operably linked 5' to the leader element, L-SETit.Prx3-1:1:1 (SEQ ID NO: 156). The plant transformation vector, pMON129243 is comprised of the promoter element, P-SETit.Prx47-1:1:2 (SEQ ID NO: 84), operably linked 5' to the leader element, L-SETit.Prx47-1:1:1 (SEQ ID NO: 157). The plant transformation vector, pMON129244 is comprised of the promoter element, P-SETit.Eie-1:1:1 (SEQ ID NO: 49), operably linked 5'

25 to the leader element, L-SETit.Eie-1:1:1 (SEQ ID NO: 129). The plant transformation vector, pMON129245 is comprised of the promoter element, P-SETit.Omt3-1:1:3 (SEQ ID NO: 69), operably linked 5' to the leader element, L-SETit.Omt3-1:1:1 (SEQ ID NO: 143). The plant transformation vector, pMON129246 is comprised of the promoter element, P-SETit.Cys-1:1:2 (SEQ ID NO: 45), operably linked 5' to the leader element, L-SETit.Cys-

1:1:1 (SEQ ID NO: 127). The plant transformation vector, pMON129247 is comprised of the promoter element, P-SETit.Cys-1:1:3 (SEQ ID NO: 46), operably linked 5' to the leader element, L-SETit.Cys-1:1:1 (SEQ ID NO: 127). The plant transformation vector, pMON129248 is comprised of the promoter element, P-SETit.Ucc1-1:1:2 (SEQ ID NO: 105),
5 operably linked 5' to the leader element, L-SETit.Ucc1-1:1:1 (SEQ ID NO: 170). The plant transformation vector, pMON129249 is comprised of the promoter element, P-SETit.Tip-1:1:4 (SEQ ID NO: 97), operably linked 5' to the leader element, L-SETit.Tip-1:1:1 (SEQ ID NO: 165). The plant transformation vector, pMON129250 is comprised of the promoter element, P-SETit.Prx72-1:1:2 (SEQ ID NO: 85), operably linked 5' to the leader element, L-
10 SETit.Prx72-1:1:1 (SEQ ID NO: 158). The plant transformation vector, pMON129251 is comprised of the promoter element, P-SETit.Prx17-1:1:2 (SEQ ID NO: 80), operably linked 5' to the leader element, L-SETit.Prx17-1:1:1 (SEQ ID NO: 154). The plant transformation vector, pMON129252 is comprised of the promoter element, P-SETit.Mt1-1:1:2 (SEQ ID NO: 63), operably linked 5' to the leader element, L-SETit.Mt1-1:1:1 (SEQ ID NO: 138).
15 The plant transformation vector, pMON129253 is comprised of the promoter element, P-SETit.Ali1-1:1:3 (SEQ ID NO: 31), operably linked 5' to the leader element, L-SETit.Ali1-1:1:1 (SEQ ID NO: 112). The plant transformation vector, pMON129254 is comprised of the promoter element, P-SETit.Rcc3-1:1:16 (SEQ ID NO: 91), operably linked 5' to the leader element, L-SETit.Rcc3-1:1:2 (SEQ ID NO: 162). The plant transformation vector,
20 pMON129255 is comprised of the promoter element, P-SETit.Pip2-3-1:1:1 (SEQ ID NO: 72), operably linked 5' to the leader element, L-SETit.Pip2-3-1:1:1 (SEQ ID NO: 146). The plant transformation vector, pMON129256 is comprised of the promoter element, P-SETit.Tga6-1:1:2 (SEQ ID NO: 95). The plant transformation vector, pMON129257 is comprised of the promoter element, P-SETit.25509-1:1:3 (SEQ ID NO: 23). The plant
25 transformation vector, pMON129258 is comprised of the promoter element, P-SETit.Grf-1:1:2 (SEQ ID NO: 57). The plant transformation vector, pMON129259 is comprised of the promoter element, P-SETit.Omt4_2-1:1:2 (SEQ ID NO: 70), operably linked 5' to the leader element, L-SETit.Omt4_2-1:1:1 (SEQ ID NO: 144).

Corn plant tissues were transformed with plant GUS expression constructs,
30 pMON129227, pMON129228, pMON129229, pMON129230, pMON129231, pMON129232, pMON129233, pMON129234, pMON129235, pMON129236, pMON129237, pMON129238, pMON129239, pMON129240, pMON129241, pMON129242, pMON129243, pMON129244, pMON129245, pMON129246, pMON129247, pMON129248, pMON129249, pMON129250, pMON129251,

pMON129252, pMON129253, pMON129254, pMON129255, pMON129256, pMON129257, pMON129258 and pMON129259, using particle bombardment.

Corn plant tissue was transformed using particle bombardment methods known to those skilled in the art with the vectors described above. Briefly, LH244 corn seeds are 5 surface sterilized and allowed to germinate in trays with a photoperiod of 16 hours light and 8 hours of darkness. After 12 to 13 days, tissue is harvested under sterile conditions from the seedlings and used for bombardment. Approximately 10 leaf and 15 root explants are used for bombardment of each experimental construct. The tissue samples are randomly placed on a petri dish containing plant culture medium. Ten micrograms of plasmid DNA is used to 10 coat 0.6 micron gold particles (Catalog #165-2262 Bio-Rad, Hercules, CA) for bombardment. Macro-carriers were loaded with the DNA-coated gold particles (Catalog #165-2335 Bio-Rad, Hercules CA). A PDS 1000/He biolistic gun was used for transformation (Catalog #165-2257 Bio-Rad, Hercules CA). The bombarded root and leaf tissues were allowed to incubate in the dark for 24 hours at 26 degrees Celsius. Following this overnight incubation, 15 the tissues are stained in solution for GUS expression overnight at 37 degrees Celsius. After staining overnight, the tissues are soaked in 70% ethanol overnight to remove chlorophyll and reveal the GUS staining. The tissues were then photographed and a rating scale of “0” to “4” reflecting the level of GUS expression is assigned to each construct.

Four control plasmids were also used for bombardment designated, pMON19469, 20 pMON59327, pMON30098 and pMON103758. The plasmid vectors, pMON19469, pMON59327, and pMON103758 contained known transcriptional regulatory elements driving GUS expression and were used as comparators for expression. The plasmid vector, pMON30098 was comprised of a transgene cassette used for the expression of green fluorescent protein and served as a negative control in the bombardment assay. The plasmid 25 vector, pMON19469 is comprised of a transgene cassette comprised of the P-CaMV.35S-enh-1:1:9 promoter (SEQ ID NO: 1096), derived from the Cauliflower mosaic virus 35S promoter, operably linked 5' to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably linked to a coding sequence for β-glucuronidase (GUS-3, SEQ ID NO: 1092), operably linked 5' to the Nopaline synthase 3' 30 termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). The plasmid vector, pMON59327 is comprised of a transgene cassette used for the expression of GUS which is comprised of the rice Rcc3 promoter (P-Os.Rcc3-1:1:24, SEQ ID NO: 1093) and leader (L-Os.Rcc3-1:1:1, SEQ ID NO: 1094), operably linked 5' to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102),

operably linked 5' to a coding sequence for β-glucuronidase (GUS-3, SEQ ID NO: 1092), operably linked 5' to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). The plasmid vector, pMON103758 is comprised of a transgene cassette used for the expression of GUS which is comprised of the rice Rcc3 promoter (P-Os.Rcc3-1:1:24, SEQ ID NO: 1093) and leader (L-Os.Rcc3-1:1:1, SEQ ID NO: 1094), operably linked 5' to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably linked 5' to a coding sequence for β-glucuronidase (GUS-3, SEQ ID NO: 1092), operably linked 5' to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). The 5 plasmid vector, pMON30098 was comprised of a green fluorescent protein transgene cassette and served as a negative control in the bombardment assay and was comprised of a transgene cassette comprised of the transcriptional regulatory element group, EXP-CaMV.35S-enh (SEQ ID NO: 1095) which was further comprised of the promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID NO: 1096), operably linked 5' to the leader element, L-CaMV.35S-1:1:2 (SEQ ID NO: 1097), operably linked 5' to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably 5' linked to a coding sequence for GFP (CR-Av.GFP.nno, SEQ ID NO: 1103), operably linked 5' to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088).

10 The 10 plasmid vector, pMON30098 was comprised of a green fluorescent protein transgene cassette and served as a negative control in the bombardment assay and was comprised of a transgene cassette comprised of the transcriptional regulatory element group, EXP-CaMV.35S-enh (SEQ ID NO: 1095) which was further comprised of the promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID NO: 1096), operably linked 5' to the leader element, L-CaMV.35S-1:1:2 (SEQ ID NO: 1097), operably linked 5' to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably 5' linked to a coding sequence for GFP (CR-Av.GFP.nno, SEQ ID NO: 1103), operably linked 5' to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088).

15 The 15 plasmid vector, pMON30098 was comprised of a green fluorescent protein transgene cassette and served as a negative control in the bombardment assay and was comprised of a transgene cassette comprised of the transcriptional regulatory element group, EXP-CaMV.35S-enh (SEQ ID NO: 1095) which was further comprised of the promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID NO: 1096), operably linked 5' to the leader element, L-CaMV.35S-1:1:2 (SEQ ID NO: 1097), operably linked 5' to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably 5' linked to a coding sequence for GFP (CR-Av.GFP.nno, SEQ ID NO: 1103), operably linked 5' to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088).

The average GUS expression ratings from the particle bombarded assay are shown in 20 Table 7 below.

Table 7. Average GUS expression ratings for bombarded corn root and leaf tissue transformed with listed plant GUS expression constructs.

Construct	Regulatory Elements	Root	Leaf
pMON19469	P-CaMV.35S-enh-1:1:9 promoter (SEQ ID NO: 1096)	4	4
pMON59327	P-Os.Rcc3-1:1:24 (SEQ ID NO: 1093) L-Os.Rcc3-1:1:1 (SEQ ID NO: 1094)	4	0
pMON30098 (Neg. Control)	EXP-CaMV.35S-enh (SEQ ID NO: 1095)	0	0

The highest average level of GUS expression for root tissues transformed by particile bombardment were observed using the constructs, pMON129231 ((P-SETit.OMT2.3-1:1:1 (SEQ ID NO: 68) + L-SETit.OMT2.2-1:1:1 (SEQ ID NO: 141)); pMON129234 ((P-SETit.Srp-1:1:2 (SEQ ID NO: 92) + L-SETit.Srp-1:1:1 (SEQ ID NO: 163)); pMON129237 ((P-SETit.Prx-1:1:1 (SEQ ID NO: 79) + L-SETit.Prx-1:1:1 (SEQ ID NO: 153)); pMON129241 ((P-SETit.Prx3-1:1:4 (SEQ ID NO: 83) + L-SETit.Prx3-1:1:1 (SEQ ID NO: 156)); pMON129242 ((P-SETit.Prx3-1:1:3 (SEQ ID NO: 82) + L-SETit.Prx3-1:1:1 (SEQ ID NO: 156)); pMON129243 ((P-SETit.Prx47-1:1:2 (SEQ ID NO: 84) + L-SETit.Prx47-1:1:1 (SEQ ID NO: 157)); pMON129247 ((P-SETit.Cys-1:1:3 (SEQ ID NO: 46) + L-SETit.Cys-1:1:1 (SEQ ID NO: 127)); pMON129248 ((P-SETit.Ucc1-1:1:2 (SEQ ID NO: 105) + L-SETit.Ucc1-1:1:1 (SEQ ID NO: 170)); pMON129249 ((P-SETit.Tip-1:1:4 (SEQ ID NO: 97) + L-SETit.Tip-1:1:1 (SEQ ID NO: 165)); pMON129250 ((P-SETit.Prx72-1:1:2 (SEQ ID NO: 85) + L-SETit.Prx72-1:1:1 (SEQ ID NO: 158)); pMON129254 ((P-SETit.Rcc3-1:1:16 (SEQ ID NO: 91) + L-SETit.Rcc3-1:1:2 (SEQ ID NO: 162)) and pMON129255 ((P-SETit.Pip2-3-1:1:1 (SEQ ID NO: 72) + L-SETit.Pip2-3-1:1:1 (SEQ ID NO: 146)). Leaf expression was seen most highest in tissues bombarded with the contstructs pMON129241 ((P-SETit.Prx3-1:1:4 (SEQ ID NO: 83) + L-SETit.Prx3-1:1:1 (SEQ ID NO: 156)) and pMON129250 ((P-SETit.Prx72-1:1:2 (SEQ ID NO: 85) + L-SETit.Prx72-1:1:1 (SEQ ID NO: 158)).

Example 4: Analysis of Regulatory Elements driving GUS in Transgenic Corn

Corn plants were transformed with plant expression vectors containing the test regulatory elements driving expression of the β -glucuronidase (GUS) transgene, and the resulting plants were analyzed for GUS protein expression.

5 Corn plants were transformed with the plant GUS expression constructs, listed in Table 8, below. Regulatory elements presented in Example 1 for monocot expression were cloned into a base plant expression vector using standard methods known in the art. The resulting plant expression vectors contained a right border region from *Agrobacterium tumefaciens*, a first transgene cassette to test the regulatory or chimeric regulatory element 10 comprised of, a regulatory or chimeric regulatory element, operably linked to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably linked to a coding sequence for β -glucuronidase (GUS) that possessed a processable intron (GUS-2, SEQ ID NO: 1091), operably linked to the 3' termination region 15 from the rice lipid transfer protein gene (T-Os.LTP-1:1:1, SEQ ID NO: 1089); a second transgene selection cassette used for selection of transformed plant cells that conferred 20 resistance to the herbicide glyphosate (driven by the rice Actin 1 promoter, SEQ ID NO: 1098), and a left border region from *A. tumefaciens*. The resulting plasmids, pMON129227, pMON129228, pMON129229, pMON129230, pMON129231, pMON129232, pMON129233, pMON129234, pMON129235, pMON129236, pMON129237, 25 pMON129238, pMON129239, pMON129240, pMON129241, pMON129242, pMON129243, pMON129244, pMON129245, pMON129246, pMON129247, pMON129249, pMON129250, pMON129251, pMON129252, pMON129253, pMON129254, pMON129255, pMON129256, pMON129257, pMON129258 and pMON129259 were used to transform corn plants.

The plant transformation vector, pMON129227 is comprised of the promoter element, P-SETit.Cyp-1-1:1:1 (SEQ ID NO: 43), operably linked 5' to the leader element, L-SETit.Cyp-1-1:1:1 (SEQ ID NO: 125). The plant transformation vector, pMON129228 is 5 comprised of the promoter element, P-SETit.Cyp78a-1:1:2 (SEQ ID NO: 44), operably linked 5' to the leader element, L-SETit.Cyp78a-1:1:1 (SEQ ID NO: 126). The plant transformation vector, pMON129229 is comprised of the promoter element, P-SETit.OMT2.1-1:1:2 (SEQ 10 ID NO: 66), operably linked 5' to the leader element, L-SETit.OMT2.1-1:1:1 (SEQ ID NO: 140). The plant transformation vector, pMON129230 is comprised of the promoter element, P-SETit.OMT2.2-1:1:2 (SEQ ID NO: 67), operably linked 5' to the leader element, L-SETit.OMT2.2-1:1:2 (SEQ ID NO: 142). The plant transformation vector, pMON129231 is 15 comprised of the promoter element, P-SETit.OMT2.3-1:1:1 (SEQ ID NO: 68), operably linked 5' to the leader element, L-SETit.OMT2.2-1:1:1 (SEQ ID NO: 141). The plant transformation vector, pMON129232 is comprised of the promoter element, P-SETit.Grcw2- 20 1:1:1 (SEQ ID NO: 56), operably linked 5' to the leader element, L-SETit.Grcw2-1:1:1 (SEQ ID NO: 134). The plant transformation vector, pMON129233 is comprised of the promoter element, P-SETit.Prx2-1:1:3 (SEQ ID NO: 81), operably linked 5' to the leader element, L-SETit.Prx2-1:1:2 (SEQ ID NO: 155). The plant transformation vector, pMON129234 is 25 comprised of the promoter element, P-SETit.Srp-1:1:2 (SEQ ID NO: 92), operably linked 5' to the leader element, L-SETit.Srp-1:1:1 (SEQ ID NO: 163). The plant transformation vector, pMON129235 is comprised of the promoter element, P-SETit.LaDo-1:1:2 (SEQ ID NO: 62), operably linked 5' to the leader element, L-SETit.LaDo-1:1:1 (SEQ ID NO: 137). The plant transformation vector, pMON129236 is comprised of the promoter element, P-SETit.Aip-1:1:1 (SEQ ID NO: 27), operably linked 5' to the leader element, L-SETit.Aip- 30 1:1:1 (SEQ ID NO: 109). The plant transformation vector, pMON129237 is comprised of the

promoter element, P-SETit.Prx-1:1:1 (SEQ ID NO: 79), operably linked 5' to the leader element, L-SETit.Prx-1:1:1 (SEQ ID NO: 153). The plant transformation vector, pMON129238 is comprised of the promoter element, P-SETit.Cbl7-1:1:1 (SEQ ID NO: 34), operably linked 5' to the leader element, L-SETit.Cbl7-1:1:1 (SEQ ID NO: 115). The plant
5 transformation vector, pMON129239 is comprised of the promoter element, P-SETit.Fst-1:1:1 (SEQ ID NO: 54), operably linked 5' to the leader element, L-SETit.Fst-1:1:1 (SEQ ID NO: 132). The plant transformation vector, pMON129240 is comprised of the promoter element, P-SETit.Cda-1:1:1 (SEQ ID NO: 36), operably linked 5' to the leader element, L-SETit.Cda-1:1:1 (SEQ ID NO: 117). The plant transformation vector, pMON129241 is
10 comprised of the promoter element, P-SETit.Prx3-1:1:4 (SEQ ID NO: 83), operably linked 5' to the leader element, L-SETit.Prx3-1:1:1 (SEQ ID NO: 156). The plant transformation vector, pMON129242 is comprised of the promoter element, P-SETit.Prx3-1:1:3 (SEQ ID NO: 82), operably linked 5' to the leader element, L-SETit.Prx3-1:1:1 (SEQ ID NO: 156). The plant transformation vector, pMON129243 is comprised of the promoter element, P-
15 SETit.Prx47-1:1:2 (SEQ ID NO: 84), operably linked 5' to the leader element, L-SETit.Prx47-1:1:1 (SEQ ID NO: 157). The plant transformation vector, pMON129244 is comprised of the promoter element, P-SETit.Eie-1:1:1 (SEQ ID NO: 49), operably linked 5' to the leader element, L-SETit.Eie-1:1:1 (SEQ ID NO: 129). The plant transformation vector, pMON129245 is comprised of the promoter element, P-SETit.Omt3-1:1:3 (SEQ ID NO: 69), operably linked 5' to the leader element, L-SETit.Omt3-1:1:1 (SEQ ID NO: 143). The plant transformation vector, pMON129246 is comprised of the promoter element, P-SETit.Cys-1:1:2 (SEQ ID NO: 45), operably linked 5' to the leader element, L-SETit.Cys-1:1:1 (SEQ ID NO: 127). The plant transformation vector, pMON129247 is comprised of the promoter element, P-SETit.Cys-1:1:3 (SEQ ID NO: 46), operably linked 5' to the leader
25 element, L-SETit.Cys-1:1:1 (SEQ ID NO: 127). The plant transformation vector, pMON129249 is comprised of the promoter element, P-SETit.Tip-1:1:4 (SEQ ID NO: 97), operably linked 5' to the leader element, L-SETit.Tip-1:1:1 (SEQ ID NO: 165). The plant transformation vector, pMON129250 is comprised of the promoter element, P-SETit.Prx72-1:1:2 (SEQ ID NO: 85), operably linked 5' to the leader element, L-SETit.Prx72-1:1:1 (SEQ
30 ID NO: 158). The plant transformation vector, pMON129251 is comprised of the promoter element, P-SETit.Prx17-1:1:2 (SEQ ID NO: 80), operably linked 5' to the leader element, L-SETit.Prx17-1:1:1 (SEQ ID NO: 154). The plant transformation vector, pMON129252 is comprised of the promoter element, P-SETit.Mt1-1:1:2 (SEQ ID NO: 63), operably linked 5' to the leader element, L-SETit.Mt1-1:1:1 (SEQ ID NO: 138). The plant transformation

vector, pMON129253 is comprised of the promoter element, P-SETit.Ali1-1:1:3 (SEQ ID NO: 31), operably linked 5' to the leader element, L-SETit.Ali1-1:1:1 (SEQ ID NO: 112). The plant transformation vector, pMON129254 is comprised of the promoter element, P-SETit.Rcc3-1:1:16 (SEQ ID NO: 91), operably linked 5' to the leader element, L-SETit.Rcc3-1:1:2 (SEQ ID NO: 162). The plant transformation vector, pMON129255 is comprised of the promoter element, P-SETit.Pip2-3-1:1:1 (SEQ ID NO: 72), operably linked 5' to the leader element, L-SETit.Pip2-3-1:1:1 (SEQ ID NO: 146). The plant transformation vector, pMON129256 is comprised of the promoter element, P-SETit.Tga6-1:1:2 (SEQ ID NO: 95). The plant transformation vector, pMON129257 is comprised of the promoter element, P-SETit.25509-1:1:3 (SEQ ID NO: 23). The plant transformation vector, pMON129258 is comprised of the promoter element, P-SETit.Grf-1:1:2 (SEQ ID NO: 57). The plant transformation vector, pMON129259 is comprised of the promoter element, P-SETit.Omt4_2-1:1:2 (SEQ ID NO: 70), operably linked 5' to the leader element, L-SETit.Omt4_2-1:1:1 (SEQ ID NO: 144).

Corn plants were transformed with plant GUS expression constructs, pMON129227, pMON129228, pMON129229, pMON129230, pMON129231, pMON129232, pMON129233, pMON129234, pMON129235, pMON129236, pMON129237, pMON129238, pMON129239, pMON129240, pMON129241, pMON129242, pMON129243, pMON129244, pMON129245, pMON129246, pMON129247, pMON129249, pMON129250, pMON129251, pMON129252, pMON129253, pMON129254, pMON129255, pMON129256, pMON129257, pMON129258 and pMON129259.

Plants were transformed using *Agrobacterium*-mediated transformations and LH244 corn seed embryos as outlined in Example 2. Leaf and root tissue were harvested from 1 to 5 transformants and assayed for GUS expression. Histochemical GUS analysis was used for qualitative expression analysis of transformed plants. Whole tissue sections were incubated with GUS staining solution X-Gluc (5-bromo-4-chloro-3-indolyl-b-glucuronide) (1 milligram/milliliter) for an appropriate length of time, rinsed, and visually inspected for blue coloration. GUS activity was qualitatively determined by direct visual inspection or inspection under a microscope using selected plant organs and tissues. The R0 plants were inspected for expression in the roots and leaves.

For quantitative analysis, total protein was extracted from selected tissues of transformed corn plants. One microgram of total protein was used with the fluorogenic

substrate 4-methyleumbelliferyl- β -D-glucuronide (MUG) in a total reaction volume of 50 microliters. The reaction product, 4-methlyumbelliferone (4-MU), is maximally fluorescent at high pH, where the hydroxyl group is ionized. Addition of a basic solution of sodium carbonate simultaneously stops the assay and adjusts the pH for quantifying the fluorescent product.

5 Fluorescence was measured with excitation at 365 nm, emission at 445 nm using a Fluoromax-3 with Micromax Reader, with slit width set at excitation 2 nm and emission 3nm.

The average R_0 GUS expression for transgenic plants transformed with the constructs described in Table 8 are shown in Table 9 below.

10 **Table 9. Average R_0 GUS V3 Leaf and Root expression in transgenic corn plants, transformed with listed constructs.**

Construct	Regulatory Elements	V3 Root	V3 Leaf

The highest average levels of GUS expression in the roots of V3 stage plants was observed in plants transformed with the constructs pMON129255 ((P-SETit.Pip2-3-1:1:1 (SEQ ID NO: 72) + L-SETit.Pip2-3-1:1:1 (SEQ ID NO: 146)) and pMON129249 ((P-SETit.Tip-1:1:4 (SEQ ID NO: 97) + L-SETit.Tip-1:1:1 (SEQ ID NO: 165)).

**Example 5: Analysis of Actin and Tubulin Regulatory Elements driving GUS
in Corn Protoplasts**

Corn leaf protoplasts are transformed with plant expression vectors containing a test transcriptional regulatory element or transcriptional regulatory expression element group, driving expression of the β -glucuronidase (GUS) transgene, and compared to leaf protoplast in which expression of GUS is driven by known constitutive promoters.

Corn protoplast cells, derived from leaf tissue are transformed using methods known in the art with plant expression vectors to compare expression of a transgene driven by the transcriptional regulatory expression element groups, EXP-SETit.TubA3:1:3 (SEQ ID NO: 19), EXP-SETit.TubA2:1:3 (SEQ ID NO: 16), EXP-SETit.TubA2-2:1:1 (SEQ ID NO: 18), EXP-SETit.Act8:1:1 (SEQ ID NO: 9), EXP-SETit.Act8:1:2 (SEQ ID NO: 10), EXP-SETit.Act8:c (SEQ ID NO: 11), EXP-SETit.TubA2-1:1:2 (SEQ ID NO: 17) and EXP-SETit.TubA2:1:1 (SEQ ID NO: 15) with that of known constitutive promoters. Each transcriptional regulatory expression element group is cloned using methods known in the art into a plant expression vector shown in Table 10 below. The resulting plant expression vectors are comprised of a transgene cassette comprised of a transcriptional regulatory expression element group, operably linked 5' to a coding sequence for β -glucuronidase (GUS) (GUS-1 or GUS-3, represented by SEQ ID NOS: 1090 and 1092, respectively), which is operably linked 5' to a 3' termination region derived from the *A. tumefaciens* Nopaline synthase gene (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088) or the wheat Hsp17 gene (T-Ta.Hsp17-1:1:1, SEQ ID NO: 1108).

Control plasmids used for comparison are constructed as described above and are comprised of a known constitutive, transcriptional regulatory expression element groups. The control plasmid vector, pMON19469 is comprised of the transcriptional regulatory element group, EXP-CaMV.35S-enh/I-Zm.DnaK-1:1:1 (SEQ ID NO: 1104). The control plasmid vector, pMON65328 is comprised of the transcriptional regulatory element group, EXP-CaMV.35S-enh-Lhcb1/I-Os.Act1-1:1:9 (SEQ ID NO: 1105). The control plasmid vector, pMON25455 is comprised of the transcriptional regulatory element group, EXP-Os.Act1:1:1 (SEQ ID NO: 1098). The control plasmid vector, pMON122605 is comprised of the transcriptional regulatory element group, EXP-Os.TubA-3:1:1 (SEQ ID NO: 1107). Each control vector transcriptional regulatory element group is operably linked 5' to a coding sequence for β -glucuronidase (GUS) (GUS-1 or GUS-3, represented by SEQ ID NOS: 1090

and 1092, respectively), which is operably linked 5' to a 3' termination region derived from the *A. tumefaciens* Nopaline synthase gene (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088) or the wheat Hsp17 gene (T-Ta.Hsp17-1:1:1, SEQ ID NO: 1108). In addition, three controls are provided as controls for background GUS and luciferase expression, a no DNA control, an
5 empty vector which is not designed for transgene expression and an expression vector used to express green fluorescent protein (GFP).

Table 10. GUS plant expression vectors and corresponding transcriptional regulatory expression element groups and constituent promoters, leaders and introns, and 3' UTR used for transformation of corn leaf protoplasts.

The plant transformation vector, pMON136270 is comprised of the transcriptional regulatory element group, EXP-SETit.TubA3:1:3 (SEQ ID NO: 19), which is further comprised of the promoter element, P-SETit.TubA3-1:1:3 (SEQ ID NO: 101), operably linked 5' to the leader element, L-SETit.TubA3-1:1:1 (SEQ ID NO: 168). The plant transformation vector, pMON136272 is comprised of the transcriptional regulatory element group, EXP-SETit.TubA2:1:3 (SEQ ID NO: 16), which is further comprised of the promoter element, P-SETit.TubA2-1-1:1:3 (SEQ ID NO: 99), operably linked 5' to the leader element, L-SETit.TubA2-1-1:1:1 (SEQ ID NO: 166), operably linked 5' to the intron element, I-SETit.TubA2_1-1:1:2 (SEQ ID NO: 176). The plant transformation vector, pMON136275 is comprised of the transcriptional regulatory element group, EXP-SETit.TubA2-2:1:1 (SEQ ID NO: 18), which is further comprised of the promoter element, P-SETit.TubA2-2-1:1:3 (SEQ ID NO: 100), operably linked 5' to the leader element, L-SETit.TubA2-2-1:1:1 (SEQ ID NO: 167). The plant transformation vector, pMON136276 is comprised of the transcriptional regulatory element group, EXP-SETit.Act8:1:1 (SEQ ID NO: 9), which is further comprised of the promoter element, P-SETit.Act8-1:1:5 (SEQ ID NO: 24), operably linked 5' to the leader element, L-SETit.Act8-1:1:2 (SEQ ID NO: 106), operably linked 5' to the intron element, I-SETit.Act8-1:1:2 (SEQ ID NO: 172), operably linked 5' to the leader element, L-SETit.Act8-1:1:3 (SEQ ID NO: 107). The plant transformation vector, pMON136277 is comprised of the transcriptional regulatory element group, EXP-SETit.Act8:1:2 (SEQ ID NO: 10), which is further comprised of the promoter element, P-SETit.Act8-1:1:6 (SEQ ID NO: 25), operably linked 5' to the leader element, L-SETit.Act8-1:1:2 (SEQ ID NO: 106), operably linked 5' to the intron element, I-SETit.Act8-1:1:2 (SEQ ID NO: 172), operably linked 5' to the leader element, L-SETit.Act8-1:1:3 (SEQ ID NO: 107). The plant transformation vector, pMON136278 is comprised of the transcriptional regulatory element group, EXP-SETit.Act8:c (SEQ ID NO: 11), which is further comprised of the promoter element, P-SETit.Act8-1-1:1:2 (SEQ ID NO: 26), operably linked 5' to the leader element, L-SETit.Act8-1:1:4 (SEQ ID NO: 108), operably linked 5' to the intron element, I-SETit.Act8-1:1:2 (SEQ ID NO: 172), operably linked 5' to the leader element, L-SETit.Act8-1:1:3 (SEQ ID NO: 107). The plant transformation vector, pMON136279 is comprised of the transcriptional regulatory element group, EXP-SETit.TubA2-1:1:2 (SEQ ID NO: 17), which is further comprised of the promoter element, P-SETit.TubA2-1-1:1:2 (SEQ ID NO: 98),

operably linked 5' to the leader element, L-SETit.TubA2-1-1:1:1 (SEQ ID NO: 166). The plant transformation vector, pMON136280 is comprised of the transcriptional regulatory element group, EXP-SETit.TubA2:1:1 (SEQ ID NO: 15), which is further comprised of the promoter element, P-SETit.TubA2-1-1:1:2 (SEQ ID NO: 98), operably linked 5' to the leader 5 element, L-SETit.TubA2-1-1:1:1 (SEQ ID NO: 166), operably linked 5' to the intron element, I-SETit.TubA2_1-1:1:2 (SEQ ID NO: 176).

Two plasmids, for use in co-transformation and normalization of data, are also constructed using methods known in the art. Each plasmid contains a specific luciferase coding sequence which is driven by a constitutive transcriptional regulatory expression 10 element group. The plant vector, pMON19437 is comprised of a transgene cassette comprised of a constitutive promoter (EXP-CaMV.35S-enh, SEQ ID NO: 1095), operably linked 5' to an intron, (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably linked 5' to a firefly (*Photinus pyralis*) luciferase coding sequence (LUCIFERASE:1:3, SEQ ID NO: 1109), operably linked 5' to a 3' termination region from the *Agrobacterium tumefaciens* nopaline 15 synthase gene (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). The plant vector, pMON63934 is comprised of a transgene cassette comprised of a constitutive transcriptional regulatory expression element group, (EXP-CaMV.35S-enh-Lhcb1, SEQ ID NO: 1106), operably linked 5' to a sea pansy (*Renilla reniformis*) luciferase coding sequence (CR-Ren.hRenilla Luciferase-0:0:1, SEQ ID NO: 1110), operably linked 5' to a 3' termination region from the 20 *Agrobacterium tumefaciens* nopaline synthase gene (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088).

Corn leaf protoplasts are transformed using a PEG-based transformation method, similar to those known in the art. Protoplast cells are transformed with a DNA prep comprised of equimolar quantities of the two luciferase expression plasmids, pMON19437 25 and pMON63934 and one of the test plasmids and incubated overnight in total darkness. After incubation, the cells are rinsed, resuspended and lysed. Measurements of both GUS and luciferase are conducted using aliquots of each lysis preparation. Essentially, the collected, transformed protoplast cells are lysed in 5X passive lysis buffer (Promega). After allowing for lysis, aliquots of the lysed preparation are placed into two different small-well 30 trays. One tray is used for GUS measurements. For quantitative analysis of GUS expression, total protein is extracted from lysis preparation. One microgram of total protein is used with the fluorogenic substrate 4-methyleumbelliferyl- β -D-glucuronide (MUG) in a total reaction volume of 50 microliters. The reaction product, 4-methyumbelliferon (4-MU), is

maximally fluorescent at high pH, where the hydroxyl group is ionized. Addition of a basic solution of sodium carbonate simultaneously stops the assay and adjusts the pH for quantifying the fluorescent product. Fluorescence is measured with excitation at 365 nm, emission at 445 nm using a Fluoromax-3 with Micromax Reader, with slit width set at 5 excitation 2 nm and emission 3nm. GUS values are expressed as pmol of 4-MU protein per minute per milligram protein (pmol 4-MU min⁻¹ mg⁻¹ protein).

The second tray is used to perform a dual luciferase assay using the dual luciferase reporter assay system (Promega, Madison, WI). All luciferase detection reagents are prepared as described by the manufacturer and assays conducted following the 10 manufacturer's protocol (See for example, Promega Notes Magazine, No: 57, 1996, p.02). Firefly luciferase reagent (LARII) is added to each sample and assay of the firefly luciferase activity recorded. Upon completion of the firefly luciferase assay, the firefly luminescence is quenched and luminescence of the *Renilla reniformis* luciferase simultaneously activated by adding Stop & Glo[™] reagent to the sample. Measurement of the *Renilla reniformis* luciferase 15 activity is recorded following activation of the *Renilla* luciferase. One or two transformations for each transcriptional regulatory expression element group are performed and the mean expression values for each transcriptional regulatory expression element group determined from several samples from each transformation experiment. Sample measurements are made using four replicates of each test transcriptional regulatory expression element group 20 construct transformation, or alternatively, three replicates of each test transcriptional regulatory expression element group construct per one of two transformation experiments. The mean GUS and luciferase expression levels are provided in Tables 11 and 12. The firefly luciferase values are provided in the column labeled "Fluc" and the *Renilla* luciferase values are provided as in the column labeled "Rluc".

25 To compare the relative activity of each transcriptional regulatory expression element group, GUS values are expressed as a ratio of the mean GUS expression to the mean luciferase activity and normalized with respect to the expression levels observed for the transcriptional regulatory expression element groups EXP-Os.Act1:1:1 (SEQ ID NO: 1098) and EXP-Os.TubA-3:1:1 (SEQ ID NO: 1107). Table 11 below shows the mean GUS/Rluc 30 ratios normalized with respect to EXP-Os.Act1:1:1 and EXP-Os.TubA-3:1:1 expression in corn protoplasts.

Table 11. Mean GUS/Rluc fold expression relative to EXP-Os.TubA-3:1:1expression in corn leaf protoplast cells.

The normalized GUS/Rluc and GUS/Fluc ratios provided in Tables 11 and 12 provide evidence that most of the expression elements are capable of driving GUS expression in corn leaf protoplasts. The constructs, pMON136275 (EXP-SETit.TubA2-2:1:1 (SEQ ID NO: 18)) and pMON136279 (EXP-SETit.TubA2-1:1:2 (SEQ ID NO: 17)) demonstrated the least amount of expression. The construct, pMON136270 (EXP-SETit.TubA3:1:3 (SEQ ID NO: 19)) provided the highest level of expression amongst the test elements relative to the constitutive controls.

Example 6: Analysis of Actin and Tubulin Regulatory Elements driving GUS in Wheat Protoplasts

Wheat leaf protoplasts were transformed with plant expression vectors containing a test transcriptional regulatory expression element group, driving expression of the β -glucuronidase (GUS) transgene, and compared to leaf protoplast in which expression of GUS is driven by known constitutive promoters.

5 Wheat protoplast cells, derived from leaf tissue were transformed using PEG based transformation methods known in the art with plant expression vectors to compare expression of a transgene driven by the transcriptional regulatory expression element groups, EXP-
10 SETit.TubA3:1:3 (SEQ ID NO: 19), EXP-SETit.TubA2:1:3 (SEQ ID NO: 16), EXP-
 SETit.TubA2-2:1:1 (SEQ ID NO: 18), EXP-SETit.Act8:1:1 (SEQ ID NO: 9), EXP-
 SETit.Act8:1:2 (SEQ ID NO: 10), EXP-SETit.Act8:c (SEQ ID NO: 11), EXP-SETit.TubA2-
 1:1:2 (SEQ ID NO: 17) and EXP-SETit.TubA2:1:1 (SEQ ID NO: 15) with that of known
15 constitutive promoters. Each transcriptional regulatory expression element group is cloned
 using methods known in the art into a plant expression vector shown in Table 10 in example
 5 above. The resulting plant expression vectors are comprised of a transgene cassette
 comprised of a transcriptional regulatory expression element group, operably linked 5' to a
 coding sequence for β -glucuronidase (GUS) (GUS-1 or GUS-3, represented by SEQ ID NOS:
 1090 and 1092, respectively), which is operably linked 5' to a 3' termination region derived
20 from the *A. tumefaciens* Nopaline synthase gene (T-AGRtu.nos-1:1:13, SEQ ID NO: 56) or
 the wheat Hsp17 gene (T-Ta.Hsp17-1:1:1, SEQ ID NO: 57).

Control plasmid vector constructs and luciferase transformation control plasmid constructs were the same as those described in example 5. Measurements of both GUS and luciferase activity were conducted as described in example 5.

25 To compare the relative activity of each transcriptional regulatory expression element group, GUS values were expressed as a ratio of GUS to luciferase activity and normalized with respect to the expression levels observed for the transcriptional regulatory expression element group EXP-Os.TubA-3:1:1 (SEQ ID NO: 1107). Table 13 below shows the GUS/Rluc ratios normalized with respect to EXP-Os.TubA-3:1:1 expression in corn
30 protoplasts.

GUS and luciferase activity are measured as described in Example 2 with replicate assays to determine the average level of GUS and luciferase expression in wheat protoplast cells. Mean GUS values are compared to the mean luciferase values and normalized with respect to expression seen in wheat protoplast cells transformed with a GUS expression

vector in which GUS is driven by the transcriptional regulatory expression element group, EXP-Os.TubA-3:1:1 (SEQ ID NO: 65) to determine the relative fold activity of GUS expression driven by the transcriptional regulatory expression element groups, EXP-SETit.TubA3:1:3 (SEQ ID NO: 19), EXP-SETit.TubA2:1:3 (SEQ ID NO: 16), EXP-
5 SETit.TubA2-2:1:1 (SEQ ID NO: 18), EXP-SETit.Act8:1:1 (SEQ ID NO: 9), EXP-SETit.Act8:1:2 (SEQ ID NO: 10), EXP-SETit.Act8:c (SEQ ID NO: 11), EXP-SETit.TubA2-1:1:2 (SEQ ID NO: 17) and EXP-SETit.TubA2:1:1 (SEQ ID NO: 15).

The mean GUS and luciferase expression levels are provided in Table 13. The *Renilla* luciferase values are provided in the column labeled “Rluc”.

10 **Table 13. Mean GUS/Rluc fold expression relative to EXP-Os.TubA-3:1:1 expression in corn leaf protoplast cells.**

	17)			
pMON136280	EXP- SETit.TubA2:1:1 (SEQ ID NO: 15)	1.516	2.710	0.125

The highest level of GUS expression in wheat protoplast was observed in cells transformed with the constructs pMON136270 (EXP-SETit.TubA3:1:3 (SEQ ID NO: 19)); pMON136276 (EXP-SETit.Act8:1:1 (SEQ ID NO: 9)); pMON136277 (EXP-SETit.Act8:1:2 (SEQ ID NO: 10)) and pMON136280 (EXP-SETit.TubA2:1:1 (SEQ ID NO: 15)).

Example 7: Identification of transcriptional regulatory elements used for seed expression.

Transcriptional regulatory elements comprising promoters, leaders, introns and 3' UTRs useful in providing expression of a transgene in plant seed and reproductive tissues are identified based upon the expression of expressed sequence tags (ESTs) in cDNA libraries made from messenger RNA isolated from seed, flower and other tissues derived from Foxtail millet (*Setaria italica* (L.) Beauv). Libraries of cDNA are made from tissues isolated from *S. italica* using methods known to those skilled in the art from flower tissue at 0, 4, 7, 14, 21 and 31 days after pollination (DAP) as well as leaf and root. The resulting cDNAs are sequenced using various sequencing methods known in the art. The resulting ESTs are assembled into clusters using bioinformatics software such as clc_ref_assemble_complete version 2.01.37139 (CLC bio USA, Cambridge, Massachusetts 02142). Transcript abundance of each cluster is determined by counting the number of cDNA reads for each cluster. Table 14 below shows cluster assemblies that have been produced using cDNAs from libraries made from *S. italica* tissue isolated from leaf, root and flower at 0, 4, 7, 14, 21 and 31 days after pollination (DAP) that demonstrate expression in specific windows of developing of the developing seed and were either not observed or minimally observed in the leaf and root. Each cluster is annotated using bioinformatics analysis methods such as nucleotide and protein BLAST against public and proprietary data of genes expressed in monocots and dicots. In many cases, a homolog to the cluster was not identified and is indicated in Table 14 as "No homolog".

An analysis of the expression of cDNAs for each cluster presented in Table 14 is provided in Table 15 below. For flower tissue, the following total numbers of EST reads were performed; flower 0 DAP, 251341; flower 4 DAP, 39277; flower 7 DAP, 34330; flower 14 DAP, 34920; flower 21 DAP, 42321; flower 31 DAP, 257327. For leaf and root tissue, 5 the following total numbers of EST reads were performed; leaf, 478570 and root, 434180.

Table 15. Count of cDNAs expressed corresponding to EST clusters.

As can be seen in Table 15 above, many of the identified clusters demonstrate expression in specific windows of seed development; at 0 DAP in which expression is inferred to be in both ovule and pollen, or during the seed development window from 4 to 31 5 DAP. The identified cDNA clusters were used to design primers, which were then used with GenomeWalker™ (Clontech Laboratories, Inc, Mountain View, CA) libraries constructed following the manufacturer's protocol to clone the 5' region of the corresponding genomic DNA sequence. In the case of promoters leaders and introns, this cloned region contained the 5'transciptional regulatory, 5' UTR and if present, intron sequence upstream of the protein-10 coding region for each gene from *S. italica*. Using this sequence, regulatory elements were bioinformatically identified within the 5' region for each gene. Bioinformatic analysis was used to identify the transcriptional start site (TSS) and any bi-directionality, introns, or upstream coding sequence present in the sequence. Using the results of this analysis, regulatory elements were defined within the 5' sequence upstream of the coding sequence of 15 the gene. Primers were then designed to amplify the regulatory elements. The corresponding

DNA molecule for each regulatory element was amplified using standard polymerase chain reaction conditions with primers containing unique restriction enzyme sites and genomic DNA isolated from *S. italica*. The resulting DNA fragments were ligated into a base plant expression vector using standard restriction enzyme digestion of compatible restriction sites and DNA ligation methods. In some cases, high sequence identity between some leaders provided the discovery of regulatory elements from homologous genes. The resulting transcriptional regulatory element groups, promoters, leaders and introns identified through this analysis are presented in Table 16 below:

Table 16. Transcriptional regulatory element groups (EXP), Promoters (P), leaders (L) and introns (I) identified using expression analysis.

In some instances, the transcriptional start site could not be identified. The transcriptional regulatory elements, P-SETit.FM54-1:1:2 (SEQ ID NO: 52), P-SETit.FM63-1:1:2 (SEQ ID NO: 53) and P-SETit.CLUS1165324-1:1:1 (SEQ ID NO: 38) may be further comprised of a promoter element operably linked to a leader element or fragment of a leader element.

Example 8: Analysis of Seed Regulatory Elements driving GUS in Bombarded Corn Tissues.

10 Seed, root and leaf tissue isolated from corn plants is bombarded with plant GUS expression and control vectors to determine the capacity of transcriptional regulatory elements derived from *Setaria italica* to drive expression of a transgene, GUS.

Corn plant tissues were transformed with the plant GUS expression constructs using particle bombardment, listed in Table 17, below. Regulatory elements presented in example 15 7 were cloned into a base plant expression vector using standard methods known in the art. The resulting plant expression vectors contained a right border region from *Agrobacterium tumefaciens*, a first transgene cassette to test the regulatory or chimeric regulatory element comprised of, a regulatory or chimeric regulatory element, operably linked to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 20 1102), operably linked to a coding sequence for β-glucuronidase (GUS) that possessed a processable intron (GUS-2, SEQ ID NO: 1091), operably linked to the 3' termination region from the rice lipid transfer protein gene (T-Os.LTP-1:1:1, SEQ ID NO: 1089); a second transgene selection cassette used for selection of transformed plant cells that conferred resistance to the herbicide glyphosate (driven by the rice Actin 1 transcriptional regulatory 25 element group, SEQ ID NO: 1098), and a left border region from *A. tumefaciens*. The

resulting plasmids, pMON117992, pMON117993, pMON117994, pMON117995, pMON117996, pMON117997, pMON117998, pMON117999, pMON130551, pMON140500, pMON140501, pMON140502, pMON140503, pMON140504, pMON140505, pMON140506, pMON140507 and pMON140508 are used to transform corn plant tissue using particle bombardment.

The plant transformation vector, pMON117992 is comprised of the promoter element, P-SETit.EST CLUS675389-2-1:1:2 (SEQ ID NO: 50), operably linked 5' to the leader element, L-SETit.EST CLUS675389-2-1:1:1 (SEQ ID NO: 130). The plant transformation vector, pMON117993 is comprised of the promoter element, P-SETit.Pro1-1:1:2 (SEQ ID NO: 77), operably linked 5' to the leader element, L-SETit.Pro1-1:1:1 (SEQ ID NO: 151). The plant transformation vector, pMON117994 is comprised of the promoter element, P-SETit.Pro2-1:1:3 (SEQ ID NO: 78), operably linked 5' to the leader element, L-SETit.Pro2-1:1:2 (SEQ ID NO: 152). The plant transformation vector, pMON117995 is comprised of the promoter element, P-SETit.CLU882664-1-1:1:2 (SEQ ID NO: 41), operably linked 5' to the leader element, L-SETit.CLU882664-1-1:1:1 (SEQ ID NO: 123). The plant transformation

vector, pMON117996 is comprised of the transcriptional regulatory element group, EXP-SETit.CLUS19108 (SEQ ID NO: 13), which is further comprised of the promoter element, P-SETit.CLUS19108-1:1:2 (SEQ ID NO: 40), operably linked 5' to the leader element, L-SETit.CLUS19108-1:1:2 (SEQ ID NO: 122), operably linked 5' to the intron element, I-SETit.CLUS19108-1:1:1 (SEQ ID NO: 174), operably linked 5' to the leader element, L-SETit.CLUS19108-1:1:1 (SEQ ID NO: 121). The plant transformation vector, pMON117997 is comprised of the promoter element, P-SETit.Alc1-1:1:1 (SEQ ID NO: 28), operably linked 5' to the leader element, L-SETit.Alc1-1:1:1 (SEQ ID NO: 110). The plant transformation vector, pMON117998 is comprised of the promoter element, P-SETit.Alc2-1:1:2 (SEQ ID NO: 30), operably linked 5' to the leader element, L-SETit.Alc2-1:1:1 (SEQ ID NO: 111). The plant transformation vector, pMON117999 is comprised of the promoter element, P-SETit.Dzs-1:1:4 (SEQ ID NO: 47), operably linked 5' to the leader element, L-SETit.Dzs-1:1:1 (SEQ ID NO: 128). The plant transformation vector, pMON130551 is comprised of the promoter element, P-SETit.Alc1-1:1:2 (SEQ ID NO: 29), operably linked 5' to the leader element, L-SETit.Alc1-1:1:1 (SEQ ID NO: 110). The plant transformation vector, pMON140500 is comprised of the promoter element, P-SETit.Dzs-1:1:5 (SEQ ID NO: 48), operably linked 5' to the leader element, L-SETit.Dzs-1:1:1 (SEQ ID NO: 128). The plant transformation vector, pMON140501 is comprised of the promoter element, P-SETit.Ssp1-1:1:1 (SEQ ID NO: 93), operably linked 5' to the leader element, L-SETit.Ssp1-1:1:1 (SEQ ID NO: 164). The plant transformation vector, pMON140502 is comprised of the promoter element, P-SETit.Ssp1-1:1:2 (SEQ ID NO: 94), operably linked 5' to the leader element, L-SETit.Ssp1-1:1:1 (SEQ ID NO: 164). The plant transformation vector, pMON140503 is comprised of the transcriptional regulatory element group, EXP-SETit.CLUS120796-1 (SEQ ID NO: 12), which is further comprised of the promoter element, P-SETit.CLUS120796-1-1:1:1 (SEQ ID NO: 39), operably linked 5' to the leader element, L-SETit.CLUS120796-1-1:1:2 (SEQ ID NO: 120), operably linked 5' to the intron element, I-SETit.CLUS120796-1-1:1:1 (SEQ ID NO: 173), operably linked 5' to the leader element, L-SETit.CLUS120796-1-1:1:1 (SEQ ID NO: 119). The plant transformation vector, pMON140504 is comprised of the promoter element, P-SETit.CLUS1164825-1-1:1:1 (SEQ ID NO: 37), operably linked 5' to the leader element, L-SETit.CLUS1164825-1-1:1:1 (SEQ ID NO: 118). The plant transformation vector, pMON140505 is comprised of the transcriptional regulatory element group, EXP-SETit.Ubq5 (SEQ ID NO: 22), which is further comprised of the promoter element, P-SETit.Ubq5-1:1:2 (SEQ ID NO: 104), operably linked 5' to the leader element, L-SETit.Ubq5-1:1:1 (SEQ ID NO: 170), operably linked 5' to the

intron element, I-SETit.Ubq5-1:1:2 (SEQ ID NO: 178). The plant transformation vector, pMON140506 is comprised of the promoter element, P-SETit.FM54-1:1:2 (SEQ ID NO: 52). The plant transformation vector, pMON140507 is comprised of the promoter element, P-SETit.FM63-1:1:2 (SEQ ID NO: 53). The plant transformation vector, pMON140508 is 5 comprised of the promoter element, P-SETit.CLU1165324-1:1:1 (SEQ ID NO: 38).

Corn plant tissues are transformed using particle bombardment methods and LH244 corn seeds as outlined in Example 3 above. The bombarded root and leaf tissues are allowed to incubate in the dark for 24 hours at 26°C. Following this overnight incubation, the tissues are stained in solution for GUS expression overnight at 37 degrees Celsius. After staining 10 overnight, the tissues are soaked in 70% ethanol overnight to remove chlorophyll and reveal the GUS staining. The tissues are then photographed and a rating scale of “0” to “4” reflecting the level of GUS expression is assigned to each construct.

Expression of the GUS transgene demonstrated in each tissue is used to infer the relative potential level and specificity of each element’s capacity to drive transgene 15 expression in stably transformed corn plants. Average GUS expression ratings are provided in Table 18 below.

Table 18. GUS expression ratings for particle bombardment assay of potential seed promoters.

In all cases, some transgene expression was observed in tissues bombarded with the construct shown above in Table 18. Highest levels of expression in the seed were observed for the tissues bombarded with the constructs, pMON117996 ((EXP-SETit.CLU19108 SEQ ID NO: 13) comprised of P-SETit.CLU19108-1:1:2 (SEQ ID NO: 40) + L-SETit.CLU19108-1:1:2 (SEQ ID NO: 122) + I-SETit.CLU19108-1:1:1 (SEQ ID NO: 174) + L-SETit.CLU19108-1:1:1 (SEQ ID NO: 121)) and pMON140505 ((EXP-SETit.Ubq5 (SEQ ID NO: 22) comprised of P-SETit.Ubq5-1:1:2 (SEQ ID NO: 104) + L-SETit.Ubq5-1:1:1 (SEQ ID NO: 170) + I-SETit.Ubq5-1:1:2 (SEQ ID NO: 178)). Surprisingly, the construct pMON140505 ((EXP-SETit.Ubq5 (SEQ ID NO: 22) comprised of P-SETit.Ubq5-1:1:2 (SEQ ID NO: 104) + L-SETit.Ubq5-1:1:1 (SEQ ID NO: 170) + I-SETit.Ubq5-1:1:2 (SEQ ID NO: 178)) demonstrated high levels of constitutive expression which had not been initially predicted by the EST counts provided in Table 15 of example 7. Some constructs such as, pMON117998 (P-SETit.Alc2-1:1:2 (SEQ ID NO: 30) + L-SETit.Alc2-1:1:1 (SEQ ID NO: 111)); pMON140500 (P-SETit.Dzs-1:1:5 (SEQ ID NO: 48) + L-SETit.Dzs-1:1:1 (SEQ ID NO: 128)); pMON140501 (P-SETit.Ssp1-1:1:1 (SEQ ID NO: 93) + L-SETit.Ssp1-1:1:1 (SEQ ID NO: 164) and pMON140502 (P-SETit.Ssp1-1:1:2 (SEQ ID NO: 94) + L-SETit.Ssp1-1:1:1 (SEQ ID NO: 164)), demonstrated expression in the endosperm and not the embryo. In addition, while the construct, pMON140500 (P-SETit.Dzs-1:1:5 (SEQ ID NO: 48) + L-SETit.Dzs-1:1:1 (SEQ ID NO: 128)) demonstrated expression in only the endosperm, the construct, pMON117999 (P-SETit.Dzs-1:1:4 (SEQ ID NO: 47) + L-SETit.Dzs-1:1:1

(SEQ ID NO: 128)), which is comprised of a longer version of the Dzs promoter, (P-SETit.Dzs-1:1:5 (SEQ ID NO: 48)), demonstrated expression in both endosperm and embryo, suggesting the potential for an embryo enhancer comprising the fragment deleted from P-SETit.Dzs-1:1:4 (SEQ ID NO: 47) to produce P-SETit.Dzs-1:1:5 (SEQ ID NO: 48).

5 **Example 9: Regulatory Elements Driving GUS Transgene Expression in
Transgenic Corn or Wheat**

Corn or wheat plants are transformed with constructs comprising regulatory elements such as the transcriptional regulatory element groups, provided as SEQ ID NOS: 1 through 22; or the promoters provided as SEQ ID NOS: 23 through 105 and SEQ ID NOS: 353 through 536, operably linked to any of the leaders provided as SEQ ID NOS: 106 through 171 and 537 through 588. The transcriptional regulatory element groups or promoters can be operably linked to a marker transgene such as GUS similar to that as described in example 2 above. In addition, intron elements such as those provided as SEQ ID NOS: 172 through 267 and SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778 can be operably linked between the expression elements and transgene of interest to improve expression or modulate the expression of the transgene within the transformed plant. The plants are transformed using agrobacterium or particle bombardment methods known in the art. Transformants containing one or two copies of the transgene cassette are selected using methods known in the art. Transformants are then assayed to determine the level of expression of the marker transgene in various tissues of the plant similar to that as described in example 2. F1 progeny are produced by either outcrossing the transformed event with an untransformed event, or through self-fertilization. The F1 progeny are grown and expression of the marker transgene is determined using progeny possessing one or two copies of the transgene cassette. Chimeric regulatory elements comprised of any of the promoters, leader 10 and introns presented above are selected based upon the level of expression and tissue specificity of expression to drive transgenes of agronomic or commercial importance.

20

25

Example 10: Enhancers Derived from the Regulatory Elements

Enhancers are derived from the promoter elements presented as SEQ ID NOS: 23 through 105 and SEQ ID NOS: 353 through 536. The enhancer element may be comprised 30 of one or more cis regulatory elements that when operably linked 5' or 3' to a promoter element, or operably linked 5' or 3' to additional enhancer elements that are operably linked to a promoter, can enhance or modulate expression of a transgene, or provide expression of a

transgene in a specific cell type or plant organ or at a particular time point in development or circadian rhythm. Enhancers are made by removing the TATA box or functionally similar elements and any downstream sequence from the promoters that allow transcription to be initiated from the promoters presented as SEQ ID NOS: 23 through 105 and SEQ ID NOS: 5 353 through 536 or fragments thereof, in which the TATA box or functionally similar elements and sequence downstream of the TATA box are removed.

Enhancer elements are derived from the promoter elements presented as SEQ ID NOS: 23 through 105 and SEQ ID NOS: 353 through 536 and cloned using methods known in the art to be operably linked 5' or 3' to a promoter element, or operably linked 5' or 3' to 10 additional enhancer elements that are operably linked to a promoter. Alternatively, enhancer elements are cloned using methods known in the art to be operably linked to one or more copies of the enhancer element which are operably linked 5' or 3' to a promoter element, or operably linked 5' or 3' to additional enhancer elements that are operably linked to a promoter. Enhancer elements can also be cloned using methods known in the art to be 15 operably linked 5' or 3' to a promoter element derived from a different genus organism, or operably linked 5' or 3' to additional enhancer elements derived from other genus organisms or the same genus organism that are operably linked to a promoter derived from either the same or different genus organism, resulting in a chimeric regulatory element. A GUS expression plant transformation vector is constructed using methods known in the art similar 20 to the constructs described in the previous examples in which the resulting plant expression vectors contains a right border region from *A. tumefaciens*, a first transgene cassette to test the regulatory or a chimeric regulatory element comprised of, a regulatory or chimeric regulatory element, operably linked to an intron derived from the HSP70 heat shock protein of *Zea mays* or any of the introns presented as SEQ ID NOS: 172 through 267 and SEQ ID 25 NOS: 317 through 323 and SEQ ID NOS: 589 through 778 or any other intron, operably linked to a coding sequence for β-glucuronidase (GUS) that either possesses a processable intron (GUS-2, SEQ ID NO: 1091) or no intron (GUS-1, SEQ ID NO: 1090), operably linked to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088) or the 3' termination region from the rice lipid transfer protein gene (T- 30 Os.LTP-1:1:1, SEQ ID NO: 1089); a second transgene selection cassette used for selection of transformed plant cells that confers resistance to the herbicide glyphosate (driven by the rice Actin 1 promoter), or alternatively, the antibiotic kanamycin (driven by the rice Actin 1 promoter) and a left border region from *A. tumefaciens*. The resulting plasmids are used to transform corn plants or other genus plants by the methods described above or by other

Agrobacterium-mediated or particle bombardment methods known in the art. Alternatively, protoplast cells derived from corn or other genus plants are transformed using methods known in the art to perform transient assays

GUS expression driven by the test regulatory element comprising one or more enhancers is evaluated in stable or transient plant assays to determine the effects of the enhancer element on expression of a transgene. Modifications to one or more enhancer elements or duplication of one or more enhancer elements is performed based upon empirical experimentation and the resulting gene expression regulation that is observed using each regulatory element composition. Altering the relative positions of one or more enhancers in the resulting regulatory or chimeric regulatory element may affect the transcriptional activity or specificity of the regulatory or chimeric regulatory element and is determined empirically to identify the best enhancers for the desired transgene expression profile within the corn plant or other genus plant.

**Example 11: Analysis of Intron-Mediated Enhancement of GUS Activity Using Plant
15 Derived Protoplasts**

The introduction of a foreign gene into a new plant host does not always result in a high expression of the incoming gene. Furthermore, if dealing with complex traits, it is sometimes necessary to modulate several genes with spatially or temporarily different expression pattern. Introns can principally provide such modulation. However multiple use of 20 the same intron in one plant has shown to exhibit disadvantages. In those cases it is necessary to have a collection of basic control elements for the construction of appropriate recombinant DNA elements. However, the available collection of introns with expression enhancing properties is limited and alternatives are needed.

In plants, the inclusion of some introns in gene constructs leads to increased mRNA 25 and protein accumulation relative to constructs lacking the intron. This effect has been termed “intron mediated enhancement” (IME) of gene expression (Mascarenhas *et al.*, (1990) *Plant Mol. Biol.* 15:913-920). Introns known to stimulate expression in plants have been identified in maize genes (*e.g.* tubA1, Adh1, Sh1, Ubi1 (Jeon *et al.* (2000) *Plant Physiol.* 123:1005-1014; Callis *et al.* (1987) *Genes Dev.* 1:1183-1200; Vasil *et al.* (1989) *Plant Physiol.* 30 91:1575-1579; Christiansen *et al.* (1992) *Plant Mol. Biol.* 18:675-689) and in rice genes (*e.g.* salt, *tpi*: McElroy *et al.*, *Plant Cell* 2:163-171 (1990); Xu *et al.*, *Plant Physiol.* 106:459-467 (1994)). Similarly, introns from dicotyledonous plant genes like those from petunia (*e.g.* *rbcS*), potato (*e.g.* *st-ls1*) and from *Arabidopsis thaliana* (*e.g.* *ubq3* and *pat1*) have been

found to elevate gene expression rates (Dean *et al.* (1989) *Plant Cell* 1:201-208; Leon *et al.* (1991) *Plant Physiol.* 95:968-972; Norris *et al.* (1993) *Plant Mol Biol* 21:895-906; Rose and Last (1997) *Plant J.* 11:455-464). It has been shown that deletions or mutations within the splice sites of an intron reduce gene expression, indicating that splicing might be needed for 5 IME (Mascarenhas *et al.* (1990) *Plant Mol Biol.* 15:913-920; Clancy and Hannah (2002) *Plant Physiol.* 130:918-929). However, that splicing per se is not required for a certain IME in dicotyledonous plants has been shown by point mutations within the splice sites of the *pat1* gene from *A. thaliana* (Rose and Beliakoff (2000) *Plant Physiol.* 122:535-542).

Enhancement of gene expression by introns is not a general phenomenon because 10 some intron insertions into recombinant expression cassettes fail to enhance expression (*e.g.* introns from dicot genes (*rbcS* gene from pea, phaseolin gene from bean and the *stls-1* gene from *Solanum tuberosum*) and introns from maize genes (*adh1* gene the ninth intron, *hsp81* gene the first intron)) (Chee *et al.* (1986) *Gene* 41:47-57; Kuhlemeier *et al.* (1988) *Mol Gen Genet* 212:405-411; Mascarenhas *et al.* (1990) *Plant Mol. Biol.* 15:913-920; Sinibaldi and 15 Mettler (1992) In WE Cohn, K Moldave, eds, *Progress in Nucleic Acid Research and Molecular Biology*, Vol 42. Academic Press, New York, pp 229-257; Vancanneyt *et al.* 1990 *Mol. Gen. Genet.* 220:245-250). Therefore, not each intron can be employed in order to manipulate the gene expression level of non-endogenous genes or endogenous genes in transgenic plants. What characteristics or specific sequence features must be present in an 20 intron sequence in order to enhance the expression rate of a given gene is not known in the prior art and therefore from the prior art it is not possible to predict whether a given plant intron, when used heterologously, will cause IME.

An intron is selected based upon experimentation and comparison with an intronless expression vector control to empirically select an intron and configuration within the vector 25 T-DNA element arrangement for optimal expression of a transgene. For example, in the expression of an herbicide resistance gene, such as CP4 which confers resistance to the herbicide glyphosate, it is desirable to have transgene expression within the reproductive tissues as well as the vegetative tissues, to prevent the loss of yield when applying the herbicide. An intron in this instance would be selected upon its ability when operably linked 30 to a constitutive promoter, to enhance expression of the herbicide resistance conferring transgene, particularly within the reproductive cells and tissues of the transgenic plant and thus providing both vegetative and reproductive tolerance to the transgenic plant, when sprayed with the herbicide (see for example International Patent Application, WO2007/098042A2).

Introns presented as SEQ ID NOS: 16 through 306 are identified using genomic DNA contigs in comparison to expressed sequence tag clusters or cDNA contigs to identify exon and intron sequences within the genomic DNA. In addition, 5' UTR or leader sequences are also used to define the intron/exon splice junction of one or more introns under conditions
5 when the gene sequence encodes a leader sequence that is interrupted by one or more introns. Introns presented as SEQ ID NOS: 172 through 267 and SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778 are cloned using methods known in the art into a plant transformation vector to be operably linked 3' to a transcriptional regulatory element and leader fragment and operably linked 5' to either a second leader fragment or to coding
10 sequences as depicted in the two transgene cassettes presented in FIG. 15. A first possible transgene cassette (Transgene Cassette Configuration 1 in FIG. 15) is comprised of a promoter or chimeric promoter element [A], operably linked 5' to a leader element [B], operably linked 5' to a test intron element [C], operably linked to a coding region [D], which is operably linked to a 3' UTR element [E]. Alternatively, a second possible transgene
15 cassette (Transgene Cassette Configuration 2 in Figure 15) is comprised of a promoter or chimeric promoter element [F], operably linked 5' to a first leader element or first leader element fragment [G], operably linked 5' to a test intron element [H], operably linked 5' to a second leader element or first leader element second fragment [I], operably linked to a coding region [J], which is operably linked to a 3' UTR element [K].

20 The first 6 nucleotides on the 5' end and the last 6 nucleotides on the 3' end of the introns presented as SEQ ID NOS: 172 through 267 and SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778 represent nucleotides before and after the intron/exon splice junction, respectively. These short 6 nucleotide sequences can be altered or modified by having additional sequence appended (*i.e.* native or artificial) to facilitate cloning of the
25 intron into a plant transformation vector, so long as the seventh and eighth nucleotides from the 5' end (GT) and the seventh and eighth nucleotide from the 3' end (AG) of SEQ ID NOS: 172 through 267 and SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778 are preserved, thus preserving the intron/exon splice junction of the intron. It is preferable to avoid using the nucleotide sequence TG or G just prior to the seventh and eighth nucleotides
30 from the 5' end (GT) and the nucleotide sequence, A or AT from the seventh and eighth nucleotide from the 3' end (AG) to eliminate the potential of unwanted stop and start codons from being formed during processing of the messenger RNA into the final transcript.

The introns are assayed for the ability to enhance expression in transient assay or stable plant assay. For transient assay of intron mediated enhancement, a base plant vector is

constructed using methods known in the art. The intron is cloned into a base plant vector which comprises an expression cassette comprised of a constitutive promoter such as the Cauliflower mosaic virus promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID NO: 1096), operably linked 5' to a leader element, L-CaMV.35S-1:1:15 (SEQ ID NO: 1111), operably linked 5' to 5 a test intron element (SEQ ID NOS: 172 through 267 and SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778), operably linked to a coding sequence for β-glucuronidase (GUS) that either possesses a processable intron (GUS-2, SEQ ID NO: 1091) or no intron (GUS-1, SEQ ID NO: 1090), operably linked to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). Protoplast cells derived from 10 corn or other genus plant tissue is transformed with the base plant vector and assayed for activity. A comparison of activity is made using a control plasmid comprised of the same transgene cassette as the test plasmid, but without the test intron to see if the intron provides an intron mediated enhancement effect.

Two plasmids, for use in co-transformation and normalization of data, are also 15 constructed using methods known in the art. Each plasmid contains a specific luciferase coding sequence which is driven by a constitutive transcriptional regulatory expression element group. The plant vector, pMON19437 is comprised of a transgene cassette comprised of a constitutive promoter (EXP-CaMV.35S-enh, SEQ ID NO: 1095), operably linked 5' to an intron, (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably linked 5' to a firefly 20 (*Photinus pyralis*) luciferase coding sequence (LUCIFERASE:1:3, SEQ ID NO: 1109), operably linked 5' to a 3' termination region from the *A. tumefaciens* nopaline synthase gene (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). The plant vector, pMON63934 is comprised of a transgene cassette comprised of a constitutive transcriptional regulatory expression element group, (EXP-CaMV.35S-enh-Lhcb1, SEQ ID NO: 1106), operably linked 5' to a sea pansy 25 (*Renilla reniformis*) luciferase coding sequence (CR-Ren.hRenilla Lucife-0:0:1, SEQ ID NO: 1110), operably linked 5' to a 3' termination region from the *A. tumefaciens* nopaline synthase gene (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088).

Corn leaf protoplasts or other genus plant protoplasts are transformed using a PEG-based transformation method, similar to those known in the art. Protoplast cells are 30 transformed with a DNA prep comprised of equimolar quantities of the two luciferase expression plasmids, pMON19437 and pMON63934 and one of the test plasmids and incubated overnight in total darkness. After incubation, the cells are rinsed, resuspended and lysed. Measurements of both GUS and luciferase are conducted using aliquots of each lysis preparation. Essentially, the collected, transformed protoplast cells are lysed in 5X passive

lysis buffer (Promega). After allowing for lysis, aliquots of the lysed preparation are placed into two different small-well trays. One tray is used for GUS measurements. For quantitative analysis of GUS expression, total protein is extracted from lysis preparation. One microgram of total protein is used with the fluorogenic substrate 4-methyleumbelliferyl-
5 β-D-glucuronide (MUG) in a total reaction volume of 50 microliters. The reaction product, 4-methyleumbelliferone (4-MU), is maximally fluorescent at high pH, where the hydroxyl group is ionized. Addition of a basic solution of sodium carbonate simultaneously stops the assay and adjusts the pH for quantifying the fluorescent product. Fluorescence is measured with excitation at 365 nm, emission at 445 nm using a Fluoromax-3 with Micromax Reader,
10 with slit width set at excitation 2 nm and emission 3nm. GUS values are expressed as pmol of 4-MU protein per minute per milligram protein (pmol 4-MU min⁻¹ mg⁻¹ protein).

The second tray is used to perform a dual luciferase assay as outlined in Example 5 above. To compare the relative ability of the intron to enhance expression, GUS values are expressed as a ratio of GUS to luciferase activity and compared with those levels imparted by
15 the constitutive promoter and a known intron standard such as that as the intron derived from the HSP70 heat shock protein of *Zea mays*, I-Zm.DnaK-1:1:1 (SEQ ID NO: 1102).

For stable plant assay of the introns presented as SEQ ID NOS: 172 through 267 and SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778, a GUS expression plant transformation vector is constructed using methods known in the art similar to the constructs
20 described in the previous examples in which the resulting plant expression vectors contains a right border region from *A. tumefaciens*, a first transgene cassette to test the intron comprised of a constitutive promoter such as the Cauliflower mosaic virus promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID NO: 1096), operably linked 5' to a leader element, L-CaMV.35S-1:1:15 (SEQ ID NO: 1111), operably linked 5' to a test intron element (SEQ ID NOS: 16 through
25 306), operably linked to a coding sequence for β-glucuronidase (GUS) that either possesses a processable intron (GUS-2, SEQ ID NO: 1091) or no intron (GUS-1, SEQ ID NO: 1090), operably linked to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088); a second transgene selection cassette used for selection of transformed plant cells that confers resistance to the herbicide glyphosate
30 (driven by the rice Actin 1 promoter), or alternatively, the antibiotic kanamycin (driven by the rice Actin 1 promoter) and a left border region from *A. tumefaciens*. The resulting plasmids are used to transform corn plants or other genus plants by the methods described above or by *Agrobacterium*-mediated methods known in the art. Single-copy or low copy

number transformants are selected for comparison to single-copy or low copy number transformed plants, transformed with a plant transformation vector identical to the test vector but without the test intron to determine if the test intron provides an intron mediated enhancement effect.

- 5 Any of the introns presented as SEQ ID NOS: 172 through 267 and SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778 can be modified in a number of ways, such as deleting fragments within the intron sequence which may reduce expression or duplication of fragments with the intron that may enhance expression. In addition, sequences within the intron that may affect the specificity of expression to either particular cells types or
- 10 tissues and organs can be duplicated or altered or deleted to affect expression and patterns of expression of the transgene. In addition, the introns presented as SEQ ID NOS: 172 through 267 and SEQ ID NOS: 317 through 323 and SEQ ID NOS: 589 through 778 can be modified to remove any potential start codons (ATG) that may cause unintentional transcripts from being expressed from improperly spliced introns as different, longer or truncated proteins.
- 15 Once the intron has been empirically tested, or it has been altered based upon experimentation, the intron is used to enhance expression of a transgene in stably transformed plants that can be of any genus monocot or dicot plant, so long as the intron provides enhancement of the transgene. The intron can also be used to enhance expression in other organisms, such as algae, fungi or animal cells, so long as the intron provides enhancement or
- 20 attenuation or specificity of expression of the transgene to which it is operably linked.

**Example 12: Plasmid constructs comprised of transgene cassettes for analysis of
Intron-Mediated Enhancement of GUS Transgene Activity**

Intron elements isolated from *Setaria italica* are cloned using methods known in the art into plasmid constructs comprising a constitutive promoter to test the effect of the intron 25 on expression of a GUS transgene driven by a constitutive promoter.

The intron elements presented as SEQ ID NOS: 179 through 267 were cloned into plasmid constructs comprising a constitutive promoter, P-CaMV.35S-enh-1:1:13 (SEQ ID NO: 1112), operably linked 5' to a leader element, L-CaMV.35S-1:1:15 (SEQ ID NO: 1111), operably linked to a test intron element (SEQ ID NOS: 179 through 267), operably linked 5' 30 to a GUS coding sequence, (GUS-1, SEQ ID NO: 1090), operably linked 5' to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). The plasmid construct identifier along with each intron annotation is presented in Table 19 below.

Table 19. Plasmid constructs comprising transgene cassettes to evaluate intron-mediated enhancement of GUS transgene expression.

Each plasmid was used as template for PCR amplification of the transgene cassette for use in protoplast assay as described below.

Example 13: Analysis of Intron-Mediated Enhancement of GUS Activity Using Corn 5 Protoplasts

Protoplast cells, derived from corn leaf tissue, are transformed with transgene cassettes in the form of PCR amplicons to determine the effect of each intron on the expression of the transgene, GUS, driven by a constitutive promoter and compared to introns known to have an enhancement effect on transgene expression.

10 The constructs described in example 12 above and presented in Table 19 of example 12 were used as template to generate PCR amplicons using methods known in the art comprising a constitutive promoter, P-CaMV.35S-enh-1:1:13 (SEQ ID NO: 1112), operably linked 5' to a leader element, L-CaMV.35S-1:1:15 (SEQ ID NO: 1111), operably linked to a test intron element (SEQ ID NOS: 179 through 267), operably linked 5' to a GUS coding sequence, (GUS-1, SEQ ID NO: 1090), operably linked 5' to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). In addition, amplicons, derived from control plasmids were also generated using the same amplification methods from the control plasmid constructs, pMON19469, pMON65328, pMON25455, pMON8677 and pMON33449. The transgene cassette of pMON19469 is 15 comprised of the transcriptional regulatory element group, EXP-CaMV.35S-enh/I-Zm.DnaK-1:1:1 (SEQ ID NO: 1104) and provides a comparison of the constitutive promoter enhanced using the intron I-Zm.DnaK-1:1:1. The transgene cassette of pMON65328 is comprised of the transcriptional regulatory element group, EXP-CaMV.35S-enh-Lhc b1/I-Os.Act1-1:1:9 (SEQ ID NO: 1105) and provides a comparison of enhancement of the 20

constitutive promoter using the intron, I-Os.Act1-1:1:9. The transgene cassette of pMON25455 is comprised of the transcriptional regulatory element group, EXP-Os.Act1:1:1 (SEQ ID NO: 1098) and provides a comparison of expression using the native promoter, leader and intron of the rice actin 1 gene. The transgene cassette of pMON8677 is comprised 5 of the promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID NO: 1096) operably linked to the GUS coding sequence and provides a comparison of expression with a constitutive promoter without an intron for enhancement. The transgene cassette of pMON33449 is comprised of a variant of the CaMV 35S promoter (P-E35S:1:52, SEQ ID NO: 1117) and provides an additional comparator lacking an intron.

10 Protoplast cells, derived from corn leaf tissue are transformed using PEG-based transformation methods known in the art. Briefly, each test and control construct is used to provide template for amplification of the transgene cassette comprising each construct. The resulting amplicon is size fractionated on an agarose gel and the amplicon DNA is excised from the gel. The amplicon DNA is extracted from the gel fragment using methods known in 15 the art and quantified by spectrophotometry. Protoplast cells are transformed using PEG methods known in the art and using either 0.3 or 0.1 pico-moles of PCR amplicon DNA. Two to four replicates are performed for each transformation and the average expression imparted by each construct determined. The mean GUS expression observed for each construct derived amplicon is normalized with respect to expression observed for the 20 amplicon derived from pMON19469 comprised of the intron element, I-Zm.DnaK-1:1:1 (SEQ ID NO: 1102). Tables 20 and 21 below show the normalized average GUS expression imparted amplicons derived from the constructs presented in table 19 of example 12 relative to the average GUS expression imparted to amplicons derived from the control plasmids described above using 0.3 and 0.1 pmol of amplicon, respectively.

25 **Table 20. Intron-mediated enhancement of GUS expression in corn protoplasts relative to I-Zm.DnaK-1:1:1 (SEQ ID NO: 1102) using 0.3 pmol of amplicon DNA.**

Using 0.3 pmol of amplicon, most of the test intron elements, derived from *S. italica*, enhanced GUS expression relative to the no intron controls using a similar promoter (pMON8677 and pMON33449). Improved enhancement of GUS expression, relative to the 5 intron element, I-Zm.DnaK-1:1:1 (SEQ ID NO: 1102) was observed for the intron elements, I-SETit.eIF5A1-1-1:1:1 (SEQ ID NO: 222), I-SETit.60S_L10A1-5-1:1:2 (SEQ ID NO: 215), I-SETit.GRP-1-1:1:1 (SEQ ID NO: 242), I-SETit.LSm8-1-1:1:2 (SEQ ID NO: 243), I-SETit.60S_L10A1-2-1:1:2 (SEQ ID NO: 212), I-SETit.TubA2_3-1:1:1 (SEQ ID NO: 264), I-SETit.14-3-3A-3-1:1:2 (SEQ ID NO: 180), I-SETit.eIF5A1-3-1:1:2 (SEQ ID NO: 224), I-SETit.14-3-3E-4-1:1:2 (SEQ ID NO: 199), I-SETit.PIP1-4_3-1:1:2 (SEQ ID NO: 252), I-SETit.PGK3_1-1:1:2 (SEQ ID NO: 247), I-SETit.40S-7S-3_1-1:1:2 (SEQ ID NO: 208), I-SETit.PIP1-1_3-1:1:2 (SEQ ID NO: 251), I-SETit.LSm8-4-1:1:2 (SEQ ID NO: 246), I-SETit.eIF5A2-2-1:1:3 (SEQ ID NO: 228), I-SETit.14-3-3E-3-1:1:2 (SEQ ID NO: 198), I-SETit.LSm8-2-1:1:1 (SEQ ID NO: 244), I-SETit.14-3-3A-2-1:1:1 (SEQ ID NO: 179), I-SETit.eIF5A3-3-1:1:2 (SEQ ID NO: 234), I-SETit.14-3-3B-2-1:1:1 (SEQ ID NO: 183), I-SETit.14-3-3D-4-1:1:3 (SEQ ID NO: 195), I-SETit.14-3-3C-1-1:1:1 (SEQ ID NO: 187), I-SETit.14-3-3C-3-1:1:2 (SEQ ID NO: 189), I-SETit.DnaJ_1-1:1:2 (SEQ ID NO: 218), I-SETit.eIF5A3-2-1:1:2 (SEQ ID NO: 233), I-SETit.40S-7S-1_2-1:1:2 (SEQ ID NO: 202), I-SETit.eIF5A3-4-1:1:2 (SEQ ID NO: 235) and I-SETit.ASA2-3-1:1:2 (SEQ ID NO: 216).

20 Data shown in Table 21 below.

Table 21. Intron-mediated enhancement of GUS expression in corn protoplasts relative to I-Zm.DnaK-1:1:1 (SEQ ID NO: 1102) using 0.1 pmol amplicon DNA.

The basic trend in enhancement was similar using 0.1 pmol of amplicon. Most of the test intron elements, derived from *S. italica*, enhanced GUS expression relative to the no intron controls using a similar promoter (pMON8677 and pMON33449). Improved enhancement of GUS expression, relative to the intron element, I-Zm.DnaK-1:1:1 (SEQ ID NO: 1102) was observed using the intron elements, I-SETit.LSm8-1-1:1:2 (SEQ ID NO: 243), I-SETit.60S_L10A1-5-1:1:2 (SEQ ID NO: 215), I-SETit.eIF5A1-3-1:1:2 (SEQ ID NO: 224), I-SETit.GRP-1-1:1:1 (SEQ ID NO: 242), I-SETit.14-3-3D-2-1:1:1 (SEQ ID NO: 193), I-SETit.14-3-3D-3-1:1:2 (SEQ ID NO: 194), I-SETit.eIF5A3-3-1:1:2 (SEQ ID NO: 234), I-SETit.LSm8-4-1:1:2 (SEQ ID NO: 246), I-SETit.LSm8-2-1:1:1 (SEQ ID NO: 244), I-SETit.eIF5A3-2-1:1:2 (SEQ ID NO: 233), I-SETit.eIF5A1-4-1:1:2 (SEQ ID NO: 225), I-SETit.ASA2-3-1:1:2 (SEQ ID NO: 216), I-SETit.60S_L10A1-2-1:1:2 (SEQ ID NO: 212), I-SETit.eIF5A2-5-1:1:2 (SEQ ID NO: 231), I-SETit.14-3-3B-3-1:1:2 (SEQ ID NO: 184), I-SETit.14-3-3B-2-1:1:1 (SEQ ID NO: 183), I-SETit.DnaJ3-2-1:1:2 (SEQ ID NO: 219), I-SETit.14-3-3A-3-1:1:2 (SEQ ID NO: 180), I-SETit.eIF5A3-4-1:1:2 (SEQ ID NO: 235), I-SETit.14-3-3C-5-1:1:2 (SEQ ID NO: 191), I-SETit.TubA3_2-1:1:1 (SEQ ID NO: 266), I-SETit.40S-7S-1_3-1:1:2 (SEQ ID NO: 203), I-SETit.TubA2_3-1:1:1 (SEQ ID NO: 264), I-

SETit.14-3-3C-3-1:1:2 (SEQ ID NO: 189), I-SETit.Prx3-1-1:1:2 (SEQ ID NO: 258) and I-SETit.DnaJ_1-1:1:2 (SEQ ID NO: 218).

Example 14: Analysis of Intron-Mediated Enhancement of GUS Activity Using Wheat Protoplasts

5 Protoplast cells, derived from wheat leaf tissue, are transformed with transgene cassettes in the form of PCR amplicons to determine the effect of each intron on the expression of the transgene, GUS, driven by a constitutive promoter and compared to introns known to have an enhancement effect on transgene expression.

The constructs described in example 12 above and presented in Table 19 of example 10 12 were used as template to generate PCR amplicons using methods known in the art comprising a constitutive promoter, P-CaMV.35S-enh-1:1:13 (SEQ ID NO: 1112), operably linked 5' to a leader element, L-CaMV.35S-1:1:15 (SEQ ID NO: 1111), operably linked to a test intron element (SEQ ID NOS: 179 through 267), operably linked 5' to a GUS coding sequence, (GUS-1, SEQ ID NO: 1090), operably linked 5' to the Nopaline synthase 3' 15 termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). In addition, amplicons, derived from control plasmids were also generated using the same amplification methods from the control plasmid constructs, pMON19469, pMON65328, pMON25455, pMON8677 and pMON33449. The transgene cassette of pMON19469 is comprised of the transcriptional regulatory element group, EXP-CaMV.35S-enh/I- 20 Zm.DnaK-1:1:1 (SEQ ID NO: 1104) and provides a comparison of the constitutive promoter enhanced using the intron I-Zm.DnaK-1:1:1. The transgene cassette of pMON65328 is comprised of the transcriptional regulatory element group, EXP-CaMV.35S-enh-Lhcb1/I-Os.Act1-1:1:9 (SEQ ID NO: 1105) and provides a comparison of enhancement of the 25 constitutive promoter using the intron, I-Os.Act1-1:1:9. The transgene cassette of pMON25455 is comprised of the transcriptional regulatory element group, EXP-Os.Act1:1:1 (SEQ ID NO: 1098) and provides a comparison of expression using the native promoter, leader and intron of the rice actin 1 gene. The transgene cassette of pMON8677 is comprised of the promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID NO: 1096) operably linked to the GUS 30 coding sequence and provides a comparison of expression with a constitutive promoter without an intron for enhancement. The transgene cassette of pMON33449 is comprised of a variant of the CaMV 35S promoter (P-E35S:1:52, SEQ ID NO: 1117) and provides an additional comparator lacking an intron.

Protoplast cells, derived from wheat leaf tissue are transformed using PEG-based transformation methods known in the art. Briefly, each test and control construct is used to provide template for amplification of the transgene cassette comprising each construct. The resulting amplicon is size fractionated on an agarose gel and the amplicon DNA is excised from the gel. The amplicon DNA is extracted from the gel fragment using methods known in the art and quantified by spectrophotometry. Protoplast cells are transformed using PEG methods known in the art and using 0.1 pico-moles of PCR amplicon DNA. Two to four replicates are performed for each transformation and the average expression imparted by each construct determined. The mean GUS expression observed for each construct derived amplicon is normalized with respect to expression observed for the amplicon derived from pMON19469 comprised of the intron element, I-Zm.DnaK-1:1:1 (SEQ ID NO: 1102). Tables 22 below show the normalized average GUS expression imparted amplicons derived from the constructs presented in Table 19 of Example 12 relative to the average GUS expression imparted to amplicons derived from the control plasmids described above using 0.1 pmol of amplicon.

Table 22. Intron-mediated enhancement of GUS expression in wheat protoplasts relative to I-Zm.DnaK-1:1:1 (SEQ ID NO: 1102).

As was observed in corn protoplast cells, many of the test intron elements provided enhancement of transgene expression relative to the intronless controls. Improved enhancement of GUS expression, relative to the intron element, I-Zm.DnaK-1:1:1 (SEQ ID

NO: 1102) was observed using the intron elements, I-SETit.LSm8-1-1:1:2 (SEQ ID NO: 243), I-SETit.60S_L10A1-5-1:1:2 (SEQ ID NO: 215), I-SETit.eIF5A1-3-1:1:2 (SEQ ID NO: 224), I-SETit.GRP-1-1:1:1 (SEQ ID NO: 242), I-SETit.14-3-3D-2-1:1:1 (SEQ ID NO: 193), I-SETit.14-3-3D-3-1:1:2 (SEQ ID NO: 194), I-SETit.eIF5A3-3-1:1:2 (SEQ ID NO: 234), I-

15 **Example 15. Assay of 3' transcription termination molecule or 3' UTRs in protoplasts.**

3' transcription termination molecules or 3' UTRs are isolated from Foxtail millet (*Setaria italica* (L.) Beauv) and cloned into plant base vectors using methods known in the art to test the effectiveness of the 3' UTR in terminating transcription as well as enhancing expression of a transgene.

20 3' UTRs useful in providing expression of a transgene in plants are identified based upon the expression of expressed sequence tags (ESTs) in cDNA libraries made from messenger RNA isolated from seed, flower and other tissues derived from Foxtail millet (*Setaria italica* (L.) Beauv). Libraries of cDNA are made from tissues isolated from *S. italica* using methods known to those skilled in the art from flower tissue, seed, leaf and root. The
25 resulting cDNAs are sequenced using various sequencing methods known in the art. The resulting ESTs are assembled into clusters using bioinformatics software such as clc_ref_assemble_complete version 2.01.37139 (CLC bio USA, Cambridge, Massachusetts 02142). Transcript abundance of each cluster is determined by counting the number of cDNA reads for each cluster.

30 The identified 3' UTRs may be comprised of sequence derived from cDNA sequence as well as sequence derived from genomic DNA. The cDNA sequence is used to design primers, which are then used with GenomeWalker™ (Clontech Laboratories, Inc, Mountain View, CA) libraries constructed following the manufacturer's protocol to clone the 3' region

of the corresponding genomic DNA sequence to provide a longer termination sequence. Analysis of relative transcript abundance either by direct counts or normalized counts of observed sequence reads for each tissue library can be used to infer properties about patterns of expression. For example, some 3' UTRs may be found in transcripts seen in higher abundance in root tissue as opposed to leaf. This is suggestive that the transcript is highly expressed in root and that the properties of root expression may be attributable to the transcriptional regulation of the promoter, the lead, the introns or the 3' UTR. Empirical testing of 3' UTRs identified by the properties of expression within specific organs, tissues or cell types can result in the identification of 3' UTRs that enhance expression in those specific organs, tissues or cell types.

3' UTR sequences isolated from *S. italica* are presented as SEQ ID NOS: 268 through 276 and SEQ ID NOS: 779 through 924. Table 23 below presents 3' UTRs identified as being useful for control of expression and enhancement of root expression or constitutive expression.

15 **Table 23. Transcription termination or 3' UTR elements derived from *S. italica*.**

The 3' UTRs of the present invention, presented as SEQ ID NOS: 268 through 276 and SEQ ID NOS: 779 through 924 are tested in transient protoplast assays. A constitutive or other type promoter is used to drive expression of a transgene such as GUS. Plant vectors are constructed using methods known in the art in which a transgene cassette is used to test the properties of the 3' UTR as well as provide transcript that can be analyzed to understand the effectiveness of the 3' UTR in controlling expression of the transgene and processing of the resulting transcript.

For transient assay of the test 3' UTR effectiveness, a base plant vector is constructed using methods known in the art. The 3' UTR is cloned into a base plant vector which comprises a first transgene cassette to test the 3' UTR comprised of, a constitutive promoter such as the Cauliflower mosaic virus promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID NO: 1096), operably linked 5' to a leader element, L-Ta.Lhcb1-1:1:1 (SEQ ID NO: 1114), operably linked to an intron derived from the HSP70 heat shock protein of *Zea mays* (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably linked to a coding sequence for β-glucuronidase (GUS) that either possessed a processable intron (GUS-2, SEQ ID NO: 1091) or no intron (GUS-1, SEQ ID NO: 1090), operably linked to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088) or the 3' termination region from the rice lipid transfer protein gene (T-Os.LTP-1:1:1, SEQ ID NO: 1089); a second transgene selection cassette used for selection of transformed plant cells that conferred resistance to the herbicide glyphosate (driven by the rice Actin 1 transcriptional regulatory element group, SEQ ID NO: 1098), or alternatively, the antibiotic kanamycin (driven by the rice Actin 1 transcriptional regulatory element group, SEQ ID NO: 1098) and a left border region from *A. tumefaciens*.

Several experimental observations are made to characterize the 3' UTR in protoplast assay. For example, the level of expression is determined using GUS staining as described in previous examples to assess the amount of protein expressed and is normalized using methods known in the art to draw a comparison in protein expression levels of the test 3' UTR relative to the T-AGRtu.nos control. Total RNA is extracted and probed on Northern blots with probes specific to the GUS coding sequence to assess the size or sizes of transcripts produced in the protoplast cells to determine the effectiveness of the 3' UTR in terminating transcription. Alternatively, the sequence 3' of the 3' UTR can be used to prime amplification reactions from reverse transcribed RNA to detect transcripts in which read-through has occurred beyond the 3' UTR. Total RNA probed on Northern blots can also reveal the relative abundance of transcript when compared to the T-AGRtu.nos control.

Example 16. Assay of transcriptional termination sequences or 3' UTRs in stable plants.

The 3' UTRs, presented as SEQ ID NOS: 268 through 276 and SEQ ID NOS: 779 through 924 are tested in stably transformed corn plants. For stable plant assay of the 3' UTR, a GUS expression plant transformation vector is constructed using methods known in the art similar to the constructs described in the previous examples. The 3' UTR is cloned into a base plant vector which comprises a first transgene cassette to test the 3' UTR comprised of, a constitutive promoter such as the Cauliflower mosaic virus promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID NO: 1096), operably linked 5' to a leader element, L-Ta.Lhcb1-1:1:1 (SEQ ID NO: 1114), or alternatively, a root promoter such as Lipid transfer protein promoter, P-Os.Rcc3-1:1:24 (SEQ ID NO: 1093), operably linked 5' to the leader, L-Os.Rcc3-1:1:2 (SEQ ID NO: 1094), operably linked to an intron derived from the HSP70 heat shock protein of Zea mays (I-Zm.DnaK-1:1:1, SEQ ID NO: 1102), operably linked to a coding sequence for β-glucuronidase (GUS) that either possessed a processable intron (GUS-2, SEQ ID NO: 1091) or no intron (GUS-1, SEQ ID NO: 1090), operably linked to a test 3' termination region; a second transgene selection cassette used for selection of transformed plant cells that conferred resistance to the herbicide glyphosate (driven by the rice Actin 1 transcriptional regulatory element group, SEQ ID NO: 1098), or alternatively, the antibiotic kanamycin (driven by the rice Actin 1 transcriptional regulatory element group, SEQ ID NO: 1098) and a left border region from *A. tumefaciens*.

The resulting plasmids are used to transform corn plants. Single-copy or low copy number transformants are selected for comparison to single-copy or low copy number

transformed plants, transformed with a plant transformation vector identical to the test vector but comprising a well characterized 3' UTR, such as the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088) operably linked to the GUS transgene.

5 Corn plants are transformed as described above or by *Agrobacterium*-mediated transformation methods known in the art. Tissue is harvested at different time points of development and from different organs and assayed for GUS activity to assess the amount of protein expressed in each tissue at different time windows of development and is compared to expression of GUS in control transformed plants. Total RNA is extracted from the different
10 tissues of interest and probed on Northern blots with probes specific to the GUS coding sequence to assess the size or sizes of transcripts produced within each of the selected tissues to determine the effectiveness of the 3' UTR in terminating transcription and the relative abundance of message in each selected tissue. Alternatively, the sequence 3' of the 3' UTR can be used to prime amplification reactions from reverse transcribed RNA to detect
15 transcripts in which read-through has occurred beyond the 3' UTR or assess the amount of transcript expressed in each tissue. The most useful and effective 3' UTRs are selected for use in transgene cassettes in which genes of agronomic importance are expressed.

Example 17: Analysis of 3' UTR-Mediated Enhancement of GUS Activity In Transgenic Corn Plants.

20 Plant binary vectors are constructed using methods known in the art similar to those described in the previous example and used to transform corn plants to test the effectiveness of selected 3' UTRs.

Plant transformation vectors are used to transform corn plants to test the effectiveness in controlling expression of the GUS transgene, when driven by either a constitutive
25 promoter, (P-FMV.35S-enh-1:1:1 (SEQ ID NO: 1115) + L-Ta.Lhcb1-1:1:1 (SEQ ID NO: 1114)) or an enhanced root promoter, ((E-CaMV.35S-enh-1:1:1 (SEQ ID NO: 1116) + P-Os.Rcc3-1:1:24 (SEQ ID NO: 1093) + L-Os.Rcc3-1:1:2 (SEQ ID NO: 1094)). The resulting plant expression vectors contains a right border region from *Agrobacterium tumefaciens*, a first transgene cassette to test the 3' UTR comprised of a either a constitutive promoter, (P-FMV.35S-enh-1:1:1 (SEQ ID NO: 1115) + L-Ta.Lhcb1-1:1:1 (SEQ ID NO: 1114)) or an
30 enhanced root promoter, ((E-CaMV.35S-enh-1:1:1 (SEQ ID NO: 1116) + P-Os.Rcc3-1:1:24 (SEQ ID NO: 1093) + L-Os.Rcc3-1:1:2 (SEQ ID NO: 1094)), operably linked 5' to a coding sequence for β-glucuronidase (GUS) that possesses a processable intron (GUS-2, SEQ ID

NO: 1091) operably linked to the test 3' UTR; a second transgene selection cassette used for selection of transformed plant cells that confers resistance to the herbicide glyphosate (driven by the rice Actin 1 promoter), and a left border region from *A. tumefaciens*. Table 24 below shows the test constructs and the corresponding promoter and 3' UTR.

5 **Table 24. Transcriptional termination or 3' UTR test constructs in which GUS is driven either by a constitutive promoter or an enhanced root promoter.**

Corn plants are transformed using *Agrobacterium*-mediated methods known in the art and as described in the previous examples. Transformed corn plants are assayed for GUS activity as described in the previous examples. Tables 25 and 26 show the average level of GUS expression observed in various tissues isolated from the transformed plants in which the constitutive promoter, ((P-FMV.35S-enh-1:1:1 (SEQ ID NO: 1115) + L-Ta.Lhcb1-1:1:1 (SEQ ID NO: 1114)), drove expression of the GUS transgene. Tables 27 and 28 show the average level of GUS expression observed in tissues isolated from the transformed plants in which the enhanced root promoter, ((E-CaMV.35S-enh-1:1:1 (SEQ ID NO: 1116) + P-Os.Rcc3-1:1:24 (SEQ ID NO: 1093) + L-Os.Rcc3-1:1:2 (SEQ ID NO: 1094)), drove

expression of the GUS transgene. Enhancement of expression imparted by the 3' UTR is inferred by the relative comparison amongst the constructs transformed comprising each UTR and specific promoter.

Table 25. Average R_0 GUS expression of a constitutive promoter driving GUS with different 3' UTRs.

The average expression of the GUS gene was effected by different 3' UTRs. GUS expression driven by the constitutive promoter appeared to be affected by the use of different 3' UTRs, particularly with respect to leaf expression. An enhancement of leaf expression at V3 and V7 stage could be seen when the 3' UTR, T-SETit.Cpt-1:1:2 (SEQ ID NO: 271) was used in combination with the constitutive promoter. Enhancement was provided for all 3 leaf stages when combining the constitutive promoter with the 3' UTRs, T-SETit.Mes2-1:1:1 (SEQ ID NO: 274), T-SETit.Act1-1:1:1 (SEQ ID NO: 268) and T-SETit.Ams1-1:1:1 (SEQ ID NO: 270). Enhancement of expression in the root using the constitutive promoter was observed through out all 3 stages using the 3' UTR, T-SETit.Ams1-1:1:1 (SEQ ID NO: 270) and at VT stage using the 3' UTRs, T-SETit.Mes2-1:1:1 (SEQ ID NO: 274), T-SETit.Act8-1:1:1 (SEQ ID NO: 269) and T-SETit.Act1-1:1:1 (SEQ ID NO: 268).

Table 26. Average R₀ GUS expression of a constitutive promoter driving GUS with different 3' UTRs.

Enhancement of GUS expression in the anther and pollen when using a constitutive promoter could be observed for the 3' UTRs, T-SETit.Fnr-1:1:1 (SEQ ID NO: 273), T-SETit.Mes2-1:1:1 (SEQ ID NO: 274), T-SETit.Act8-1:1:1 (SEQ ID NO: 269), T-SETit.Act1-1:1:1 (SEQ ID NO: 268) and T-SETit.Ams1-1:1:1 (SEQ ID NO: 270). Enhancement of GUS expression in the endosperm when using a constitutive promoter could be observed for the 3' UTR, T-SETit.Sus2-1:1:1 (SEQ ID NO: 276). Enhancement of GUS expression in the embryo when using a constitutive promoter could be observed in most of the 3' UTRs relative to the lowest expressor, T-SETit.Ntr-1:1:1 (SEQ ID NO: 275). The greatest amount of enhancement in embryo was observed using the 3' UTRs, T-SETit.Mes2-1:1:1 (SEQ ID NO: 274) and T-SETit.Act1-1:1:1 (SEQ ID NO: 268).

Readthrough was assessed using PCR methods known in the art. Those 3' UTRs demonstrating some readthrough in assay were T-SETit.Ntr-1:1:1 (SEQ ID NO: 275), T-SETit.Sus2-1:1:1 (SEQ ID NO: 276), T-SETit.Cpt-1:1:2 (SEQ ID NO: 271), T-SETit.Mes2-1:1:1 (SEQ ID NO: 274) and T-SETit.Act1-1:1:1 (SEQ ID NO: 268). Those 3' UTRs in which readthrough was not observed were T-SETit.Fnr-1:1:1 (SEQ ID NO: 273), T-

SETit.Fba-1:1:1 (SEQ ID NO: 272), T-SETit.Act8-1:1:1 (SEQ ID NO: 269) and T-SETit.Ams1-1:1:1 (SEQ ID NO: 270).

5 Using an enhanced root promoter, enhancement in root at V3 and V7 stage was observed using the 3' UTR, T-SETit.Sus2-1:1:1 (SEQ ID NO: 276). Slight enhancement of root expression could also be observed when using the 3' UTRs, T-SETit.Cpt-1:1:2 (SEQ ID NO: 271) (V3 and V7 stage), T-SETit.Fnr-1:1:1 (SEQ ID NO: 273) (V3 stage) and T-SETit.Fba-1:1:1 (SEQ ID NO: 272) (V3 stage). An enhancement of leaf expression was
10 observed when using the enhanced root promoter in combination with T-SETit.Fnr-1:1:1 (SEQ ID NO: 273).

Table 28. Average R₀ GUS expression of an enhanced root promoter driving GUS with different 3' UTRs.

Construct	3' UTR Annotation	VT Anther	VT Silk	21 DAP Embryo	21 DAP Endosperm

Enhancement of expression in the embryo was observed for the 3' UTR, T-SETit.Sus2-1:1:1 (SEQ ID NO: 276) when combined with the enhanced root promoter. The 3' UTR elements presented above each had an effect on expression of GUS when combined in operable linkage with either a constitutive promoter or an enhanced root promoter.

5 **Example 18. Identification and Assay of Chloroplast Transit Peptides (CTPs).**

It is well known that the cells of eukaryotic organisms, and more particularly plant cells, contain distinct sub-cellular compartments, or organelles, delimited by characteristic membrane systems and performing specialized functions within the cell. In photosynthetic leaf cells of higher plants the most conspicuous organelles are the chloroplasts, which exist in
10 a semi-autonomous fashion within the cell, containing their own genetic system and protein synthesis machinery, but relying upon a close cooperation with the nucleo-cytoplasmic system in their development and biosynthetic activities.

Most chloroplast proteins are coded for in the nuclear DNA and are the products of protein synthesis on cytoplasmic ribosomes, many as soluble higher molecular weight
15 precursors. These precursors are then translocated through either one or both of the plastid envelope membranes, processed, and assembled into their final organellar compartment or holoenzyme complex. *In vitro* reconstitution experiments using isolated chloroplasts, have demonstrated that the uptake and processing of over one hundred nuclear-encoded, cytoplasmically synthesized precursors by chloroplasts occurs by an energy-dependent, post-
20 translational mechanism.

The most extensively characterized of these nuclear-encoded chloroplast proteins is the small subunit of ribulose-1,5-bisphosphate (RuBP) carboxylase. This polypeptide is synthesized on free cytoplasmic ribosomes as a precursor of 20,000 daltons containing an amino terminal extension or transit peptide of approximately 5-6,000 daltons. During or
25 immediately after import of the precursor into the chloroplast, the transit peptide is proteolytically removed in two steps by a soluble protease, yielding a mature small subunit polypeptide of 15,000 daltons. This polypeptide is then assembled with an endogenous large subunit into the functional RuBP carboxylase holoenzyme.

These different properties of the transit peptides are at the basis of the recombinant
30 DNAs, more particularly recombinant vectors including a DNA sequence coding for a determined protein or polypeptide, particularly a foreign protein, sought to be introduced and processed in chloroplasts, as well as the processes for the introduction of such foreign

polypeptide or protein into the chloroplasts, for instance in the thylacoid membranes or, preferably, in the stroma thereof.

Chloroplast transit peptides (CTPs) are isolated from *S. italica* based upon an analysis of EST cluster sequences and homology to known plastid targeted molecules. Clusters of
5 EST sequences are used to deduce the coding sequence of chloroplast targeted protein molecules. A fragment derived from the 5' end of the coding sequence of the deduced chloroplast targeted molecule is cloned using methods known in the art to produce a chimeric molecule in which a coding sequence encoding a non-chloroplast targeted molecule is fused in frame at the 5' end with a DNA fragment encoding the putative transit peptide sequence
10 and cloned into a plant expression vector to determine the ability and efficiency of the putative CTP to cause importation of the chimeric molecule into the chloroplast and subsequent processing of the transit peptide sequence into the mature, processed protein.

Translated *S. italica* EST sequence clusters are compared with DNA sequences encoding known plastid targeted molecules from monocots such as corn, sorghum and rice to
15 determine the completeness of the cluster coding sequence and deduce the potential N-terminal amino acid sequence that will be useful as a transit peptide coding sequence. In some instances, the 5' most portion of the *S. italica* EST cluster is absent. In those conditions, a degenerative oligo is designed based upon an alignment of sorghum and rice coding sequences, encoding homologs to the *S. italica* protein coding sequence to facilitate
20 amplification of the unknown 5' sequence.

Sequences encoding plastid targeted proteins useful in isolating and cloning *S. italica* CTPs are presented as SEQ ID NOS: 1034 through 1060. Protein sequences representing plastid targeted peptides useful in identification of *S. italica* CTPs are presented as 1061 through 1087. Nucleotide sequences encoding transit peptides shown in Table 29 below are
25 presented as SEQ ID NOS: 277 through 284, 289 through 293, 296, 301 through 304 and 307 through 316. Protein sequences of the encoded transit peptides are presented as SEQ ID NOS: 324 through 350.

Constructs for use in cloning the transit peptides and sequences encoding the transit peptide as well as the transit peptide sequence IDs are presented in Table 29 below.

Table 29. Plasmid constructs for use in cloning chloroplast transit peptides and associated protein and nucleotide coding sequences.

The transit peptide encoding sequences presented as SEQ ID NOS: 325, 326, 332, 334, 335 and 340 are derived and cloned from DNA sequences comprising a processable intron. The plasmids construct pMON136303 is comprised of the transit peptide encoding sequence, GOI-TS-APX, presented as SEQ ID NO: 277, which is further comprised of the element, TS-SETit.APX.ex1-1:1:1 (SEQ ID NO: 286), operably linked 5' to the intron element, I-SETit.APX-1:1:1 (SEQ ID NO: 318), operably linked 5' to the element, TS-SETit.APX.ex2-1:1:2 (SEQ ID NO: 287). The plasmids construct pMON139282 is comprised of the transit peptide encoding sequence, GOI-TS-APX:1:2, presented as SEQ ID NO: 278, which is further comprised of the element, TS-SETit.APX.ex1-1:1:1 (SEQ ID NO: 286), operably linked 5' to the intron element, I-SETit.APX-1:1:2 (SEQ ID NO: 319), operably linked 5' to the element, TS-SETit.APX.ex2-1:1:2 (SEQ ID NO: 287). The plasmids construct pMON139283 is comprised of the transit peptide encoding sequence, GOI-TS-APX2:1:1, presented as SEQ ID NO: 279, which is further comprised of the element, TS-SETit.APX.2.ex1-1:1:1 (SEQ ID NO: 285), operably linked 5' to the intron element, I-SETit.APX.2-1:1:1 (SEQ ID NO: 317), operably linked 5' to the element, TS-SETit.APX2.ex2-1:1:1 (SEQ ID NO: 288). The plasmids construct pMON139281 is comprised of the transit peptide encoding sequence, GOI-TS-CNT:1:2, presented as SEQ ID NO: 280, which is further comprised of the element, TS-SETit.CNT-1:1:1 (SEQ ID NO: 318), operably linked 5' to the element, TS-SETit.CNT.ex1-1:1:1 (SEQ ID NO: 289), operably linked 5' to the element, TS-SETit.CNT.ex2-1:1:1 (SEQ ID NO: 290).

NO: 280, which is further comprised of the element, TS-SETit.CNT.ex1-1:1:1 (SEQ ID NO: 294), operably linked 5' to the intron element, I-SETit.CNT.1-1:1:1 (SEQ ID NO: 320), operably linked 5' to the element, TS-SETit.CNT.ex2-1:1:2 (SEQ ID NO: 295). The plasmids construct pMON139291 is comprised of the transit peptide encoding sequence,
5 GOI-TS-DHDPS:1:2, presented as SEQ ID NO: 281, which is further comprised of the element, TS-SETit.DHDPS.Ex1-1:1:1 (SEQ ID NO: 297), operably linked 5' to the intron element, I-SETit.DHDPS_1-1:1:1 (SEQ ID NO: 321), operably linked 5' to the element, TS-SETit.DHDPS.Ex2-1:1:1 (SEQ ID NO: 298). The plasmids construct pMON139288 is comprised of the transit peptide encoding sequence, GOI-TS-Fe-SD:1:1, presented as SEQ
10 ID NO: 282, which is further comprised of the element, TS-SETit.Fe-SD.ex1-1:1:1 (SEQ ID NO: 299), operably linked 5' to the intron element, I-SETit.Fe-SD-1:1:1 (SEQ ID NO: 322), operably linked 5' to the element, TS-SETit.Fe-SD.ex2-1:1:1 (SEQ ID NO: 300). The plasmids construct pMON139287 is comprised of the transit peptide encoding sequence,
15 GOI-TS-PPR:1:1, presented as SEQ ID NO: 283, which is further comprised of the element, TS-SETit.PPR.ex1-1:1:1 (SEQ ID NO: 305), operably linked 5' to the intron element, I-SETit.PPR-1:1:2 (SEQ ID NO: 323), operably linked 5' to the element, TS-SETit.PPR.ex2-1:1:2 (SEQ ID NO: 306).

Isolated coding sequences encoding *S. italica* CTPs are tested using plant vectors designed for use in either transient protoplast or stable transformation plant assays. DNA
20 fragments encoding the CTP are cloned in frame with a GUS coding sequence using methods known in the art. A plant transformation vector is constructed using methods known in the art and is comprised in a similar manner as the plant vectors described in the previous examples. The expression cassette used to test the CTP is comprised of a constitutive promoter such as the Cauliflower mosaic virus promoter, P-CaMV.35S-enh-1:1:9 (SEQ ID
25 NO: 1096), operably linked 5' to a leader element, L-Ta.Lhcb1-1:1:1 (SEQ ID NO: 1097), operably linked 5' to a coding sequence for GFP in which the test CTP is fused in frame at the 5' end of the GFP coding sequence to enable translation of a chimeric CTP-GFP molecule, operably linked to the Nopaline synthase 3' termination region from *A. tumefaciens* (T-AGRtu.nos-1:1:13, SEQ ID NO: 1088). For stable plant transformation, a second
30 transgene selection cassette used for selection of transformed plant cells that confers resistance to the herbicide glyphosate (driven by the rice Actin 1 promoter) is cloned adjacent to the CTP test transgene cassette. The two transgene cassettes are flanked at the by a right border and left border region from *Agrobacterium tumefaciens* to allow for stable integration of both transgene cassettes in the plant cell genome.

For transient assay testing of the CTP, protoplast cells are transformed with the plant plasmid construct comprising the CTP test transgene cassette. Transformed protoplast cells are observed using microscopy and fluorescence to determine the relative amount of GFP protein present in the chloroplast and in the cytosol. An effective CTP will cause most GFP 5 fluorescence to appear in the chloroplast stroma or thylacoid, depending upon the type of CTP chosen. Protein is isolated and electrophoresed on polyacrylamide gels and stained using standard methods and compared with a non-plastid targeted GFP protein standard to determine if proper processing of the transit peptide has occurred.

For stable plant transformation, corn plants are transformed as described above by 10 using *Agrobacterium*-mediated transformation methods known in the art. Tissues are harvested from the developing transformants and viewed microscopically with fluorescence to determine the relative amounts of GFP protein in the chloroplast and cytosol. Protein is isolated and electrophoresed on polyacrylamide gels and stained using standard methods and compared with a non-plastid targeted GFP protein standard to determine if proper processing 15 of the transit peptide has occurred.

Having illustrated and described the principles of the present invention, it should be apparent to persons skilled in the art that the invention can be modified in arrangement and detail without departing from such principles. We claim all modifications that are within the spirit and scope of the claims. All publications and published patent documents cited herein 20 are hereby incorporated by reference to the same extent as if each individual publication or patent application is specifically and individually indicated to be incorporated by reference.

CLAIMS

Claim 1. A DNA molecule comprising a DNA sequence selected from the group consisting of:

- a) a sequence with at least 85 percent sequence identity to any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924;
- b) a sequence comprising any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924; and
- c) a fragment of any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924, wherein the fragment has gene-regulatory activity, or wherein the encoded peptide functions to localize an operably linked polypeptide within a cell;
wherein said sequence is operably linked to a heterologous transcribable polynucleotide molecule.

Claim 2. The DNA molecule of claim 1, wherein said sequence has at least 90 percent sequence identity to a DNA sequence of any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924.

Claim 3. The DNA molecule of claim 1, wherein said sequence has at least 95 percent sequence identity to a DNA sequence selected from the group consisting of SEQ ID NOS: 1-323 and SEQ ID NOS: 352-924.

Claim 4. The DNA molecule of claim 1, wherein the DNA sequence comprises a regulatory element.

Claim 5. The DNA molecule of claim 1, wherein the heterologous transcribable polynucleotide molecule comprises a gene of agronomic interest.

Claim 6. The DNA molecule of claim 1, wherein the heterologous transcribable polynucleotide molecule comprises a gene capable of providing herbicide resistance in plants.

Claim 7. The DNA molecule of claim 1, wherein the transcribable polynucleotide molecule comprises a gene capable of providing plant pest control in plants.

Claim 8. A transgenic plant cell comprising a DNA construct comprising a sequence selected from the group consisting selected from the group consisting of:

- a) a sequence with at least 85 percent sequence identity to any of SEQ ID NOS: 1-323 or SEQ ID NOS: 352-924;

- b) a sequence comprising any of SEQ ID NOs: 1-323 or SEQ ID NOs: 352-924; and
- c) a fragment of any of SEQ ID NOs: 1-323 or SEQ ID NOs: 352-924, wherein the fragment has gene-regulatory activity, or wherein the encoded peptide functions to localize an operably linked polypeptide within a cell;
wherein said sequence is operably linked to a heterologous transcribable polynucleotide molecule.

Claim 9. The transgenic plant cell of claim 8, wherein said transgenic plant cell is a monocotyledonous plant cell.

Claim 10. The transgenic plant cell of claim 8, wherein said transgenic plant cell is a dicotyledonous plant cell.

Claim 11. A transgenic plant, or part thereof, comprising the DNA molecule of claim 1.

Claim 12. A progeny plant of the transgenic plant of claim 11, or a part thereof, wherein the progeny plant or part thereof comprises said DNA molecule.

Claim 13. A transgenic seed, wherein the seed comprises the DNA molecule of claim 1.

Claim 14. A DNA molecule comprising a DNA sequence encoding a chloroplast transit peptide, wherein the protein sequence of the encoded transit peptide is selected from the group consisting of:

- a) a transit peptide protein sequence of any of SEQ ID NOs: 324-350; and
- b) a transit peptide protein sequence with at least 95 percent sequence identity to any of SEQ ID NOs: 324-350;

wherein the chloroplast transit peptide-encoding DNA molecule is operably linked to a heterologous transcribable polynucleotide molecule.

Claim 15. The DNA molecule of claim 14 comprising a DNA sequence encoding a chloroplast transit peptide, wherein the DNA sequence comprises the sequence of any of SEQ ID NOs: 277-284, 289-293, 296, 301-304 or 307-316.

Claim 16. A transgenic plant cell comprising the DNA molecule of claim 14.

Claim 17. The transgenic plant cell of claim 16, wherein said transgenic plant cell is a monocotyledonous plant cell.

Claim 18. The transgenic plant cell of claim 16, wherein said transgenic plant cell is a dicotyledonous plant cell.

Claim 19. A transgenic plant, or part thereof, comprising the DNA molecule of claim 14.

Claim 20. A progeny plant, or part thereof, of the transgenic plant of claim 19, wherein the progeny plant or part thereof comprises said DNA molecule.

Claim 21. A transgenic seed comprising the DNA molecule of claim 14.

INTERNATIONAL SEARCH REPORT

International application No
PCT/US2011/021269

A. CLASSIFICATION OF SUBJECT MATTER
 INV. C12N15/82 C12N9/10
 ADD.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
C12N

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, BIOSIS, MEDLINE, WPI Data, EMBL

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	WO 2009/073844 A1 (MONSANTO TECHNOLOGY LLC [US]; FLASINSKI STANISLAW [US]; GUO SHIRLEY XI) 11 June 2009 (2009-06-11) the whole document -----	1-13
X	WO 2006/084868 A2 (BASF PLANT SCIENCE GMBH [DE]; SONG HEE-SOOK [US]; MORRA MARC [US]; DAM) 17 August 2006 (2006-08-17) examples 1-7 -----	1-13
X	WO 99/09188 A2 (VLAAMS INTERUNIV INST BIOTECH [BE]; CHEN CUIYING [BE]; MEYERMANS HUGO) 25 February 1999 (1999-02-25) the whole document ----- -/-	1-13

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family

Date of the actual completion of the international search 21 March 2011	Date of mailing of the international search report 21/06/2011
Name and mailing address of the ISA/ European Patent Office, P.B. 5818 Patentlaan 2 NL - 2280 HV Rijswijk Tel. (+31-70) 340-2040, Fax: (+31-70) 340-3016	Authorized officer Bilang, Jürg

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US2011/021269

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of additional fees.

3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

see additional sheet

Remark on Protest

- The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 1-13(partially)

Gene regulatory elements derived from *S. italica* Cafeoyl CoA methyltransferase (SEQ ID NOS 1, 35, 116, 373-376, 544-546)

2-125. claims: 1-13(partially)

As invention 1, but elements derived from one of glutathione-S-transferase (invention 2), isoflavone reductase (invention 3), peroxidase (invention 4) (according to table 1)

126. claims: 14-21(partially)

Chloroplast transit peptide derived from *S. italica* casein lytic proteinase B3 heat shock protein-like protein (SEQ ID NO: 324)

127-148. claims: 14-21(partially)

As invention 126, but transit peptide derived from one of ascorbate peroxidase (invention 127), anthranilate synthase alpha 2 subunit (invention 128) (according to table 1)
