(54) Title: METHODS FOR UPGRADING OF CONTAMINATED HYDROCARBON STREAMS

Fig 1

(57) Abstract: A method of upgrading a heteroatom-containing hydrocarbon feed by removing heteroatom contaminants is disclosed. The method includes contacting the heteroatom-containing hydrocarbon feed with an oxidant to oxidize the heteroatoms, contacting the oxidized- heteroatom-containing hydrocarbon feed with caustic and a selectivity promoter, and removing the heteroatom contaminants from the heteroatom-containing hydrocarbon feed. The oxidant may be used in the presence of a catalyst.

METHODS FOR UPGRADING OF CONTAMINATED HYDROCARBON STREAMS

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application is a continuation in part of Serial No. 12/904,446, filed October 14, 2010, entitled Methods for Upgrading of Contaminated Hydrocarbon Streams, which is a continuation in part of Serial No. 12/933,898, filed September 22, 2010, entitled Sulfoxidation Catalysts and Method of Using the Same), which claims priority under 35 USC 371 based upon PCT/US08/82095, entitled Sulfoxidation Catalysts and Method of Using the Same), which claims priority to provisional patent application 61/039,619, entitled Sulfoxidation Catalysts and Method of Using the Same); and this application is a continuation in part of Serial No. 12/888,049, filed September 22, 2010, entitled Reaction System and Products Therefrom, the disclosure of each is hereby incorporated by reference to the extent not inconsistent with the present disclosure.

BACKGROUND

[0002] The present disclosure is directed to systems and methods for upgrading crude oil, refinery intermediate streams, and refinery products to substantially decrease the content of undesired heteroatom contaminants, including, but not limited to, sulfur, nitrogen, phosphorus, nickel, vanadium, iron, with the added benefit of decreasing the total acid number and increasing the API gravity. A heteroatom contaminated hydrocarbon feed stream is subjected to heteroatom oxidizing conditions to produce an oxidized-heteroatom-containing hydrocarbon intermediate stream and then contacting said stream with a selectivity promoter and caustic thereby removing the heteroatom contaminants from the hydrocarbon stream and thereby increasing the API gravity and decreasing the total acid number relative to the initial contaminated hydrocarbon feed stream.

[0003] As is well known in the industry, crude oil contains heteroatom contaminants including, but not limited to, sulfur, nitrogen, phosphorus, nickel, vanadium, and iron and acidic oxygenates in quantities that negatively impact the refinery processing of the crude oil fractions. Light crude oils or condensates contain heteroatoms in concentrations as low as 0.001 wt %. In contrast, heavy crude oils contain heteroatoms as high as 5-7 wt %. The heteroatom content of crude oil increases with increasing boiling point and the heteroatom content increases with decreasing API gravity. These contaminants must be removed during refining operations to meet the environmental regulations for the final product specifications (e.g., gasoline, diesel, fuel oil) or to prevent the contaminants from decreasing catalyst activity, selectivity, and lifetime in downstream refining operations. Contaminants such as sulfur, nitrogen, phosphorus, nickel,

vanadium, iron, and total acid number (TAN) in the crude oil fractions negatively impact these downstream processes, and others, including hydrotreating, hydrocracking and FCC to name just a few. These contaminants are present in the crude oil fractions in various organic hydrocarbon molecules and in various concentrations.

[0004] Sulfur is widely recognized as the most egregious heteroatom contaminant as a result of the environmental hazard caused by its release into the environment after combustion. It is believed, sulfur oxides from combustion (known collectively as SO_x emissions) contribute to the formation of acid rain and also to the reduction of the efficiency of catalytic converters in automobiles. Furthermore, sulfur compounds are thought to ultimately increase the particulate content of combustion products. Nitrogen, phosphorus, and other heteroatom contaminants present similar environmental risks.

[0005] A variety of methods have been implemented for removing sulfur compounds either from fuels before combustion or from emission gases afterward. Most refineries employ hydrodesulfurization (HDS) as the predominant process for removing sulfur from hydrocarbon streams. HDS remains a cost-effective option for light streams with sulfur levels up to about 2% (w/w) elemental sulfur, but the environmental and economic benefits of HDS are offset in very heavy and sour (>2% elemental sulfur) streams because the energy input to the reaction, the high pressures and the amount of hydrogen necessary to remove the sulfur paradoxically create a substantial CO₂ emission problem.

[0006] Because of these issues, reduction of contaminants and, in particular, of the sulfur content in hydrocarbon streams has become a major objective of environmental legislation worldwide. Sulfur is regulated in the United States for on-road diesel at a maximum concentration of 15 ppm. By October 2012, sulfur specifications will be 15 ppm for non-road, locomotive, and marine diesel fuel. In the European Union that specification is expected to tighten to 10 ppm in January 2011 for diesels intended for inland waterways and for on-road and off-road diesel operated equipment. In China, the on-road diesel specification will be 10 ppm by 2012. Currently the tightest specifications in the world are in Japan, where the on-road diesel specification is 10 ppm.

[0007] Refiners typically use catalytic hydrodesulfurizing ("HDS", commonly referred to as "hydrotreating") methods to lower the sulfur content of hydrocarbon fuels, decrease the total acid number, and increase the API gravity. In HDS, a hydrocarbon stream that is derived from petroleum distillation is treated in a reactor that operates at temperatures ranging between 575 and 750 °F. (about 300 to about 400 °C.), a hydrogen pressure that ranges between 430 to 14,500 psi (3000 to 10,000 kPa or 30 to 100 atmospheres) and hourly space velocities ranging between 0.5 and 4 h⁻¹. Dibenzothiophenes in the feed react with hydrogen when in contact with a

catalyst arranged in a fixed bed that comprises metal sulfides from groups VI and VIII (e.g., cobalt and molybdenum sulfides or nickel and molybdenum sulfides) supported on alumina. Because of the operating conditions and the use of hydrogen, these methods can be costly both in capital investment and operating costs.

[0008] As is currently known, HDS or hydrotreating may provide a treated product in compliance with the current strict sulfur level targets. However, due to the presence of sterically hindered refractory sulfur compounds such as substituted dibenzothiophenes, the process is not without issues. For example, it is particularly difficult to eliminate traces of sulfur using such catalytic processes when the sulfur is contained in molecules such as dibenzothiophene with alkyl substituents in position 4-, or 4- and 6-positions of the parent ring. Attempts to completely convert these species, which are more prevalent in heavier stocks such as diesel fuel and fuel oil, have resulted in increased equipment costs, more frequent catalyst replacements, degradation of product quality due to side reactions, and continued inability to comply with the strictest sulfur requirements for some feeds.

[0009] This has prompted many to pursue non-hydrogen alternatives to desulfurization, such as oxydesulfurization. One attempt at solving the problem discussed above includes selectively desulfurizing dibenzothiophenes contained in the hydrocarbon stream by oxidizing the dibenzothiophenes into a sulfone in the presence of an oxidizing agent, followed by optionally separating the sulfone compounds from the rest of the hydrocarbon stream and further reacting the sulfones with a caustic to remove the sulfur moiety from the hydrocarbon fragment.

[0010] Oxidation has been found to be beneficial because oxidized sulfur compounds can be removed using a variety of separation processes that rely on the altered chemical properties such as the solubility, volatility, and reactivity of the sulfone compounds. An important consideration in employing oxidation is chemical selectivity. Selective oxidation of sulfur heteroatom moieties without oxidizing the plethora of olefins and benzylic hydrocarbons found in crude oils, refinery intermediates, and refinery products remains a significant challenge. One selective sulfoxidation method and system is disclosed in International Publication Number WO 2009/120238 A1, to Litz et al. The inventors of the present disclosure have further discovered that the catalyst of the above-mentioned international publication number is further capable of oxidizing additional heteroatoms, including, but not limited to nitrogen and phosphorus found as naturally abundant contaminants in crude oils, refinery intermediates, and refinery products as organic heteroatom-containing compounds. Figure 1 describes a table of available oxidation states for organic heteroatom compounds.

[0011] Another concern with heteroatom oxidation lies in the fate of the oxidized organic heteroatom compounds produced. If the oxidized organic heteroatom compounds are

hydrotreated, they may be converted back to the original heteroatom compounds thereby regenerating the original problem. The feed heteroatom content may be likely to be in the range of 0% to 10% by weight heteroatom. Heteroatoms, on average, comprise about 15 wt % of substituted and unsubstituted organic heteroatom molecules. Therefore, up to 67 wt % of the oil may be removed as oxidized organic heteroatom extract if not removed from the organic molecules. For a typical refinery processing 40,000 barrels per day of crude oil, up to 27,000 barrels per day of oxidized organic heteroatom oil will be generated, which is believed to be too much to dispose conventionally as a waste product. Further, the disposal of oxidized organic heteroatom oil also wastes valuable hydrocarbons, which could theoretically be recycled if an efficient process were available.

[0012] A considerable challenge presented to heteroatom removal remains the removal of the oxidized heteroatom fragment from the oxidized organic heteroatom compounds created by oxidation of the initial organic heteroatom species without producing substantial oxygenated by-product. Therefore, a need exists for methods and systems for upgrading heteroatom-contaminated hydrocarbon feed streams by removing heteroatom contaminants from hydrocarbon streams with the added benefit of decreasing the total acid number and increasing the API gravity of the resulting product relative to the contaminated hydrocarbon feed stream.

SUMMARY OF THE DISCLOSURE

[0013] The present invention relates to a method of upgrading a heteroatom-containing hydrocarbon feed by removing heteroatom contaminants, the method comprising: contacting the heteroatom-containing hydrocarbon feed with an oxidant; contacting the oxidized heteroatom-containing hydrocarbon feed with at least one caustic and at least one selectivity promoter, said at least one selectivity promoter comprising an organic compound having at least one acidic proton; and removing the heteroatom contaminants from the heteroatom-containing hydrocarbon feed. The oxidant may be used in the presence of a catalyst.

[0014] The invention further provides a method of upgrading a heteroatom-containing hydrocarbon feed by removing heteroatom contaminants, the method comprising:

contacting the heteroatom-containing hydrocarbon feed with an oxidant to oxidize at least a portion of the heteroatom contaminants to form a first intermediate stream; contacting the first intermediate stream with at least one caustic and at least one selectivity promoter to form a second intermediate stream; separating a substantially heteroatom-free hydrocarbon product from the second intermediate stream; recovering the at least one caustic and at least one selectivity promoter from the second intermediate stream; and recycling the recovered at least one caustic and at least one selectivity promoter.

[0015] The invention still further provides a method of upgrading a heteroatom-containing hydrocarbon feed by removing heteroatom contaminants, the method comprising oxidizing dibenzothiophenes to sulfones, reacting the sulfones with caustic and a selectivity promoter, and separating a substantially heteroatom-free hydrocarbon product for fuel.

[0016] Other features, aspects, and advantages of the present invention will become better understood with reference to the following description.

BRIEF DESCRIPTION OF THE DRAWINGS

[0017] The features of the disclosure are set forth in the appended claims. The disclosure itself, however, will be best understood by reference to the following detailed description of illustrative embodiments when read in conjunction with the accompanying drawings, wherein:

[0018] Figure 1 is a graphic representation of the various oxidation states of certain heteroatoms, in accordance with embodiments of the present disclosure.

[0019] Figure 2 is a generic process flow diagram of an embodiment of a combination heteroatom oxidation process followed by heteroatom cleavage, in accordance with embodiments of the present disclosure.

[0020] Figure 3A is a more detailed process flow diagram of an embodiment of a combination heteroatom oxidation process followed by heteroatom cleavage, in accordance with embodiments of the present disclosure.

[0021] Figure 3B is an alternative more detailed process flow diagram of an embodiment of a combination heteroatom oxidation process followed by heteroatom cleavage, in accordance with embodiments of the present disclosure.

[0022] Figure 4 is an even more detailed process flow diagram of an embodiment of a combination heteroatom oxidation process followed by heteroatom cleavage, in accordance with embodiments of the present disclosure.

[0023] Figure 5 is an alternative even more detailed process flow diagram of an embodiment of a combination heteroatom oxidation process followed by heteroatom cleavage, in accordance with embodiments of the present disclosure.

DETAILED DESCRIPTION OF THE PRESENTLY PREFERRED EMBODIMENTS

[0024] While this disclosure contains many specific details, it should be understood that various changes and modifications may be made without departing from the scope of the technology herein described. The scope of the technology shall in no way be construed as being limited to the number of constituting components, the concentration of constituting components,

the materials thereof, the shapes thereof, the relative arrangement thereof, the temperature employed, the order of combination of constituents thereof, etc., and are disclosed simply as examples. The depictions and schemes shown herein are intended for illustrative purposes and shall in no way be construed as being limiting in the number of constituting components, connectivity, reaction steps, the materials thereof, the shapes thereof, the relative arrangement thereof, the order of reaction steps thereof, etc., and are disclosed simply as an aid for understanding. The examples described herein relate to the oxidation of heteroatom contaminants in hydrocarbon streams including crude oil, refinery intermediate streams, and refinery products, and they relate to systems and methods for the removal of said oxidized heteroatoms from said hydrocarbon streams.

[0025] Unless otherwise indicated, all numbers expressing quantities of ingredients, properties such as molecular weight, reaction conditions, and so forth used in this specification and claims are to be understood as being modified in all instances by the term "about." Accordingly, unless indicated to the contrary, the numerical parameters set forth in the following specification and attached claims are approximations that may vary depending upon the desired properties sought to be obtained by the present disclosure. At the very least, and not as an attempt to limit the application of the doctrine of equivalents to the scope of the claims, each numerical parameter should at least be construed in light of the number of reported significant digits and by applying ordinary rounding techniques.

[0026] Notwithstanding that the numerical ranges and parameters setting forth the broad scope of the disclosure are approximations, the numerical values set forth in the specific examples are reported as precisely as possible. Any numerical value, however, inherently contain certain errors necessarily resulting from the standard deviation found in their respective testing measurements.

[0027] As used in this application, the term "promoted-caustic visbreaker" means a heated reactor that contains a caustic and a selectivity promoter that react with oxidized heteroatoms to remove sulfur, nickel, vanadium, iron and other heteroatoms, increase API gravity and decrease total acid number.

[0028] As used in this application, the term "contaminated hydrocarbon stream" is a mixture of hydrocarbons containing heteroatom constituents. "Heteroatoms" is intended to include all elements other than carbon and hydrogen.

[0029] As used in this application, the term "sulfoxidation" is a reaction or conversion, whether or not catalytic, that produces organo-sulfoxide, organo-sulfone, organo-sulfonate, or organo-sulfonic acid compounds (and/or mixtures thereof) from organosulfur compounds.

[0030] The oxidation reaction may be carried out at a temperature of about 20°C to

about 120°C, at a pressure of about 0.5 atmospheres to about 10 atmospheres, with a contact time of about 2 minutes to about 180 minutes. The oxidant employed may be any oxidant which, optionally in the presence of a catalyst, oxidizes heteroatoms in the heteroatom-containing hydrocarbon feed, for example, but not limited to, hydrogen peroxide, peracetic acid, benzyl hydroperoxide, ethylbenzene hydroperoxide, cumyl hydroperoxide, sodium hypochlorite, oxygen, air, etc, and more presently preferably an oxidant which does not oxidize the heteroatom-free hydrocarbons in the contaminated hydrocarbon feed. Even more preferably, the catalyst employed therein may be any catalyst capable of utilizing an oxidant to oxidize heteroatoms in the heteroatom-containing hydrocarbon feed

[0031] Suitable catalysts include, but are not limited to, catalyst compositions represented by the formula $M_mO_n(OR)_n$, where M is a metal complex, such as, for example, titanium or any metal, including, but not limited to, rhenium, tungsten or other transition metals alone or in combination that causes the chemical conversion of the sulfur species, as described herein. R is carbon group having at least 3 carbon atoms, where at each occurrence R may individually be a substituted alkyl group containing at least one OH group, a substituted cycloalkyl group containing at least one OH group, a substituted cycloalkylalkyl group containing at least one OH group, a substituted heterocyclyl group containing at least one OH group, or a heterocyclylalkyl containing at least one OH group. The subscripts m and n may each independently be integers between about 1 and about 8. R may be substituted with halogens such as F, Cl, Br, and I. In some embodiments, the metal alkoxide comprises bis(glycerol)oxotitanium(IV), where M is Ti, m is 1, n is 2, and R is a glycerol group. Other examples of metal alkoxides include bis(ethyleneglycol)oxotitanium (IV), bis(erythritol)oxotitanium (IV), and bis(sorbitol)oxotitanium (IV), as disclosed in International Publication Number WO 2009/120238 A1, to Litz et al.

[0032] Other suitable catalysts include, but are not limited to, catalyst compositions prepared by the reaction of Q-R-Q' with a bis(polyol)oxotitanium(IV) catalyst, wherein Q and Q' each independently comprise an isocyanate, anhydride, sulfonyl halide, benzyl halide, carboxylic acid halide, phosphoryl acid halide, silyl chloride, or any chemical functionality capable of reacting with the -OH pendant group of the catalyst, and wherein R comprises a linking group. The R linking group is selected from the group consisting of alkyl groups (including linear, branched, saturated, unsaturated, cyclic, and substituted alkyl groups, and wherein hetero atoms, such as oxygen, nitrogen, sulfur, silicon, phosphorus, and the like can be present in the alkyl group), typically with from 1 to about 22 carbon atoms, preferably with from 1 to about 12 carbon atoms, and more preferably with from 1 to about 7 carbon atoms, although the number of carbon atoms can be outside of these ranges, aryl groups (including substituted

aryl groups), typically with from about 6 to about 30 carbon atoms, preferably with from about 6 to about 15 carbon atoms, and more preferably with from about 6 to about 12 carbon atoms, although the number of carbon atoms can be outside of these ranges, arylalkyl groups (including substituted arylalkyl groups), typically with from about 7 to about 30 carbon atoms, preferably with from about 7 to about 15 carbon atoms, and more preferably with from about 7 to about 12 carbon atoms, although the number of carbon atoms can be outside of these ranges, such as benzyl or the like, alkylaryl groups (including substituted alkylaryl groups), typically with from about 7 to about 30 carbon atoms, preferably with from about 7 to about 15 carbon atoms, and more preferably with from about 7 to about 12 carbon atoms, although the number of carbon atoms can be outside of these ranges, silicon or phosphorus, typically with from 1 to about 22 carbon atoms, preferably with from 1 to about 12 carbon atoms, and more preferably with from 1 to about 7 carbon atoms, although the number of carbon atoms can be outside of these ranges, polyalkyleneoxy groups (including substituted polyalkyleneoxy groups), such as polyethyleneoxy groups, polypropyleneoxy groups, polybutyleneoxy groups, and the like, typically with from about 3 to about 60 repeat alkyleneoxy units, preferably with from about 3 to about 30 repeat alkyleneoxy units, and more preferably with from about 3 to about 20 repeat alkyleneoxy units, although the number of repeat alkyleneoxy units can be outside of these ranges, as disclosed in International Publication Number WO 2009/120238 A1, to Litz et al.

[0033] The solvent used in extracting the heteroatom-containing hydrocarbon stream after the oxidation reaction (e.g. in a liquid-liquid extractor) may be any solvent with relatively low solubility in oil but relatively high solubility of oxidized heteroatom-containing hydrocarbons, including, but not limited to, acetone, methanol, ethanol, ethyl lactate, N-methylpyrrolidone, dimethylacetamide, dimethylformamide, gamma-butyrolactone, dimethyl sulfoxide, propylene carbonate, acetonitrile, acetic acid, sulfuric acid, liquid sulfur dioxide, etc, which is capable of extracting the heteroatoms from the heteroatom containing hydrocarbon stream and producing a substantially heteroatom-free hydrocarbon product.

[0034] The caustic of the present invention may be any compound which exhibits basic properties including, but not limited to, metal hydroxides and sulfides, such as alkali metal hydroxides and sulfides, including, but not limited to, LiOH, NaOH, KOH and Na₂S; alkali earth metal hydroxides, such as Ca(OH)₂, Mg(OH)₂ and Ba(OH)₂; carbonate salts, such as alkali metal carbonates, including, but not limited to, Na₂CO₃ and K₂CO₃; alkali earth metal carbonates, such as CaCO₃, MgCO₃ and BaCO₃; phosphate salts, including, but not limited to, alkali metal phosphates, such as sodium pyrophosphate, potassium pyrophosphate, sodium tripolyphosphate and potassium tripolyphosphate; and alkali earth metal phosphates, such as calcium pyrophosphate, magnesium pyrophosphate, barium pyrophosphate, calcium tripolyphosphate,

magnesium tripolyphosphate and barium tripolyphosphate; silicate salts, such as, alkali metal silicates, such as sodium silicate and potassium silicate, and alkali earth metal silicates, such as calcium silicate, magnesium silicate and barium silicate, organic alkali compounds expressed by the general formula : $R-E^n M^m Q^{m-1}$, where R is hydrogen or an organic compound (which may be further substituted) including, but not limited to, straight, branched and cyclic alkyl groups; straight, branched and cyclic alkenyl groups; and aromatic or polycyclic aromatic groups. Further substituents where R is an organic may include hydroxide groups, carbonyl groups, aldehyde groups, ether groups, carboxylic acid and carboxylate groups, phenol or phenolate groups, alkoxide groups, amine groups, imine groups, cyano groups, thiol or thiolate groups, thioether groups, disulfide groups, sulfate groups, and phosphate groups. E^n represents an atom with a negative charge (where $n = -1, -2, -3, -4$ etc.) such as oxygen, sulfur, selenium, tellurium, nitrogen, phosphorus, and carbon; and M^m is any cation ($m = +1, +2, +3, +4$ etc.), such as a metal ion, including, but not limited to, alkali metals, such as Li, Na, and K, alkali earth metals, such as Mg and Ca, and transition metals, such as Zn, and Cu. When $m > +1$, Q may be the same as E^n -R or an atom with a negative charge such as Br-, Cl-, I, or an anionic group that supports the charge balance of the cation M^m , including but not limited to, hydroxide, cyanide, cyanate, and carboxylates.

[0035] Examples of the straight or branched alkyl groups may include methyl, ethyl, n-, i-, sec- and t-butyl, octyl, 2-ethylhexyl and octadecyl. Examples of the straight or branched alkenyl groups may include vinyl, propenyl, allyl and butenyl. Examples of the cyclic alkyl and cyclic alkenyl groups may include cyclohexyl, cyclopentyl, and cyclohexene. Examples of the aromatic or polycyclic aromatic groups may include aryl groups, such as phenyl, naphthyl, and anthracenyl; aralkyl groups, such as benzyl and phenethyl; alkylaryl groups, such as methylphenyl, ethylphenyl, nonylphenyl, methylnaphthyl and ethylnaphthyl.

[0036] Preferred caustic compounds, based on reaction conversion and selectivity, are alkali metal hydroxides and sulfides, such as NaOH, KOH, Na_2S , and/or mixtures thereof.

[0037] In one embodiment of the present invention, the caustic may be in the molten phase. Presently preferred molten phase caustics include, but are not limited to, eutectic mixtures of the inorganic hydroxides with melting points less than 350°C , such as, for example, a 51 mole % NaOH / 49 mole % KOH eutectic mixture which melts at about 170°C .

[0038] In another embodiment of the present invention, the caustic may be supported on an inorganic support, including, but not limited to, oxides, inert or active, such as, for example, a porous support, such as talc or inorganic oxides.

[0039] Suitable inorganic oxides include, but are not limited to, oxides of elements of groups IB, II-A and II-B, III-A and II-B, IV-A and IV-B, V-A and V-B, VI-B, of the Periodic

Table of the Elements. Examples of oxides preferred as supports include copper oxides, silicon dioxide, aluminum oxide, and/or mixed oxides of copper, silicon and aluminum. Other suitable inorganic oxides which may be used alone or in combination with the abovementioned preferred oxide supports may be, for example, MgO, ZrO₂, TiO₂, CaO and/or mixtures thereof.

[0040] The support materials used may have a specific surface area in the range from 10 to 1000 m²/g, a pore volume in the range from 0.1 to 5 ml/g and a mean particle size of from 0.1 to 10 μ m. Preference may be given to supports having a specific surface area in the range from 0.5 to 500 m²/g, a pore volume in the range from 0.5 to 3.5 ml/g and a mean particle size in the range from 0.5 to 3 μ m. Particular preference may be given to supports having a specific surface area in the range from 200 to 400 m²/g, and a pore volume in the range from 0.8 to 3.0 ml/g.

[0041] The selectivity promoter of the present invention may be any organic compound having at least one acidic proton. Generally, the selectivity promoter has a pK_a value (as measured in DMSO) in the range of from about 9 to about 32, preferably in the range of from about 18 to about 32. Examples of the selectivity promoter include, but are not limited to, hydroxyl-functional organic compounds; straight, branched, or cyclic amines having at least one H substituent; and/or mixtures thereof. The selectivity promoter may further include crown ethers.

[0042] Suitable hydroxyl-functional organic compounds include, but are not limited to: (i) straight-, branched-, or cyclic-alkyl alcohols (which may be further substituted) such as methanol, ethanol, isopropanol, ethylhexanol, cyclohexanol, ethanolamine, di-, and tri-ethanolamine, mono- and di-methylaminoethanol; including -diols such as ethylene glycol, propylene glycol, 1,3-propanediol, and 1,2-cyclohexanediol; and -polyols, such as glycerol, erythritol, xylitol, sorbitol, etc; -monosaccharides, such as glucose, fructose, galactose, etc; -disaccharides, such as sucrose, lactose, and maltose; -polysaccharides, such as starch, cellulose, glycogen, chitin, wood chips and shavings; (ii) straight-, branched-, or cyclic-alkenyl alcohols (which may be further substituted), such as vinyl alcohol, and allyl alcohol; (iii) aryl- and aralkyl-alcohols (which may be further substituted), such as phenol, and benzyl alcohol; (iv) polycyclic aryl- and aralkyl- alcohols (which may be further substituted), such as naphthol, and α -tetralol; and (v) ammonium salts, such as choline hydroxide, and benzyltrimethylammonium hydroxide.

[0043] Examples of straight or branched alkyls may include: methyl, ethyl, n-, i-, sec- and t-butyl, octyl, 2-ethylhexyl and octadecyl. Examples of the straight or branched alkenyls may include: vinyl, propenyl, allyl and butenyl. Examples of the cyclic-alkyls may include: cyclohexyl, and cyclopentyl. Examples of aryls, aralkyls and polycyclics include: aryls, such as

phenyl, naphthyl, anthracenyl; aralkyls, such as benzyl and phenethyl; alkylaryl, such as methylphenyl, ethylphenyl, nonylphenyl, methylnaphthyl and ethylnaphthyl.

[0044] Suitable amines, include, but are not limited to, straight-, branched-, and cyclic- amines having at least one H substituent, which may be further substituted, including, but not limited to, mono-, or di-substituted amines, such as methylamine, ethylamine, 2-ethylhexylamine, piperazine, 1,2-diaminoethane and/or mixtures thereof.

[0045] Suitable crown ethers, which may be further substituted, include, but are not limited to, 18-crown-6, 15-crown-5, etc; and/or mixtures thereof.

[0046] Preferred selectivity promoters, based on reaction conversion and selectivity, are ethylene glycol, propylene glycol, triethanolamine, and/or mixtures thereof.

[0047] The selectivity promoter is believed to decrease the likelihood of oxygenated byproduct formation as a result of the oxidized heteroatom removal.

[0048] In one embodiment of the present invention the at least one caustic and the at least one selectivity promoter may be different components. In another embodiment of the present invention the at least one caustic and the at least one selectivity promoter may be the same component. When the at least one caustic and the at least one selectivity promoter are the same component they may be referred to as a caustic selectivity promoter. Moreover, a suitable caustic selectivity promoter may possess the properties of both the at least one caustic and the at least one selectivity promoter. That is, combinations of caustics with selectivity promoters may react (*in situ* or *a priori*) to form a caustic selectivity promoter which has the properties of both a caustic and a selectivity promoter.

[0049] The caustic selectivity promoter may react with the oxidized heteroatom-containing compounds, such as dibenzothiophene sulfoxides, dibenzothiophene sulfones, and/or mixtures thereof, to produce substantially non-oxygenated hydrocarbon products, such as biphenyls. Non-limiting examples of caustic selectivity promoters include, but are not limited to, sodium ascorbate, sodium erythorbate, sodium gluconate, 4-hydroxyphenyl glycol, sodium salts of starch or cellulose, potassium salts of starch or cellulose, sodium salts of chitan or chitosan, potassium salts of chitan or chitosan, sodium glycolate, glyceraldehyde sodium salt, 1-thio-beta-D-glucose sodium salt, and/or mixtures thereof.

[0050] For example, the caustic, such as sodium hydroxide and/or potassium hydroxide and the selectivity promoter, such as ethylene glycol, may react in situ or prior to contacting with the oxidized heteroatom-containing hydrocarbon feed, to form water and a caustic selectivity promoter, such as the sodium or potassium salt of ethylene glycol. Generally, an excess molar ratio of selectivity promoter hydroxyl groups to caustic cations is preferred for conversion and selectivity.

[0051] The promoted-caustic visbreaker reaction may take place at a temperature in the range of from about 150°C to about 350°C, at a pressure in the range of from about 0 psig to about 2000 psig, with a contact time in the range of from about 2 minutes to about 180 minutes. Without being limited to any particular theory, the reaction mechanism is believed to include a solvolysis reaction; particularly alcoholysis when the selectivity promoter is an alcohol, and aminolysis when the selectivity promoter is an amine; without the selectivity promoter of the present invention, the reaction mechanism may involve hydrolysis which leads to the undesirable formation of substantially oxygenated product.

[0052] Generally, the mole ratio of caustic to selectivity promoter is in the range of from about 10:1 to about 1:10, preferably the mole ratio of caustic to selectivity promoter is in the range of from about 3:1 to about 1:3, and more preferably the mole ratio of caustic to selectivity promoter is in the range of from about 2:1 to about 1:2.

[0053] Generally, the mole ratio of caustic and selectivity promoter to heteroatom in the heteroatom-containing hydrocarbon feed oil is in the range of from about 100:1 to about 1:1, preferably the mole ratio of caustic and selectivity promoter to heteroatom in the heteroatom-containing hydrocarbon feed oil is in the range of from about 10:1 to about 1:1, and more preferably the mole ratio of caustic and selectivity promoter to heteroatom in the heteroatom-containing hydrocarbon feed oil is in the range of from about 3:1 to about 1:1.

[0054] Separation of the heavy caustic phase from the light oil phase may be by gravity. Other suitable methods include, but are not limited to, solvent extraction of the caustic or oil phases, such as by washing with water, centrifugation, distillation, vortex separation, and membrane separation and combinations thereof. Trace quantities of caustic and selectivity promoter may be removed according to known methods by those skilled in the art.

[0055] As a result of removing the heteroatom contaminants from the heteroatom-containing hydrocarbon feed and producing few oxygenated by-products, the light oil phase product has a lower density and viscosity than the untreated, contaminated feed. The heavy caustic phase density is generally in the range of from about 1.0 to about 3.0 g/mL and the light product oil phase density is generally in the range of from about 0.7 to about 1.1 g/mL.

[0056] Without the selectivity promoter the treated stream contains substantial oxygenated by-products. Generally, the method of the present invention produces less than about 70% oxygenated by-products, preferably less than about 40% oxygenated by-products, and more preferably less than about 20% oxygenated by-products in the treated stream. This beneficial effect is more clearly demonstrated in the non-limiting examples below.

[0057] As illustrated in Figure 2, a heteroatom-containing hydrocarbon feed 10 may be combined with an oxidant 11 and subjected to an oxidizing process in an oxidizer vessel 12 in

order to meet current and future environmental standards. The oxidizer vessel 12 may optionally contain a catalyst or promoter (not shown).

[0058] After subjecting a hydrocarbon stream to oxidation conditions in oxidizer vessel 12, thereby oxidizing at least a portion of the heteroatom compounds (e.g., oxidizing dibenzothiophenes to sulfones), a first intermediate stream 13 may be generated. The first intermediate stream 13 may be reacted with caustic (e.g., sodium hydroxide, potassium hydroxide, eutectic mixtures thereof etc.) and a selectivity promoter 24 to produce a biphasic second intermediate stream 16.

[0059] Second intermediate stream 16 may be transferred to a product separator 18 from which a substantially heteroatom-free hydrocarbon product 20 may be recovered from the light phase. The denser phase 21 containing the selectivity promoter and caustic and heteroatom by-products may be transferred to a recovery vessel 22 in which the selectivity promoter and caustic 24 may be recovered and recycled to reactor 14 and the heteroatom-containing byproduct 26 may be sent to a recovery area for further processing, as would be understood by those skilled in the art.

[0060] In a more specific embodiment, as illustrated in Figure 3A, a heteroatom-containing hydrocarbon feed 30 may be combined with a hydroperoxide 32 in a catalytic oxidizer 34 thereby oxidizing the heteroatoms yielding a first intermediate stream 36. First intermediate stream 36 may be fed to a by-product separator 38 from which the hydroperoxide by-product may be recovered and recycled for reuse in catalytic oxidizer 34 (as would be understood by those skilled in the art) yielding a second intermediate stream 39. The second intermediate stream 39 may be reacted with a selectivity promoter and caustic feed 42 in promoted-caustic visbreaker 40 producing a third intermediate biphasic stream 44 that may be separated in product separator 46 to produce a substantially heteroatom-free hydrocarbon product 48 from the light phase. The dense phase 49 from product separator 46 may be transferred to heteroatom by-product separator 50 from which a heteroatom-containing byproduct stream 52 and selectivity promoter and caustic feed 42 may be independently recovered, as would be known by those skilled in the art.

[0061] In still another embodiment, as illustrated in Figure 3B, the heteroatom-containing hydrocarbon feed 30 may be combined with hydroperoxide 32 and contacted with a catalyst in catalytic oxidizer 34 yielding first intermediate stream 60 which may be transferred to a promoted-caustic visbreaker 40 where it reacts with selectivity promoter and caustic feed 42 producing a biphasic second intermediate stream 62. Second intermediate stream 62 may be transferred to a product separator 38 from which a substantially heteroatom-free hydrocarbon product stream 48 may be removed as the light phase and transported to storage or commercial

use. The byproduct separator 54 may separate the dense phase 64 into two streams: a heteroatom-containing by-product stream 52 (which may be transported to storage or commercial use) and a by-product mixture stream 66 containing the selectivity promoter, caustic, and hydroperoxide by-products for recovery and recycle, as would be known by those skilled in the art.

[0062] In yet another embodiment, as illustrated in Figure 4, the heteroatom-containing hydrocarbon feed 30 may be mixed with a hydroperoxide feed 32 and may be reacted with a catalyst or promoter (not shown) in the catalytic oxidizer 34 producing a first intermediate stream 36. Stream 36 may be transferred to a by-product separator 38 from which the hydroperoxide by-product 37 may be separated producing a second intermediate stream 70. Stream 70 may be extracted by solvent 78 in product separator 46 (e.g. a liquid-liquid extraction column) from which a substantially heteroatom-free hydrocarbon product 72 may be withdrawn resulting in a third intermediate stream 74. Stream 74 may be fed to solvent recovery 76 from which solvent 78 may be recovered and recycled to product separator 46, producing a fourth intermediate stream 80. Stream 80 may be treated in the promoted-caustic visbreaker 40 containing selectivity promoter and caustic feed 42 producing a biphasic fifth intermediate stream 82. The two phases of stream 82 may be separated in product separator 84 as a light phase 48 and a dense phase 86. The light phase 48 may comprise a substantially heteroatom-free hydrocarbon product that may be shipped to storage or commercial use. The dense phase 86 may be transferred to a heteroatom by-product separator 88 from which a heteroatom-containing byproduct stream 52 may be separated from resulting in a stream 42 containing a selectivity promoter and caustic that may be recovered and recycled for reuse in the promoted-caustic visbreaker 40, as would be understood by those skilled in the art.

[0063] In still another embodiment, as illustrated in Figure 5, the heteroatom-containing hydrocarbon feed 30 may be fed to a catalytic oxidizer 34 where it may be reacted with catalyst stream 90 in the catalytic oxidizer 34 producing a first intermediate stream 92. Stream 92 may be transferred to catalyst separator 94 from which a second intermediate stream 70 and a depleted catalyst stream 96 may be separated. Stream 96 may be fed to catalyst regenerator 98 for regeneration by oxidant feed 100 producing catalyst stream 90 and an oxidant by-product stream 102. Oxidant by-product stream 102 may be optionally recovered, recycled, and reused as would be understood by those skilled in the art. Stream 70 may be extracted by solvent 78 in product separator 46 (e.g. a liquid-liquid extraction column) from which a substantially heteroatom-free hydrocarbon product 72 may be withdrawn resulting in a third intermediate stream 74. Stream 74 may be fed to solvent recovery 76 from which solvent 78 may be recovered and recycled to product separator 46, producing a fourth intermediate stream

80. Stream 80 may be treated in the promoted-caustic visbreaker 40 containing selectivity promoter and caustic feed 42 producing a biphasic fifth intermediate stream 82. The two phases of stream 82 may be separated in product separator 84 as a light phase 48 and a dense phase 86. The light phase 48 may comprise a substantially heteroatom-free hydrocarbon product that may be shipped to storage or commercial use. The dense phase 86 may be transferred to a heteroatom by-product separator 88 from which a heteroatom-containing byproduct stream 52 may be separated from resulting in a stream 42 containing a selectivity promoter and caustic that may be recovered and recycled for reuse in the promoted-caustic visbreaker 40, as would be understood by those skilled in the art.

[0064] The following non-limiting examples illustrate certain aspects of the present invention.

[0065] Examples

[0066] Example 1

[0067] Preparation of Pelletized Polymeric Titanyl Catalyst

[0068] A dimethyl sulfoxide (DMSO) solution of co-monomer (e.g. 4,4'-bisphenol A dianhydride (BPADA)) is prepared and is combined with a DMSO solution of the titanyl (e.g. bis(glycerol)oxotitanium(IV)) with stirring at 70°C for about 4 hrs to produce a copolymer solution. Then, the solution is cooled to room temperature, and the polymer product is precipitated with excess acetone. The polymeric precipitate is collected by vacuum filtration and is dried. The yield of precipitated polymeric titanyl catalyst is greater than 90%.

[0069] A blend of bonding agent (Kynar®), optional inert filler (silica or alumina), and the polymeric titanyl catalyst is prepared in a solid mixer or blender. The blended mixture is then extruded or pelletized by compression producing uniform catalyst pellets with hardness test strength preferably greater than 2 kp.

[0070] Example 2

[0071] Continuous Catalytic Removal of Heteroatoms from a Heteroatom-contaminated Light Atmospheric Gas Oil

[0072] Straight- run light atmospheric gas oil (LAGO) (3.45 % sulfur) and cumene hydroperoxide (30% in cumene, fed at a rate of 2.1 mole equivalents to sulfur in LAGO feed) are fed to a fixed bed reactor containing pelletized titanyl polymeric catalyst, prepared in accordance with Example 1, at about 85°C with a combined LHSV of about 1.0 hr⁻¹ producing a first intermediate stream. The first intermediate stream is vacuum distilled at -25 in Hg to remove and recover a low boiling distillate comprising cumene, cumyl alcohol, alpha-methylstyrene, and acetophenone from a heavy second intermediate stream. The heavy second intermediate stream essentially comprises light atmospheric gas oil with oxidized heteroatom compounds. The

second intermediate stream is then fed into a heated reactor wherein it combines with a feed stream containing caustic and ethylene glycol (the combined liquid residence time is 1.0 hr^{-1}) to produce a biphasic mixture that exits the reactor. The biphasic mixture is then separated by gravity to produce a light phase product comprising essentially heteroatom-free LAGO and a heavy phase by-product stream comprising essentially caustic, ethylene glycol, and heteroatom-containing salts. Sulfur removal from the light phase product is greater than 50%, nitrogen removal is greater than 50%, vanadium removal is greater than 50%, nickel removal is greater than 50%, and iron removal is greater than 50% when the samples are measured for elemental composition and compared against the LAGO feed composition. The heavy phase by-product is further treated according to known methods to recover and recycle the caustic and ethylene glycol from the heteroatom by-products.

[0073] Examples 3-12

[0074] Desulfonylation Using Hydroxide and Various Alcohols

[0075] A mixture of dibenzothiophene sulfone in 1,2,3,4-tetrahydronaphthalene is reacted with six molar equivalents of various alcohols, three molar equivalents sodium hydroxide, and three molar equivalents potassium hydroxide. Reactions are performed at 275°C for one hour. The products of the reaction are acidified with aqueous hydrochloric acid, and then extracted with dichloromethane. The dichloromethane extract is analyzed by high pressure liquid chromatography (HPLC) to determine percent conversion of dibenzothiophene sulfone, and mole percent yield of biphenyl and ortho-phenylphenol. The results are given below in Table 1.

Example	Alcohol	Biphenyl	o-Phenylphenol	Conversion
3	None	7%	64%	93%
4	Ethylene Glycol	65%	9%	89%
5	Propylene Glycol	37%	17%	99%
6	Glycerol	41%	51%	99%
7	1,3-Propanediol	16%	45%	95%
8	Pinacol	13%	56%	100%
9	Ethanolamine	20%	21%	100%
10	Diethanolamine	47%	27%	97%
11	Triethanolamine	41%	32%	100%
12	4-(2-hydroxyethyl)morpholine	8%	31%	100%

[0076] Examples 13-26

[0077] Desulfonylation Using Phenoxide and Various Alcohols

[0078] A mixture of dibenzothiophene sulfone in 1,2,3,4-tetrahydronaphthalene is reacted with six molar equivalents of various alcohols, and six molar equivalents of sodium phenoxide monohydrate. Reactions are performed at 300°C for fifteen minutes. The products of the reaction are acidified with aqueous hydrochloric acid, and then extracted with dichloromethane. The dichloromethane extract is analyzed by HPLC to determine percent conversion of dibenzothiophene sulfone, and mole percent yield of biphenyl and ortho-phenylphenol. The results are given below in Table 2.

Example	Alcohol	Biphenyl	o-Phenylphenol	Conversion
13	None	1%	5%	77%
14	Ethylene Glycol	23%	59%	97%
15	Propylene Glycol	32%	20%	97%
16	Glycerol	19%	18%	59%
17	1,3-Propanediol	25%	7%	79%
18	Pinacol	4%	4%	35%
19	Ethanolamine	23%	18%	91%
20	Diethanolamine	20%	50%	85%
21	Triethanolamine	19%	26%	100%
22	4-(2-hydroxyethyl)morpholine	5%	33%	71%
23	Methanol	15%	9%	42%
24	t-Butanol	10%	9%	42%
25	Catechol	0%	0%	0%
26	Hydroquinone	40%	5%	95%

[0079] Examples 27-38

[0080] Desulfonylation Using Acetate and Various Alcohols

[0081] A mixture of dibenzothiophene sulfone in 1,2,3,4-tetrahydronaphthalene is reacted with six molar equivalents of various alcohols, and six molar equivalents of a salt mixture comprising 57 mole % cesium acetate and 43 mole % potassium acetate. Reactions are performed at 300°C for fifteen minutes. The products of the reaction are acidified with aqueous hydrochloric acid, and then extracted with dichloromethane. The dichloromethane extract is

analyzed by HPLC to determine percent conversion of dibenzothiophene sulfone, and mole percent yield of biphenyl and ortho-phenylphenol. The results are given below in Table 3.

Example	Alcohol	Biphenyl	o-Phenylphenol	Conversion
27	None	0%	0%	0%
28	Ethylene Glycol	19%	6%	35%
29	Propylene Glycol	26%	3%	88%
30	Glycerol	3%	2%	70%
31	1,3-Propanediol	12%	7%	84%
32	Pinacol	0%	0%	54%
33	Ethanolamine	24%	5%	50%
34	Diethanolamine	35%	9%	69%
35	Triethanolamine	41%	13%	79%
36	Cellulose Powder	14%	0%	25%
37	Methanol	8%	5%	37%
38	t-Butanol	0%	0%	11%

[0082] Examples 39-45

[0083] Desulfonation Using Ethylene Glycol and Various Nucleophiles.

[0084] A mixture of dibenzothiophene sulfone in 1,2,3,4-tetrahydronaphthalene is reacted with six molar equivalents of ethylene glycol, and six molar equivalents of various nucleophiles. Example 41 used the following molar equivalents to dibenzothiophene sulfone: 1.8 molar equivalents sodium hydroxide, 1.8 molar equivalents potassium hydroxide, 0.7 molar equivalents sodium sulfide nonahydrate and 3.5 molar equivalents ethylene glycol. Reactions are performed at 300°C for fifteen minutes. The products of the reaction are acidified with aqueous hydrochloric acid, and then extracted with dichloromethane. The dichloromethane extract is analyzed by HPLC to determine percent conversion of dibenzothiophene sulfone, and mole percent yield of biphenyl and ortho-phenylphenol. The results are given below in Table 4.

Example	Nucleophile	Biphenyl	o-Phenylphenol	Conversion
39	None	0	0	0
40	Sodium sulfide nonahydrate	55	3	87
41	Sodium sulfide	76	13	98

	nonahydrate, sodium hydroxide, potassium hydroxide			
42	Potassium t-butoxide	40	23	100
43	Sodium methoxide	3	0	69
44	Sodium hydrosulfide	3	0	89
45	Sodium thiophenolate monohydrate	4	3	98

[0085] Examples 46-48

[0086] Desulfonylation Using Hydroxide, Sulfide, and Ethylene Glycol

[0087] A mixture of an aromatic sulfone in 1,2,3,4-tetrahydronaphthalene is reacted with 3.5 molar equivalents of ethylene glycol, 1.8 molar equivalents of a sodium hydroxide, 1.8 molar equivalents of potassium hydroxide, and 0.7 molar equivalents of sodium sulfide nonahydrate. Reactions are performed at 275°C for sixty minutes. The products of the reaction are acidified with aqueous hydrochloric acid, and then extracted with dichloromethane. The dichloromethane extract is analyzed by HPLC to determine percent conversion of sulfone, and mole percent yield of organic products as compared to the initial moles of starting sulfone. The results are given below in Table 5.

Example	Sulfone	Conversion	Products (mole percent)
46	Diphenyl sulfone	16%	Benzene (6%) Phenol (0.7%)
47	Thianthrene disulfone	100%	Benzene (99%) Phenol (30%) Biphenyl (0.3%) Dibenzothiophene sulfone (3%)
48	Benzothiophene sulfone	100%	Styrene (1.3%)

[0088] Examples 49-51

[0089] Desulfonylation Using Phenoxide, and Propylene Glycol

[0090] A mixture of an aromatic sulfone in 1,2,3,4-tetrahydronaphthalene is reacted with six molar equivalents of propylene glycol, and six molar equivalents of sodium phenoxide monohydrate. Reactions are performed at 275°C for sixty minutes. The products of the reaction

are acidified with aqueous hydrochloric acid, and then extracted with dichloromethane. The dichloromethane extract is analyzed by HPLC to determine percent conversion of sulfone, and mole percent yield of organic products as compared to the initial moles of starting sulfone. The results are given below in Table 6.

Example	Sulfone	Conversion	Products (mole percent)
49	Diphenyl sulfone	32%	Benzene (61%) Biphenyl (1%)
50	Thianthrene disulfone	100%	Benzene (78%) Diphenyl sulfone (3%) Dibenzothiophene sulfone (0.5%)
51	Benzothiophene sulfone	100%	Styrene (17%)

[0091] Examples 52-54

[0092] Desulfonylation Using Acetate and Triethanolamine

[0093] An aromatic sulfone is reacted with twelve molar equivalents of triethanolamine, and twelve molar equivalents of a salt mixture comprised of 57 mole % cesium acetate and 43 mole % potassium acetate. Reactions are performed at 275°C for sixty minutes. The products of the reaction are acidified with aqueous hydrochloric acid, and then extracted with dichloromethane. The dichloromethane extract is analyzed by HPLC to determine percent conversion of sulfone, and mole percent yield of organic products as compared to the initial moles of starting sulfone. The results are given below in Table 7.

Example	Sulfone	Conversion	Products (mole percent)
52	Diphenyl sulfone	69%	Benzene (118%) Biphenyl (1%) Phenol (2%) Dibenzothiophene sulfone (2%)
53	Thianthrene disulfone	100%	Benzene (30%) Phenol (3%) Diphenyl sulfone (29%) Dibenzothiophene sulfone (5%) Biphenyl (1%) Benzene sulfonate (29%)

			Dibenzothiophene (3)
54	Benzothiophene sulfone	100%	Styrene (13%)

[0094] The foregoing description of the embodiments of this invention has been presented for purposes of illustration and description. It is not intended to be exhaustive or to limit the invention to the precise form disclosed, and obviously, many modifications and variations are possible. Such modifications and variations that may be apparent to a person skilled in the art are intended to be included within the scope of the above described invention.

CLAIMS

1. A method of upgrading a heteroatom-containing hydrocarbon feed by removing heteroatom contaminants, the method comprising:
 - contacting the heteroatom-containing hydrocarbon feed with an oxidant;
 - contacting the oxidized heteroatom-containing hydrocarbon feed with at least one caustic and at least one selectivity promoter, said at least one selectivity promoter comprising an organic compound having at least one acidic proton; and
 - removing the heteroatom contaminants from the heteroatom-containing hydrocarbon feed.
2. The method of claim 1, wherein the at least one caustic and the at least one selectivity promoter are different components.
3. The method of claim 1, wherein the selectivity promoter has a pKa value, as measured in DMSO, in the range of from about 9 to about 32.
4. The method of claim 1, wherein the at least one selectivity promoter further comprises a crown ether.
5. The method of claim 1, wherein the at least one selectivity promoter is selected from the group consisting of a hydroxyl- functional organic compound; straight, branched, or cyclic amines having at least one H substituent; and/or mixtures thereof.
6. The method of claim 5, wherein the at least one selectivity promoter is a hydroxyl-functional organic compound.
7. The method of claim 6, wherein the hydroxyl-functional organic compound is selected from the group consisting of ethylene glycol, propylene glycol, triethanolamine, and/or mixtures thereof.
8. The method of claim 7, wherein the hydroxyl-functional organic compound is ethylene glycol.
9. The method of claim 1, wherein the at least one caustic is selected from the group

consisting of inorganic oxides and sulfides from group IA and IIA elements, inorganic hydroxides from group IA and IIA elements, and/or mixtures thereof.

10. The method of claim 9, wherein the at least one caustic is selected from the group consisting of NaOH, KOH, Na₂S, and or mixtures thereof.

11. The method of claim 1, wherein the at least one caustic and the at least one selectivity promoter are the same component.

12. The method of claim 11, wherein the same component is formed in situ.

13. The method of claim 11, wherein the at least one caustic is a Group IA or IIA hydroxide and the at least one selectivity promoter is ethylene glycol.

14. The method of claim 11, wherein the same component is formed prior to contacting the oxidized heteroatom-containing hydrocarbon feed with at least one caustic and at least one selectivity promoter.

15. The method of claim 1, wherein the removal of the heteroatom contaminants from the heteroatom-containing hydrocarbon feed is by gravity.

16. The method of claim 1, wherein the removal of the heteroatom contaminants from the heteroatom-containing hydrocarbon feed is by solvent extraction with water.

17. The method of claim 1, wherein the mole ratio of caustic: selectivity promoter is in the range of from about 10:1 to about 1:10.

18. The method of claim 1, wherein the mole ratio of caustic and selectivity promoter: heteroatom in the heteroatom-containing hydrocarbon feed is in the range of from about 100:1 to about 1:1.

19. A method of upgrading a heteroatom-containing hydrocarbon feed by removing heteroatom contaminants, the method comprising oxidizing dibenzothiophenes in the heteroatom-containing feed to sulfones, contacting the sulfones under oxidizing biphasic conditions with an oxidant to remove at least a portion of the heteroatom contaminants, then

reacting the sulfones with caustic and a selectivity promoter, and separating a substantially heteroatom-free hydrocarbon product for fuel.

20. The method of claim 19, wherein the heteroatom-free hydrocarbon product has a density in the range of from about 0.7 to about 1.1 g/mL.

USPC: 208/189, 196, 208R, 222, 226, 228, 230, 237, 240, 249, 254R, 295, 299, 325, 326

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched
unrestricted keyword search of patent and NPL literature, classification search, citation analysis

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)
Patbase, Google Patents, Google Scholar, Google; keywords: Oil, petroleum, Brent, paraffin*, crude, hydrocarbon*, glycol*, diol*, alcohol*, (selectivity wf2 promoter*), alkali, caustic, soda, potash, hydroxide, ammoniua, amine, triphosphate, carbonate, alcoholate, oxidizer*, oxidant*, oxygen, air, chlorine, hypochlorite, peroxide*, hydroperoxide*,

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X ----- Y	US 2011/0031164 A1 (LITZ et al.) 10 February 2011 (10.02.2011); para [0002], [0008], [0009], [0013], [0014], [0015], [0030], [0035], [0040], [0046], [0051]	1-3, 5-10, 15, 19 ----- 4, 11-14, 16-18, 20
Y	US 6,471,852 B1 (Mark et al.) 29 October 2002 (29.10.2002) col 1, lines 50-60; col 2, line 43	4
Y	KR100733571 B1 (RYOO) 22 June 2007 (22.06.2007) (Abstract)	11-14, 17, 18
Y	US 2011/0011771 A1 (LITZ et al.) 20 January 2011 (20.01.2011) para [0108]	16
Y	US 2005/0023188 A1 (CONNOR) 03 February 2005 (03.02.2005) para [0002], [0006], [0007], [0008], [0022]	20
A	Online Material by D.H. Ripin et al. Entitled: 'pKa's of Inorganic and Oxo Acids'; URL: http://evans.harvard.edu/pdf/evans_pka_table.pdf ; published 04.11.2005; accessed 01.02.2013; applies to claim 3	3

☐ Further documents are listed in the continuation of Box C. ☐

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance
"E" earlier application or patent but published on or after the international filing date
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
"O" document referring to an oral disclosure, use, exhibition or other means
"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

Date of the actual completion of the international search
02 February 2013 (02/02/2013)

Date of mailing of the international search report

26 FEB 2013
