GLUCOCORTICOID-SELECTIVE ANTIINFLAMMATORY AGENTS

Technical Field

The present invention relates to glucocorticoid receptor-selective benzopyrano[3,4-f]quinolines that are useful for treating immune or autoimmune diseases, to pharmaceutical compositions comprising these compounds, and to methods of inhibiting inflammation, inflammatory disease, immune, and autoimmune diseases in a mammal.

Background of the Invention

Intracellular receptors (IR’s) are a class of structurally related proteins involved in the regulation of gene expression. The steroid hormone receptors are a subset of this superfamily whose natural ligands are typically comprised of endogenous steroids such as estradiol, progesterone, and cortisol. Man-made ligands to these receptors play an important role in human health and, of these receptors, the glucocorticoid receptor (GR) has an essential role in regulating human physiology and immune response. Steroids which interact with GR have been shown to be potent anti-inflammatory agents. Despite this benefit, steroidal GR ligands are not selective. Side effects associated with chronic dosing are believed to be the result of cross-reactivity with other steroid receptors such as estrogen, progesterone, androgen, and mineralocorticoid receptors which have somewhat homologous ligand binding domains.

Selective GR modulators (e.g. repressors, agonists, partial agonists and antagonists) of the present disclosure can be used to influence the basic, life-sustaining systems of the body, including carbohydrate, protein and lipid metabolism, and the functions of the cardiovascular, kidney, central nervous, immune, skeletal muscle, and other organ and tissue systems. In this regard, prior art GR modulators have proven useful in the treatment of inflammation, tissue rejection, auto-immunity, various malignancies, such as leukemias and lymphomas, Cushing’s syndrome, acute adrenal insufficiency, congenital adrenal hyperplasia, rheumatic fever, polyarteritis nodosa, granulomatous polyarteritis, inhibition of myeloid cell lines, immune proliferation/apoptosis, HPA axis suppression and regulation, hypercortisolism, modulation of the Th1/Th2 cytokine balance, chronic kidney disease, stroke and spinal cord injury, hypercalcemia, hyperglycemia, acute adrenal insufficiency, chronic primary adrenal insufficiency, secondary adrenal insufficiency, congenital adrenal hyperplasia, cerebral edema, thrombocytopenia, and Little’s syndrome.

GR modulators are especially useful in disease states involving systemic inflammation such as inflammatory bowel disease, systemic lupus erythematosus, polyarthritis nodosa, Wegener’s granulomatosis, giant cell arteritis, rheumatoid arthritis, osteoarthritis, hay fever, allergic rhinitis, urticaria, angioneurotic edema, chronic obstructive pulmonary disease, asthma, tendonitis, bursitis.
Crohn's disease, ulcerative colitis, autoimmune chronic active hepatitis, organ transplantation, hepatitis, and cirrhosis. GR active compounds have also been used as immunostimulants and repressors, and as wound healing and tissue repair agents.

GR modulators have also found use in a variety of topical diseases such as inflammatory scalp alopecia, panniculitis, psoriasis, discoid lupus erythematosus, inflamed cysts, atopic dermatitis, pyoderma gangrenosum, pemphigus vulgaris, bullous pemphigoid, systemic lupus erythematosus, dermatomyositis, herpes gestationis, erosinophilic fasciitis, relapsing polychondritis, inflammatory vasculitis, sarcoidosis, Sweet's disease, type 1 reactive leprosy, capillary hemangiomas, contact dermatitis, atopic dermatitis, lichen planus, exfoliative dermatitis, erythema nodosum, acne, hirsutism, toxic epidermal necrolysis, erythema multiform, cutaneous T-cell lymphoma.

Selective antagonists of the glucocorticoid receptor have been unsuccessfully pursued for decades. These agents would potentially find application in several disease states associated with Human Immunodeficiency Virus (HIV), cell apoptosis, and cancer including, but not limited to, Kaposi's sarcoma, immune system activation and modulation, desensitization of inflammatory responses, IL-1 expression, anti-retroviral therapy, natural killer cell development, lymphocytic leukemia, and treatment of retinitis pigmentosa. Cognitive and behavioral processes are also susceptible to glucocorticoid therapy where antagonists would potentially be useful in the treatment of processes such as cognitive performance, memory and learning enhancement, depression, addiction, mood disorders, chronic fatigue syndrome, schizophrenia, stroke, sleep disorders, and anxiety.

**Summary of The Invention**

In one embodiment of the present invention are compounds represented by

**Formula I**

Detailed Description of The Invention
Definition of Terms

The term "alkanoyl" refers to an alkyl group attached to the parent molecular group through a carbonyl group.
The term "alkanoyloxy" refers to an alkanoyl group attached to the parent molecular group through an oxygen atom.

The term "alkenyl" refers to a monovalent straight or branched chain group of two to twelve carbons derived from a hydrocarbon having at least one carbon-carbon double bond.

The term "alkoxy" refers to an alkyl group attached to the parent molecular group through an oxygen atom.

The term "alkoxycarbonyl" refers to an ester group, i.e. an alkoxy group attached to the parent molecular moiety through a carbonyl group.

The term "alkyl" refers to a monovalent straight or branched chain group of one to twelve carbons derived from a saturated hydrocarbon.

The term "alkylene" refers to a divalent straight or branched chain group of one to twelve carbons derived from an alkane.

The term "alkynyl" refers to a monovalent straight or branched chain hydrocarbon of two to twelve carbons with at least one carbon-carbon triple bond.

The term "alkynylene" refers to a divalent straight or branched chain group of two to twelve carbons derived from an alkyne.

The term "amino" refers to -NH₂.

The term "aryl" refers to a mono- or bicyclic carbocyclic ring system having one or two aromatic rings. The aryl group can also be fused to a cyclohexane, cyclohexene, cyclopentane or cyclopentene ring.

The term "carboxy" refers to -CO₂H.

The term "cycloalkenyl" refers to a monovalent group derived from a cyclic or bicyclic hydrocarbon of three to twelve carbons that has at least one carbon-carbon double bond.

The term "cycloalkyl" refers to a monovalent group three to twelve carbons derived from a saturated cyclic or bicyclic hydrocarbon.

The term "halo" refers to F, Cl, Br, or I.

The term "heterocycle" represents a represents a 4-, 5-, 6- or 7-membered ring containing one, two or three heteroatoms independently selected from the group consisting of nitrogen, oxygen and sulfur. The 4- and 5-membered rings have zero to two double bonds and the 6- and 7-membered rings have zero to three double bonds. The term "heterocycle" also includes bicyclic, tricyclic and tetracyclic groups in which any of the above heterocyclic rings is fused to one or two rings independently selected from an aryl ring, a cyclohexane ring, a cyclohexene ring, a cyclopentane ring, a cyclopentene ring or another monocyclic heterocyclic ring. Heterocycles include acridinyl, benzimidazolyl, benzofuryl, benzoazolyl, benzothiophenyl, benzoxazolyl, biotinyl, cinnolinyl, dihydrofuryl, dihydroindolyl, dihydroxypropyl, dihydrothienyl, dithiazolyl, furyl, homopiperidinyl,
imidazolindinyl, imidazolinyl, imidazolyl, indolyl, isoquinolyl, isothiazolidinyl, isothiazolyl, isoxazolidinyl, isoxazolyl, morpholinyl, oxadiazolyl, oxazolidinyl, oxazolyl, piperazinyl, piperidinyl, pyranyl, pyrazolidinyl, pyrazinyl, pyrazolyl, pyridazinyl, pyridyl, pyrimidinyl, pyrimidyl, pyrroldinyl, pyrrolinyl, pyrrolyl, quinolinyl, quinoxalyl, tetrahydrofuryl, tetrahydroisoquinolyl, tetrahydroquinolyl, tetrazolyl, thiadiazolyl, thiazolidinyl, thiazolyl, thienyl, thiomorpholinyl, triazolyl, and the like.

Heterocyclics also include bridged bicyclic groups where a monocyclic heterocyclic group is bridged by an alkylene group such as

Heterocyclics also include compounds of the formula

where X* is selected from -CH₂-, -CH₂O- and -O-, and Y* is selected from -C(O)- and -(C(R'₂)v -, where R' is hydrogen or alkyl of one to four carbons, and v is 1-3. These heterocycles include 1,3-benzodioxolyl, 1,4-benzodioxanylyl, and the like.

The term "heterocy cloalkyl" as used herein, refers to a non-aromatic, partially unsaturated or fully saturated 4- to 8-membered ring having from one or two heteroatoms independently selected from oxygen, sulfur and nitrogen, in which the nitrogen and sulfur heteroatoms can optionally be oxidized and the nitrogen heteroatom can optionally be quaternized.

The term "N-protected amino" refers to groups intended to protect an amino group against undesirerable reactions during synthetic procedures. Commonly used N-protecting groups are disclosed in Greene, "Protective Groups In Organic Synthesis," (John Wiley & Sons, New York (1981)). Preferred N-protecting groups are formyl, acetyl, benzoyl, pivaloyl, t-butyacetyl, phenylsulfonfyl, benzyl, t-butyloxycarbonyl (Boc), and benzylxycarbonyl (Cbz).

The term "O-protected carboxy" refers to a carboxylic acid protecting ester or amide group typically employed to block or protect the carboxylic acid functionality while the reactions involving other functional sites of the compound are performed. Carboxy protecting groups are disclosed in Greene, "Protective Groups in Organic Synthesis" (1981). Additionally, a carboxy protecting group can be used as a prodrug whereby the carboxy protecting group can be readily cleaved in vivo, for example by enzymatic hydrolysis, to release the biologically active parent. Such carboxy protecting groups are well known to those skilled in the art, having been extensively used in the protection of
carboxyl groups in the penicillin and cephalosporin fields as described in U.S. Pat. No. 3,840,556 and 3,719,667.

The term "oxo" refers to (=O).

The term "pharmaceutically acceptable prodrugs" represents those prodrugs of the compounds of the present invention which are, within the scope of sound medical judgement, suitable for use in contact with the tissues of humans and lower animals with undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use, as well as the zwitterionic forms, where possible, of the compounds of the invention.

The term "prodrug" represents compounds which are rapidly transformed in vivo to the parent compound of the above formula, for example, by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, Vol. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference.

The term "pharmaceutically acceptable salt" represents those salts which are, within the scope of sound medical judgement, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge, et al. describe pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences*, 1977, 66:1 - 19. The salts can be prepared *in situ* during the final isolation and purification of the compounds of the invention, or separately by reacting the free base function with a suitable organic acid. Representative acid addition salts include acetate, adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphersulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, fumarate, glucoheptonate, glycerophosphate, hemisulfate, heptonate, hexanoate, hydrobromide, hydrochloride, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, toluenesulfonate, undecanoate, valerate salts, and the like. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like, as well as nontoxic ammonium, quaternary ammonium, and amine cations, including, but not limited to ammonium, tetramethylammonium, tetraethylammonium, methylamine, dimethylamine, trimethylamine, triethylamine, ethylamine, and the like.
Compounds of the present invention can exist as stereoisomers where asymmetric or chiral centers are present. These compounds are designated by the symbols "R" or "S," depending on the configuration of substituents around the chiral carbon atom. The present invention contemplates various stereoisomers and mixtures thereof. Stereoisomers include enantiomers and diastereomers, and equal mixtures of enantiomers are designated (±).

Individual stereoisomers of compounds of the present invention can be prepared synthetically from commercially available starting materials which contain asymmetric or chiral centers or by preparation of racemic mixtures followed by resolution well-known to those of ordinary skill in the art. These methods of resolution are exemplified by (1) attachment of a mixture of enantiomers to a chiral auxiliary, separation of the resulting mixture of diastereomers by recrystallization or chromatography and liberation of the optically pure product from the auxiliary or (2) direct separation of the mixture of enantiomers on chiral chromatographic columns.

Geometric isomers can also exist in the compounds of the present invention. The present invention contemplates the various geometric isomers and mixtures thereof resulting from the arrangement of substituents around a carbon-carbon double bond or arrangement of substituents around a ring. Substituents around a carbon-carbon double bond are designated as being in the Z or E configuration where the term "Z" represents substituents on the same side of the carbon-carbon double bond and the term "E" represents substituents on opposite sides of the carbon-carbon double bond. The arrangement of substituents around a ring are designated as cis or trans where the term "cis" represents substituents on the same side of the plane of the ring and the term "trans" represents substituents on opposite sides of the plane of the ring. Mixtures of compounds where the substituents are disposed on both the same and opposite sides of plane of the ring are designated cis/trans.

Methods for Radioligand Binding Studies with Human Glucocorticoid and Progestosterone Receptor Cytosol

The procedure described in Anal. Biochem. 1970, 37, 244-252, hereby incorporated by reference, was used. Briefly, cytosol preparations of human glucocorticoid receptor-α [GRX] isoform and human progesterone receptor-A [PRA] isoform were obtained from Ligand Pharmaceuticals (San Diego, CA). Both receptor cDNAs were cloned into baculovirus expression vectors and expressed in insect SF21 cells. [3H]-dexamethasone (Dex, specific activity 82-86 Ci/mmol) and [3H]-progesterone (Prog, specific activity 97-102 Ci/mmol) were purchased from Amersham Life Sciences (Arlington Heights, IL).

Glass fiber type C multiscreen MAFC NOB plates were from Millipore (Burlington, MA). Hydroxyapatite Bio-Gel HTP gel was from Bio-Rad Laboratories (Hercules, CA). Tris(hydroxymethyl)aminomethane (Tris), ethylenediaminetetraacetic acid (EDTA),
glycerol, dithiothreitol (DTT) and sodium molybdate were obtained from Sigma Chemicals (St. Louis, MO). Microscint-20 scintillation fluid was from Packard Instrument (Meriden, CT).

Stock solutions (32 mM) of compounds were prepared in dimethylsulfoxide (DMSO), and 50X solutions of test compounds were prepared from the 32 mM solution with a 50:50 mixture of DMSO/ethanol. The 50X solution was then diluted with binding buffer that contained 10 mM Tris-HCl, 1.5 mM EDTA, 10% glycerol, 1 mM DTT, 20 mM sodium molybdate, pH 7.5 @ 4°C. 1% DMSO/ethanol was present in the binding assay.

GRX and PRA binding reactions were performed in Millipore Multiscreen plates. For GR binding assays, [³H]-Dex (~35,000 dpm (~0.9 nM)), GRX cytosol (~35 µg protein), test compounds and binding buffer were mixed in a total volume of 200 µL and incubated at 4 °C overnight in a plate shaker. Specific binding was defined as the difference between binding of [³H]Dex in the absence and in the presence of 1µM unlabelled Dex.

For PR binding assays, [³H]Prog (~36,000 dpm (~0.8 nM)), PRA cytosol (~40 µg protein), test compounds and binding buffer were mixed in a total volume of 200 µL and incubated at 4 °C at overnight in a plate shaker. Specific binding was defined as the difference between binding of [³H]Prog in the absence and in the presence of 3 µM unlabelled Prog.

After an overnight incubation, 50 µL of hydroxyapatite (25 % weight/volume) slurry were added to each well and plates were incubated for 10 min at 4°C in a plate shaker. Plates were suctioned with a Millipore vacuum manifold and each well was rinsed with 300 µL of ice-cold binding buffer. A 250 µL aliquot of Packard Microscint-20 was added to each well and the wells were shaken at room temperature for 20 minutes. The amount of radioactivity was determined with a Packard TopCount plate reader.

**Determination of Inhibition Constant (Ki)**

The concentration of test compounds that inhibited 50% of specific binding (IC₅₀) was determined from a Hill analysis of the competitive binding experiments. The Ki of test compounds was determined using the Cheng-Prusoff equation

\[
Ki = IC_{50}/(1+L^*/K_L)
\]

where L* is the concentration of radioligand and K_L is the dissociation constant of the radioligand determined from saturation analysis. For GRX, K_L was ~1.5 nM, and for PRA, K_L was ~4.5 nM. The inhibitory potencies of compounds of this invention and their selectivity for GR and PR receptors are shown in Table 1.

The present invention also provides pharmaceutical compositions which comprise compounds of the present invention formulated together with one or more non-toxic pharmaceutically acceptable carriers. The pharmaceutical compositions may be specially formulated for oral administration in solid or liquid form, for parenteral injection, or for rectal administration.

The pharmaceutical compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), buccally, or as an oral or nasal spray. The term "parenteral" administration refers to modes of administration which include intravenous, intramuscular, intraperitoneal, intratrernal, subcutaneous and intraarticular injection and infusion.

Pharmaceutical compositions of this invention for parenteral injection comprise pharmaceutically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions as well as sterile powders for reconstitution into sterile injectable solutions or dispersions just prior to use. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (such as glycerol, propylene glycol, polyethylene glycol, and the like), and suitable mixtures thereof, vegetable oils (such as olive oil), and injectable organic esters such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of coating materials such as lecithin, by the maintenance of the required particle size in the case of dispersions, and by the use of surfactants. Conversely, reduced particle size may maintain biological activity.

These compositions may also contain adjuvants such as preservative, wetting agents, emulsifying agents, and dispersing agents. Prevention of the action of microorganisms may be ensured by the inclusion of various antibacterial and antifungal agents, for example, paraben, chlorobutanol, phenol sorbic acid, and the like. It may also be desirable to include isotonic agents such as sugars, sodium chloride, and the like. Prolonged absorption of the injectable pharmaceutical form may be brought about by the inclusion of agents which delay absorption such as aluminum monostearate and gelatin.

In some cases, in order to prolong the effect of the drug, it is desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be
accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

Injectable depot forms are made by forming microencapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium just prior to use.

Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginites, gelatin, polyvinylpyrrolidone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example, cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a
certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

The active compounds can also be in micro-encapsulated form, if appropriate, with one or more of the above-mentioned excipients.

Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethyl formamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof.

Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

Suspensions, in addition to the active compounds, may contain suspending agents as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metaphosphate, bentonite, agar-agar, and tragacanth, and mixtures thereof.

Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at room temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

Compounds of the present invention can also be administered in the form of liposomes. As is known in the art, liposomes are generally derived from phospholipids or other lipid substances. Liposomes are formed by mono- or multi-lamellar hydrated liquid crystals that are dispersed in an aqueous medium. Any non-toxic, physiologically acceptable and metabolizable lipid capable of forming liposomes can be used. The present compositions in liposome form can contain, in addition to a compound of the present invention, stabilizers, preservatives, excipients, and the like. The preferred lipids are the phospholipids and the phosphatidyl cholines (lecithins), both natural and synthetic.

Dosage forms for topical administration of a compound of this invention include powders, sprays, ointments and inhalants. The active compound is mixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives, buffers, or propellants which may be required. Ophthalmic formulations, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention may be varied so as to obtain an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular patient, compositions, and mode of administration. The selected dosage level will depend upon the activity of the particular compound, the route of administration, the severity of the condition being treated, and the condition and prior medical history of the patient being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required for to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

Generally dosage levels of about 1 to about 50, more preferably of about 5 to about 20 mg of active compound per kilogram of body weight per day are administered orally to a mammalian patient. If desired, the effective daily dose may be divided into multiple doses for purposes of administration, e.g. two to four separate doses per day.

Abbreviations

Abbreviations that have been used in the descriptions of the scheme and the examples that follow are: BF$_3$·OEt$_2$ for boron trifluoride diethyl ether complex; DMF for N,N-dimethylformamide, DMSO for dimethylsulfoxide; and THF for tetrahydrofuran.

Synthetic Methods

The compounds and processes of the present invention will be better understood in connection with the following synthetic schemes which illustrate the methods by which the compounds of the invention can be prepared.

Syntheses of the compounds of the present invention are described in Schemes 1-21.
As exemplified in Scheme 1, resorcinol dimethyl ether was metallated with a strong base such as n- or sec-butyllithium, treated with a trialkoxyborate such as trimethyl- or triisopropylborate and hydrolyzed with acid such as 2M HCl to provide boronic-acid 1A. Treatment of 1A with methyl 5-nitro-2-bromobenzoate in the presence of a palladium catalyst such as tetrakis(triphenylphosphine)palladium(0) or dichlorobis(triphenylphosphine)palladium (II) provided biphenyl 1B. Demethylation of 1B was accomplished with reagents such as BBr₃, to provide hydroxylactone 1C, which was treated with alkylating agents such as methyl iodide to provide 1D. Conversion of 1D to amine 1E was accomplished using hydrogen gas and a palladium catalyst such as 10% palladium on carbon. 1E was converted to quinoline 1F by a Skraup ring annulation reaction. Introduction of functionalization at the C-5 position of 1F to provide 1 was achieved through addition of organometallic reagents such as phenyllithium to the C-5 carbonyl to provide 1G, followed by deoxygenation with Lewis acids such as BF₃·OEt₃ and reducing agents such as triethylsilane to provide 1.
A more preferred route to compounds of this invention is exemplified in Scheme 2. 1F was converted to methyl acetal 2B, via hemiacetal 2A, using a two-step procedure comprising conversion of 1F to 2A with reagents such as diisobutylaluminum hydride in an aprotic solvent such as dichloromethane followed by acid-catalyzed acetal formation with acids such as p-toluenesulfonic acid monohydrate and alcohols such as methanol to provide 2B. 2B was treated with nucleophiles such as allytrimethylsilane in the presence of a Lewis acid such as boron trifluoride diethyl etherate to form C-5 allyl analogs such as Example 2. The Lewis acid/methyl acetal complex was also condensed with organomagnesium chlorides, bromides or iodides to provide compounds of this invention such as Example 11.
As exemplified in Scheme 3, the C-10 position of 1C was subjected the same reduction/Skraup conditions described in Scheme 1 to afford hydroxyquinoline 3B. 3B was converted to triflate derivative 3C with reagents such as trifluoromethanesulfonic anhydride then derivatized at the C-5 position as described in schemes 1 and 2 to provide analogs such as 3D. The functionalized C-10 triflates were used in coupling reactions mediated by palladium catalysts for aminations, carbonylations, Stille couplings and modified Sonagashira reactions and provided aminomethyl, carbomethoxy, vinyl and acetylenic derivatives of 3D such as the C-5 allyl-substituted examples 3, 4, 5, and 6, respectively.
As shown in Scheme 4, treatment of 3B with tert-butyl dimethylsilyl (TBS) ether and a base such as imidazole, triethylamine or diisopropylethylamine and functionalization of the C-5 position as described in schemes 1-3 provided silane 7B. Removal of the silane group with reagents such as tetra n-butylammonium fluoride in THF, to provide phenol 7, and treatment with R-X or RC(O)X, where R is an alkyl group and X is a leaving group such as halogen, provided alkoxy and carboxy compounds such as examples 9 and 10. Halo alkoxy analogs were prepared from 3B by nucleophilic displacement using a polyhalogenated alkylating agent such as CF₂HCl to provide 8A followed by functionalization at the C-5 position of 8A, as described in Schemes 1-3, to provide 8.
As exemplified in Scheme 5, 1F was treated with lithiated, O-protected phenol reagents, such as 3-(methoxymethoxy)phenyllithium, to provide 12A. The protecting group was cleaved in acidic media, such as methanolic or aqueous HCl, to provide diol 12B which was converted to phenyl acetates 12C with reagents such as acetyl chloride and base such as pyridine, triethylamine or diisopropylethylamine. The tertiary alcohol was then reduced as described in Scheme 1, and the acetate group of Example 12 was removed to provide Example 13. Example 13 was alkylated or acylated as described in Scheme 4 to provide examples 14 and 15.
As shown in Scheme 6, functionality in the meta position of the phenyl ring in the C-5 position was introduced using meta-halophenyl analogs such as Example 11, prepared as described in Scheme 2. Stille or Suzuki couplings or aminations with palladium catalysts such as [1,1-bis(diphenylphosphino)ferrocene]dichloropalladium(II) or tetrakis(triphenylphosphine)palladium(0) in the presence of ligands such as tributylstannylfuran or morpholine provided carbon- or nitrogen-bound groups in the meta position of the aromatic ring at the C-5 position as exemplified in examples 16 and 17, respectively.
As shown in Scheme 7, 1F was treated with magnesium halides, preferably bromides, to provide an intermediate hemiketal which was treated with acid catalysts such as para-toluenesulfonic acid, methanesulfonic acid or aqueous hydrochloric acid to provide optionally substituted analogs such as 18 as mixtures of E and Z isomers.

The chemistry shown in Scheme 1 was found to be general. Thus, a variety of tetracyclic cores could be prepared from an assortment of substituted anisoles via their corresponding boronic acids according to Scheme 8.

Scheme 8 shows the applicability of the chemistry described in Scheme 1 and Examples 1-131 to the synthesis of new cores with substituents other than alkoxy at the C-10 position. Ortho metallation of substituted anisoles with a strong base such as n- or sec-butyllithium, followed by sequential treatment with a trialkoxyborate such as trimethyl- or triisopropylborate and hydrolysis with acid, as described in Scheme 1, provided the appropriately substituted boronic acids which were then elaborated to compounds of Formula I using chemistry described above. Further elaboration of the ring to provide Cores 1-17 is described below.
Examples of novel tetracyclic cores prepared using the chemistry described in Scheme 8 are shown below.

Core 7

Core 8

Further derivatization of Core 1 using methods well-known in the art provide additional tetracyclic coumarins for subsequent elaboration at the C-5 position, as shown in Scheme 9. For example, selective alkylation of the C-10 hydroxyl of Core 1 with alkylation agents (e.g., methyl iodide) and base, such as potassium carbonate, provided Core 7. Selective derivitization of Core 1 at the C-7 position with halogenating agents such as bromine or N-bromosuccinimide provided the compound of Formula I precursor Core 8.
Scheme 10 shows additional selective bromination chemistry. Regiochemical bromination of Example 1F, as directed by the C-10 methoxy group and choice of brominating agent, provided Cores 9, 10, and 11. These brominated rings were further derivatized at the brominated position(s) by transition metal-catalyzed introduction of a variety of functional groups.

As shown in Scheme 11, cores bearing phenolic hydroxyl functionality were either dehydroxylated (as shown for Core 2), acetylated, or alkylated by transformations well-known in the art. See Larock, "Comprehensive Organic Transformations. A Guide to

$X_1=\text{CON(CH}_3\text{)}_2$ (Example 182)

$X_1=\text{CH}_2\text{OCH}_3$ (Example 183)

As shown in Scheme 15, elaboration of the C-5 nitrile of Example 44 to the $\alpha,\beta$-unsaturated ester Example 179 followed by selective reduction of the alkoxy carbonyl group to the alkeny alcohol ($X_1$ is H) provided precursors for carbamates and methoxymethyl ethers Examples 182 and 183, respectively.
As shown in Scheme 16, conversion of ester Example 46 to its Weinreb amide derivative Example 185 and subsequent reduction to aldehyde Example 186 provided precursors for alkene Examples 187, 194, 195, and 200 by treatment of the aldehydes with a number of commercially available Wittig of Horner-Wadsworth-Emmons reagents.
As shown in Scheme 17, Example 1F was converted to a ring-opened aldehyde using a two-step sequence involving treatment with a reducing agent such as diisobutylaluminum hydride in an aprotic solvent such as dichloromethane followed by treatment with a silylating reagent such as tert-butyldimethylsilyl chloride in the presence of a base such as potassium tert-butoxide. Addition of organolithium reagents such as lithiopyridines to the aldehyde produced benzylc alcohols (R=pyridyl) which could then be converted to analogs such as Examples 213-215 using a two-step sequence comprising removal of the silicon group with reagents such as tetrabutlammonium fluoride and subsequent cyclization using reagent combinations such as triethylphosphine and 1,1'-(azodicarbonyl)dipiperidine.
As shown in Scheme 18, Example 7 was converted to the triflate derivative with reagents such as trifluoromethanesulfonic anhydride, then derivatized at the C-10 position using the methods described in Scheme 3. Reduction of Example 335 with reagents such as diisobutylaluminum hydride provided Example 336. Treatment of Example 336 with oxidizing reagents such as tetrapropylammonium perruthenate afforded Example 337. Alkylation of Example 336 could be accomplished with reagents such as iodomethane in the presence of a base such as potassium bis(trimethylsilyl)amide to provide analogs such as Example 338.
As shown in Scheme 19, triflate 3C was also converted to a C-10 vinyl derivative Example 339 and subsequently to its methyl acetal using the methods described in Schemes 3 and 2, respectively. The acetal was treated with nucleophiles such as 3-(trimethylsilyl)cyclohexene or 3-(dimethylphenylsilyl)-3-methylcyclohexene in the presence of a Lewis acid such as boron trifluoride etherate to provide analogs such as Examples 340 and 341, respectively.
Introduction of sulfur at C-10 position of Example 3B is shown in Scheme 20. Example 3B was treated with reagents such as dimethylcarbamoyl chloride to give a thionocarbamate which underwent thermal rearrangement to provide the sulfur-carbon bond at C-10. The allyl group at C-5 was introduced as described in Scheme 2. Hydrolysis with a strong base such as potassium hydroxide and alkylation of sulfur with electrophiles such as iodomethane in the presence of a base such as cesium carbonate provided analogs bearing thioalkoxy functionality at C-10, such as Example 343.
A route to make Examples 320-323 is shown in Scheme 21. Example 2B was treated with nucleophiles such as tributylvinyltin in the presence of Lewis acids such as boron trifluoride diethyl etherate to provide Example 320 which was then coupled with aryl halides such as iodobenzene in the presence of catalysts such as palladium (II) acetate to provide trans isomer Example 321. The Lewis acid/methyl acetal complex was also condensed with tributylphenylacetylenyltin to provide Example 322 which was then partially hydrogenated in the presence of catalysts such as palladium on BaSO₄ to provide cis isomer Example 323.

It is understood from the preceding schemes and the following examples that the substituents R₁, R₂, R₃, R₄, R₅, R₆, R₁₆, R₁₇, R₁₈, R₁₈', Y, R₂, and L₂ can be determined by selection of the appropriate commercially available or known starting materials (e.g., substituted methoxybenzenes) or introduced synthetically by known chemical methods such as those disclosed in Larock, "Comprehensive Organic Transformations. A Guide to Functional Group Preparations," VCH Publishers, New York (1989), hereby incorporated by reference.

Also, it will be appreciated by one skilled in the art that selective protection and deprotection steps depending on the nature of R₁, R₂, R₃, R₄, R₅, R₆, R₁₆, R₁₆', R₁₇, R₁₈, R₁₈', Y, R₂, and L₂ can be carried out in varying order or number of steps to successfully complete the synthetic sequences. Commonly used protecting groups are disclosed in Greene, "Protective Groups In Organic Synthesis," John Wiley & Sons, New York (1981), hereby incorporated by reference.

2,5-dihydro-10-methoxy-2,2,4-trimethyl-5-phenyl-1H-[1]benzopyrano[3,4-flquinoline1H-
[1]benzopyrano[3,4-flquinoline

Example 1A

A solution of 1,3-dimethoxybenzene (33.2 g, 240 mmol) in hexanes (20 mL) at
−20 °C was treated sequentially with n-butyllithium (100 mL of a 2.4 M solution in hexanes,
240 mmol) and N,N,N',N'-tetramethylethylene diamine (1.81 mL, 12 mmol), stirred at 23
°C for 1.5 hours, cooled to −78 °C, treated with triisopropylborate (60.9 mL, 264 mmol) in
diethyl ether (60 mL) over 1.5 hours with additional diethyl ether (150 mL) added to
maintain stirring, stirred at 23 °C for 2 hours, poured into ice (150 mL) and 3M HCl (150
mL), and extracted with ethyl acetate. The extract was dried (Na2SO4), filtered, and
concentrated, during which a white solid precipitated from solution. The solid was collected
by filtration and washed with hexanes to provide the desired compound.

Example 1B

A mixture of Example 1A, methyl 5-nitro-2-bromobenzoate (25.8 g, 99.2 mmol),
(21.7 g, 119 mmol), cesium carbonate (97.1 g, 298 mmol), and dichlorobis-
(triphenylphosphine)palladium(II) (3.5 g, 5.0 mmol) in DMF (300 mL) was stirred for 24
hours at 80 °C, cooled to 23 °C, treated with water (600 mL), and extracted with ethyl
acetate (800 mL). The extract was dried (Na2SO4) and concentrated, during which a light
yellow solid precipitated from solution. The mixture was placed in a freezer (−20 °C) for 2
hours then filtered to provide the desired compound.

Example 1C

A solution of Example 1B (11.1 g, 35.1 mmol) in dichloromethane (60 mL) at −78
°C was treated with boron tribromide (25.0 g, 99.8 mmol), warmed to 23 °C for 1 hour,
recooled to −78 °C, and treated with methanol (100 mL). The mixture was warmed to 0 °C,
and the precipitate was collected by filtration and recrystallized from methanol to provide the
desired compound.

The extract was washed with brine, dried (MgSO₄), filtered, and concentrated. The residue was purified by flash chromatography on silica gel with a gradient from 10-25% ethyl acetate/hexanes to provide the desired lactol.

The lactol (0.043 g, 0.101 mmol) was dissolved in dichloromethane (7 mL), treated with triethylsilane (0.16 mL, 1.01 mmol), cooled to 0 °C, treated with BF₃·OEt₂ (0.12 mL, 1.01 mmol), warmed to room temperature, stirred for 19 hours, and treated with NaHCO₃, and extracted with ethyl acetate. The extract was washed with brine, dried (MgSO₄), and concentrated. The residue was purified by flash chromatography on silica gel with 5-10% ethyl acetate/hexanes to provide the desired compound.

A solution of Example 4 (32 mg, 0.085 mmol) in dichloromethane (3 mL) under argon, at -78°C, was treated dropwise with disobutylaluminum hydride (1.0 M) in cyclohexanes (0.400 mL, 0.40 mmol), warmed to 0°C for 3.5 hours, treated with Rochelle's salt, separated, and extracted with ethyl acetate. The extract was dried (MgSO4), filtered, and concentrated. The residue was applied to two 10 x 20 cm, 0.25 mm thick silica gel plates which were eluted three times with hexane, then ethyl acetate/hexanes (10:90). The product band was scraped off and extracted with ethyl acetate to provide the desired compound.

Example 103
2,5-dihydro-10-methoxy-2,4,5-trimethyl-5-[3-(methylthio)phenyl]-1H-[1]benzopyrano[3,4-flquinoline

Example 103A
A solution of 3-bromophenylmethoxymethyl ether (3.50 g, 15.0 mmol) in THF (150 mL) at -78 °C was treated with n-butyllithium (2.5 M in hexanes, 6.00 mL) over 5 minutes, warmed to -30 °C, cooled to -78 °C, treated with Example 1F in one portion, warmed to -40 °C, quenched with saturated NH_{4}Cl, warmed to ambient temperature, and allowed to settle. The supernatant was decanted and concentrated, and the residue was partitioned between water and ethyl acetate. The organic layer was washed sequentially with water and brine, dried (Na_{2}SO_{4}) and concentrated. Flash chromatography of the residue on silica gel with 20-25% ethyl acetate/hexane provided the desired compound.

N'-(3-(2,5-dihydro-10-methoxy-2,2,4-trimethyl-1H-[1]benzopyrano[3,4-flquinolin-5-yl]-5-methylphenyl)-N,N-dimethylurea

A solution of Example 115 (0.112 g, 0.247 mmol) in 10% ethanol/water (10 mL) was treated with 1,4-diazabicyclo[2.2.2]octane (0.056 g, 0.495 mmol) and chlorotris(triphenylphosphine)rhodium(I) (0.115 g, 0.124 mmol), refluxed for 15 hours, poured into 5% HCl, stirred 20 minutes, neutralized with NaHCO3, and extracted with ethyl acetate. The extract was washed with brine, dried (Na2SO4), filtered, and concentrated. The residue was purified by flash chromatography on silica gel with 20-33% ethyl acetate/hexanes to provide the desired aniline.

The aniline (0.030 g, 0.073 mmol) was dissolved in 2:1 toluene:THF (7 mL), treated sequentially with diisopropylethylamine (38 μL, 0.218 mmol) and N,N-dimethylcarbamoyl chloride (20 μL, 0.218 mmol), refluxed for 18 hours, cooled, treated with water, and extracted with ethyl acetate. The extract was washed with brine, dried (MgSO4), filtered, and concentrated. The residue was purified by flash chromatography on silica gel with 25-50% ethyl acetate/hexanes to provide the desired compound.

Example 200

2,5-dihydro-10-methoxy-5-(2-(N-benzylcarbonyloxy)ethyl)-2,2,4-trimethyl-1H-1,11-benzopyrano[3,4-flquinoline

Example 199 (0.200 g, 0.57 mmol) was combined with N,N'-disuccinimidyl carbonate (0.217 g, 0.85 mmol), (i-Pr)₂NEt (0.30 ml, 1.71mmol), and acetonitrile (2mL), stirred at room temperature 2 hours and partitioned between CH₂Cl₂ and saturated aqueous sodium bicarbonate. The organic layer was washed with brine, dried (MgSO₄), and purified by silica gel chromatography eluting with 6% ethyl acetate in dichloromethane to give 0.252 g (90%) of the succinate ester as a white foam.

The succinate ester (0.020 g, 0.041mmol), benzyl amine (6.6 µl, 0.061mmol), and CH₂Cl₂ (3 ml) were combined and stirred for 20 minutes at room temperature. The reaction mixture was diluted with CH₂Cl₂ and the organic layers washed with H₂O, saturated aqueous sodium bicarbonate, brine, dried (MgSO₄) and purified by silica gel chromatography eluting with 20% ethyl acetate in hexane to give 19 mg (97%) of the desired compound as a white solid.

2,5-dihydro-10-methoxy-5-(2,2-dimethylethoxycarbonylamino)methyl)-2,4-trimethyl-1H-[1]benzopyranof[3,4-fl]quinoline

Example 206A

2,5-dihydro-10-methoxy-5-(aminomethyl)-2,4-trimethyl-1H-[1]benzopyranof[3,4-fl]quinoline

A 10 ml ethereal suspension of LiAlH₄ (0.050 g, 1.31 mmol) was treated dropwise at room temperature with a 5.0 ml ethereal solution of AlCl₃ (0.59 g, 4.4 mmol), stirred for 30 minutes and treated dropwise with a 4.0 ml ethereal solution of Example 44. After stirring for 1 hour at room temperature, 2.0 ml of H₂O carefully added followed by dropwise addition of 15% NaOH until a white paste formed. The ether solution was decanted, the paste washed several times with ether and combined organics washed with brine and dried (Na₂SO₄). The residue was purified by silica gel column chromatography eluting with CH₂Cl₂:CH₃OH (8:1) to give 0.031 g (69%) aminomethyl analog that was carried directly to the next step.

Example 206

2,5-dihydro-10-methoxy-5-(2,2-dimethylethoxycarbonylamino)methyl)-2,4-trimethyl-1H-[1]benzopyranof[3,4-fl]quinoline

The aminomethyl analog above (0.065 g, 0.19 mmol) was dissolved in dichloromethane (6.0 ml), cooled to 0 ºC, treated with Boc₂O (0.93 g, 0.42 mmol). Allowed to warm to room temperature overnight. 10 ml H₂O was added and the phases separated. The organic layer was washed with brine and dried (Na₂SO₄). The residue was purified by silica gel column chromatography eluting with CH₂Cl₂:CH₃OH (8:1) to give 0.080 g (95%) desired compound:

2,5-dihydro-10-methoxy-5-(2-pyridyl)-2,2,4-trimethyl-1H-[1]benzopyrano[3,4-f]quinoline

To a solution of Example 2A (1.42 g, 4.39 mmol) in THF (40 mL) at 0 °C was added a solution of potassium tert-butoxide (1.48 g, 13.2 mmol) in THF (13 mL). The mixture was stirred 45 min at 0 °C then a solution of TBSCI (1.46 g, 9.66 mmol) in THF
(9.5 mL) was introduced in dropwise fashion. The solution was stirred at 0 °C for 30 min then was quenched by addition of saturated aqueous NH₄Cl (10 mL) and was extracted with EtOAc (2 x 30 mL). The combined organic portions were washed with brine (8 mL) and were dried (Na₂SO₄). Filtration and concentration gave a brown residue which was purified via flash chromatography (elution with 2% EtOAc/CH₂Cl₂) to give the desired product as a yellow solid (994 mg, 2.28 mmol, 52%). MS (DCl/NH₃) m/z 438 (M+H)⁺.

Example 213

**2,5-dihydro-10-methoxy-5-(2-pyridyl)-2,2,4-trimethyl-1H-[1]benzopyranolo[3,4-f]quinoline**

A solution of the 2-lithiopyridine (nominally 1 M in THF) was formed by addition of n-BuLi (680 µL of a 2.5 M solution in hexane, 1.70 mmol) to a solution of 2-bromopyridine (285 mg, 1.80 mmol) in THF (17 mL) at −78 °C. This solution was stirred for 20 min then a solution of the aldehyde prepared above (211 mg, 0.480 mmol) in THF (2.0 mL) was added in dropwise fashion at −78 °C. The solution was stirred at −78 °C for 30 min then was quenched by addition of saturated aqueous NH₄Cl (7 mL) and was extracted with EtOAc (2 x 30 mL). The combined organic portions were washed with brine (10 mL) and were dried (Na₂SO₄). Filtration and concentration gave a brown residue which was used without further purification.

The crude material prepared above was dissolved in THF (10 mL) at 23 °C and was treated with tetrabutylammonium fluoride (500 µL of a 1 M solution in THF, 0.500 mmol). After 1 h, the reaction mixture was concentrated in vacuo, was resuspended in EtOAc (20 mL) and then was washed with water (5 mL) and brine (5 mL), and was dried (Na₂SO₄). Filtration and concentration gave a brown residue which was used without further purification.

This crude residue was dissolved in THF (10 mL), and the solution was cooled to 0 °C. To this solution was added triethylphosphine (48 mg, 0.410 mmol) followed by a solution of 1,1’-(azodicarbonyl)dipiperidine (103 mg, 0.410 mmol) in THF (1.5 mL). The solution was stirred for 30 min at 0 °C then at 23 °C for 7 h. The reaction mixture was concentrated and was purified by flash chromatography (elution with 25% EtOAc/hexane) to give the desired product (13 mg, 0.034 mmol, 8%) as a colorless solid.

\(5\text{-butyl-2,5-dihydro-9-hydroxy-10-methoxy-2,2,4-trimethyl-1H-[1]}\)benzopyrano[3,4-f]quinoline

The C-5 lactol-9-tert-butyldimethylsilylether of core 7 (0.057 g, 0.122 mmol) was dissolved in 1,2-dichloroethane (5 ml), cooled to -10°C, and treated dropwise with 

\(\text{BF}_3\cdot\text{OEt}_2\) (46 mL, 0.366 mmol). The resulting deep green solution was treated dropwise with an ethereal solution of \(n\)-butylmagnesium chloride (0.19 ml of a 2M / Et,O solution, 0.380 mmol). The color changed to yellow-brown. The reaction mixture was partitioned between saturated aqueous sodium bicarbonate and ethyl acetate, the aqueous layer extracted with ethyl acetate, the combined organics washed with brine, dried (MgSO_4), and concentrated to a yellow oil.

The resulting yellow oil was dissolved in THF (5 ml), cooled to 0°C, and treated with tetrabutylammonium fluoride solution (0.14 ml of a 1M / THF solution, 0.14 mmol). After 10 minutes, the mixture was quenched by the addition of saturated aqueous ammonium chloride and pH 7.0 buffer, and the layers were separated. The aqueous layer was extracted with ethyl acetate, the combined organics washed with brine, dried (MgSO_4), and concentrated. The residue was purified by silica gel chromatography eluting with 25% ethyl acetate in hexanes to give 0.032 g (72%) of the desired compound.

The C-5 lactol-9-TBS ether of core 7 and 3-cyclopentenyl trimethylsilane were processed as above to give a 1:1 diastereomeric product mixture which was subjected to HPLC on an (R,R) WHELK-O 1 column eluting with 2% ETOH in hexanes to provide the individual enantiomers.

The C-5 lactol-9-TBS ether of core 7 (0.150 g, 0.321 mmol) was dissolved in
dichloromethane (15 ml), treated with 2-[(trimethylsilyl)methyl]-2-propene-1-yl acetate
(0.180 g, 0.962 mmol), cooled to -78°C, treated dropwise with BF₃·Et₂O and allowed to
warm to 0°C. After 10 minutes, the reaction mixture was partitioned between saturated
aqueous bicarbonate and ethyl acetate, layers separated, aqueous layer extracted with ethyl
acetate, the combined organics washed with brine, dried (MgSO₄) and concentrated.

The resulting yellow oil was dissolved in THF (10 ml), cooled to 0°C, and treated
with tetrabutylammonium fluoride solution (0.35 ml of a 1M / THF solution, 0.35 mmol).
After 10 minutes, the mixture was quenched by the addition of saturated aqueous
ammonium chloride and pH 7.0 buffer, and the layers were separated. The aqueous layer
was extracted with ethyl acetate, the combined organics washed with brine, dried (MgSO₄),
and concentrated. The residue was purified by silica gel chromatography eluting with 25%

To 77 ml of a 0.36 M THF solution of dimethylphenylsilyl methyl cuprate (27.7 mmol) (Fleming, I.; Newton, T. W. J. Chem. Soc. Perkin Trans. 1, 1984, 1805.) at -23°C was added 3-ethyl-cyclohex-2-ene-1-one (2.73 g, 27.0 mmol). The mixture was stirred for 1 hr at -23°C, then for 2 hr at 0°C, treated with N-phenyl-bis-(trifluoromethanesulphonamide) (4.43 g, 26.4 mmol), allowed to warm to room temperature and stirred for 18 hr. The reaction mixture was quenched with saturated aqueous sodium bicarbonate, filtered through celite, and the layers were separated. The organic layer was washed with saturated aqueous sodium bicarbonate, brine, and dried (Na₂SO₄). The product was purified by silica gel column chromatography eluting with hexanes to give the intermediate triflate as a light yellow oil.

The above triflate (0.70 g, 1.28 mmol) was combined with tributyltin hydride (0.92 g, 2.13 mmol) in THF and added dropwise to a THF solution of tetrakis(triphenylphosphine)palladium(0) (0.44 g, 3.5 mmol) and LiCl (0.45 g, 10.7 mmol) at room temperature. After the addition, the reaction was refluxed for 24 hr, cooled, filtered through a pad of celite, and stirred vigorously with saturated potassium fluoride solution for 2 hours. The mixture was filtered through celite, diluted with ethyl acetate, and the layers were separated. The organic layer was washed with saturated aqueous sodium bicarbonate, brine, and dried (Na₂SO₄). The product was purified by silica gel column chromatography eluting with hexanes to give 3-ethyl-3-dimethylphenylsilyl-cyclohexene as a colorless oil.

The C-5 lactol-9-TBS ether of core 7 and 3-ethyl-3-dimethylphenylsilyl-cyclohexene were processed according to example 276 to give the product as a mixture of diastereomers that was separated on a (R,R)-Whelk-O1 HPLC column eluting with hexane:ethanol (98:2) to give the desired compound. : ¹H NMR (500 MHz, DMSO-d₆) δ 8.01 (d, J=8 Hz, 1H), 6.63 (d, J=8 Hz, 1H), 6.61 (d, J=9 Hz, 1H), 6.53 (d, J=9 Hz, 1H), 6.20 (s, 1H), 5.48 (s, 1H), 5.44 (s, 1H), 5.32 (d, J=9 Hz, 1H), 3.64 (s, 3H), 2.26 (m, 1H), 1.90-1.73 (m, 3H), 1.60 (m, 1H), 1.26-1.18 (m, 2H), 1.03 (s, 3H), 0.88 (t, J=7 Hz, 3H); ¹³C NMR (50 MHz, DMSO-d₆) δ 145.3, 144.8, 144.0, 143.6, 140.3, 133.5, 130.8, 127.8, 126.0, 120.0, 118.1, 117.8, 116.5, 114.2, 113.2, 111.9, 76.1, 59.2, 49.4,

(Z) 2,5-dihydro-9-hydroxy-10-methoxy-2,2,4-trimethyl-5-(2-butenyl)-1H-
[1]benzopyranol[3,4-flquinoline

The intermediate silylated product from example 281 (0.445 g, 0.87 mmol) was dissolved THF (4 ml), cooled to 0°C, treated dropwise with Dibal-H (2.69 mL of a 1M/THF solution, 2.69mmol), and stirred for 30 minutes. The reaction mixture was poured over a rapidly stirring mixture of 100 mL of saturated aqueous potassium sodium tartrate and 100 mL of ethyl acetate and stirred for 1 hour. The layers were separated, the
aqueous layer extracted with ethyl acetate, the combined organic layers washed with saturated aqueous sodium bicarbonate, brine and dried (MgSO₄). The residue was purified by silica gel chromatography eluting with 20% then 30% methyl t-butyl ether in hexane followed by 6% ethyl acetate in dichloromethane to give the primary alcohol (0.293 g, 70%) as a white solid. $^1$H NMR (300 MHz, DMSO-d$_6$) $\delta$ 7.92 (d, J=9 Hz, 1H), 6.65 (d, J=9 Hz, 1H), 6.61 (d, J=9 Hz, 1H), 6.57 (d, J=9 Hz, 1H), 6.21 (s, 1H), 5.88 (dd, J=10, 3 Hz, 1H), 5.43 (s, 1H), 4.62 (t, J=5 Hz, 1H), 3.61 (s, 3H), 2.19 (s, 3H), 1.90-1.75 (m, 2H), 1.62-1.47 (m, 2H), 1.17 (s, 3H), 1.15 (s, 3H), 0.99 (s, 9H), 0.20 (s, 3H), 0.15 (s, 3H); MS (APCI) m/e (M+H)$^+$ 482, (M-H)$^-$ 480.

A stirring solution of oxalyl chloride (22 μL, 0.249 mmol) in THF (2 mL) was cooled to -78°C, treated with DMSO (24 μL, 0.332 mmol), stirred for 5 minutes and treated dropwise with a solution of the above primary alcohol (0.080 g, 0.166 mmol) in 2 mL of THF. The resulting mixture was stirred for 40 minutes, treated with triethylamine (92.5 μL, 0.664 mmol) stirred a further 10 minutes and allowed to warm to 0°C. After 30 minutes at 0°C the reaction mixture was partitioned between water and dichloromethane, the aqueous layer extracted with dichloromethane, and the combined organic layers dried (MgSO$_4$). The product was purified by silica gel chromatography eluting with 20% then 30% ethyl acetate in hexane to give the aldehyde (0.059 g, 73%) as a white solid. $^1$H NMR (300 MHz, DMSO-d$_6$) $\delta$ 9.65 (s, 1H), 7.93 (d, J=9 Hz, 1H), 6.67 (d, J=9 Hz, 1H), 6.65 (d, J=9 Hz, 1H), 6.48 (d, J=9 Hz, 1H), 6.33 (m, 2H), 5.46 (s, 1H), 3.63 (s, 3H), 2.87 (m, 1H), 2.65 (m, 1H), 2.18 (s, 3H), 1.19 (s, 3H), 1.14 (s, 3H), 1.00 (s, 9H), 0.21 (s, 3H), 0.15 (s, 3H); MS (APCI) m/e (M+H)$^+$ 480, (M-H)$^-$ 478.

A solution of ethyltriphenylphosphonium bromide (0.130 g, 0.351 mmol) in THF:Et$_2$O (3 ml, 3:2) was cooled to 0°C and treated dropwise with n-BuLi (140 μL of a 2.5 M/hexanes, 0.351 mmol). The resulting deep red solution was stirred for 30 minutes at 0°C, cooled to -78°C and treated with the above aldehyde (0.056 g, 0.117 mmol) in THF (2 mL). The reaction mixture was stirred for 5 minutes at -78°C, warmed to 0°C for 40 minutes and quenched by the addition of water. The layers were separated, the aqueous layer extracted with dichloromethane, the combined organic layers washed with brine and dried (MgSO$_4$). The product was purified by silica gel chromatography eluting with a gradient from 5% to 20% ethyl acetate in hexane to provide the intermediate silyl ether (0.038 g, 87%) as a white solid. $^1$H NMR (300 MHz, DMSO-d$_6$) $\delta$ 7.92 (d, J=9 Hz, 1H), 6.65 (d, J=9 Hz, 1H), 6.63 (d, J=9 Hz, 1H), 6.20 (s, 1H), 5.68 (dd, J=10, 3 Hz, 1H), 5.43 (m, 3H), 3.64 (s, 3H), 2.15 (s, 3H), 1.26 (d, J=5 Hz, 3H), 1.17 (s, 6H), 1.00 (s, 9H), 0.20 (s, 3H), 0.15 (s, 3H); MS (APCI) m/e (M+H)$^+$ 492, (M-H)$^-$ 490.

The intermediate silyl ether (0.038 g, 0.077 mmol) was dissolved in THF (3 ml), cooled to 0°C, treated with tetrabutylammonium fluoride (80 ml of a 1 M/THF solution,
0.080 mmol), and the mixture was partitioned between ethyl acetate and saturated ammonium chloride. The aqueous layer was extracted with ethyl acetate, the combined organics were washed with brine, dried (MgSO₄) and purified by silica gel chromatography eluting with 25% ethyl acetate in hexanes to give the desired compound (0.024 g, 83%).

Example 276 (0.040 g, 0.092 mmol) and dichlorobis(triphenylphosphine)palladium(II) (0.006 g, 0.009 mmol) were dissolved in dioxane (5 ml), heated to 100 °C and treated with sodium borohydride (0.017 g, 0.460 mmol). The resulting black solution was allowed to cool to room temperature, diluted with water and ethyl acetate and filtered through celite. The layers were separated, the aqueous layer was extracted with ethyl acetate, the combined organics were washed with brine, dried (MgSO4), and concentrated. Purification by silica gel chromatography eluting with 25% ethyl acetate in hexanes provided the desired product (0.028 g, 80%) as a colorless foam.

2,5-dihydro-10-methoxy-5-(3-(2-hydroxyethyl)phenyl)-2,2,4-trimethyl-1H-benzopyran[3,4-f]quinoline

A solution of 3-(2'-methoxymethoxy)ethylphenyl bromide (3.55 g, 14.5 mmol) in THF (150 ml) at -78 °C was treated with n-butyllithium (2.5 M in hexane, 5.80 ml) over 15 minutes, warmed to -30 °C, cooled down to -78 °C, treated with compound 1F in one portion, warmed to -50 °C, quenched with saturated ammonium chloride, and allowed to warm to ambient temperature and settle. The supernatant was decanted and concentrated, and the residue was partitioned between water and ethyl acetate. The organic layer was washed sequentially with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated. Flash chromatography of the residue on silica gel with 20-35% ethyl acetate/hexane provided 0.82 g (56%) of the title 5-(3'-MOMO-phenyl)hemiketal.

A solution of of the hemiketal prepared above (0.70 g, 1.43 mmol) in methanol (10 ml) was treated with saturated hydrogen chloride in methanol (20 ml) at ambient temperature, stirred for 18 hours, poured into 1:1 ethyl acetate/saturated ammonium chloride. The separated aqueous layer was extracted with ethyl acetate, and the combined acetate layers were sequentially washed with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated to provide 0.52 g (82%) of the unmasked hemiketal.

MS (DCI/NH<sub>3</sub>) m/e 444 (M+H)<sup>+</sup>.

A solution of the unmasked hemiketal prepared above (0.45 g, 1.00 mmol) and triethylsilane (1.16 g, 10 mmol) in dichloromethane (20 mL) was treated with boron trifluoride etherate (1.42 g, 10 mmol) at ambient temperature, stirred for 18 hours, and poured into 1:1 ethyl acetate/saturated NaHCO<sub>3</sub>. The separated aqueous layer was extracted with ethyl acetate, and the combined extracts were washed sequentially with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated. Flash chromatography of the residue on silica gel with 25-45% ethyl acetate in hexane provided 0.342 of the title compound.

To a solution of Example 335 (136 mg, 0.330 mmol) in anhydrous CH₂Cl₂ (12 mL) at -50 °C was added Dibal-H (1.65 mL of a 1.0 M solution in heptane, 1.65 mmol). The resulting orange solution was warmed gradually to 0 °C over a 30 min period, then was stirred at 0 °C for 2 h. EtOAc (5 mL) was then added to the solution at 0 °C to quench the excess Dibal-H reagent (indicated by a color change of the solution from orange to light yellow) and the reaction mixture was then treated with saturated aqueous NH₄Cl (5 mL). The reaction mixture was partitioned between EtOAc (40 mL) and saturated aqueous Rochelle's salt (sodium potassium tartrate; 35 mL) and the resulting mixture was stirred vigorously until a clear separation of layers was observed (ca. 1 h). The layers were partitioned and the aqueous layer was extracted with EtOAc (15 mL). The organics were combined and were washed with brine (10 mL) and then were dried (Na₂SO₄). Filtration and concentration gave the desired compound (116 mg, 0.302 mmol, 92%) as a colorless foamy solid.

Example 342

2,5-dihydro-5-(3-propenyl)-10-methylthio-2,2,4-trimethyl-1H-[1]benzopyrano[3,4-flquinoline

To a magnetically stirred solution of Example 3B (120 mg, 0.390 mmol) in anhydrous DMF (1.0 mL) at 0 °C was added sodium hydride (17 mg of a 60% dispersion in
mineral oil, 0.430 mmol). The mixture was stirred under an atmosphere of nitrogen until evolution of hydrogen had ceased (1 h). Solid dimethylthiocarbamoyl chloride (64 mg, 0.520 mmol) was then introduced in a single portion and stirring was continued at 0 °C for 30 min. The cooling bath was removed and the mixture heated at 80 °C for 45 min. The reaction mixture was then poured into 1% NaOH (10 mL) and extracted with EtOAc (2 x 25 mL). The combined organics portions were washed with water (3 x 5 mL) and with brine (3 mL) then dried (MgSO₄), filtered and concentrated. The resulting brown residue was purified flash chromatography (elution with 25% EtOAc/hexanes) to provide the resulting thionocarbamate (43 mg, 0.109 mmol, 28%) as a yellow solid.

MS (DCI/NH₃) m/z 348 (M+H)+.

The compound prepared above (113 mg, 0.280 mmol) was placed in an open vial and immersed in a Woods metal bath heated to 270-280 °C for 6 min. The reaction was cooled and the resulting dark brown residue was purified flash chromatography (gradient elution: 20% → 40% EtOAc/hexanes) to provide the thermally rearranged thiocarbamate product (67 mg, 0.165 mmol, 59%) as a yellow solid.

MS (DCI/NH₃) m/z 348 (M+H)+.

To a solution of the rearranged product (500 mg, 1.26 mmol) in anhydrous toluene (70 mL) at –78 °C under N₂ was added dropwise Dibal-H (2.02 mL of a 1.0 M solution in heptane, 2.02 mmol) maintaining the temperature at –78 °C. The resulting orange-red solution was stirred at –78 °C for 1.5 h at which time a TLC of an aliquot (quenched with satd. ammonium chloride) indicated conversion to desired product. Some lower Rf material (dial resulting from over-reduction) was also observed. EtOAc (10 mL) was added to the solution at –78 °C to quench the excess DIBAL-H reagent (indicated by a color change of the solution from orange-red to light yellow), followed by addition of saturated aqueous NH₄Cl solution (15 mL). The reaction mixture was partitioned between EtOAc (150 mL) and aqueous Rochelle’s salt (sodium potassium tartrate, 40 mL) and the resulting mixture was stirred vigorously until a clear separation of layers was observed. The layers were separated and the organic layer was washed with brine (20 mL), was dried (Na₂SO₄), and was filtered. Removal of solvent gave the lactol as a light yellow foam (512 mg) which was used without further purification.

The lactol was dissolved in MeOH (30 mL) at 23 °C and p-TsOH•H₂O (50 mg, 25% w/w) was added portionwise as a solid. The mixture was stirred for 14 h at 23 °C and then was quenched with saturated aqueous sodium bicarbonate (10 mL) and was extracted with EtOAc (2 x 50 mL). The organics portions were combined and were washed with brine (20 mL) and were dried (Na₂SO₄). Filtration and concentration provided a yellow residue which was purified by flash chromatography (elution with 5% EtOAc/CH₂Cl₂) to
provide the product methylacetal (157 mg, 0.416 mmol, 33% over two steps) as a yellow foam.

MS (DCI/NH₃) m/z 379 (M-OCH₃)*.

The lactol prepared above and allyltrimethylsilane were processed as in Example 2 to give a C-5 allyl compound.

Example 357A

8-amino-7-bromo-1-methoxy-6H-benzo[c]chromen-6-one

A solution of Example 1E (3.0 g, 12.0 mmol) in DMF (100 mL) was treated with N-bromosuccinimide (2.2 g, 12.0 mmol), stirred for 40 minutes, poured into 900 mL of water, stirred for 5 minutes and the resulting solid was collected by filtration and dried to give the desired compound.

Example 357B

7-bromo-1-methoxy-6-phenyl-6H-benzo[c]chromen-8-ylamine

Example 357A (2.0 g, 6.25 mmol) and phenyllithium were processed as in Examples 1G and 1 to provide the desired compound.

Example 357C

1-(7-bromo-1-methoxy-6-phenyl-6H-benzo[c]chromen-8-yl)ethan-1-one

Example 357B (1.23 g, 3.22 mmol), tributyl(1-ethoxyvinyl)tin, (1.4 g, 3.86 mmol), and dichlorobis(triphenylphosphine)palladium (II) (263 mg, 0.322 mmol) in NMP (30 mL) were heated at 85 °C for 24 hours under nitrogen. The mixture was partitioned between EtOAc and saturated aqueous sodium bicarbonate and filtered through Celite. The EtoAc layer was concentrated and the residue was dissolved in acetonitrile, washed 5 X 20 mL with hexanes and concentrated. The resulting residue was treated with a 1:1 volume of 1N HCl / THF, stirred for 30 minutes, poured into cold, saturated sodium bicarbonate and extracted with EtOAc (5 X 25 mL). The organics were washed with brine, dried (Na2SO4) and flash chromatographed on silica eluting with 4:1 hexane/EtOAc to give the desired compound.

Example 357D

1-(7-bromo-1-methoxy-6-phenyl-6H-benzo[c]chromen-8-yl)ethan-1-one oxime

A solution of Example 357C (700 mg, 2.03 mmol) and hydroxylamine hydrochloride (2.45 g, 30.4 mmol) in a mixture of EtOH (70 mL) and pyridine (70 mL) was refluxed for 8 hours, cooled and concentrated. The residue was dissolved in EtOAc, washed with water, brine, dried (Na2SO4) and concentrated to provide the desired compound without purification.
Example 357

2,5-dihydro-10-methoxy-2,2,4,trimethyl-3-oxide-5-phenyl-1H-[1]benzopyranof3,4-flquinazoline

Example 357D (700 mg, 1.94 mmol), CuSO₄ (105 mg) and acetic acid (3 drops) were combined in acetone (30 mL) and refluxed for 8 hours. The mixture was cooled, poured into water and extracted with EtOAc (3 X 50 mL). The organics were combined, washed with brine, dried (Na₂SO₄) and concentrated. The residue was triturated with EtOAc (30 mL) and the yellow solid was collected by filtration to provide the desired compound.

INTERNATIONAL SEARCH REPORT

Box I  Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. **X**
   - **Claims Nos.:** 35–36
   - because they relate to subject matter not required to be searched by this Authority, namely:
     - Remark: Although claims 35 and 36 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

2. **☐**
   - **Claims Nos.:**
   - because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. **☐**
   - **Claims Nos.:**
   - because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II  Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. **☐**
   - As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. **☐**
   - As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. **☐**
   - As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. **☐**
   - No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
