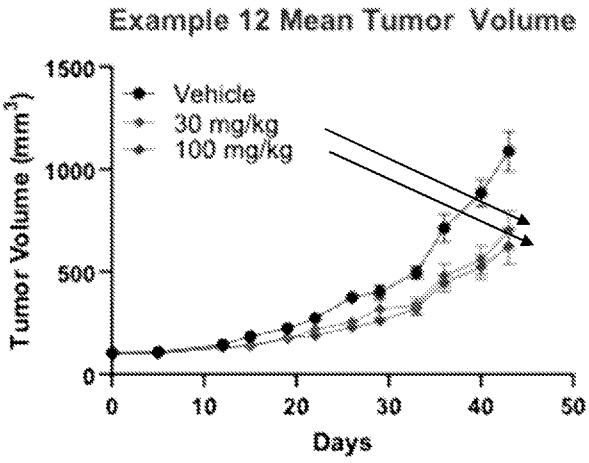
(54) Title: COMPOSITIONS COMPRISING USP1 INHIBITORS AND METHODS OF USING THE SAME

FIG. 1



(57) Abstract: The subject matter described herein relates to compositions comprising Ubiquitin- Specific Protease 1 (USP1) inhibitors and methods of using the same.

WO 2025/129135 A2

COMPOSITIONS COMPRISING USP1 INHIBITORS AND METHODS OF USING THE SAME

CROSS-REFERENCE TO RELATED APPLICATION

This application claims priority to U.S. Provisional Application No. 63/610,860 filed December 15, 2023, the contents of which are incorporated herein by reference in their entirety.

TECHNICAL FIELD

The subject matter described herein relates to compositions comprising Ubiquitin-Specific Protease 1 (USP1) inhibitors and methods of using the same.

BACKGROUND

The USP1 gene encodes a deubiquitinase that is directly involved in DNA damage repair by regulating the ubiquitination of key regulators like PCNA and FANCD2. Overexpression of USP1 is commonly observed in osteosarcoma, colorectal, non-small cell lung, and gastric cancers, and blockade of USP1 induces apoptosis in many cancers. Moreover, several USP1 inhibitors sensitize cancer cells to platinum-, DNA-damaging-, and radiation-induced death. Given the well-established role USP1 as a selective anti-cancer target for inhibition, there remains a need in the art for new USP1 inhibitors for use in the treatment of such cancers.

SUMMARY OF THE INVENTION

In certain aspects, the compositions and methods described herein relate to compositions comprising USP1 inhibitors and methods of their use in treating disease, e.g., cancer.

In certain embodiments, the compositions and methods described herein relate to a compound of formula (I), or a pharmaceutically acceptable salt thereof:

1. Definitions

Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art. In case of conflict, the present document, including definitions, will control. Preferred methods and materials are described below, although methods and materials similar or equivalent to those described herein can be used in practice or testing of the presently disclosed subject matter. All publications, patent applications, patents and other references mentioned herein are incorporated by reference in their entirety. The materials, methods, and examples disclosed herein are illustrative only and not intended to be limiting.

The terms "comprise(s)," "include(s)," "having," "has," "can," "contain(s)," and variants thereof, as used herein, are intended to be open-ended transitional phrases, terms, or words that do not preclude the possibility of additional acts or structures. The singular forms "a," "an" and "the" include plural references unless the context clearly dictates otherwise. The present disclosure also contemplates other instances "comprising," "consisting of", and "consisting essentially of," the instances or elements presented herein, whether explicitly set forth or not.

For the recitation of numeric ranges herein, each intervening number within the range is explicitly contemplated with the same degree of precision. For example, for the range of 6-9, the numbers 7 and 8 are contemplated in addition to 6 and 9, and for the range 6.0-7.0, the number 6.0, 6.1, 6.2, 6.3, 6.4, 6.5, 6.6, 6.7, 6.8, 6.9, and 7.0 are explicitly contemplated.

As used herein, the term "about" or "approximately" means within an acceptable error range for the particular value as determined by one of ordinary skill in the art, which will depend in part on how the value is measured or determined, i.e., the limitations of the measurement system. For example, "about" can mean within 3 or more than 3 standard deviations, per the practice in the art. Alternatively, "about" can mean a range of up to 20%, preferably up to 10%, more preferably up to 5%, and more preferably still up to 1% of a given value. Alternatively, particularly with respect to biological systems or processes, the term can mean within an order of magnitude, preferably within 5-fold, and more preferably within 2-fold, of a value.

As used herein, "modulate" or "modulating" refers to increasing or decreasing, e.g., modulation of the activity of an enzyme includes increasing the activity of the enzyme as well as decreasing the activity of the enzyme.

As used herein, "treat" or "treating" refers to an effort to alter the natural course of a disease, including prophylaxis of the disease, alleviation of symptoms and/or ameliorating pathology associated with the disease.

As used herein, "alkyl" includes both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms and may be unsubstituted or substituted. Thus, C_1-C_n as in "C_1-C_n alkyl" is defined to include groups having 1, 2, ..., n-1 or n carbons in a linear or branched arrangement. For example, C_1-C_6, as in "C_1-C_6 alkyl" is defined to include groups having 1, 2, 3, 4, 5, or 6 carbons in a linear or branched arrangement, and specifically includes methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, pentyl, hexyl, and octyl.

As used herein, "alkenyl" refers to a non-aromatic hydrocarbon radical, straight or branched, containing at least 1 carbon to carbon double bond, and up to the maximum possible number of non-aromatic carbon-carbon double bonds may be present, and may be unsubstituted or substituted. For example, "C_2-C_6 alkenyl" means an alkenyl radical having 2, 3, 4, 5, or 6 carbon atoms, and up to 1, 2, 3, 4, or 5 carbon-carbon double bonds respectively. Alkenyl groups include ethenyl, propenyl, butenyl and cyclohexenyl.

The term "alkynyl" refers to a hydrocarbon radical straight or branched, containing at least 1 carbon to carbon triple bond, and up to the maximum possible number of non-aromatic carbon-carbon triple bonds may be present, and may be unsubstituted or substituted. Thus, "C_2-C_6 alkynyl" means an alkynyl radical having 2 or 3 carbon atoms and 1 carbon-carbon triple bond, or having 4 or 5 carbon atoms and up to 2 carbon-carbon triple bonds, or having 6 carbon atoms and up to 3 carbon-carbon triple bonds. Alkynyl groups include ethynyl, propynyl and butynyl.

As used herein, "heteroalkyl" includes both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms and at least 1 heteroatom within the chain or branch.

As used herein, "cycloalkyl" shall mean cyclic rings of alkanes of three to eight total carbon atoms, or any number within this range (i.e., cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl or cyclooctyl).

As used herein, the term "heterocyclyl" or "heterocyclic" refers to a mono- or poly-cyclic ring system which can be saturated or contains one or more degrees of unsaturation and contains one or more heteroatoms. Preferred heteroatoms include N, O, and/or S, including N-oxides, sulfur oxides, and dioxides. Preferably the ring is three to ten-membered and is either saturated or has one or more degrees of unsaturation. The heterocycle may be unsubstituted or substituted, with multiple degrees of substitution being allowed. Such rings may be optionally fused to one or more of another "heterocyclic" ring(s), heteroaryl ring(s), aryl ring(s), or cycloalkyl ring(s). Examples of heterocycles include, but are not limited to, tetrahydrofuran, pyran, 1,4-dioxane, 1,3-dioxane, piperidine, piperazine, pyrrolidine, morpholine, thiomorpholine, tetrahydrothiopyran, tetrahydrothiophene, 1,3- oxathiolane, and the like. The alkyl, alkenyl, alkynyl, aryl, heteroaryl and heterocyclyl substituents may be substituted or unsubstituted, unless specifically defined otherwise.

As used herein, "aryl" is intended to mean any stable monocyclic, bicyclic or polycyclic carbon ring of up to 10 atoms in each ring, wherein at least one ring is aromatic,

and may be unsubstituted or substituted. Examples of such aryl elements include phenyl, p-toluenyl (4-methylphenyl), naphthyl, tetrahydro-naphthyl, indanyl, biphenyl, phenanthryl, anthryl or acenaphthyl. In cases where the aryl substituent is bicyclic and one ring is non-aromatic, it is understood that attachment is via the aromatic ring.

As used herein, the term "halogen" refers to F, Cl, Br, and I.

As used herein, the term "haloalkyl" means an alkyl group that is substituted with one or more fluorine, chlorine, bromine or iodine atoms. Examples of such haloalkyl include fluoromethyl, difluoromethyl, trifluoromethyl, pentafluoroethyl, 1,1-difluoroethyl, chloromethyl, chlorofluoromethyl and trichloromethyl groups.

As used herein, the term "alkoxy" means an -O-alkyl group in which alkyl is defined herein. Preferably the alkoxy is a C_1-C_6 alkoxy. Examples include, but are not limited to, methoxy and ethoxy. The group may be a terminal group or a bridging group.

The term "substitution," "substituted" and "substituent" refers to a functional group as described above in which one or more bonds to a hydrogen atom contained therein are replaced by a bond to non-hydrogen or non-carbon atoms, provided that normal valencies are maintained and that the substitution results in a stable compound. Substituted groups also include groups in which one or more bonds to a carbon(s) or hydrogen(s) atom are replaced by one or more bonds, including double or triple bonds, to a heteroatom. Examples of substituent groups include the functional groups described herein, and halogens (i.e., F, Cl, Br, and I); alkyl groups, such as methyl, ethyl, n-propyl, and trifluorom ethyl; hydroxyl; alkoxy groups, such as methoxy, ethoxy, n-propoxy, and isopropoxy; aryloxy groups, such as phenoxy; arylalkyloxy. Where multiple substituent moieties are disclosed or claimed, the substituted compound can be independently substituted by one or more of the disclosed or claimed substituent moieties, singly or plurally. By independently substituted, it is meant that the (two or more) substituents can be the same or different. It is understood that substituents and substitution patterns on the compounds of the instant invention can be selected by one of ordinary skill in the art to provide compounds that are chemically stable and that can be readily synthesized by techniques known in the art, as well as those methods set forth below, from readily available starting materials. If a substituent is itself substituted with more than one group, it is understood that these multiple groups may be on the same carbon or on different carbons, so long as a stable structure result.

The compounds of the subject invention may have spontaneous tautomeric forms. In cases wherein compounds may exist in tautomeric forms, such as keto-enol tautomers,

each tautomeric form is contemplated as being included within this invention whether existing in equilibrium or predominantly in one form.

This invention also provides isotopic variants of the compounds disclosed herein, including wherein the isotopic atom is ^{2}H and/or wherein the isotopic atom ^{13}C. Accordingly, in the compounds provided herein hydrogen can be enriched in the deuterium isotope. It is to be understood that the invention encompasses all such isotopic forms.

In the compound structures depicted herein, hydrogen atoms are not shown for carbon atoms having less than four bonds to non-hydrogen atoms. However, it is understood that enough hydrogen atoms exist on said carbon atoms to satisfy the octet rule.

Except where otherwise specified, if the structure of a compound of this invention includes an asymmetric carbon atom, it is understood that the compound occurs as a racemate, racemic mixture, and isolated single enantiomer. All such isomeric forms of these compounds are expressly included in this invention. Except where otherwise specified, each stereogenic carbon may be of the R or S configuration. It is to be understood accordingly that the isomers arising from such asymmetry (e.g., all enantiomers and diastereomers) are included within the scope of this invention, unless indicated otherwise. Such isomers can be obtained in substantially pure form by classical separation techniques and by stereochemically controlled synthesis.

The compounds of the present invention include all hydrates, solvates, and complexes of the compounds used by this invention. If a chiral center or another form of an isomeric center is present in a compound of the present invention, all forms of such isomer or isomers, including enantiomers and diastereomers, are intended to be covered herein. Compounds containing a chiral center may be used as a racemic mixture, an enantiomerically enriched mixture, or the racemic mixture may be separated using well-known techniques and an individual enantiomer may be used alone. The compounds described in the present invention are in racemic form or as individual enantiomers.

In choosing the compounds of the present invention, one of ordinary skill in the art will recognize that the various substituents, i.e., R_1, R_2, etc. are to be chosen in conformity with well-known principles of chemical structure connectivity.

The compounds used in the method of the present invention may be in a salt form. As used herein, a “salt” is a salt of the instant compounds which has been modified by making acid or base salts of the compounds. In the case of compounds used to treat an infection or disease caused by a pathogen, the salt is pharmaceutically acceptable. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid

salts of basic residues such as amines; alkali or organic salts of acidic residues such as phenols. The salts can be made using an organic or inorganic acid. Such acid salts are chlorides, bromides, sulfates, nitrates, phosphates, sulfonates, formates, tartrates, maleates, malates, citrates, benzoates, salicylates, ascorbates, and the like. Phenolate salts are the alkali earth metal salts, sodium, potassium or lithium. The term "pharmaceutically acceptable salt" in this respect, refers to the relatively non-toxic, inorganic and organic acid or base addition salts of compounds of the present invention. These salts can be prepared in situ during the final isolation and purification of the compounds of the invention, or by separately reacting a purified compound of the invention in its free base or free acid form with a suitable organic or inorganic acid or base, and isolating the salt thus formed. Representative salts include the hydrobromide, hydrochloride, sulfate, bisulfate, phosphate, nitrate, acetate, valerate, oleate, palmitate, stearate, laurate, benzoate, lactate, phosphate, tosylate, citrate, maleate, fumarate, succinate, tartrate, napthylate, mesylate, glucoheptonate, lactobionate, and laurylsulphonate salts and the like.

The compounds used in the method of the present invention can be administered in admixture with suitable pharmaceutical diluents, extenders, excipients, or in carriers such as the novel programmable sustained-release multi-compartmental nanospheres (collectively referred to herein as a pharmaceutically acceptable carrier) suitably selected with respect to the intended form of administration and as consistent with conventional pharmaceutical practices. The unit will be in a form suitable for oral, nasal, rectal, topical, intravenous or direct injection or parenteral administration. The compounds can be administered alone or mixed with a pharmaceutically acceptable carrier. This carrier can be a solid or liquid, and the type of carrier is generally chosen based on the type of administration being used. The active agent can be co-administered in the form of a tablet or capsule, liposome, as an agglomerated powder or in a liquid form. Examples of suitable solid carriers include lactose, sucrose, gelatin and agar. Capsule or tablets can be easily formulated and can be made easy to swallow or chew; other solid forms include granules, and bulk powders. Tablets may contain suitable binders, lubricants, diluents, disintegrating agents, coloring agents, flavoring agents, flow- inducing agents, and melting agents. Examples of suitable liquid dosage forms include solutions or suspensions in water, pharmaceutically acceptable fats and oils, alcohols or other organic solvents, including esters, emulsions, syrups or elixirs, suspensions, solutions and/or suspensions reconstituted from non-effervescent granules and effervescent preparations reconstituted from effervescent granules. Such liquid dosage forms may contain, for example, suitable solvents,

preservatives, emulsifying agents, suspending agents, diluents, sweeteners, thickeners, and melting agents. Oral dosage forms optionally contain flavorants and coloring agents. Parenteral and intravenous forms may also include minerals and other materials to make them compatible with the type of injection or delivery system chosen.

Test EXAMPLES

The compounds' activities that target USP-1 protein complex and the compounds' physiochemical and pharmacological properties can be assessed by the following *in vitro* and *in vivo* methods.

USP1 and USP30 Ubiquitin-Rhodamine Activity Assay

To measure USP1 activity, purified recombinant USP1-UAF1 heterodimer (R&D Systems, Cat# E-568) was diluted into assay buffer containing 50mM HEPES pH 8.0, 100nM NaCl, 1 mM EDTA, 1 mM TCEP, 0.01% Tween-20, and 0.5 mg/mL Bovine Serum Albumin. Compounds were dispensed into black, round bottom, low binding, 384-well assay plates (Corning, Cat# 4514) in a 10-pt 3.16 step serial dilution and backfilled with dimethyl sulfoxide to a final concentration of 1% using an Echo acoustic liquid dispenser (Labcyte/Beckman Coulter). 1 μM KSQ-4279 (C_{pos}) and dimethyl sulfoxide (C_{neg}) were used as reference compounds for USP1. Enzymes were dispensed into compound-containing plates using a Multidrop™ Combi liquid dispenser (ThermoFisher). Enzymes were incubated with compounds for 45 minutes at room temperature before adding Ubiquitin-Rhodamine110 substrate (R&D systems, Cat# U-555) for a final concentration of 0.1 nM USP1-UAF1. Reaction proceeded for 45 minutes at room temperature before adding an acetic acid stop solution to a final concentration of 100 mM acetic acid. Assay was read on an Envision 2105 multimode plate reader (Perkin Elmer) with filters and mirrors for 485 nm excitation and 535 nm emission wavelengths.

Percent inhibition was calculated using the following equation: % Inhibition = (FI – C_{pos})/(C_{pos}-C_{neg}) * 100, where FI is the fluorescence intensity of wells treated with test compound. The compound concentration of compound leading to 50% inhibition of enzyme activity (IC_{50}) was carried out by fitting a 4-parameter non-linear regression using GraphPad Prism. IC_{50}s were measured in at least 3 independent experiments for each compound.

Ubiquityl-PCNA Immunofluorescence Assay

All cell lines used were obtained from ATCC. To measure ubiquityl-PCNA (Ub-PCNA) levels, the human colorectal cancer cell lines HCT-116 (CVCL_1724) were used.

Cells were cultured in McCoy 5A media (ThermoFisher Cat# 16600082) supplemented with 10% fetal bovine serum (Cytiva Cat# SH30071.03IH25), 1x penicillin/streptomycin (ThermoFisher Cat# 15140122), 1x non-essential ammino acids (ThermoFisher Cat# 11140050), 2 mM GlutaMAX (ThermoFisher Cat# 35050079). Cells were cultured at 37 ºC in a humidified 5% CO_2 incubator. To seed cells for the assay, cells were trypsinized and resuspended in complete culture media to the desired concentration (60,000 cells/mL). Cell suspensions were seeded in 50 μL of complete culture media and onto 384-well black clear-bottom optical plastic plates (Greiner Bio-One Cat# 781097) using a Multidrop™ Combi liquid dispenser in the slowest setting in triplicate. After 24 h,

cells were treated with compounds in a 10-pt, 3.16 step serial dilution using an Echo acoustic liquid dispenser and incubated at 37 °C in a humidified 5% CO_2 incubator. 10 μM KSQ-4279 (C_{pos}) and dimethyl sulfoxide (C_{neg}) were used as reference compounds.

6 h after compound treatments, cells were fixed in ice cold 100% MeOH for 10 min, washed three times with PBS, with extreme care taken to prevent sample dehydration. Samples were blocked and further permeabilized in 1x PBS containing 10% goat serum and 0.1% triton X-100 for at least 30 min. After blocking and permeabilization, plates were evacuated to decant all media. Recombinant rabbit primary antibody against Ub-PCNA (Lys 164) (Cell Signaling Technology, Cat# #13439, clone D5C7P) in blocking/permeabilization solution was added to plates and incubated for 16 h at 4 °C. After 1° antibody incubation, plates were evacuated and decanted to remove all media. Blocking/permeabilization solution containing the DNA counterstain Hoechst, and a secondary antibody against rabbit (raised in goats) conjugated to a AlexaFluor 647 fluorophore (ThermoFisher Cat# A32728), were added to empty plates, and incubated for 30 min at 25 °C, in the dark. After 2° antibody incubation, plates were washed 5 times in PBS, and sealed with thermal foil seals.

Sealed plates were imaged using an ImageXpress Micro slit confocal microscope (Molecular Devices) using a 40x water immersion objective, and 6 fields of views per well. Exposure parameters were optimized to prevent pixel saturation for each channel. Images were analyzed using MetaXpress Custom Module Editor, by using a Hoechst mask to identify nuclei, then measuring the average AlexaFluor 648 intensity across all nuclei in the FOV, background corrected, then averaged.

Percent Ub-PCNA signal was calculated by using the following equation: $\%S = (T - C_{pos})/(C_{pos} - C_{neg}) * 100$, where %S is percent Ub-PCNA signal and T is the measured Ub-PCNA fluorescence of the wells treated with test compound, C_{pos} and C_{neg} are reference compounds defined above. The effective compound concentration leading to a 50% induction of Ub-PCNA signal (EC_{50}), and the resulting cell Ub-PCNA signal measured at the highest tested compound tested (c_{max}) was carried out by fitting a 4-parameter non-linear regression using GraphPad Prism. At least three biological replicates were done per compound tested.

MDA-MB-436 Cell Viability Assay:

The human breast cancer cell line MDA-MB-436 (ATCC cat. no. HTB-130) was used to assess the effect of compound treatment on cellular viability. The complete media for the cells was prepared by supplementing RPMI 1640 + GlutaMAX (Gibco cat. no. 61870-036) with 10% fetal bovine serum (Corning cat. no. 35-015-CV), and 1x

penicillin/streptomycin (Gibco cat. no. 15140-122). The cells were maintained at 37°C / 5% CO_2 (similar incubation conditions were used throughout the experiment).

For the Viability Assay, cells were resuspended in complete media at 6,250 cells/mL and seeded into 384-well, white, clear-bottom plates (ThermoFisher cat. no. 142762) at 40 mL/well (250 cells/well). Following overnight incubation, cells were compound treated (10-pt 3.16 step serial dilution) and backfilled with dimethyl sulfoxide to a final concentration of 1% using an Echo acoustic liquid dispenser (Labcyte/Beckman Coulter). 10 mM KSQ-4279 (C_{pos}) and dimethyl sulfoxide (C_{neg}) were used as reference compounds. Eleven days post compound addition, viability was assessed by measuring cellular ATP concentrations. Briefly, an equivalent volume (40 mL/well) of CellTiter-Glo 2.0 reagent (Promega cat. no. G9241) was added and plates were mixed on a plate shaker (700rpm) for 2 minutes. Plates were then allowed to equilibrate for 10 minutes at room temperature before taking luminescence readings using an EnVision Multimode Plate Reader (Perkin Elmer).

Percent inhibition of cell growth (%INH) was calculated by the following equation: $\%INH = 100 - ((RLU_{TC} - RLU_{Cpos}) / (RLU_{Cpos} - RLU_{Cneg}) * 100)$, where RLU_{TC} is the measured luminescence of the wells treated with test compound, and RLU_{Cpos} and RLU_{Cneg} the measured luminescence of the positive and negative controls, respectively. The effective compound concentration leading to a 50% inhibition of cell growth (IC_{50}) was determined by fitting %INH and compound concentration values to a 4-parameter non-linear regression equation (using GraphPad Prism or CDD). At least three biological replicates were done per compound tested.

Caco-2 Permeability Assay:

Preparation of stock solutions: 10 mM stock solutions of test compounds were prepared in DMSO. The stock solutions of positive controls were prepared in DMSO at the concentration of 10 mM. Digoxin, minoxidil and propranolol were used as control compounds in this assay.

Preparation of Caco-2 cells: 50 μL and 25 mL of cell culture medium were added to each well of the Transwell insert and reservoir, respectively. And then the HTS transwell plates were incubated at 37 °C, 5% CO_2 for 1 hour before cell seeding. Caco-2 cells were diluted to $6.86x10^5$ cells/mL with culture medium and 50 μL of cell suspension were dispensed into the filter well of the 96-well HTS Transwell plate. Cells were cultivated for 14-18 days in a cell culture incubator at 37 °C, 5% CO_2, 95% relative humidity. Cell culture medium was replaced every other day, beginning no later than 24 hours after initial plating.

Assessment of cell monolayer integrity: Medium was removed from the reservoir and each Transwell insert and replaced with prewarmed fresh culture medium. Transepithelial electrical resistance (TEER) across the monolayer was measured using Millicell Epithelial Volt-Ohm measuring system (Millipore, USA). The plate was returned to the incubator once the measurement was done. The TEER value was calculated according to the following equation:

TEER measurement (ohms) x Area of membrane (cm2) = TEER value (ohm•cm2)

TEER value should be greater than 230 ohm•cm2 , which indicates the well-qualified Caco-2 monolayer.

Assay procedure: The Caco-2 plate was removed from the incubator and washed twice with pre-warmed HBSS (10 mM HEPES, pH 7.4), and then incubated at 37 °C for 30 minutes. The stock solutions of control compounds and test compounds were diluted in DMSO to get 1 mM solutions and then diluted with HBSS (10 mM HEPES, pH 7.4) get 5 μM working solutions. The final concentration of DMSO in the incubation system was 0.5%. To determine the rate of drug transport in the apical to basolateral direction. 125 μL of 5 μM working solution of control compounds and test compounds were added to the Transwell insert (apical compartment) and transfer 50 μL sample (D_0 sample) immediately from the apical compartment to a new 96-well plate. Fill the wells in the receiver plate (basolateral compartment) with 235 μL of HBSS (10 mM HEPES, pH 7.4). To determine the rate of drug transport in the basolateral to apical direction. 285 μL of 5 μM working solution of control compounds and test compounds were to the receiver plate wells (basolateral compartment), and transfer 50 μL sample (D_0 sample) immediately from the basolateral compartment to a new 96-well plate. Fill the wells in the Transwell insert (apical compartment) with 75 μL of HBSS (10 mM HEPES, pH 7.4). The assay was performed in duplicate. The plates were incubated at 37 °C for 2 hours. At the end of the incubation, 50 μL samples from donor sides (apical compartment for Ap→Bl flux, and basolateral compartment for Bl→Ap) and receiver sides (basolateral compartment for Ap→Bl flux, and apical compartment for Bl→Ap) were transferred to wells of a new 96-well plate, followed by the addition of 4 volume of cold MeCN containing appropriate internal standards (IS). Samples were Vortexed for 5 minutes and then centrifuged at 3,220 g for 40 minutes. An aliquot of 100 μL of the supernatant was mixed with an appropriate volume of ultra-pure water before LCMS/MS analysis. To determine the Lucifer Yellow leakage after 2 hour transport period, stock solution of Lucifer yellow was prepared in water and diluted with HBSS (10 mM HEPES, pH 7.4) to reach the final concentration of 100 μM. 100 μL of the Lucifer yellow solution was added to each Transwell insert (apical compartment), followed by filling the wells in the receiver plate (basolateral compartment) with 300 μL of HBSS (10 mM HEPES, pH 7.4). The plates were Incubated at 37 °C for 30 mins. 80 μL samples were removed directly from the apical and basolateral wells (using the basolateral access holes) and transferred to wells of new 96 wells plates. The Lucifer Yellow fluorescence (to monitor monolayer integrity) signal was measured in a fluorescence plate reader at 485 nM excitation and 530 nM emission. The apparent permeability coefficient (Papp), in units of centimeter per second, can be calculated for Caco-2 drug transport assays using the following equation: Papp = (VA×[drug]acceptor)/(Area×Time×[drug]initial,donor). Where

VA is the volume (in mL) in the acceptor well, Area is the surface area of the membrane (0.143 cm^2 for Transwell-96 Well Permeable Supports), and time is the total transport time in seconds. The efflux ratio will be determined using the following equation: Efflux Ratio=Papp(B-A)/Papp(A-B).

Hepatocyte Stability Assay:

Prepare 10 mM stock solutions of test compound(s) and positive control in appropriate solvent (DMSO). In separate conical tubes, dilute the 10 mM test compound and the positive control to 100 µM by combining 495 µL of 50% MeCN/50% water and 5 µL of 10 mM stock. Preparation of hepatocytes: Place incubation medium (William's E Medium supplemented with GlutaMAX) and hepatocyte thawing medium in a 37°C water bath and allow warming for at least 15 minutes prior to use. Remove a vial of cryopreserved hepatocytes from storage, ensuring that vials remain at cryogenic temperatures until thawing process ensues. Thaw the cells by placing the vial in a 37°C water bath and gently shaking the vials for 2 minutes. After thawing is completed, spray vial with 70% ethanol, transfer the vial to a biosafety cabinet. Use wide-bore pipette tip to transfer hepatocytes into 50 mL conical tube containing thawing medium. Place the 50 mL conical tube into a centrifuge and spin at 100 g for 10 minutes. Upon completion of spin, aspirate thawing medium and resuspend hepatocytes in enough incubation medium to yield ~1.5 × 106 cells/mL. Using an AOPI staining solution, count cells and determine the viable cell density. Cells with poor viability (<75% viability) are not acceptable for use. Dilute cells with incubation medium to a working cell density of 0.5×10^6 viable cells/mL. A portion of the hepatocytes at 0.5×10^6 viable cells/mL should be boiled for 5 min prior to adding to the plate as representative of a negative control. This will eliminate the enzymatic activity so that little or no substrate turnover should be observed.

Procedure for Stability Determination: Pipette 198 µL of hepatocytes into each wells of a 96-well non-coated plate. Place the plate in the incubator on an orbital shaker to allow the hepatocytes to warm for 10 minutes. Pipette 2 µL of the 100 µM test compound or positive control into respective wells of the 96-well non-coated plate to start the reaction. The final concentration of test compound or control compounds was 1 µM. Return the plate to the incubator and place on an orbital shaker. Remove well contents in 25 µL aliquots at time points of 0 and 60 minutes. The aliquots are then mixed with 6 volumes (150 µL) of MeCN containing internal standards (IS: 100 nM alprazolam, 200 nM labetalol, 200 nM caffeine and 2 µM ketoprofen) to terminate the reaction. Centrifuge the plate for 20 minutes at 3,220 g. Aliquot of 100 µL of the supernatant was mixed with 100 µL of ultra-pure H_2O and then used for LCMS/MS analysis. All incubations will be performed in duplicate.

MDA-MB-436 Efficacy Model:

Evaluation of In Vivo Efficacy in a Subcutaneous MDA-MB-436 Xenograft Model

All mice studies were performed at the Mispro Vivarium facility in New York, NY, and were conducted according to the guidelines of the Mispro Institutional Animal Care and Use Committee and Eikon Therapeutics protocol. MDA-MB-436 cells ($2.5x10^6$ cells/mouse in 50% Matrigel:50% HBSS) were injected subcutaneously into the right hind flank of female NOD/SCID mice at 7-9 weeks of age. Body weight was measured twice weekly. Tumor length (L) and width (W) were measured twice weekly using digital calipers to calculate tumor volumes using the following formula: 0.5*L*W^2. Once tumor volumes reached an average of approximately 100 mm^3, mice were randomly assigned (n=8) into treatment groups. Mice were treated daily by oral gavage (10 mL/kg). Animals were euthanized if body weight loss >20% was observed, tumor volume achieved >1500 mm^3, or a humane endpoint was reached. Means with error bars representing s.e.m. were plotted. The treatment groups were as follows: (1) Vehicle (0.5% HPMC, 0.1% Tween 80); (2) Example 12 30 mg/kg (FIG. 1); (3) Example 12 100 mg/kg (FIG. 1); (4) Example 21 30 mg/kg (FIG. 2); (5) Example 21 100 mg/kg (FIG. 2); (6) Example 129 30 mg/kg (FIG. 3); (7) Example 129 100 mg/kg (FIG. 3); (8) Example 133 30 mg/kg (FIG. 4); (9) Example 133 100 mg/kg (FIG. 4).
