BACKGROUND

Synthetic RNA and Nucleic-Acid Therapeutics

Ribonucleic acid (RNA) is ubiquitous in both prokaryotic and eukaryotic cells, where it encodes genetic information in the form of messenger RNA, binds and transports amino acids in the form of transfer RNA, assembles amino acids into proteins in the form of ribosomal RNA, and performs numerous other functions including gene expression regulation in the forms of microRNA and long non-coding RNA. RNA can be produced synthetically by methods including direct chemical synthesis and *in vitro* transcription, and can be administered to patients for therapeutic use. However, previously described synthetic RNA molecules are unstable and trigger a potent innate-immune response in human cells. In addition, methods for efficient non-viral delivery of nucleic acids to patients, organs, tissues, and cells *in vivo* have not been previously described. The many drawbacks of existing synthetic RNA technologies and methods for delivery of nucleic acids make them undesirable for therapeutic or cosmetic use.

Cell Reprogramming and Cell-Based Therapies

Cells can be reprogrammed by exposing them to specific extracellular cues and/or by ectopic expression of specific proteins, microRNAs, *etc.* While several reprogramming methods have been previously described, most that rely on ectopic expression require the introduction of exogenous DNA, which can carry mutation risks. DNA-free reprogramming methods based on direct delivery of reprogramming proteins have been reported. However, these methods are too inefficient and unreliable for commercial use. In addition, RNA-based reprogramming

2016218977 17 Jun 2022

methods have been described (see, e.g., Angel. MIT Thesis. 2008. 1-56; Angel et al. PLoS ONE. 2010. 5,107; Warren et al. Cell Stem Cell. 2010. 7,618-630; Angel. MIT Thesis. 2011. 1-89; and Lee et al. Cell. 2012. 151,547 558; the contents of all of which are hereby incorporated by reference). However, existing RNA-based reprogramming methods are slow, unreliable, and inefficient when performed on adult cells, require many transfections (resulting in significant expense and opportunity for error), can reprogram only a limited number of cell types, can reprogram cells to only a limited number of cell types, require the use of immunosuppressants, and require the use of multiple human-derived components, including blood-derived HSA and human fibroblast feeders. The many drawbacks of previously disclosed RNA-based reprogramming methods make them undesirable for research, therapeutic or cosmetic use.

Gene Editing

Several naturally occurring proteins contain DNA-binding domains that can recognize specific DNA sequences, for example, zinc fingers (ZFs) and transcription activator-like effectors (TALEs). Fusion proteins containing one or more of these DNA-binding domains and the cleavage domain of FokI endonuclease can be used to create a double-strand break in a desired region of DNA in a cell (see, e.g., US Patent Appl. Pub. No. US 2012/0064620, US Patent Appl. Pub. No. US 2011/0239315, US Patent No. 8,470,973, US Patent Appl. Pub. No. US 2013/0217119, US Patent No. 8,420,782, US Patent Appl. Pub. No. US 2011/0301073, US Patent Appl. Pub. No. US 2011/0145940, US Patent No. 8,450,471, US Patent No. 8,440,431, US Patent No. 8,440,432, and US Patent Appl. Pub. No. 2013/0122581, the contents of all of which are hereby incorporated by reference). Other gene-editing proteins include clustered regularly interspaced short palindromic repeat (CRISPR)-associated proteins. However, current methods for gene editing cells are inefficient and carry a risk of uncontrolled mutagenesis, making them undesirable for research, therapeutic or cosmetic use. Methods for DNA-free gene editing of somatic cells have not been previously explored, nor have methods for simultaneous or sequential gene editing and reprogramming of somatic cells. In addition, methods for directly gene editing cells in patients (i.e., in vivo) have not been previously explored, and the development of such methods has been limited by a lack of acceptable targets, inefficient delivery, inefficient expression of the gene-editing protein/proteins, inefficient gene editing by the expressed gene-editing protein/proteins, due in part to poor binding of DNA-binding domains, excessive off-target effects, due in part to non-directed dimerization of the FokI cleavage domain and poor specificity of DNA-binding domains, and other factors. Finally, the use of gene editing in anti-bacterial, anti viral, and anti-cancer treatments has not been previously explored.

Accordingly, there remains a need for improved methods and compositions for the production and delivery of nucleic acids to cells, tissues, organs, and patients.

DETAILED DESCRIPTION OF THE INVENTION

The present invention is based, in part, on the discovery of a safe and effective dosing strategy for nucleic acid drugs, including RNA, such as RNA comprising non-canonical (or "modified") nucleotides, in humans. The inventors believe this to be the first report of safe and effective dosing of RNA molecules, including those comprising non-canonical nucleotides, in humans. Despite reports in the art that very large doses of RNA

molecules are needed for mammalian dosing, and minimal therapeutic effect is achieved despite high dosing (*see, e.g.* US Patent Publication No. 2013/0245103), the present inventors have surprisingly managed to dose synthetic RNA in a human and achieve significant target protein expression with minimal immunological or other side effects.

In various embodiments, the present invention provides improved doses, formulations, administration and methods of use of nucleic acid drugs, which include RNA, which may contain non-canonical nucleotides (*e.g.* a residue other than adenine, guanine, thymine, uracil, and cytosine or the standard nucleoside, nucleotide, deoxynucleoside or deoxynucleotide derivatives thereof). In various embodiments, the RNA comprising non-canonical nucleotides leads to the expression of a protein encoded by the RNA, the protein often being one of therapeutic benefit (sometimes called the "target" or "protein of interest"). Further, this expression of therapeutic protein is achieved with minimal or negligible toxicity.

In various aspects, the present invention is based on the surprising discovery of safe and effective doses and administration parameters of nucleic acid drugs for human subjects. Nucleic acid drugs include a dsDNA molecule, a ssDNA molecule, a RNA molecule, a dsRNA molecule, a ssRNA molecule, a plasmid, an oligonucleotide, a synthetic RNA molecule, a miRNA molecule, an mRNA molecule, and an siRNA molecule. In various embodiments, the RNA comprises non-canonical nucleotides.

In some aspects, there is provided a method for delivering a nucleic acid drug, comprising administering an effective dose of a nucleic acid drug to a human subject in need thereof, wherein the nucleic acid drug comprises a synthetic RNA. In various embodiments, the effective dose is an amount sufficient to substantially increase an amount of a protein encoded by the nucleic acid drug in the human subject. For example, when the nucleic acid drug is a synthetic RNA comprising one or more modified nucleotides, the nucleic acid drug may result in higher protein expression than levels obtainable with a nucleic acid drug that does not comprise one or more modified nucleotides (*e.g.*, RNA comprising the canonical nucleotides A, G, U, and C). In some embodiments, the nucleic acid drug results in about a 2-fold, or about a 3-fold, or about a 4-fold, or about a 5-fold, or about a 10-fold, or about a 15-fold, or about a 20-fold, or about a 25-fold, or about a 30-fold, or about a 35-fold, or about a 40-fold, or about a 45-fold, or about a 50-fold, or about a 100-fold increase in protein expression as compared to levels obtainable with a nucleic acid drug that does not comprise one or more modified nucleotides.

In some embodiments, the nucleic acid drug provides a sustained therapeutic effect that is optionally mediated by a sustained expression of target protein. For instance, in some embodiments, the therapeutic effect is present for over about 1 day, or over about 2 days, or over about 3 days, or over about 4 days, or over about 5 days, or over about 6 days, or over about 7 days, or over about 8 days, or over about 9 days, or over about 10 days, or over about 14 days after administration. In some embodiments, this sustained effect obviates the need for, or reduces the amount of, maintenance doses.

In some embodiments, the nucleic acid drug provides a sustained target protein level. For instance, in some embodiments, the target protein is present (*e.g.* in measurable amounts, *e.g.* in the serum of a patient to whom the nucleic acid drug has been administered) for over about 1 day, or over about 2 days, or over about 3 days, or over about 4 days, or over about 5 days, or over about 6 days, or over about 7 days, or over about 8 days, or over about 9 days, or over about 10 days, or over about 14 days after administration. In some embodiments, this sustained effect obviates the need for, or reduces the amount of, maintenance doses.

In various embodiments, the nucleic acid drug provides therapeutic action without sustained presence of the nucleic acid drug itself. In some embodiments, the nucleic acid drug is rapidly metabolized, for instance, within about 6 hours, or about 12 hours, or about 18 hours, or about 24 hours, or about 2 days, or about 3 days, or about 4 days, or about 5 days, or about 1 week from administration.

In various embodiments, the effective dose is an amount that substantially avoids cell toxicity *in vivo*. In various embodiments, the effective dose is an amount that substantially avoids an immune reaction in a human subject. For example, the immune reaction may be an immune response mediated by the innate immune system. Immune response can be monitored using markers known in the art (*e.g.* cytokines, interferons, TLRs). In some embodiments, the effective dose obviates the need for treatment of the human subject with immune suppressants agents (*e.g.* B18R) used to moderate the residual toxicity. Accordingly, in some embodiments, the present methods allow for dosing that provides increased protein expression and reduces toxicity.

In some embodiments, the immune response is reduced by about 10%, about 20%, about 30%, about 40%, about 50%, about 60%, about 70%, about 80%, about 90%, about 95%, about 99%, about 99.9%, or greater than about 99.9% as compared to the immune response induced by a corresponding unmodified nucleic acid. In some embodiments, upregulation of one or more immune response markers is reduced by about 10%, about 20%, about 30%, about 40%, about 50%, about 60%, about 70%, about 80%, about 90%, about 95%, about 99%, about 99.9%, or greater than about 99.9% as compared to the upregulation of the one or more immune response markers induced by a corresponding unmodified nucleic acid. In some embodiments, the immune response marker comprises an mRNA or protein product of an interferon gene, including an interferon alpha gene, IFNB1, TLR3, RARRES3, EIF2AK2, STAT1, STAT2, IFIT1, IFIT2, IFIT3, IFIT5, OAS1, OAS2, OAS3, OASL, ISG20 or a fragment, variant, analogue, or family-member thereof. In some embodiments, the immune response marker comprises an mRNA or protein product of an TNF gene, including an TNF alpha gene, TNFRSF1A; TNFRSF1B; LTBR; TNFRSF4; CD40; FAS; TNFRSF6B; CD27; TNFRSF8; TNFRSF9; TNFRSF10A; TNFRSF10B; TNFRSF10C; TNFRSF10D; TNFRSF11A; TNFRSF11B; TNFRSF12A; TNFRSF13B; TNFRSF13C; TNFRSF14; NGFR; TNFRSF17; TNFRSF18; TNFRSF19; TNFRSF21; TNFRSF25; and EDA2R or a fragment, variant, analogue, or family-member thereof. In some embodiments, the immune response marker comprises an mRNA or protein product of an interleukin gene, including an IL-6 gene, IL-1; IL-2; IL-3; IL-4; IL-5; IL-6; IL-7; IL-8 or CXCL8; IL-9; IL-10; IL-11; IL-12; IL-13; IL-14; IL-15; IL-16; IL-17; IL-18; IL-19;

IL-20; IL-21; IL-22; IL-23; IL-24; IL-25; IL-26; IL-27; IL-28; IL-29; IL-30; IL-31; IL-32; IL-33; IL-35; IL-36 or a fragment, variant, analogue, or family-member thereof.

In some embodiments, cell death is about 10%, about 25%, about 50%, about 75%, about 85%, about 90%, about 95%, or over about 95% less than the cell death observed with a corresponding unmodified nucleic acid. Moreover, cell death may affect fewer than about 50%, about 40%, about 30%, about 20%, about 10%, about 5%, about 1%, about 0.1%, about 0.01% or fewer than about 0.01% of cells contacted with the modified nucleic acids.

In some embodiments, there is provided a method for expressing a protein of interest in a population of cells in a mammalian subject, comprising administering a non-viral transfection composition comprising an effective dose of a RNA encoding the protein of interest to said cells, the RNA containing one or more non-canonical nucleotides that avoid substantial cellular toxicity, where the transfection composition is administered in an amount that allows for expression of said protein in said cells for at least about five days (*e.g.* about 5, or about 6, or about 7, about 8, or about 9, or about 10, or about 14 days) without substantial cellular toxicity. In some embodiments, there is provided a method for expressing a protein of interest in a population of cells in a mammalian subject, comprising administering a non-viral transfection composition comprising an effective dose of a RNA encoding the protein of interest to said cells, the RNA containing one or more non-canonical nucleotides that avoid substantial cellular toxicity, where the transfection composition is administered in an amount that allows for expression of said protein in said cells for at least about six hours (*e.g.* about six hours, or about 12 hours, or about 1 day, or about 2 days, or about 3 days, or about 4 days, or about 5 days) without substantial cellular toxicity.

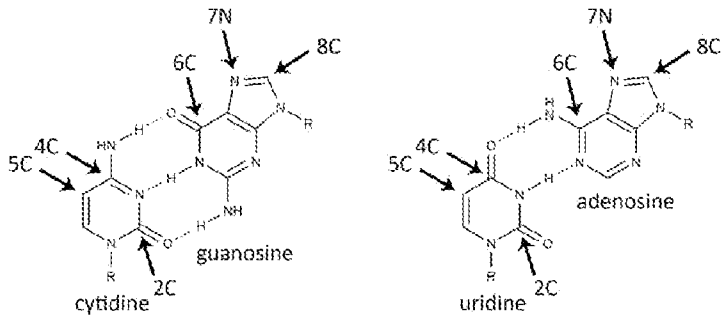
Certain proteins have long half-lives, and can persist in tissues for several hours, days, weeks, months or years. It has now been discovered that certain methods of treating a patient can result in accumulation of one or more

proteins, including, for example, one or more beneficial proteins. Certain embodiments are therefore directed to a method for treating a patient comprising delivering to a patient in a series of doses a nucleic acid encoding one or more proteins. In one embodiment the nucleic acid comprises RNA comprising one or more non-canonical nucleotides. In another embodiment, a first dose is given at a first time-point. In yet another embodiment, a second dose is given at a second time-point. In a further embodiment, the amount of at least one of the one or more proteins in the patient at the second time-point is greater than the amount of said protein at the first time-point. In a still further embodiment, the method results in the accumulation of said protein in the patient.

In various embodiments, the present invention relates to nucleic acid drugs, which, in various embodiments are RNA comprising one or more non-canonical nucleotides. Certain non-canonical nucleotides, when incorporated into RNA molecules, can reduce the toxicity of the RNA molecules, in part, without wishing to be bound by theory, by interfering with binding of proteins that detect exogenous nucleic acids, for example, protein kinase R, Rig-1 and the oligoadenylate synthetase family of proteins. Non-canonical nucleotides that have been reported to reduce the toxicity of RNA molecules when incorporated therein include: pseudouridine, 5-methyluridine, 2-thiouridine, 5-methylcytidine, N6-methyladenosine, and certain combinations thereof. However, the chemical characteristics of non-canonical nucleotides that can enable them to lower the *in vivo* toxicity of RNA molecules have, until this point, remained unknown. Furthermore, incorporation of large amounts of most non-canonical nucleotides, for example, 5-methyluridine, 2-thiouridine, 5-methylcytidine, and N6-methyladenosine, can reduce the efficiency with which RNA molecules can be translated into protein, limiting the utility of RNA molecules containing these nucleotides in applications that require protein expression. In addition, while pseudouridine can be completely substituted for uridine in RNA molecules without reducing the efficiency with which the synthetic RNA molecules can be translated into protein, in certain situations, for example, when performing frequent, repeated transfections, synthetic RNA molecules containing only adenosine, guanosine, cytidine, and pseudouridine can exhibit excessive toxicity.

It has now been discovered that, and in some embodiments the invention pertains to, RNA molecules containing one or more non-canonical nucleotides that include one or more substitutions at the 2C and/or 4C and/or 5C positions in the case of a pyrimidine or the 6C and/or 7N and/or 8C positions in the case of a purine can be less toxic than synthetic RNA molecules containing only canonical nucleotides, due in part to the ability of substitutions at these positions to interfere with recognition of synthetic RNA molecules by proteins that detect exogenous nucleic acids, and furthermore, that substitutions at these positions can have minimal impact on the efficiency with which the synthetic RNA molecules can be translated into protein, due in part to the lack of interference of substitutions at these positions with base-pairing and base-stacking interactions.



Examples of non-canonical nucleotides that include one or more substitutions at the 2C and/or 4C and/or 5C positions in the case of a pyrimidine or the 6C and/or 7N and/or 8C positions in the case of a purine include, but are not limited to: 2-thiouridine, 5-azauridine, pseudouridine, 4-thiouridine, 5-methyluridine, 5-methylpseudouridine, 5-aminouridine, 5-aminopseudouridine, 5-hydroxyuridine, 5-hydroxypseudouridine, 5-methoxyuridine, 5-methoxypseudouridine, 5-hydroxymethyluridine, 5-hydroxymethylpseudouridine, 5-carboxyuridine, 5-carboxypseudouridine, 5-formyluridine, 5-formylpseudouridine, 5-methyl-5-azauridine, 5-amino-5-azauridine, 5-hydroxy-5-azauridine, 5-methylpseudouridine, 5-aminopseudouridine, 5-hydroxypseudouridine, 4-thio-5-azauridine, 4-thiopseudouridine, 4-thio-5-methyluridine, 4-thio-5-aminouridine, 4-thio-5-hydroxyuridine, 4-thio-5-methyl-5-azauridine, 4-thio-5-amino-5-azauridine, 4-thio-5-hydroxy-5-azauridine, 4-thio-5-methylpseudouridine, 4-thio-5-aminopseudouridine, 4-thio-5-hydroxypseudouridine, 2-thiocytidine, 5-azacytidine, pseudoisocytidine, N4-methylcytidine, N4-aminocytidine, N4-hydroxycytidine, 5-methylcytidine, 5-aminocytidine, 5-hydroxycytidine, 5-methoxycytidine, 5-hydroxymethylcytidine, 5-carboxycytidine, 5-formylcytydine, 5-methyl-5-azacytidine, 5-amino-5-azacytidine, 5-hydroxy-5-azacytidine, 5-methylpseudoisocytidine, 5-aminopseudoisocytidine, 5-hydroxypseudoisocytidine, N4-methyl-5-azacytidine, N4-methylpseudoisocytidine, 2-thio-5-azacytidine, 2-thiopseudoisocytidine, 2-thio-N4-methylcytidine, 2-thio-N4-aminocytidine, 2-thio-N4-hydroxycytidine, 2-thio-5-methylcytidine, 2-thio-5-aminocytidine, 2-thio-5-hydroxycytidine, 2-thio-5-methyl-5-azacytidine, 2-thio-5-amino-5-azacytidine, 2-thio-5-hydroxy-5-azacytidine, 2-thio-5-methylpseudoisocytidine, 2-thio-5-aminopseudoisocytidine, 2-thio-5-hydroxypseudoisocytidine, 2-thio-N4-methyl-5-azacytidine, 2-thio-N4-methylpseudoisocytidine, N4-methyl-5-methylcytidine, N4-methyl-5-aminocytidine, N4-methyl-5-hydroxycytidine, N4-methyl-5-methyl-5-azacytidine, N4-methyl-5-amino-5-azacytidine, N4-methyl-5-hydroxy-5-azacytidine, N4-methyl-5-methylpseudoisocytidine, N4-methyl-5-aminopseudoisocytidine, N4-methyl-5-hydroxypseudoisocytidine, N4-amino-5-azacytidine, N4-aminopseudoisocytidine, N4-amino-5-methylcytidine, N4-amino-5-aminocytidine, N4-amino-5-hydroxycytidine, N4-amino-5-methyl-5-azacytidine, N4-amino-5-amino-5-azacytidine, N4-amino-5-hydroxy-5-azacytidine, N4-amino-5-methylpseudoisocytidine, N4-amino-5-aminopseudoisocytidine, N4-amino-5-hydroxypseudoisocytidine, N4-hydroxy-5-azacytidine, N4-hydroxypseudoisocytidine, N4-hydroxy-5-methylcytidine, N4-hydroxy-5-aminocytidine, N4-hydroxy-5-hydroxycytidine, N4-hydroxy-5-methyl-5-azacytidine, N4-hydroxy-5-amino-5-azacytidine, N4-hydroxy-5-hydroxy-5-azacytidine, N4-hydroxy-5-methylpseudoisocytidine, N4-hydroxy-5-aminopseudoisocytidine, N4-hydroxy-5-hydroxypseudoisocytidine, 2-thio-N4-methyl-5-methylcytidine, 2-thio-N4-

In another embodiment, the one or more nucleotides includes: pseudoisocytidine and 7-deazaguanosine and pseudouridine. In one embodiment, the RNA comprising one or more non-canonical nucleotides is present *in vivo.*

Certain non-canonical nucleotides can be incorporated more efficiently than other non-canonical nucleotides into RNA molecules by RNA polymerases that are commonly used for *in vitro* transcription, due in part to the tendency of these certain non-canonical nucleotides to participate in standard base-pairing interactions and base-stacking interactions, and to interact with the RNA polymerase in a manner similar to that in which the corresponding canonical nucleotide interacts with the RNA polymerase. As a result, certain nucleotide mixtures containing one or more non-canonical nucleotides can be beneficial in part because *in vitro*-transcription reactions containing these nucleotide mixtures can yield a large quantity of RNA. Certain embodiments are therefore directed to a nucleotide mixture containing one or more nucleotides that includes one or more substitutions at the 2C and/or 4C and/or 5C positions in the case of a pyrimidine or the 6C and/or 7N and/or 8C

positions in the case of a purine. Nucleotide mixtures include, but are not limited to (numbers preceding each nucleotide indicate an exemplary fraction of the non-canonical nucleotide triphosphate in an *in vitro*-transcription reaction, for example, 0.2 pseudoisocytidine refers to a reaction containing adenosine-5'-triphosphate, guanosine-5'-triphosphate, uridine-5'-triphosphate, cytidine-5'-triphosphate, and pseudoisocytidine-5'-triphosphate, wherein pseudoisocytidine-5'-triphosphate is present in the reaction at an amount approximately equal to 0.2 times the total amount of pseudoisocytidine-5'-triphosphate + cytidine-5'-triphosphate that is present in the reaction, with amounts measured either on a molar or mass basis, and wherein more than one number preceding a nucleoside indicates a range of exemplary fractions): 1.0 pseudouridine, 0.1 – 0.8 2-thiouridine, 0.1 – 0.8 5-methyluridine, 0.2 – 1.0 5-hydroxyuridine, 0.2 – 1.0 5-methoxyuridine, 0.1 – 1.0 5-aminouridine, 0.1 – 1.0 4-thiouridine, 0.1 – 1.0 2-thiopseudouridine, 0.1 – 1.0 4-thiopseudouridine, 0.1 – 1.0 5-hydroxypseudouridine, 0.2 – 1 5-methylpseudouridine, 0.2 – 1.0 5-methoxypseudouridine, 0.1 – 1.0 5-aminopseudouridine, 0.2 – 1.0 2-thiocytidine, 0.1 – 0.8 pseudoisocytidine, 0.2 – 1.0 5-methylcytidine, 0.2 – 1.0 5-hydroxycytidine, 0.2 – 1.0 5-hydroxymethylcytidine, 0.2 – 1.0 5-methoxycytidine, 0.1 – 1.0 5-aminocytidine, 0.2 – 1.0 N4-methylcytidine, 0.2 – 1.0 5-methylpseudoisocytidine, 0.2 – 1.0 5-hydroxypseudoisocytidine, 0.2 – 1.0 5-aminopseudoisocytidine, 0.2 – 1.0 N4-methylpseudoisocytidine, 0.2 – 1.0 2-thiopseudoisocytidine, 0.2 – 1.0 7-deazaguanosine, 0.2 – 1.0 6-thioguanosine, 0.2 – 1.0 6-thio-7-deazaguanosine, 0.2 – 1.0 8-azaguanosine, 0.2 – 1.0 7-deaza-8-azaguanosine, 0.2 – 1.0 6-thio-8-azaguanosine, 0.1 – 0.5 7-deazaadenosine, and 0.1 – 0.5 N6-methyladenosine.

In various embodiments, the RNA comprising one or more non-canonical nucleotides composition or synthetic polynucleotide composition (*e.g.*, which may be prepared by in vitro transcription) contains substantially or entirely the canonical nucleotide at positions having adenine or "A" in the genetic code. The term "substantially" in this context refers to at least 90%. In these embodiments, the RNA composition or synthetic polynucleotide composition may further contain (*e.g.*, consist of) 7-deazaguanosine at positions with "G" in the genetic code as well as the corresponding canonical nucleotide "G", and the canonical and non-canonical nucleotide at positions with G may be in the range of 5:1 to 1:5, or in some embodiments in the range of 2:1 to 1:2. In these embodiments, the RNA composition or synthetic polynucleotide composition may further contain (*e.g.*, consist of) one or more (*e.g.*, two, three or four) of 5-hydroxycytidine, 5-methylcytidine, 5-hydroxymethylcytidine, 5-carboxycytidine, 5-formylcytidine, 5-methoxycytidine at positions with "C" in the genetic code as well as the canonical nucleotide "C", and the canonical and non-canonical nucleotide at positions with C may be in the range of 5:1 to 1:5, or in some embodiments in the range of 2:1 to 1:2. In some embodiments, the level of non-canonical nucleotide at positions of "C" are as described in the preceding paragraph. In these embodiments, the RNA composition or synthetic polynucleotide composition may further contain (*e.g.*, consist of) one or more (*e.g.*, two, three, or four) of 5-hydroxyuridine, 5-methyluridine, 5-hydroxymethyluridine, 5-carboxyuridine, 5-formyluridine, 5-methoxyuridine, pseudouridine, 5-hydroxypseudouridine, 5-methylpseudouridine, 5-hydroxymethylpseudouridine, 5-carboxypseudouridine, 5-formylpseudouridine, and 5-methoxypseudouridineat positions with "U" in the genetic code as well as the canonical nucleotide "U", and the canonical and non-canonical nucleotide at positions with "U" may be in the range of 5:1 to 1:5, or in some embodiments in the range

of 2:1 to 1:2. In some embodiments, the level of non-canonical nucleotide at positions of "U" are as described in the preceding paragraph.

It has now been discovered that combining certain non-canonical nucleotides can be beneficial in part because the contribution of non-canonical nucleotides to lowering the toxicity of RNA molecules can be additive. Certain embodiments are therefore directed to a nucleotide mixture, wherein the nucleotide mixture contains more than one of the non-canonical nucleotides listed above, for example, the nucleotide mixture contains both pseudoisocytidine and 7-deazaguanosine or the nucleotide mixture contains both N4-methylcytidine and 7-deazaguanosine, *etc.* In one embodiment, the nucleotide mixture contains more than one of the non-canonical nucleotides listed above, and each of the non-canonical nucleotides is present in the mixture at the fraction listed above, for example, the nucleotide mixture contains 0.1 – 0.8 pseudoisocytidine and 0.2 – 1.0 7-deazaguanosine or the nucleotide mixture contains 0.2 – 1.0 N4-methylcytidine and 0.2 – 1.0 7-deazaguanosine, *etc.*

In certain situations, for example, when it may not be necessary or desirable to maximize the yield of an *in vitro*-transcription reaction, nucleotide fractions other than those given above may be used. The exemplary fractions and ranges of fractions listed above relate to nucleotide-triphosphate solutions of typical purity (greater than 90% purity). Larger fractions of these and other nucleotides can be used by using nucleotide-triphosphate solutions of greater purity, for example, greater than about 95% purity or greater than about 98% purity or greater than about 99% purity or greater than about 99.5% purity, which can be achieved, for example, by purifying the nucleotide triphosphate solution using existing chemical-purification technologies such as high-pressure liquid chromatography (HPLC) or by other means. In one embodiment, nucleotides with multiple isomers are purified to enrich the desired isomer.

Other embodiments are directed to a method for inducing a cell *in vivo* to express a protein of interest by contacting the cell with a RNA molecule that contains one or more non-canonical nucleotides that includes one or more substitutions at the 2C and/or 4C and/or 5C positions in the case of a pyrimidine or the 6C and/or 7N and/or 8C positions in the case of a purine. Still other embodiments are directed to a method for transfecting, reprogramming, and/or gene-editing a cell *in vivo* by contacting the cell with a RNA molecule that contains one or more non-canonical nucleotides that includes one or more substitutions at the 2C and/or 4C and/or 5C positions in the case of a pyrimidine or the 6C and/or 7N and/or 8C positions in the case of a purine. In one embodiment, the RNA molecule is produced by *in vitro* transcription. In one embodiment, the RNA molecule encodes one or more reprogramming factors. In another embodiment, the one or more reprogramming factors includes Oct4 protein. In another embodiment, the cell is also contacted with a RNA molecule that encodes Sox2 protein. In yet another embodiment, the cell is also contacted with a RNA molecule that encodes Klf4 protein. In yet another embodiment, the cell is also contacted with a RNA molecule that encodes c-Myc protein. In yet another embodiment, the cell is also contacted with a RNA molecule that encodes Lin28 protein.

Enzymes such as T7 RNA polymerase may preferentially incorporate canonical nucleotides in an *in vitro*-transcription reaction containing both canonical and non-canonical nucleotides. As a result, an *in vitro*-

transcription reaction containing a certain fraction of a non-canonical nucleotide may yield RNA containing a different, often lower, fraction of the non-canonical nucleotide than the fraction at which the non-canonical nucleotide was present in the reaction. In certain embodiments, references to nucleotide incorporation fractions (for example, "a synthetic RNA molecule containing 50% pseudoisocytidine" or "0.1 – 0.8 pseudoisocytidine") therefore can refer both to RNA molecules containing the stated fraction of the nucleotide, and to RNA molecules synthesized in a reaction containing the stated fraction of the nucleotide (or nucleotide derivative, for example, nucleotide-triphosphate), even though such a reaction may yield RNA containing a different fraction of the nucleotide than the fraction at which the non-canonical nucleotide was present in the reaction.

Different nucleotide sequences can encode the same protein by utilizing alternative codons. In certain embodiments, references to nucleotide incorporation fractions therefore can refer both to RNA molecules containing the stated fraction of the nucleotide, and to RNA molecules encoding the same protein as a different RNA molecule, wherein the different RNA molecule contains the stated fraction of the nucleotide.

Certain embodiments are directed to a kit containing one or more materials needed to practice the present invention. In one embodiment, the kit contains one or more synthetic RNA molecules. In one embodiment, the kit contains one or more synthetic RNA molecules that encode one or more reprogramming factors and/or gene-editing proteins. In another embodiment, the one or more synthetic RNA molecules contain one or more non-canonical nucleotides that include one or more substitutions at the 2C and/or 4C and/or 5C positions in the case of a pyrimidine or the 6C and/or 7N and/or 8C positions in the case of a purine. In another embodiment, the kit contains one or more of: a transfection medium, a transfection reagent, a complexation medium, and a matrix solution. In one embodiment, the matrix solution contains fibronectin and/or vitronectin or recombinant fibronectin and/or recombinant vitronectin. In one embodiment, one or more of the components of the kit are present as a plurality of aliquots. In one embodiment, the kit contains aliquots of nucleic acid transfection-reagent complexes. In another embodiment, the kit contains aliquots of nucleic acid transfection-reagent complexes that are provided in a solid form, for example, as frozen or freeze-dried pellets. In yet another embodiment, the kit contains aliquots of medium, wherein each aliquot contains transfection reagent-nucleic acid complexes that are stabilized either by chemical treatment or by freezing.

Transfection, in general, and reprogramming, in particular, can be difficult and time-consuming techniques that can be repetitive and prone to error. However, these techniques are often performed manually due to the lack of automated transfection equipment. Certain embodiments are therefore directed to a system that can transfect, reprogram, and/or gene-edit cells *in vivo* in an automated or semi-automated manner.

It has now been discovered that the non-canonical nucleotide members of the 5-methylcytidine de-methylation pathway, when incorporated into synthetic RNA, can increase the efficiency with which the synthetic RNA can be translated into protein *in vivo*, and can decrease the toxicity of the synthetic RNA *in vivo*. These non-canonical nucleotides include, for example: 5-methylcytidine, 5-hydroxymethylcytidine, 5-formylcytidine, and 5-carboxycytidine (a.k.a. "cytidine-5-carboxylic acid"). Certain embodiments are directed to a protein. Other embodiments are directed to a nucleic acid that encodes a protein. In one embodiment, the protein is a protein of interest. In another embodiment, the protein is selected from: a reprogramming protein and a gene-editing protein. In one embodiment, the nucleic acid is a plasmid. In another embodiment, the nucleic acid is present in a virus or viral vector. In a further embodiment, the virus or viral vector is replication incompetent. In a still further embodiment, the virus or viral vector is replication competent. In one embodiment, the virus or viral vector includes at least one of: an adenovirus, a retrovirus, a lentivirus, a herpes virus, an adeno-associated virus or a natural or engineered variant thereof, and an engineered virus.

It has also been discovered that certain combinations of non-canonical nucleotides can be particularly effective at increasing the efficiency with which synthetic RNA can be translated into protein *in vivo*, and decreasing the toxicity of synthetic RNA *in vivo*, for example, the combinations: 5-methyluridine and 5-methylcytidine, 5-hydroxyuridine and 5-methylcytidine, 5-hydroxyuridine and 5-hydroxymethylcytidine, 5-methyluridine and 7-deazaguanosine, 5-methylcytidine and 7-deazaguanosine, 5-methyluridine, 5-methylcytidine, and 7-deazaguanosine, and 5-methyluridine, 5-hydroxymethylcytidine, and 7-deazaguanosine. Certain embodiments are therefore directed to a nucleic acid comprising at least two of: 5-methyluridine, 5-methylcytidine, 5-

hydroxymethylcytidine, and 7-deazaguanosine or one or more derivatives thereof. Other embodiments are directed to a nucleic acid comprising at least three of: 5-methyluridine, 5-methylcytidine, 5-hydroxymethylcytidine, and 7-deazaguanosine or one or more derivatives thereof. Other embodiments are directed to a nucleic acid comprising all of: 5-methyluridine, 5-methylcytidine, 5-hydroxymethylcytidine, and 7-deazaguanosine or one or more derivatives thereof. In one embodiment, the nucleic acid comprises one or more 5-methyluridine residues, one or more 5-methylcytidine residues, and one or more 7-deazaguanosine residues or one or more 5-methyluridine residues, one or more 5-hydroxymethylcytidine residues, and one or more 7-deazaguanosine residues.

It has been further discovered that synthetic RNA molecules containing certain fractions of certain non-canonical nucleotides and combinations thereof can exhibit particularly high translation efficiency and low toxicity *in vivo*. Certain embodiments are therefore directed to a nucleic acid comprising at least one of: one or more uridine residues, one or more cytidine residues, and one or more guanosine residues, and comprising one or more non-canonical nucleotides. In one embodiment, between about 20% and about 80% of the uridine residues are 5-methyluridine residues. In another embodiment, between about 30% and about 50% of the uridine residues are 5-methyluridine residues. In a further embodiment, about 40% of the uridine residues are 5-methyluridine residues. In one embodiment, between about 60% and about 80% of the cytidine residues are 5-methylcytidine residues. In another embodiment, between about 80% and about 100% of the cytidine residues are 5-methylcytidine residues. In a further embodiment, about 100% of the cytidine residues are 5-methylcytidine residues. In a still further embodiment, between about 20% and about 100% of the cytidine residues are 5-hydroxymethylcytidine residues. In one embodiment, between about 20% and about 80% of the guanosine residues are 7-deazaguanosine residues. In another embodiment, between about 40% and about 60% of the guanosine residues are 7-deazaguanosine residues. In a further embodiment, about 50% of the guanosine residues are 7-deazaguanosine residues. In one embodiment, between about 20% and about 80% or between about 30% and about 60% or about 40% of the cytidine residues are N4-methylcytidine and/or N4-acetylcytidine residues. In another embodiment, each cytidine residue is a 5-methylcytidine residue. In a further embodiment, about 100% of the cytidine residues are 5-methylcytidine residues and/or 5-hydroxymethylcytidine residues and/or N4-methylcytidine residues and/or N4-acetylcytidine residues and/or one or more derivatives thereof. In a still further embodiment, about 40% of the uridine residues are 5-methyluridine residues, between about 20% and about 100% of the cytidine residues are N4-methylcytidine and/or N4-acetylcytidine residues, and about 50% of the guanosine residues are 7-deazaguanosine residues. In one embodiment, about 40% of the uridine residues are 5-methyluridine residues and about 100% of the cytidine residues are 5-methylcytidine residues. In another embodiment, about 40% of the uridine residues are 5-methyluridine residues and about 50% of the guanosine residues are 7-deazaguanosine residues. In a further embodiment, about 100% of the cytidine residues are 5-methylcytidine residues and about 50% of the guanosine residues are 7-deazaguanosine residues. In a further embodiment, about 100% of the uridine residues are 5-hydroxyuridine residues. In one embodiment, about 40% of the uridine residues are 5-methyluridine residues, about 100% of the cytidine

residues are 5-methylcytidine residues, and about 50% of the guanosine residues are 7-deazaguanosine residues. In another embodiment, about 40% of the uridine residues are 5-methyluridine residues, between about 20% and about 100% of the cytidine residues are 5-hydroxymethylcytidine residues, and about 50% of the guanosine residues are 7-deazaguanosine residues. In some embodiments, less than 100% of the cytidine residues are 5-methylcytidine residues. In other embodiments, less than 100% of the cytidine residues are 5-hydroxymethylcytidine residues. In one embodiment, each uridine residue in the synthetic RNA molecule is a pseudouridine residue or a 5-methylpseudouridine residue. In another embodiment, about 100% of the uridine residues are pseudouridine residues and/or 5-methylpseudouridine residues. In a further embodiment, about 100% of the uridine residues are pseudouridine residues and/or 5-methylpseudouridine residues, about 100% of the cytidine residues are 5-methylcytidine residues, and about 50% of the guanosine residues are 7-deazaguanosine residues.

Other non-canonical nucleotides that can be used in place of or in combination with 5-methyluridine include, but are not limited to: pseudouridine, 5-hydroxyuridine, 5-hydroxypseudouridine, 5-methoxyuridine, 5-methoxypseudouridine, 5-carboxyuridine, 5-carboxypseudouridine, 5-formyluridine, 5-formylpseudouridine, 5-hydroxymethyluridine, 5-hydroxymethylpseudouridine, and 5-methylpseudouridine (a.k.a. "1-methylpseudouridine", a.k.a. "N1-methylpseudouridine") or one or more derivatives thereof. Other non-canonical nucleotides that can be used in place of or in combination with 5-methylcytidine and/or 5-hydroxymethylcytidine include, but are not limited to: pseudoisocytidine, 5-methylpseudoisocytidine, 5-hydroxymethylcytidine, 5-formylcytidine, 5-carboxycytidine, 5-methoxycytidine, N4-methylcytidine, N4-acetylcytidine or one or more derivatives thereof. In certain embodiments, for example, when performing only a single transfection, injection or delivery or when the cells, tissue, organ or patient being transfected, injected or delivered to are not particularly sensitive to transfection-associated toxicity or innate-immune signaling, the fractions of non-canonical nucleotides can be reduced. Reducing the fraction of non-canonical nucleotides can be beneficial, in part, because reducing the fraction of non-canonical nucleotides can reduce the cost of the nucleic acid. In certain situations, for example, when minimal immunogenicity of the nucleic acid is desired, the fractions of non-canonical nucleotides can be increased.

Enzymes such as T7 RNA polymerase may preferentially incorporate canonical nucleotides in an *in vitro*-transcription reaction containing both canonical and non-canonical nucleotides. As a result, an *in vitro*-transcription reaction containing a certain fraction of a non-canonical nucleotide may yield RNA containing a different, often lower, fraction of the non-canonical nucleotide than the fraction at which the non-canonical nucleotide was present in the reaction. In certain embodiments, references to nucleotide incorporation fractions (for example, "50% 5-methyluridine") therefore can refer both to nucleic acids containing the stated fraction of the nucleotide, and to nucleic acids synthesized in a reaction containing the stated fraction of the nucleotide (or nucleotide derivative, for example, nucleotide-triphosphate), even though such a reaction may yield a nucleic acid containing a different fraction of the nucleotide than the fraction at which the non-canonical nucleotide was

present in the reaction. In addition, different nucleotide sequences can encode the same protein by utilizing alternative codons. In certain embodiments, references to nucleotide incorporation fractions therefore can refer both to nucleic acids containing the stated fraction of the nucleotide, and to nucleic acids encoding the same protein as a different nucleic acid, wherein the different nucleic acid contains the stated fraction of the nucleotide.

In a further embodiment, the 3'-poly(A) tail is between about 20 nt and about 250 nt or between about 120 nt and about 150 nt long. In a further embodiment, the 3'-poly(A) tail is about 20 nt, or about 30 nt, or about 40 nt, or about 50 nt, or about 60 nt, or about 70 nt, or about 80 nt, or about 90 nt, or about 100 nt, or about 110 nt, or about 120 nt, or about 130 nt, or about 140 nt, or about 150 nt, or about 160 nt, or about 170 nt, or about 180 nt, or about 190 nt, or about 200 nt, or about 210 nt, or about 220 nt, or about 230 nt, or about 240 nt, or about 250 nt long.

In various embodiments, the present invention contemplates the targeting of the precursor forms and/or mature forms and/or isoforms of any of the proteins disclosed in **Table 2B**.

In various embodiments, the present invention contemplates the targeting of a protein having about 60% (*e.g.* about 60%, or about 61%, or about 62%, or about 63%, or about 64%, or about 65%, or about 66%, or about 67%, or about 68%, or about 69%, or about 70%, or about 71%, or about 72%, or about 73%, or about 74%, or

about 75%, or about 76%, or about 77%, or about 78%, or about 79%, or about 80%, or about 81%, or about 82%, or about 83%, or about 84%, or about 85%, or about 86%, or about 87%, or about 88%, or about 89%, or about 90%, or about 91%, or about 92%, or about 93%, or about 94%, or about 95%, or about 96%, or about 97%, or about 98%, or about 99%) sequence identity with any of the protein sequences disclosed herein (*e.g.* in **Table 2B**).

In various embodiments, the present invention contemplates the targeting of a protein comprising an amino acid sequence having one or more amino acid mutations relative to any of the protein sequences described herein (*e.g.* in **Table 2B**). For example, the present invention contemplates the targeting of a protein comprising an amino acid sequence having 1, or 2, or 3, or 4, or 5, or 6, or 7, or 8, or 9, or 10, or 11, or 12 amino acid mutations relative to any of the protein sequences described herein (*e.g.* in **Table 2B**). In some embodiments, the one or more amino acid mutations may be independently selected from substitutions, insertions, deletions, and truncations.

In some embodiments, the amino acid mutations are amino acid substitutions, and may include conservative and/or non-conservative substitutions.

"Conservative substitutions" may be made, for instance, on the basis of similarity in polarity, charge, size, solubility, hydrophobicity, hydrophilicity, and/or the amphipathic nature of the amino acid residues involved. The 20 naturally occurring amino acids can be grouped into the following six standard amino acid groups: (1) hydrophobic: Met, Ala, Val, Leu, Ile; (2) neutral hydrophilic: Cys, Ser, Thr; Asn, Gln; (3) acidic: Asp, Glu; (4) basic: His, Lys, Arg; (5) residues that influence chain orientation: Gly, Pro; and (6) aromatic: Trp, Tyr, Phe.

As used herein, "conservative substitutions" are defined as exchanges of an amino acid by another amino acid listed within the same group of the six standard amino acid groups shown above. For example, the exchange of Asp by Glu retains one negative charge in the so modified polypeptide. In addition, glycine and proline may be substituted for one another based on their ability to disrupt α-helices.

As used herein, "non-conservative substitutions" are defined as exchanges of an amino acid by another amino acid listed in a different group of the six standard amino acid groups (1) to (6) shown above.

In various embodiments, the substitutions may also include non-classical amino acids (*e.g.* selenocysteine, pyrrolysine, *N*-formylmethionine β-alanine, GABA and δ-Aminolevulinic acid, 4-aminobenzoic acid (PABA), D-isomers of the common amino acids, 2,4-diaminobutyric acid, α-amino isobutyric acid, 4-aminobutyric acid, Abu, 2-amino butyric acid, γ-Abu, ε-Ahx, 6-amino hexanoic acid, Aib, 2-amino isobutyric acid, 3-amino propionic acid, ornithine, norleucine, norvaline, hydroxyproline, sarcosme, citrulline, homocitrulline, cysteic acid, t-butylglycine, t-butylalanine, phenylglycine, cyclohexylalanine, β-alanine, fluoro-amino acids, designer amino acids such as β methyl amino acids, C α-methyl amino acids, N α-methyl amino acids, and amino acid analogs in general).

In various embodiments, the nucleic acid drug, including synthetic RNA, is administered is a manner that it effects one or more of keratinocytes and fibroblasts (*e.g.* causes these cells to express one or more therapeutic proteins). For example, present methods allow for methods in which a patient's cells are used to generate a therapeutic protein and the levels of such protein are tailored by synthetic RNA dosing.

In a specific embodiment, the synthetic RNA targets a soluble protein. In some embodiments, the synthetic RNA targets a protein of one or more of the following families of proteins: transforming growth factor (TGF) beta, bone

morphogenetic proteins (BMPs), Fibroblast growth factors (FGFs), vascular endothelial growth factors (VEGFs), and interleukins. The terms “family”, “superfamily”, and “subfamily” can be used interchangeably

In a specific embodiment, the synthetic RNA targets a member of the TGF beta family. TGF-β superfamily proteins comprise cytokines characterized by six-conserved cysteine residues (Lander *et al.*, (2001) Nature, 409:860-921). The human genome contains at least about 42 open reading frames encoding TGF-β superfamily proteins. TGF-β superfamily proteins can at least be divided into the BMP subfamily and the TGF-β subfamily based on sequence similarity and the specific signaling pathways that they activate. In various embodiments, the synthetic RNA targets one or more of TGFs (*e.g.*, TGF-β1, TGF-β2, and TGF-β3), activins (*e.g.*, activin A) and inhibins, macrophage inhibitory cytokine-1 (MIC-1), Mullerian inhibiting substance, anti-Mullerian hormone, and glial cell line derived neurotrophic factor (GDNF).

The TGF-β superfamily comprises a subset of the cysteine knot cytokine superfamily. Additional members of the cysteine knot cytokine superfamily include, but are not limited to, platelet derived growth factor (PDGF), vascular endothelial growth factor (VEGF), placenta growth factor (P1GF), Noggin, neurotrophins (BDNF, NT3, NT4, and βNGF), gonadotropin, follitropin, lutropin, interleukin-17, and coagulogen. This family of proteins is also among the targets encompassed by the present invention.

In various embodiments, the present invention relates to targeting a TGF beta family member for treatment or prevention of various immunological disorders, cancer, bronchial asthma, lung fibrosis, heart disease, diabetes, hereditary hemorrhagic telangiectasia, Marfan syndrome, Vascular Ehlers-Danlos syndrome, Loeys–Dietz syndrome, Parkinson's disease, chronic kidney disease, multiple sclerosis and AIDS.

In a specific embodiment, the synthetic RNA targets a member of the BMP family. The BMP subfamily includes, but is not limited to, BMP-2, BMP-3 (osteogenin), BMP-3b (GDF-10), BMP-4 (BMP-2b), BMP-5, BMP-6, BMP-7 (osteogenic protein-1 or OP-1), BMP-8 (OP-2), BMP-8B (OP-3), BMP-9 (GDF-2), BMP-10, BMP-11 (GDF-11), BMP-12 (GDF-7), BMP-13 (GDF-6, CDMP-2), BMP-15 (GDF-9), BMP-16, GDF-1, GDF-3, GDF-5 (CDMP-1), and GDF-8 (myostatin). In various embodiments, the synthetic RNA targets one or more of BMP-2, BMP-3 (osteogenin), BMP-3b (GDF-10), BMP-4 (BMP-2b), BMP-5, BMP-6, BMP-7 (osteogenic protein-1 or OP-1), BMP-8 (OP-2), BMP-8B (OP-3), BMP-9 (GDF-2), BMP-10, BMP-11 (GDF-11), BMP-12 (GDF-7), BMP-13 (GDF-6, CDMP-2), BMP-15 (GDF-9), BMP-16, GDF-1, GDF-3, GDF-5 (CDMP-1), and GDF-8 (myostatin). BMPs are sometimes referred to as Osteogenic Protein (OPs), Growth Differentiation Factors (GDFs), or Cartilage-Derived Morphogenetic Proteins (CDMPs). In a specific embodiment, the synthetic RNA targets one or more BMP fusions (*e.g.* as described in US Patent Publication No. 2009/0202638, the entire contents of which are hereby incorporated by reference) and/or one or more BMP mutants (*e.g.* as described in US Patent Publication No. 2011/0039773, the entire contents of which are hereby incorporated by reference).

In various embodiments, the present invention relates to targeting a BMP family member for regenerative medicine or metabolic applications, including without limitation orthopedic applications such as spinal fusions,

nonunions and oral surgerie, metabolic disease, prediabetes, diabetes, thermogenesis, insulin sensitivity, insulin resistance, and adipogenesis, including brown-fat adipogenesis. Various other metabolic applications are described elesewhere herein. In various embodiments, the present invention relates to targeting a BMP family member, including BMP-7, for treatment of chronic kidney disease (CKD) and/or to reverse the loss of glomeruli due to sclerosis.

In various embodiments, the present invention relates to targeting a BMP family member to induce proliferation of bone and cartilage in a variety of locations in the body. For example, repair of joints such as knee, elbow, ankle, and finger joints are contemplated by the invention. For example, targeting a BMP family member may result in regenerating cartilage in patients suffering from arthritis or other cartilage degenerating diseases. Further, the invention pertains to treating tears in cartilage due to injury. In addition, the invention is useful for inducing bone growth in patients, for instance, by way of non-limitation, for use in treating patients suffering from bone fractures or breaks, osteoporosis, or patients in need of spinal fusion or for repair of the spine, vertebrae or the like.

In various embodiments, the present invention relates to targeting a BMP family member to induce a developmental cascade of bone morphogenesis and tissue morphogenesis for a variety of tissues in mammals different from bone or bone cartilage. This morphogenic activity includes the ability to induce proliferation and differentiation of progenitor cells, and the ability to support and maintain the differentiated phenotype through the progression of events that results in the formation of bone, cartilage, non-mineralized skeletal or connective tissues, and other adult tissues.

For example, the present invention may be used for treatment to prevent loss of and/or increase bone mass in metabolic bone diseases. General methods for treatment to prevent loss of and/or increase bone mass in metabolic bone diseases using osteogenic proteins are disclosed in US Pat. No. 5,674,844, the entire contents of which are hereby incorporated by reference. Further the present compositions and methods find use in replacing or repairing bone or cartilage at injury sites such as bone breaks, bone fractures, and cartilage tears, periodontal tissue regeneration (*e.g.* general methods for periodontal tissue regeneration using osteogenic proteins are disclosed in US Pat. No. 5,733,878, the entire contents of which are hereby incorporated by reference), liver regeneration, including following a partial hepatectomy (*see, e.g.*, US Pat. No. 5,849,686, the entire contents of which are hereby incorporated by reference), treatment of chronic renal failure (*see, e.g.,* US. Pat. No. 6,861,404, the entire contents of which are hereby incorporated by reference), enhancing functional recovery following central nervous system ischemia or trauma (*see, e.g.* US Pat. No. 6,407,060, the entire contents of which are hereby incorporated by reference), inducing dendritic growth (*see, e.g.,* US Pat. No. 6,949,505, the entire contents of which are hereby incorporated by reference), inducing neural cell adhesion (*see, e.g.,* US Pat. No. 6,800,603, the entire contents of which are hereby incorporated by reference), and treatment and prevention of Parkinson's disease (*see, e.g.,* US Pat. No. 6,506,729, the entire contents of which are hereby incorporated by reference). As another example, the present compositions and methods, including

when targeting one or more BMPs, can be used to induce dentinogenesis. To date, the unpredictable response of dental pulp tissue to injury is a basic clinical problem in dentistry. Using standard dental surgical procedures, small areas (*e.g.*, 2 mm) of dental pulps can be surgically exposed by removing the enamel and dentin immediately above the pulp (by drilling) of sample teeth, performing a partial amputation of the coronal pulp tissue, inducing hemostasis, application of the pulp treatment, and sealing and filling the cavity by standard procedures.

In various embodiments, the present invention relates to targeting a BMP family member for the treatment of one or more metabolic-related disorders as described herein.

In a specific embodiment, the synthetic RNA targets a member of the FGF family. FGFs are a family of growth factors, with members involved in angiogenesis, wound healing, embryonic development and various endocrine signaling pathways. In various embodiments, any one of the following FGFs are targets of the invention: FGF1, FGF2, FGF3, FGF4, FGF5, FGF6, FGF7, FGF8, FGF9, FGF10, FGF11, FGF12, FGF13, FGF14 (FGF11, FGF12, FGF13, and FGF14 being FGF homologous factors 1-4 (FHF1-FHF4)), FGF16, FGF17, FGF18, FGF19 (aka FHF15/19), FGF20, FGF21, FGF22 and FGF22. The present invention also encompasses as targets VEGF-related proteins including orf virus-encoded VEGF-like proteins referred to as VEGF-E and a series of snake venoms referred to as VEGF-F. VEGFs and VEGF-related proteins are members of the Platelet Derived Growth Factor (PDGF) supergene family of cystine knot growth factors. All members of the PDGF supergene family share a high degree of structural homology with PDGF.

In a specific embodiment, the synthetic RNA targets a member of the interleukin family. The interleukins represent a large group of cytokines with diverse functions and were first characterized by expression in leukocytes and have since been shown to be expressed in a wide variety of cells, for example macrophages, TH-1 and TH-2 cells, T- lymphocytes, monocytes and bone marrow stroma. Broadly, the function of the immune system depends in a large part on the expression and function of the interleukins. In some embodiments, the target is one or more of interleukins 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 , 32, 33, 35 and 36, and, within each species of interleukin, various isotypes and/or interleukin receptors (*e.g.*, IL-1R, IL-2R, IL-3R, IL-4R, IL-5R, IL-6R, IL-7R, IL-8R, IL-9R, IL-10R, IL-11R, IL-12R, IL-13R, IL-14R, IL-15R, IL-16R, IL-17R, IL-18R, IL-19R, IL-20R, IL-21R, IL-22R, IL-23R, IL-24R, IL-25R, IL-26, IL-27R, IL-28R, IL-29R, IL-30R, IL-31R, IL-32R, IL-33R, IL-34R, IL-35R, and IL-36R). In a specific embodiment, both IL-15 and IL-15R (*e.g.*, IL-15RA) are targeted. Without wishing to be bound by theory, it is believed that the targeting of both interleukin (*e.g.*, IL-15) and its cognitive interleukin receptor (*e.g.*, IL-15RA) results in synergistic beneficial effects. In various embodiments, the present invention relates to targeting a member of the interleukin family to treat cancer, inflammatory, respiratory, autoimmune, cardiovascular, neurological, metabolic, and/or proliferative diseases, disorders, and/or conditions in a subject or organism, as described herein. Erythropoietin can stimulate erythropoiesis in anemic patients with chronic renal failure in whom the endogenous production of erythropoietin is impaired. Without being bound by theory, because of the length of time often required for erythropoiesis (several days for erythroid progenitors to mature and be released into the circulation), a clinically significant increase in hemoglobin is usually not observed in less than two weeks and may require up to ten weeks in some patients. The present methods and compositions provide, in some embodiments, more rapid therapeutic effect. The present methods and compositions provide, in some embodiments, more rapid therapeutic effect, for instance, when compared to wild type EPO and/or EPO without non-canonical nucleotides and/or EPO delivered as a protein biologic. The present methods and compositions provide, in some embodiments, a sustained therapeutic effect. The present methods and compositions provide, in some embodiments, a sustained therapeutic effect, for instance, when compared to wild type EPO and/or EPO without non-canonical nucleotides and/or EPO delivered as a protein biologic.

For instance, for EPO, the present methods and compositions provide a clinically significant increase in hematocrit in less than about 6 weeks, or less than about 5 weeks, or less than about 4 weeks, or less than about 3 weeks, or less than about 2 weeks, or less than about 1 week. In some embodiments, the present methods and compositions provide a clinically significant increase in hematocrit in about 2 weeks, or about 10 days, or about 1 week, or about 3 days, or about 1 day. In various embodiments, the present methods and compositions accelerate the process by which erythroid progenitors mature and are released into the circulation.

In some embodiments, the present EPO-related compositions find use in decreasing the dose and/or frequency of administration when compared to wild type EPO and/or EPO without non-canonical nucleotides and/or EPO delivered as a protein biologic. For instance, the present EPO-related compositions may find use in treatment regimens for the diseases disclosed herein (including, without limitation, one or more anemias) that involve administration on a monthly, or biweekly, or weekly basis. In some embodiments, therefore, the present EPO-related compositions reduce the need for daily, or, in some embodiments, weekly, administration. In some embodiments, the present EPO-related compositions require lower maintenance doses as compared to wild type EPO and/or EPO without non-canonical nucleotides and/or EPO delivered as a protein biologic. Certain embodiments are particularly useful for treating chemotherapy-induced anemia. Many proteins and peptides, when translated from in vitro transcribed RNA, can exhibit reduced activity resulting from incomplete or inadequate post-translational processing. It has now been discovered that the amount of active protein, polypeptide or peptide produced following RNA transfection can be increased by contacting cells with and/or inducing cells to express a second protein that is capable of processing a polypeptide into the protein, peptide or polypeptide. Certain embodiments are therefore directed to a method for inducing a cell to express an active protein, polypeptide or peptide comprising contacting the cell with a synthetic RNA molecule encoding a first polypeptide and contacting the cell with a second protein that is capable of processing the first polypeptide into an active protein, polypeptide or peptide.

In certain embodiments, the second protein is administered to a patient. In one embodiment, the second protein is a recombinant protein. In another embodiment, the cells are contacted with a synthetic RNA molecule encoding the second protein. In a further embodiment, the cells are contacted with and/or induced to express an

inhibitor of a molecule that inhibits the second protein. In one embodiment, the inhibitor is a short interfering RNA molecule.

In certain embodiments, the second protein is a member of the PCSK family. In other embodiments, the second protein is a proprotein convertase. In still other embodiments, the second protein is a prohormone convertase. In still other embodiments, the second protein is a carboxypeptidase. In one embodiment, the second protein is PCSK3 (Furin/PACE). In another embodiment, the second protein is primarily secreted. In yet another embodiment, the second protein is primarily intracellular. In a further embodiment, the first polypeptide, protein, polypeptide or peptide is selected from the group: a product of proopiomelanocortin, renin, a product of enkephalin, a product of prodynorphin, somatostatin, insulin, agouti-related peptide, glucagon, parathyroid hormone, a member of the transforming growth factor beta superfamily, albumin, beta-secretase 1, nerve growth factor, caldesmon, the alpha-integrins, factor IX, α-melanocyte-stimulating hormone, adrenocorticotropic hormone, β-endorphin, and met-enkefalin.

Glycation and glycosylation are processes by which one or more sugar molecules are bound to a protein. It has now been discovered that altering the number or location of glycation and glycosylation sites can increase or decrease the stability of a protein. Certain embodiments are therefore directed to a protein with one or more glycation or glycosylation sites. In one embodiment, the protein is engineered to have more glycation or glycosylation sites than a natural variant of the protein. In another embodiment, the protein is engineered to have fewer glycation or glycosylation sites than a natural variant of the protein. In yet another embodiment, the protein has increased stability. In yet another embodiment, the protein has decreased stability. In some embodiments, the protein is a circulating protein. In one embodiment, the protein is erythropoietin or a biologically active fragment, variant, analogue, or family-member thereof. In another embodiment, the protein is darbepoetin alfa or a biologically active fragment, variant, analogue, or family-member thereof. In another embodiment, the protein is NOVEPOETIN or a biologically active fragment, variant, analogue, or family-member thereof.

It has been further discovered that in certain situations, including one or more steroids and/or one or more antioxidants in the transfection medium can increase *in vivo* transfection efficiency, *in vivo* reprogramming efficiency, and *in vivo* gene-editing efficiency. Certain embodiments are therefore directed to contacting a cell or patient with a glucocorticoid, such as hydrocortisone, prednisone, prednisolone, methylprednisolone, dexamethasone or betamethasone. Other embodiments are directed to a method for inducing a cell to express a protein of interest by contacting a cell with a medium containing a steroid and contacting the cell with one or more nucleic acid molecules. In one embodiment, the nucleic acid molecule comprises synthetic RNA. In another embodiment, the steroid is hydrocortisone. In yet another embodiment, the hydrocortisone is present in the medium at a concentration of between about 0.1uM and about 10uM, or about 1uM. Other embodiments are directed to a method for inducing a cell *in vivo* to express a protein of interest by contacting the cell with a medium containing an antioxidant and contacting the cell with one or more nucleic acid molecules. In one embodiment, the antioxidant is ascorbic acid or ascorbic-acid-2-phosphate. In another embodiment, the ascorbic

acid or ascorbic-acid-2-phosphate is present in the medium at a concentration of between about 0.5mg/L and about 500mg/L, including about 50mg/L. Still other embodiments are directed to a method for reprogramming and/or gene-editing a cell *in vivo* by contacting the cell with a medium containing a steroid and/or an antioxidant and contacting the cell with one or more nucleic acid molecules, wherein the one or more nucleic acid molecules encodes one or more reprogramming and/or gene-editing proteins. In certain embodiments, the cell is present in an organism, and the steroid and/or antioxidant are delivered to the organism.

Adding transferrin to the complexation medium has been reported to increase the efficiency of plasmid transfection in certain situations. It has now been discovered that adding transferrin to the complexation medium can also increase the efficiency of *in vivo* transfection with synthetic RNA molecules. Certain embodiments are therefore directed to a method for inducing a cell *in vivo* to express a protein of interest by adding one or more synthetic RNA molecules and a transfection reagent to a solution containing transferrin. In one embodiment, the transferrin is present in the solution at a concentration of between about 1mg/L and about 100mg/L, such as about 5mg/L. In another embodiment, the transferrin is recombinant.

In certain situations, including pertaining to culturing, it may be desirable to replace animal-derived components with non-animal-derived and/or recombinant components, in part because non-animal-derived and/or recombinant components can be produced with a higher degree of consistency than animal-derived components, and in part because non-animal-derived and/or recombinant components carry less risk of contamination with toxic and/or pathogenic substances than do animal-derived components. Certain embodiments are therefore directed to a protein that is non-animal-derived and/or recombinant. Other embodiments are directed to a medium, wherein some or all of the components of the medium are non-animal-derived and/or recombinant.

Other embodiments are directed to a method for transfecting a cell *in vivo*. In one embodiment, a cell *in vivo* is transfected with one or more nucleic acids, and the transfection is performed using a transfection reagent, such as a lipid-based transfection reagent. In one embodiment, the one or more nucleic acids includes at least one RNA molecule. In another embodiment, the cell is transfected with one or more nucleic acids, and the one or more nucleic acids encodes at least one of: p53, TERT, an antibody, an extracellular matrix protein, a cytokine, a secreted protein, a membrane-bound protein, an enzyme, a gene-editing protein, a chromatin-modifying protein, a DNA-binding protein, a transcription factor, a histone deacetylase, a pathogen-associated molecular pattern, and a tumor-associated antigen or a biologically active fragment, analogue, variant or family-member thereof. In another embodiment, the cell is transfected repeatedly, such as at least about 2 times during about 10 consecutive days, or at least about 3 times during about 7 consecutive days, or at least about 4 times during about 6 consecutive days. Some embodiments are directed to a method for increasing expression of telomerase in one of a fibroblast, a hematopoietic stem cell, a mesenchymal stem cells, a cardiac stem cell, a hair follicle stem cell, a neural stem cell, an intestinal stem cell, an endothelial stem cell, an olfactory stem cell, a neural crest stem cell, a testicular cell, and a keratinocyte. Some embodiments are directed to a method for increasing the length of telomeres in one of a fibroblast, a hematopoietic stem cell, a mesenchymal stem cells, a cardiac stem

cell, a hair follicle stem cell, a neural stem cell, an intestinal stem cell, an endothelial stem cell, an olfactory stem cell, a neural crest stem cell, a testicular cell, and a keratinocyte. Other embodiments are directed to a method for isolating a cell from a patient, contacting the cell with a nucleic acid drug encoding a component of telomerase (*e.g.*, TERT), and reintroducing the cell to the patient. Various embodiments are directed to a method for increasing the replicative potential of a cell.

Reprogramming can be performed by transfecting cells with one or more nucleic acids encoding one or more reprogramming factors. Examples of reprogramming factors include, but are not limited to: Oct4 protein, Sox2 protein, Klf4 protein, c-Myc protein, l-Myc protein, TERT protein, Nanog protein, Lin28 protein, Utf1 protein, Aicda protein, miR200 micro-RNA, miR302 micro-RNA, miR367 micro-RNA, miR369 micro-RNA and biologically active fragments, analogues, variants and family-members thereof. Certain embodiments are therefore directed to a method for reprogramming a cell *in vivo*. In one embodiment, the cell *in vivo* is reprogrammed by transfecting the cell with one or more nucleic acids encoding one or more reprogramming factors. In one embodiment, the one or more nucleic acids includes an RNA molecule that encodes Oct4 protein. In another embodiment, the one or more nucleic acids also includes one or more RNA molecules that encodes Sox2 protein, Klf4 protein, and c-Myc protein. In yet another embodiment, the one or more nucleic acids also includes an RNA molecule that encodes Lin28 protein. In one embodiment, the cell is a human skin cell, and the human skin cell is reprogrammed to a pluripotent stem cell. In another embodiment, the cell is a human skin cell, and the human skin cell is reprogrammed to a glucose-responsive insulin-producing cell. Examples of other cells that can be reprogrammed and other cells to which a cell can be reprogrammed include, but are not limited to: skin cells, pluripotent stem cells, mesenchymal stem cells, β-cells, retinal pigmented epithelial cells, hematopoietic cells, cardiac cells, airway epithelial cells, neural stem cells, neurons, glial cells, bone cells, blood cells, and dental pulp stem cells. In one embodiment, the cell is contacted with a medium that supports the reprogrammed cell. In one embodiment, the medium also supports the cell.

Importantly, infecting skin cells with viruses encoding Oct4, Sox2, Klf4, and c-Myc, combined with culturing the cells in a medium that supports the growth of cardiomyocytes, has been reported to cause reprogramming of the skin cells to cardiomyocytes, without first reprogramming the skin cells to pluripotent stem cells (*See* Efs *et al* Nat Cell Biol. 2011;13:215-22, the contents of which are hereby incorporated by reference). In certain situations, direct reprogramming (reprogramming one somatic cell to another somatic cell without first reprogramming the somatic cell to a pluripotent stem cell, also known as “transdifferentiation”) may be desirable, in part because culturing pluripotent stem cells can be time-consuming and expensive, the additional handling involved in establishing and characterizing a stable pluripotent stem cell line can carry an increased risk of contamination, and the additional time in culture associated with first producing pluripotent stem cells can carry an increased risk of genomic instability and the acquisition of mutations, including point mutations, copy-number variations, and karyotypic abnormalities. Certain embodiments are therefore directed to a method for reprogramming a somatic

cell *in vivo*, wherein the cell is reprogrammed to a somatic cell, and wherein a characterized pluripotent stem-cell line is not produced.

It has been further discovered that, in certain situations, fewer total transfections may be required to reprogram a cell according to the methods of the present invention than according to other methods. Certain embodiments are therefore directed to a method for reprogramming a cell *in vivo*, wherein between about 1 and about 12 transfections are performed during about 20 consecutive days, or between about 4 and about 10 transfections are performed during about 15 consecutive days, or between about 4 and about 8 transfections are performed during about 10 consecutive days. It is recognized that when a cell is contacted with a medium containing nucleic acid molecules, the cell may likely come into contact with and/or internalize more than one nucleic acid molecule either simultaneously or at different times. A cell can therefore be contacted with a nucleic acid more than once, *e.g.* repeatedly, even when a cell is contacted only once with a medium containing nucleic acids.

Of note, nucleic acids can contain one or more non-canonical or "modified" residues as described herein. For instance, any of the non-canonical nucleotides described herein can be used in the present reprgramming methods. In one embodiment, pseudouridine-5'-triphosphate can be substituted for uridine-5'-triphosphate in an *in vitro*-transcription reaction to yield synthetic RNA, wherein up to 100% of the uridine residues of the synthetic RNA may be replaced with pseudouridine residues. *In vitro*-transcription can yield RNA with residual immunogenicity, even when pseudouridine and 5-methylcytidine are completely substituted for uridine and cytidine, respectively (*see, e.g.,* Angel. Reprogramming Human Somatic Cells to Pluripotency Using RNA [Doctoral Thesis]. Cambridge, MA: MIT; 2011, the contents of which are hereby incorporated by reference). For this reason, it is common to add an immunosuppressant to the transfection medium when transfecting cells with RNA. In certain situations, adding an immunosuppressant to the transfection medium may not be desirable, in part because the recombinant immunosuppressant most commonly used for this purpose, B18R, can be expensive and difficult to manufacture. It has now been discovered that cells *in vivo* can be transfected and/or reprogrammed according to the methods of the present invention, without using B18R or any other immunosuppressant. It has been further discovered that reprogramming cells *in vivo* according to the methods of the present invention without using immunosuppressants can be rapid, efficient, and reliable. Certain embodiments are therefore directed to a method for transfecting a cell *in vivo*, wherein the transfection medium does not contain an immunosuppressant. Other embodiments are directed to a method for reprogramming a cell *in vivo*, wherein the transfection medium does not contain an immunosuppressant. In certain situations, for example when using a high cell density, it may be beneficial to add an immunosuppressant to the transfection medium. Certain embodiments are therefore directed to a method for transfecting a cell *in vivo*, wherein the transfection medium contains an immunosuppressant. Other embodiments are directed to a method for reprogramming a cell *in vivo*, wherein the transfection medium contains an immunosuppressant. In one embodiment, the immunosuppressant is B18R or a biologically active fragment, analogue, variant or family-member thereof or dexamethasone or a derivative thereof. In one embodiment, the transfection medium does not

contain an immunosuppressant, and the nucleic-acid dose is chosen to prevent excessive toxicity. In another embodiment, the nucleic-acid dose is less than about 1mg/cm^2 of tissue or less than about 1mg/100,000 cells or less than about 10mg/kg.

Reprogrammed cells produced according to certain embodiments of the present invention are suitable for therapeutic and/or cosmetic applications as they do not contain undesirable exogenous DNA sequences, and they are not exposed to animal-derived or human-derived products, which may be undefined, and which may contain toxic and/or pathogenic contaminants. Furthermore, the high speed, efficiency, and reliability of certain embodiments of the present invention may reduce the risk of acquisition and accumulation of mutations and other chromosomal abnormalities. Certain embodiments of the present invention can thus be used to generate cells that have a safety profile adequate for use in therapeutic and/or cosmetic applications. For example, reprogramming cells using RNA and the medium of the present invention, wherein the medium does not contain animal or human-derived components, can yield cells that have not been exposed to allogeneic material. Certain embodiments are therefore directed to a reprogrammed cell that has a desirable safety profile. In one embodiment, the reprogrammed cell has a normal karyotype. In another embodiment, the reprogrammed cell has fewer than about 5 copy-number variations (CNVs) relative to the patient genome, such as fewer than about 3 copy-number variations relative to the patient genome, or no copy-number variations relative to the patient genome. In yet another embodiment, the reprogrammed cell has a normal karyotype and fewer than about 100 single nucleotide variants in coding regions relative to the patient genome, or fewer than about 50 single nucleotide variants in coding regions relative to the patient genome, or fewer than about 10 single nucleotide variants in coding regions relative to the patient genome.

Endotoxins and nucleases can co-purify and/or become associated with other proteins, such as serum albumin. Recombinant proteins, in particular, can often have high levels of associated endotoxins and nucleases, due in part to the lysis of cells that can take place during their production. Endotoxins and nucleases can be reduced, removed, replaced or otherwise inactivated by many of the methods of the present invention, including, for example, by acetylation, by addition of a stabilizer such as sodium octanoate, followed by heat treatment, by the addition of nuclease inhibitors to the albumin solution and/or medium, by crystallization, by contacting with one or more ion-exchange resins, by contacting with charcoal, by preparative electrophoresis or by affinity chromatography. It has now been discovered that partially or completely reducing, removing, replacing or otherwise inactivating endotoxins and/or nucleases from a medium and/or from one or more components of a medium can increase the efficiency with which cells can be transfected and reprogrammed. Certain embodiments are therefore directed to a method for transfecting a cell *in vivo* with one or more nucleic acids, wherein the transfection medium is treated to partially or completely reduce, remove, replace or otherwise inactivate one or more endotoxins and/or nucleases. Other embodiments are directed to a medium that causes minimal degradation of nucleic acids. In one embodiment, the medium contains less than about 1EU/mL, or less than about 0.1EU/mL, or less than about 0.01EU/mL.

In certain situations, protein-based lipid carriers such as serum albumin can be replaced with non-protein-based lipid carriers such as methyl-beta-cyclodextrin. The medium of the present invention can also be used without a lipid carrier, for example, when transfection is performed using a method that may not require or may not benefit from the presence of a lipid carrier, for example, using one or more lipid-based transfection reagents, polymer-based transfection reagents or peptide-based transfection reagents or using electroporation. Many protein-associated molecules, such as metals, can be highly toxic to cells *in vivo*. This toxicity can cause decreased viability, as well as the acquisition of mutations. Certain embodiments thus have the additional benefit of producing cells that are free from toxic molecules.

The associated-molecule component of a protein can be measured by suspending the protein in solution and measuring the conductivity of the solution. Certain embodiments are therefore directed to a medium that contains a protein, wherein about a 10% solution of the protein in water has a conductivity of less than about 500 μmho/cm. In one embodiment, the solution has a conductivity of less than about 50 μmho/cm. In another embodiment, less than about 0.65% of the dry weight of the protein comprises lipids and/or less than about 0.35% of the dry weight of the protein comprises free fatty acids.

The amount of nucleic acid delivered to cells *in vivo* can be increased to increase the desired effect of the nucleic acid. However, increasing the amount of nucleic acid delivered to cells *in vivo* beyond a certain point can cause a decrease in the viability of the cells, due in part to toxicity of the transfection reagent. It has now been discovered that when a nucleic acid is delivered to a population of cells *in vivo* in a fixed volume (for example, cells in a region of tissue), the amount of nucleic acid delivered to each cell can depend on the total amount of nucleic acid delivered to the population of cells and to the density of the cells, with a higher cell density resulting in less nucleic acid being delivered to each cell. In certain embodiments, a cell *in vivo* is transfected with one or more nucleic acids more than once. Under certain conditions, for example when the cells are proliferating, the cell density may change from one transfection to the next. Certain embodiments are therefore directed to a method for transfecting a cell *in vivo* with a nucleic acid, wherein the cell is transfected more than once, and wherein the amount of nucleic acid delivered to the cell is different for two of the transfections. In one embodiment, the cell proliferates between two of the transfections, and the amount of nucleic acid delivered to the cell is greater for the second of the two transfections than for the first of the two transfections. In another embodiment, the cell is transfected more than twice, and the amount of nucleic acid delivered to the cell is greater for the second of three transfections than for the first of the same three transfections, and the amount of nucleic acid delivered to the cells is greater for the third of the same three transfections than for the second of the same three transfections. In yet another embodiment, the cell is transfected more than once, and the maximum amount of nucleic acid delivered to the cell during each transfection is sufficiently low to yield at least about 80% viability for at least two consecutive transfections.

It has now been discovered that modulating the amount of nucleic acid delivered to a population of proliferating cells *in vivo* in a series of transfections can result in both an increased effect of the nucleic acid and increased

viability of the cells. It has been further discovered that, in certain situations, when cells *in vivo* are contacted with one or more nucleic acids encoding one or more reprogramming factors in a series of transfections, the efficiency of reprogramming can be increased when the amount of nucleic acid delivered in later transfections is greater than the amount of nucleic acid delivered in earlier transfections, for at least part of the series of transfections. Certain embodiments are therefore directed to a method for reprogramming a cell *in vivo*, wherein one or more nucleic acids is repeatedly delivered to the cell in a series of transfections, and the amount of the nucleic acid delivered to the cell is greater for at least one later transfection than for at least one earlier transfection. In one embodiment, the cell is transfected between about 2 and about 10 times, or between about 3 and about 8 times, or between about 4 and about 6 times. In another embodiment, the one or more nucleic acids includes at least one RNA molecule, the cell is transfected between about 2 and about 10 times, and the amount of nucleic acid delivered to the cell in each transfection is the same as or greater than the amount of nucleic acid delivered to the cell in the most recent previous transfection. In yet another embodiment, the amount of nucleic acid delivered to the cell in the first transfection is between about 20ng/cm^2 and about 250ng/cm^2, or between 100ng/cm^2 and 600ng/cm^2. In yet another embodiment, the cell is transfected about 5 times at intervals of between about 12 and about 48 hours, and the amount of nucleic acid delivered to the cell is about 25ng/cm^2 for the first transfection, about 50ng/cm^2 for the second transfection, about 100ng/cm^2 for the third transfection, about 200ng/cm^2 for the fourth transfection, and about 400ng/cm^2 for the fifth transfection. In yet another embodiment, the cell is further transfected at least once after the fifth transfection, and the amount of nucleic acid delivered to the cell is about 400ng/cm^2.

Certain embodiments are directed to a method for transfecting a cell *in vivo* with a nucleic acid, wherein the amount of nucleic acid is determined by measuring the cell density, and choosing the amount of nucleic acid to transfect based on the measurement of cell density. In one embodiment, the cell density is measured by optical means. In another embodiment, the cell is transfected repeatedly, the cell density increases between two transfections, and the amount of nucleic acid transfected is greater for the second of the two transfections than for the first of the two transfections.

It has now been discovered that, in certain situations, the amount of a circulating protein that is produced in a patient can be increased by administering to a patient a nucleic acid at a plurality of administration sites. In certain embodiments, the amount of a circulating protein is increased relative to the amount of the circulating protein that is produced in a patient by administering to the patient the nucleic acid at a single injection site. In one embodiment, the administering is by injection. In another embodiment, the injection is intradermal injection. In still another embodiment, the injection is subcutaneous or intramuscular injection. In some embodiments, the plurality of administration sites comprise administration sites in the skin. In other embodiments, the plurality of administration sites are at least about 1 or at least about 2 or at least about 5 or at least about 10 or at least about 20 or at least about 50 or at least about 100 administration sites. In one embodiment, the administering is performed within at least about 5 minutes or at least about 10 minutes or at least about 30 minutes or at least

about 1 hour or at least about 2 hours or at least about 5 hours or at least about 12 hours or at least about 1 day. In certain embodiments, the amount of a circulating protein is increased by at least about 10 percent or at least about 20 percent or at least about 50 percent or at least about 100 percent or at least about 3-fold or at least about 5-fold or at least about 10-fold or at least about 20-fold or at least about 50-fold or at least about 100-fold or at least about 500-fold or at least about 1000-fold or greater than 1000-fold.

It has now been discovered that, in certain situations, the *in vivo* transfection efficiency and viability of cells contacted with the medium of the present invention can be improved by conditioning the medium. Certain embodiments are therefore directed to a method for conditioning a medium. Other embodiments are directed to a medium that is conditioned. In one embodiment, the feeders are fibroblasts, and the medium is conditioned for approximately 24 hours. Other embodiments are directed to a method for transfecting a cell *in vivo*, wherein the transfection medium is conditioned. Other embodiments are directed to a method for reprogramming and/or gene-editing a cell *in vivo*, wherein the medium is conditioned. In one embodiment, the feeders are mitotically inactivated, for example, by exposure to a chemical such as mitomycin-C or by exposure to gamma radiation. In certain embodiments, it may be beneficial to use only autologous materials, in part to, for example and not wishing to be bound by theory, avoid the risk of disease transmission from the feeders to the cell or the patient. Certain embodiments are therefore directed to a method for transfecting a cell *in vivo*, wherein the transfection medium is conditioned, and wherein the feeders are derived from the same individual as the cell being transfected. Other embodiments are directed to a method for reprogramming and/or gene-editing a cell *in vivo*, wherein the medium is conditioned, and wherein the feeders are derived from the same individual as the cell being reprogrammed and/or gene-edited.

Several molecules can be added to media by conditioning. Certain embodiments are therefore directed to a medium that is supplemented with one or more molecules that are present in a conditioned medium. In one embodiment, the medium is supplemented with Wnt1, Wnt2, Wnt3, Wnt3a or a biologically active fragment, analogue, variant, agonist, or family-member thereof. In another embodiment, the medium is supplemented with TGF-β or a biologically active fragment, analogue, variant, agonist, or family-member thereof. In yet another embodiment, a cell *in vivo* is reprogrammed according to the method of the present invention, wherein the medium is not supplemented with TGF-β for between about 1 and about 5 days, and is then supplemented with TGF-β for at least about 2 days. In yet another embodiment, the medium is supplemented with IL-6, IL-6R or a biologically active fragment, analogue, variant, agonist, or family-member thereof. In yet another embodiment, the medium is supplemented with a sphingolipid or a fatty acid. In still another embodiment, the sphingolipid is lysophosphatidic acid, lysosphingomyelin, sphingosine-1-phosphate or a biologically active analogue, variant or derivative thereof.

In addition to mitotically inactivating cells, under certain conditions, irradiation can change the gene expression of cells, causing cells to produce less of certain proteins and more of certain other proteins that non-irradiated cells, for example, members of the Wnt family of proteins. In addition, certain members of the Wnt family of proteins

can promote the growth and transformation of cells. It has now been discovered that, in certain situations, the efficiency of reprogramming can be greatly increased by contacting a cell *in vivo* with a medium that is conditioned using irradiated feeders instead of mitomycin-c-treated feeders. It has been further discovered that the increase in reprogramming efficiency observed when using irradiated feeders is caused in part by Wnt proteins that are secreted by the feeders. Certain embodiments are therefore directed to a method for reprogramming a cell *in vivo*, wherein the cell is contacted with Wnt1, Wnt2, Wnt3, Wnt3a or a biologically active fragment, analogue, variant, family-member or agonist thereof, including agonists of downstream targets of Wnt proteins, and/or agents that mimic one or more of the biological effects of Wnt proteins, for example, 2-amino-4-[3,4-(methylenedioxy)benzylamino]-6-(3-methoxyphenyl)pyrimidine.

Because of the low efficiency of many DNA-based reprogramming methods, these methods may be difficult or impossible to use with cells derived from patient samples, which may contain only a small number of cells. In contrast, the high efficiency of certain embodiments of the present invention can allow reliable reprogramming of a small number of cells, including single cells. Certain embodiments are directed to a method for reprogramming a small number of cells. Other embodiments are directed to a method for reprogramming a single cell. In one embodiment, the cell is contacted with one or more enzymes. In another embodiment, the enzyme is collagenase. In yet another embodiment, the collagenase is animal-component free. In one embodiment, the collagenase is present at a concentration of between about 0.1mg/mL and about 10mg/mL, or between about 0.5mg/mL and about 5mg/mL. In another embodiment, the cell is a blood cell. In yet another embodiment, the cell is contacted with a medium containing one or more proteins that is derived from the patient's blood. In still another embodiment, the cell is contacted with a medium comprising: DMEM/F12 + 2mM L-alanyl-L-glutamine + between about 5% and about 25% patient-derived serum, or between about 10% and about 20% patient-derived serum, or about 20% patient-derived serum.

It has now been discovered that, in certain situations, transfecting cells *in vivo* with a mixture of RNA encoding Oct4, Sox2, Klf4, and c-Myc using the medium of the present invention can cause the rate of proliferation of the cells to increase. When the amount of RNA delivered to the cells is too low to ensure that all of the cells are transfected, only a fraction of the cells may show an increased proliferation rate. In certain situations, such as when generating a personalized therapeutic, increasing the proliferation rate of cells may be desirable, in part because doing so can reduce the time necessary to generate the therapeutic, and therefore can reduce the cost of the therapeutic. Certain embodiments are therefore directed to a method for transfecting a cell *in vivo* with a mixture of RNA encoding Oct4, Sox2, Klf4, and c-Myc. In one embodiment, the cell exhibits an increased proliferation rate. In another embodiment, the cell is reprogrammed.

Many diseases are associated with one or more mutations. Mutations can be corrected by contacting a cell with a nucleic acid that encodes a protein that, either alone or in combination with other molecules, corrects the mutation (an example of gene-editing). Examples of such proteins include: a nuclease, a transcription activator-like effector nuclease (TALEN), a zinc-finger nuclease, a meganuclease, a nickase, a clustered regularly

interspaced short palindromic repeat (CRISPR)-associated protein or a natural or engineered variant, family-member, orthologue, fragment or fusion construct thereof. Certain embodiments are therefore directed to a method for transfecting a cell *in vivo* with a nucleic acid, wherein the nucleic acid encodes a protein that, either alone or in combination with other molecules, creates a single-strand or double-strand break in a DNA molecule. In a one embodiment, the protein is a zinc finger nuclease or a TALEN. In another embodiment, the nucleic acid is an RNA molecule. In yet another embodiment, the single-strand or double-strand break is within about 5,000,000 bases of the transcription start site of a gene selected from the group: CCR5, CXCR4, GAD1, GAD2, CFTR, HBA1, HBA2, HBB, HBD, FANCA, XPA, XPB, XPC, ERCC2, POLH, HTT, DMD, SOD1, APOE, PRNP, BRCA1, and BRCA2 or an analogue, variant or family-member thereof. In one embodiment, the present invention relates to gene-editing of the MYC protein (*e.g.* correcting one or more muations that may be linked to cancer), optionally with a TALEN. In yet another embodiment, the cell is transfected with a nucleic acid that acts as a repair template by either causing the insertion of a DNA sequence in the region of the single-strand or double-strand break or by causing the DNA sequence in the region of the single-strand or double-strand break to otherwise change. In yet another embodiment, the cell is reprogrammed, and subsequently, the cell is gene-edited. In yet another embodiment, the cell is gene-edited, and subsequently, the cell is reprogrammed. In yet another embodiment, the gene-editing and reprogramming are performed within about 7 days of each other. In yet another embodiment, the gene-editing and reprogramming occur simultaneously or on the same day. In yet another embodiment, the cell is a skin cell, the skin cell is gene-edited to disrupt the CCR5 gene, the skin cell is reprogrammed to a hematopoietic stem cell, thus producing a therapeutic for HIV/AIDS, and the therapeutic is used to treat a patient with HIV/AIDS. In yet another embodiment, the skin cell is derived from the same patient whom the therapeutic is used to treat.

Genes that can be edited according to the methods of the present invention to produce therapeutics of the present invention include genes that can be edited to restore normal function, as well as genes that can be edited to reduce or eliminate function. Such genes include, but are not limited to beta globin (HBB), mutations in which can cause sickle cell disease (SCD) and β-thalassemia, breast cancer 1, early onset (BRCA1) and breast cancer 2, early onset (BRCA2), mutations in which can increase susceptibility to breast cancer, C-C chemokine receptor type 5 (CCR5) and C-X-C chemokine receptor type 4 (CXCR4), mutations in which can confer resistance to HIV infection, cystic fibrosis transmembrane conductance regulator (CFTR), mutations in which can cause cystic fibrosis, dystrophin (DMD), mutations in which can cause muscular dystrophy, including Duchenne muscular dystrophy and Becker's muscular dystrophy, glutamate decarboxylase 1 and glutamate decarboxylase 2 (GAD1, GAD2), mutations in which can prevent autoimmune destruction of β-cells, hemoglobin alpha 1, hemoglobin alpha 2, and hemoglobin delta (HBA1, HBA2, and HBD), mutations in which can cause thalassemia, desmoplakin, keratin 5, keratin 14, plectin, integrin alpha-6, integrin beta-4, laminin subunit alpha-3, laminin subunit beta-3, laminin subunit gamma-2, collagen type VII alpha 1, collagen type XVII alpha 1, and matrix metalloproteinase-1 (DSP, KRT5, KRT14, PLEC1, ITGA6, ITGB4, LAMA3, LAMB3, LAMC2, COL7A1, COL17A1, and MMP1), mutations in which can cause epidermolysis bullosa, Huntington (HTT), mutations in which can

cause Huntington's disease, superoxide dismutase 1 (SOD1), mutations in which can cause amyotrophic lateral sclerosis (ALS), XPA, XPB, XPC, XPD (ERCC6) and polymerase (DNA directed), eta (POLH), mutations in which can cause xeroderma pigmentosum, leucine-rich repeat kinase 2 (LRRK2), mutations in which can cause Parkinson's disease, and Fanconi anemia, complementation groups A, B, C, D1, D2, E, F, G, I, J, L, M, N, P (FANCA, FANCB, FANCC, FANCD1, FANCD2, FANCE, FANCF, FANCG, FANCI, FANCJ, FANCL, FANCM, FANCN, FANCP), and RAD51 homolog C (S. cerevisiae) (RAD51C), mutations in which can cause Fanconi anemia.

Certain embodiments are directed to a therapeutic comprising a nucleic acid. In one embodiment, the nucleic acid encodes one or more gene-editing proteins. Other embodiments are directed to a therapeutic comprising one or more cells that are transfected, reprogrammed, and/or gene-edited *in vivo* according to the methods of the present invention. In one embodiment, a cell is transfected, reprogrammed, and/or gene-edited, and the transfected, reprogrammed, and/or gene-edited cell is introduced into a patient. In another embodiment, the cell is harvested from the same patient into whom the transfected, reprogrammed and/or gene-edited cell is introduced. Examples of diseases that can be treated with therapeutics of the present invention include, but are not limited to Alzheimer's disease, spinal cord injury, amyotrophic lateral sclerosis, cystic fibrosis, heart disease, including ischemic and dilated cardiomyopathy, macular degeneration, Parkinson's disease, Huntington's disease, diabetes, sickle-cell anemia, thalassemia, Fanconi anemia, xeroderma pigmentosum, muscular dystrophy, severe combined immunodeficiency, hereditary sensory neuropathy, cancer, and HIV/AIDS. In certain embodiments, the therapeutic comprises a cosmetic. In one embodiment, a cell is harvested from a patient, the cell is reprogrammed and expanded to a large number of adipose cells to produce a cosmetic, and the cosmetic is introduced into the patient. In still another embodiment, the cosmetic is used for tissue reconstruction.

While detailed examples are provided herein for the production of specific types of cells and for the production of therapeutics comprising specific types of cells, it is recognized that the methods of the present invention can be used to produce many other types of cells, and to produce therapeutics comprising one or more of many other types of cells, for example, by reprogramming a cell according to the methods of the present invention, and culturing the cell under conditions that mimic one or more aspects of development by providing conditions that resemble the conditions present in the cellular microenvironment during development.

Certain embodiments are directed to a library of cells with a variety of human leukocyte antigen (HLA) types ("HLA-matched libraries"). An HLA-matched library may be beneficial in part because it can provide for the rapid production and/or distribution of therapeutics without the patient having to wait for a therapeutic to be produced from the patient's cells. Such a library may be particularly beneficial for the production of cosmetics and for the treatment of heart disease and diseases of the blood and/or immune system for which patients may benefit from the immediate availability of a therapeutic or cosmetic.

The DNA sequence of a cell can be altered by contacting the cell with a gene-editing protein or by inducing the cell to express a gene-editing protein. However, previously disclosed gene-editing proteins suffer from low

binding efficiency and excessive off-target activity, which can introduce undesired mutations in the DNA of the cell, severely limiting their use *in vivo*, for example in therapeutic and cosmetic applications, in which the introduction of undesired mutations in a patient's cells could lead to the development of cancer. It has now been discovered that gene-editing proteins that comprise the StsI endonuclease cleavage domain (SEQ ID NO: 1) can exhibit substantially lower off-target activity *in vivo* than previously disclosed gene-editing proteins, while maintaining a high level of on-target activity *in vivo*. Other novel engineered proteins have also been discovered that can exhibit high on-target activity *in vivo*, low off-target activity *in vivo*, small size, solubility, and other desirable characteristics when they are used as the nuclease domain of a gene-editing protein: StsI-HA (SEQ ID NO: 2), StsI-HA2 (SEQ ID NO: 3), StsI-UHA (SEQ ID NO: 4), StsI-UHA2 (SEQ ID NO: 5), StsI-HF (SEQ ID NO: 6), and StsI-UHF (SEQ ID NO: 7). StsI-HA, StsI-HA2 (high activity), StsI-UHA, and StsI-UHA2 (ultra-high activity) can exhibit higher on-target activity *in vivo* than both wild-type StsI and wild-type FokI, due in part to specific amino-acid substitutions within the N-terminal region at the 34 and 61 positions, while StsI-HF (high fidelity) and StsI-UHF (ultra-high fidelity) can exhibit lower off-target activity *in vivo* than both wild-type StsI and wild-type FokI, due in part to specific amino-acid substitutions within the C-terminal region at the 141 and 152 positions.

Certain embodiments are therefore directed to a protein. In some embodiments, the protein is present *in vivo*. In other embodiments, the protein comprises a nuclease domain. the T7 High Yield RNA Synthesis Kit and the Vaccinia Capping System kit with mRNA Cap 2'-O-Methyltransferase (all from New England Biolabs, Inc.), according to the manufacturer's instructions and the present inventors' previously disclosed inventions (US Application No. 13/465,490 (now US Patent No. 8,497,124), International Application No. PCT/US12/67966, US Application No. 13/931,251, International Application No. PCT/US13/68118, and International Application No. PCT/US2015/013949, the contents of all of which are hereby incorporated by reference in their entirety) (**Table 4**). The RNA was then diluted with nuclease-free water to between 100ng/μL and 2000ng/μL. For certain experiments, an RNase inhibitor (Superase·In, Life Technologies Corporation) was added at a concentration of 1μL/100μg of RNA. RNA solutions were stored at room temperature, 4C, -20C or -80C. For reprogramming experiments, RNA encoding Oct4, Sox2, Klf4, c-Myc-2 (T58A), and Lin28 was mixed at a molar ratio of 3:1:1:1:1.

Example 2 Preparation of RNA-Transfection-Reagent Complexes

For each microgram of RNA, 1µg RNA and 1µL transfection reagent (LIPOFECTAMINE 3000, Life Technologies Corporation) were first diluted separately in complexation medium (Opti-MEM, Life Technologies Corporation or DMEM/F12 + 10µg/mL insulin + 5.5µg/mL transferrin + 6.7ng/mL sodium selenite + 2µg/mL ethanolamine) to a total volume of between 5µL and 100µL each. Diluted RNA and transfection reagent were then mixed and incubated for 10min at room temperature, according to the transfection reagent-manufacturer's instructions.

Example 3 Transfection of Cells with Synthetic RNA

Complexes were prepared according to Example 2, and were then added directly to cells in culture. For transfection in 6-well plates, between 10µL and 250µL of complexes were added to each well of the 6-well plate, which already contained 2mL of transfection medium per well. Plates were shaken gently to distribute the complexes throughout the well. Cells were incubated with complexes for 4 hours to overnight, before replacing the medium with fresh transfection medium (2mL/well). Alternatively, the medium was not replaced. Volumes were scaled for transfection in 24-well and 96-well plates.

Example 4 Toxicity of and Protein Translation from Synthetic RNA Containing Non-Canonical Nucleotides

Primary human fibroblasts were transfected according to Example 2, using RNA synthesized according to Example 1. Cells were fixed and stained 20-24h after transfection using an antibody against Oct4. The relative toxicity of the RNA was determined by assessing cell density at the time of fixation.

Example 5 Delivery of Synthetic RNA to the Skin

The complexation reaction shown in **Table 5** was prepared using RNA encoding green fluorescent protein (GFP) or collagen, type VII, alphal (COL7), synthesized according to Example 1. The concentration of the RNA stock solution was 500µg/mL.

Table 5. *RNA Complexation Reaction*

RNA solution tube	Volume
GFP or COL7 RNA	8µL
FactorPlex™ complexation buffer	42µL
Transfection reagent solution tube	
LIPOFECTAMINE 3000 (LIFE TECHNOLOGIES)	4µL
FactorPlex™ complexation buffer	46µL

Each tube was mixed by pipetting, and the transfection reagent solution tube was incubated for 30s at room temperature. The transfection reagent solution was then transferred to the RNA solution, and the contents were mixed by rapidly pipetting up and down 10 times. Following a 10min incubation, dilutions were prepared according to

For each injection, the corresponding solution was drawn into a 3cc insulin syringe with an 8mm, 31 gauge needle (Becton, Dickinson and Company, Part Number: 328291) and air bubbles were removed. A clear field was selected on the left forearm of a healthy 33 year-old male human subject, and was disinfected with 70% isopropanol and allowed to dry. The needle was positioned at an angle of approximately 10° to the anterior (palmar) forearm with bevel facing up, and was inserted until the bevel was just covered. 30µL of the RNA solution was injected intradermally over the course of approximately 10sec. A distinct wheal appeared during the injection process. The needle was withdrawn, the wheal remained for approximately 1 minute, and no fluid escaped from the injection site. A total of 4 injections were performed according to **Table 6**, and all of the injections were performed between 11 and 28 minutes following the preparation of the RNA complexation reaction. No swelling, redness, or soreness occurred as a result of the injections. A small amount of bleeding occurred when the needle was removed from sites 2 and 4, resulting in the appearance of a small red spot at these sites.

The injection sites were imaged according to the schedule of **Table 7**, and every 24 hours thereafter for 6 days. Fluorescence images were acquired using an inverted microscope (Nikon Eclipse TS100) equipped with an EXFO X-Cite™ 120 fluorescence illumination system and the filter sets shown in **Table 7**. Fluorescence images were captured using a Sony NEX-7 digital camera (**FIGs. 9-12**).

Sub-confluent layers of primary human keratinocytes cultured in EpiLife medium were transfected in wells of a 6 well plate according to Example 3 with 1 µg of RNA per well. 12, 24, 36 and 48h following transfection, 0.5 mL of medium was removed and 0.5 mL of fresh EpiLife medium was added to the plate. After the final medium sampling, the cells were harvested by trypsinization, and total RNA was isolated using the RNeasy mini kit (Qiagen). Genomic DNA was digested using DNase I and RNA was purified. Expression of interferon-β and GAPDH was measured by RT-PCR (**FIG. 5**).

Example 7 Transfection of Human Cells with RNA Encoding hTERT

A sub-confluent layer of primary human dermal fibroblasts cultured in DMEM+10%FBS were transfected in wells of a 24 well plate according to Example 3 with 0.25 µg of RNA per well. 12h after transfection, cells were fixed and stained using a 1:50 dilution of rabbit anti-hTERT antibody (Millipore, Part Number: MABE14) (**FIG. 16**).

Example 8 High-Efficiency Gene Editing by Repeated Transfection with RIBOSLICE

Primary human fibroblasts were plated in 6-well plates coated with recombinant human fibronectin and recombinant human vitronectin (each diluted in DMEM/F12 to a concentration of 1µg/mL, 1mL/well, and incubated at room temperature for 1h) at a density of 10,000 cells/well in transfection medium. The following day, the cells were transfected as in Example 2 with RNA synthesized according to Example 1. The following day cells in one of the wells were transfected a second time. Two days after the second transfection, the efficiency of gene editing was measured using a mutation-specific nuclease assay.

Example 9 Transfection of Cells with Synthetic RNA Containing Non-Canonical Nucleotides and DNA Encoding a Repair Template

For transfection in 6-well plates, 1µg RNA encoding gene-editing proteins targeting exon 16 of the human APP gene, 1µg single-stranded repair template DNA containing a PstI restriction site that was not present in the target cells, and 6µL transfection reagent (LIPOFECTAMINE RNAiMAX, Life Technologies Corporation) were first diluted separately in complexation medium (Opti-MEM, Life Technologies Corporation) to a total volume of 120µL. Diluted RNA, repair template, and transfection reagent were then mixed and incubated for 15min at room temperature, according to the transfection reagent-manufacturer's instructions. Complexes were added to cells in culture. Approximately 120µL of complexes were added to each well of a 6-well plate, which already contained 2mL of transfection medium per well. Plates were shaken gently to distribute the complexes throughout the well. Cells were incubated with complexes for 4 hours to overnight, before replacing the medium with fresh transfection medium (2mL/well). The next day, the medium was changed to DMEM + 10% FBS. Two days after transfection, genomic DNA was isolated and purified. A region within the APP gene was amplified by PCR, and the amplified product was digested with PstI and analyzed by gel electrophoresis.

Example 10 in vivo RIBOSLICE Safety Study

40 female NCr nu/nu mice were injected subcutaneously with 5 x 10^6 MDA-MB-231 tumor cells in 50% Matrigel (BD Biosciences). Cell injection volume was 0.2mL/mouse. The age of the mice at the start of the study was 8 to 12 weeks. A pair match was conducted, and animals were divided into 4 groups of 10 animals each when the tumors reached an average size of 100-150mm^3, and treatment was begun. Body weight was measured every day for the first 5 days, and then biweekly to the end of the study. Treatment consisted of RIBOSLICE BIRC5-1.2 complexed with a vehicle (LIPOFECTAMINE 2000, Life Technologies Corporation). To prepare the dosing solution for each group, 308µL of complexation buffer (Opti-MEM, Life Technologies Corporation) was pipetted into each of two sterile, RNase-free 1.5mL tubes. 22µL of RIBOSLICE BIRC5-1.2 (500ng/µL) was added to one of the two tubes, and the contents of the tube were mixed by pipetting. 22µL of vehicle was added to the second tube. The contents of the second tube were mixed, and then transferred to the first tube, and mixed with the contents of the first tube by pipetting to form complexes. Complexes were incubated at room temperature for 10min. During the incubation, syringes were loaded. Animals were injected either intravenously or intratumorally with a total dose of 1µg RNA/animal in 60µL total volume/animal. A total of 5 treatments were given, with injections performed every other day. Doses were not adjusted for body weight. Animals were followed for 17

days. No significant reduction in mean body weight was observed, demonstrating the *in vivo* safety of RIBOSLICE gene-editing RNA.

For TNFα analysis, plasma samples were analyzed using a commercially-available assay kit from R&D SYSTEMS (cat. no. RTA00). The rat TNFα ELISA is a solid phase enzyme-linked immunosorbent assay. The ELISA kit employs a TNFα-specific anti-rat monoclonal antibody for solid phase immobilization (pre-coated on the microtiter plate), and HRP conjugated to an anti-rat TNFα polyclonal antibody for detection. The reference standard provided with the kit is a recombinant rat TNFα. For each assay, plasma samples and standards were diluted with the diluent provided in each respective kit. For the TNFα ELISA, plasma samples were diluted 1:2. The standard curve consisted of six (6) serial 2-fold concentrations ranging from 800 to 12.5 pg/mL. Controls were reconstituted with diluent, and blanks contained diluent only.

Following sample, standard, control, or diluent addition (50 µL per well, each in duplicate), plates were incubated for 2 hours at room temperature. Following a wash step to remove unbound substances, HRP conjugate was added to each well (100 µL/well), and plates were incubated for 2 hours at room temperature. Following a second wash step, 100 µL/well TMB substrate was added to the plate. The plate was incubated for 30 minutes at room temperature, protected from light, to allow the color reaction to develop. The reaction was stopped following the addition of HCl Stop Solution (100 µL/well). The optical density was read on a SpectraMax 340 (MOLECULAR DEVICES) plate reader at 450 nm, within 30 minutes following addition of Stop Solution. The intensity of the color measured was in proportion to the amount of rat TNFα bound in the initial step. A standard curve was generated for each assay plate, and test sample TNFα concentrations were determined by interpolation of absorbance A_{450} values from the standard curve and dilution factor. The assay range for the TNFα kit is 12.5 - 800 pg/mL, with a minimum detectable concentration of less than 10 pg/mL (with the 1:2 minimum required dilution for plasma samples).

For IL-6 analysis, plasma IL-6 samples were analyzed using a commercially-available assay kit from R&D SYSTEMS (cat. no. R6000B – IL-6). The rat IL-6 ELISA is a solid phase enzyme-linked immunosorbent assay.

The ELISA kit employs anti-rat IL-6 monoclonal antibody for solid phase immobilization (pre-coated on the microtiter plate), and HRP conjugated to IL-6-specific anti-rat polyclonal antibody for detection. The reference standard provided with the kit is a recombinant rat IL-6. Plasma samples were used undiluted (as provided), and standards were diluted with the diluent provided in the kit. The standard curve consisted of six (6) serial 2-fold concentrations ranging from 4,000 to 62.5 pg/mL. Controls were reconstituted with diluent, and blanks contained diluent only. Following sample, standard, control, or diluent addition (50 µL per well, each in duplicate), plates were incubated for 2 hours at room temperature. Following a wash step to remove unbound substances, HRP conjugate was added to each well (100 µL/well), and plates were incubated for 2 hours at room temperature. Following a second wash step, 100 µL/well TMB substrate was added to the plate. The plate was incubated for 30 minutes at room temperature, protected from light, to allow the color reaction to develop. The reaction was stopped following the addition of HCl Stop Solution (100 µL/well). The optical density was read on a SpectraMax 340 (MOLECULAR DEVICES) plate reader at 450 nm, within 30 minutes following addition of Stop Solution. The intensity of the color measured was in proportion to the amount of rat IL-6 bound in the initial step. A standard curve was generated for each assay plate, and test sample IL-6 concentrations were determined by interpolation of absorbance A450 values from the standard curve and dilution factor. The assay range for the IL-6 kit is 62.5 – 4,000 pg/mL, with a minimum detectable concentration of less than 21 pg/mL.

For IFNα analysis, plasma IFNα samples were analyzed using a commercially-available assay kit from NOVATEINBIO (cat. no. BG-RAT11380). The ELISA is a solid phase enzyme-linked immunosorbent assay. The ELISA kit employs anti-rat IFNα monoclonal antibody for solid phase immobilization (pre-coated on the microtiter plate), and HRP conjugated antibody specific for IFNα for detection. Plasma samples were diluted 1:4, and the standards were used as provided in the kit. Standards consisted of six (6) serial 2-fold concentrations ranging from 100 to 3.1 pg/mL. Blanks contained diluent only. Following sample, standard, or diluent addition (50 µL per well, each in duplicate), HRP conjugate was added to each well (100 µL/well), and plates were incubated for 1 hours at 37°C. Following a wash step, 50 µL/well each of Chromogen Solution A and Chromogen Solution B were added to the plate. The plate was incubated for 15 minutes at 37°C, protected from light, to allow the color reaction to develop. The reaction was stopped following the addition of Stop Solution (50 µL/well). The optical density was read on a SpectraMax 340 (MOLECULAR DEVICES) plate reader at 450 nm. The intensity of the color measured was in proportion to the amount of rat IFNα bound in the initial step. A standard curve was generated for each assay plate, and test IFNα concentrations were determined by interpolation of absorbance A450 values from the standard curve and dilution factor. The assay range for the IFNα kit is 3.1 – 100 pg/mL, with a minimum detectable concentration of less than 1 pg/mL (4 pg/mL, with the 1:4 dilution required for plasma samples).

The results of this study were, *inter alia*, that NOVECRIT was not detected at the injection site 24h after dosing (as assayed by RT-PCR). More specifically, NOVECRIT was not detected in any of the following samples (RT-PCR): serum (6h, 24h, 48h and 72h after dosing), liver (6h and 24h after dosing), and kidney (6h and 24h after

dosing). Further, positive controls (spiked with NOVECRIT) yielded a robust signal in all tissues (as assayed RT-PCR). **FIG. 18** depicts single administration of NOVECRIT induced a rapid increase and sustained level of NOVEPOIETIN in serum. The Y axis shows concentration of NOVEPOIETIN protein (mU/mL). This suggests, without wishing to be bound by theory, that the studied RNA therapeutic is able to provide therapeutically important pharmacodynamic properties. In fact, this PD behavior is vastly improved relative to wild type EPO (which is known in the art to have a half-life of about 4-12 hours).

Furthermore, serum spiked with NOVECRIT showed near-instant degradation of the RNA (as assayed by RT-PCR). Without wishing to be bound by theory, this data indicates that the present RNA therapeutics are safe and have little chance of toxicity limitations, for example, liver or kidney toxicities.

FIG. 19 depicts a single administration of NOVECRIT stimulated erythropoiesis, yielding elevated hematocrit for at least 14 days. The left panel shows % hematocrit on the Y axis, while the right panel shows % reticulocytes. Accordingly, the studied RNA therapeutic is fully functional.

With respect to cytokines, IL-6 and TNFα cytokine levels were below assay detection thresholds for all animals at each of the timepoints evaluated in this study. Low levels of IFN-□were only detectable in the Day 8 samples from animals in Groups 3 and 4. **FIG. 20** depicts a table summarizing TNFα, IL-6, and IFNα cytokine levels in plasma samples collected from a maximum tolerated dose of NOVECRIT in male Sprague Dawley rats. Without wishing to be bound by theory, this data indicates that the present RNA therapeutics do not stimulate an unfavorable immunogenicity which has limited the therapeutic utility of certain RNA therapeutics.

Example 36: Gene Editing of the COL7A Gene

The present RNA-based gene editing approaches were applied to the COL7A1 gene. This gene is of interest because, *inter alia*, it is frequently involved in dystrophic epidermolysis bullosa. **FIG. 21** depicts a SURVEYOR assay using the DNA of primary adult human dermal fibroblasts transfected with RNA TALENs targeting the sequence TGAGCAGAAGTGGCTCAGTG (SEQ ID NO:467) and TGGCTGTACAGCTACACCCC (SEQ ID NO:468), located within the COL7A1 gene. The bands present in the +RNA lane indicate editing of a region of the gene that is frequently involved in dystrophic epidermolysis bullosa. **FIG. 22** depicts another SURVEYOR assay using the DNA of primary adult human dermal fibroblasts transfected with RNA TALENs, now targeting the sequence TTCCACTCCTGCAGGGCCCC (SEQ ID NO:469) and TCGCCCTTCAGCCCGCGTTC (SEQ ID NO:470), located within the COL7A1 gene. The bands present in the +RNA lane indicate editing of a region of the gene that is frequently involved in dystrophic epidermolysis bullosa. This data points to, among others, a gene editing approach to the treatment of certain genetic disorders such as dystrophic epidermolysis bullosa.

Example 37: Gene-editing of the MYC gene using a Synthetic RNA with Non-Canonical Nucleotides

Experiments were conducted with *in vitro* transcribed synthetic RNA molecules containing non-canonical nucleotides and encoding gene-editing proteins. The immunogenicity and the gene-editing efficiency of *in vitro* transcribed synthetic RNA molecules having (1) only pseudouridine (psU) as a non-canonical nucleotide; (2) only

5-methylcytidine (5mC) as a non-canonical nucleotide; and (3) both of pseudouridine and 5-methylcytidine as non-canonical nucleotides was evaluated (as well as controls).

Specifically, mRNA containing the following nucleotide combinations: (i) A,G,U,C, (ii) A,G,psU,C, (iii) A,G,U,5mC, and (iv) A,G,psU,5mC, and encoding TALEN pairs targeting the following DNA sequences, which can be found within the MYC gene: TCGGCCGCCGCCAAGCTCGT (SEQ ID NO:474) and TGCGCGCAGCCTGGTAGGAG (SEQ ID NO:475), were synthesized according to the methods described herein. Human dermal fibroblasts (MA001SK) were plated in 6-well and 24-well tissue culture plates in DMEM with 10% FBS at 100,000 and 10,000 cells per well, respectively. The next day, the cells were transfected in the 6-well plate with 2 µg of RNA (1 µg for each component of the TALEN pair) and the cells were transfected in the 24-well plate with 0.2 µg of RNA (0.1 µg for each component of the TALEN pair) according to the methods described herein. 24 hours after transfection, the total RNA from the cells in the 24-well culture plate was isolated using an RNeasy Mini Kit (74106; QIAGEN), including isolating the total RNA from a sample of cells that had not been transfected with RNA (negative control; "Neg." in **FIG. 23**). The genomic DNA was removed by a 15 minute digestion with DNase I (RNase-Free) (M0303L; NEW ENGLAND BIOLABS) and the reaction purified using an RNeasy Mini Kit. 1 µL of total RNA was used to assess gene expression by real-time RT-PCR using TAQMAN gene-expression assays (APPLIED BIOSYSTEMS) designed to detect expression of the immunogenicity markers TLR3, IFIT1, and IFIT2 (**FIG. 23**). The data were normalized to both the positive experimental control sample ("A,G,U,C") and to a loading control (GAPDH).

48 hours after transfection, the genomic DNA was isolated from the cells in the 6-well culture plate using a DNeasy Blood and Tissue Kit (69506; QIAGEN), including from a sample of cells that had not been transfected with RNA (negative control, "Neg." in **FIG. 24**). A 970 bp region of the MYC gene surrounding the predicted TALEN cut location was amplified using a 35 cycle 2-step PCR reaction containing the following primers: TAACTCAAGACTGCCTCCCGCTTT (SEQ ID NO: 476) and AGCCCAAGGTTTCAGAGGTGATGA (SEQ ID NO: 477). 160 ng was hybridized in 5 µL of amplified sequence from RNA-treated cells to 160 ng in 5 µL of amplified sequences from untreated MA001SK cells by mixing the two sequences with 0.5 µL of 1M KCl and 0.5 µL of 25mM $MgCl_2$ and running the following program in a thermocycler: 95ºC for 10 minutes; 95ºC to 85ºC at 0.625C/s; 85ºC to 25ºC at 0.125C/s. The SURVEYOR assay was performed by adding 0.5µL of SURVEYOR nuclease and 0.5µL of Enhancer from the SURVEYOR Mutation Detection Kit (706020I; INTEGRATED DNA TECHNOLOGIES) to the hybridized product, mixing, and incubating at 42ºC for 25 minutes. The protocol above was also used to process the positive control DNA sample provided with the SURVEYOR Mutation Detection Kit as a positive experimental control for the SURVEYOR Assay ("Assay Pos." in **FIG. 24**). Samples were analyzed by agarose gel electrophoresis (**FIG. 24**). For each sample, gene-editing efficiency was calculated as a ratio of the intensity of the digested bands (indicated by "*" in **FIG. 24**) to that of the undigested band.

As shown in **FIG. 23** below, the samples from cells transfected with the positive control RNA (A,G,U,C), and the samples from cells transfected with RNA containing either pseudouridine or 5-methylcytidine exhibited

upregulation of all three of the immunogenicity markers TLR3, IFIT1, and IFIT2. The sample from cells transfected with RNA containing both pseudouridine and 5-methylcytidine exhibited negligible upregulation of the immunogenicity markers (less than 0.01-fold of the positive control), demonstrating that *in vitro* transcribed synthetic RNA with both pseudouridine and 5-methylcytidine and encoding a gene-editing protein can evade detection by the innate-immune system of mammalian cells.

Further, as shown in **FIG. 24** below, the sample from cells transfected with RNA containing both pseudouridine and 5-methylcytidine exhibited highly efficient gene editing (41.7%), which was greater than the efficiency exhibited by samples from cells transfected with RNA containing pseudouridine alone (35.2%), demonstrating that *in vitro* transcribed synthetic RNA comprising both pseudouridine and 5-methylcytidine and encoding a gene-editing protein can both (i) gene-edit mammalian cells at high efficiency, and (ii) gene-edit mammalian cells at higher efficiency than *in vitro* transcribed synthetic RNA comprising pseudouridine and not comprising 5-methylcytidine.

Example 38: COL7A1 Gene Editing and Repair in Human Cells

RNA encoding gene editing proteins targeting the following sequences in the COL7A1 gene was synthesized according to Example 1: TGAGCAGAAGTGGCTCAGTG (SEQ ID NO:473) and TGGCTGTACAGCTACACCCC (SEQ ID NO:468) (see also table below).

50,000 primary human epidermal keratinocytes (HEKn, Gibco) were plated in wells of 6-well plates in EpiLife + Supplement S7. The next day, cells were transfected according to Example 3 with 1 µg of RNA encoding each component of the gene editing pair and 2 µg of a single-stranded DNA repair template having a length of 60, 70, 80, 90 or 100 nucleotides ("nt"). 48 hours after transfection, genomic DNA was purified. A segment of the COL7A1 gene was amplified using the primers GCATCTGCCCTGCGGGAGATC (SEQ ID NO:478) and CCACGTTCTCCTTTCTCTCCCCGTTC (SEQ ID NO:479), which produce a 535 bp amplicon. The efficiency of gene editing was assessed using T7 Endonuclease I ("T7E1", New England Biolabs) according to the manufacturer's instructions. Bands of approximately 385 bp and 150 bp indicate successful gene editing. **FIG. 25** and **FIG. 29** show the result of digestion with T7EI, analyzed by agarose gel electrophoresis. **FIG. 27** and **FIG. 29**

show the result of digestion with MluI-HF, analyzed by agarose gel electrophoresis. Because the repair template contains the sequence ACGCGT (SEQ ID NO:480), digestion of the amplified product with MluI-HF (New England Biolabs) produces bands of approximately 385 bp and 150 bp in the case of successful gene repair.

50,000 primary human dermal fibroblasts (MA001SK, Factor Bioscience) or 100,000 primary human epidermal keratinocytes (HEKn, Gibco) were plated in DMEM+10% FBS or EpiLife + Supplement S7, respectively. Secreted BMP7 levels were determined by measuring 450 nm absorbance using a microplate reader (EMax Plus, Molecular Devices). Secreted BMP7 levels are shown in **FIG. 30**.

Example 41: Intradermal, Subcutaneous, Rectal and Nasal Administration of NOVECRIT for the Treatment of Anemia

A repeat dose toxicity study of Novecrit was conducted for the treatment of anemia. Specifically, 8-10 weeks old male Sprague Dawley rats were administered with Novecrit via intradermal, subcutaneous, rectal, or nasal routes once per day on days 1, 8, and 15. The animals were assigned to groups and treated as indicated in the table below:

Group	**Group Color**	**Test Article**	**Dose Route**	**Dose Level (µg)**	**Dose Concentration (µg/mL)**	**Dose Volume (µL)**	**Number of Animals**
							Males
1	White	Control	Intradermal	0.0	0.0	50	3[a] + 8[b]
2	Yellow	Novecrit	Intradermal	4X (0.25 µg /injection; 1.0 µg total)	5.0	50	3[a] + 8[b]

5	Red	Novecrit	Nasal	4.0	20.0	200	3[a] + 8[b]

Note: Total dose volume (µL/per animal) are constant

[a] Toxicity animals (also called main study animals), necropsy on Day 44

[b]TK animals, euthanized as n = 2/time point on Days 2, 16, 23 and 44

More particularly, Group 1 was dosed via intradermal injection. Each dose was administered in four intradermal injections of 50 µL/injection for a total of 200 uL per animal. Injections were carried out on previously marked sites near the midline of the dorsal lumbar area (upper left, upper right, lower left and lower right quadrants). Group 2 was dosed four intradermal injections at 0.25 µg each (1.0 µg total) into previously marked sites near the midline of the dorsal lumbar area (upper left, upper right, lower left and lower right quadrants). Group 3 was dosed by subcutaneous injections into an area of the back located in the lower dorsal thoracic/lumbar region. Group 4 was dosed by rectal administration. The animal was manually restrained and the abdomen of each rat was manually palpated to remove any fecal matter. If deemed necessary, the rectum was lavaged with up to 2 ml of saline for enema followed by manual palpation of the abdomen to remove the fecal matter, if any. Novecrit was drawn into a syringe and an appropriately sized gavage needle with a rounded tip (ball) was attached to the syringe. A lubricant jelly was applied to the insertion device to aid with insertion; it was advanced approximately 1cm into the lumen of the colon and the Novecrit instilled. The rat was then maintained in a head-down position for approximately 20 - 30 seconds to limit the expulsion of solution. Group 5 was dosed via nasal route. The animal was anesthetized (per SNBL USA SOP). The animal laid on its back with the head elevated. The dose was dispensed slowly into the nares. Approximately half the dose volume was administered to one nare. The remaining dose volume was administered to another nare. The first dose was administered on Day 1, and the last dose on Day 15.

The rats were clinically monitored including their food consumption and body weight. In addition, blood was collected for hematology, coagulation, and serum chemistry analysis as indicated below:

Day 44	1X (n = 3/Group)	1X (n = 3/Group	1X (n = 3/Group)

x = Number of times procedure performed

Analysis was done on the toxicokinetic group as follows:

Terminal necropsy for toxicity animals occurred on Day 44. TK animals were euthanized on Days 2, 16, 23, and 44. Pathological analysis was conducted on the animals.

As shown in **FIG. 32**, administration of NOVECRIT stimulated erythropoiesis resulting in elevated hematocrit for at least 14 days in all four study groups compared to control.

Example 42: Intradermal Administration of RNA Encoding BMP7 Variants for the Treatment of Diabetic Nephropathy

A ZDSD rat model was utilized to study the effects of RNAs encoding BMP7 variants for the prevention and treatment of diabetic nephropathy. Specifically, ZDSD rats were treated with RNAs encoding BMP7 variants administered intradermally. A schematic of the study design is provided in **FIG. 33**. The animals were assigned to groups and treated as indicated in the table below:

Group Number	Treatment	No. of Animals	Dose Level (µg)	Dose Conc. (µg /ml)	Dose Volume (ml/kg)	Frequency	Route of Admin.
1	Vehicle	24	0	0	0.1	2x/wk	I.D.
2	FTB-F1 (wt BMP7)	6	1	5	0.1	2x/wk	I.D.
3	FTB-F2 (BMP7 variant A)	6	1	5	0.1	2x/wk	I.D.

6 [a]	Vehicle	20	0	0	0.2/rat	3x/wk	I.D.
7 [a]	FTB-F2 (BMP7 variant A)	10	2	10	0.2/rat	3x/wk	I.D.

[a] Group 1 animals at the end of the "Prevention" arm were randomized into Groups 6 and 7 (n=20 or 10 each, respectively) to define the "Treatment" arm. The remaining 6 animals from Group 1 were euthanized for kidney collection and blood draw at the end of the "Prevention" arm.

To study the effect of the RNAs on prevention of diabetic nephropathy, animals were delivered from the barrier (PCO-5638) to the vivarium (PCO-Rm C) and allowed 3 days for acclimation. All animals were placed on 5SCA diabetogenic diet for 3 weeks (weekly body weight measurements were taken). Animals were then returned to regular 5008 diet for the duration of the study (weekly body weight measurements were taken). After 2 weeks on 5008 diet, body weight measurement, blood draw (500 ul) and a 24 hour baseline urine collection (urinary albumin and creatinine measurements) were performed on all animals. 36 rats were randomized to groups 1, 2 and 3 based on body weight, glucose and urinary albumin. Groups 1, 2, 3 and 4 received either vehicle or test article (i.d.) via intradermal administration (2x/week, Mon and Thur). Group 5 was administered Lisinopril admixed in the 5008 diet (food consumption will begin on this group of animals). Blood draws (500 ul, tail vein) were taken from Groups 2, 3 and 4, 24 hours after each dose for the first 2 weeks and then 1x/week thereafter. After 4 weeks of dosing, blood sample via tail vein (500 ul) was taken from all animals (Groups 1-5). At the end of 8 weeks of dosing, a 24 hour urine collection was performed (urinary albumin and creatinine measurements) together with a tail vein (500 ul) blood sample from Group 1 (n=18 going into the Treatment arm). Results for urine volume, creatinine, and albumin is shown in **FIG. 35**. As shown in **FIG. 35**, treatment with RNA encoding BMP7 Variant A resulted in reduced levels of urine albumin in rats afflicted with diabetic nephropathy compared

to the control, indicating superior kidney function in the treated animals compared to the control animals (placebo group). To terminate the study, all animals were euthanized with CO_2 asphyxiation and a blood draw was performed via cardiac puncture to collect serum for BUN, creatinine and glucose, and plasma for compound exposure and biomarker analysis. Both kidneys were dissected and fixed for histology. **FIG. 34** shows the serum level of BMP7 protein in Groups 1, 2, 3, and 4. Results indicate that the serum levels of BMP7 protein in these groups were as follows: Group 4, Group 3 > Group 2, Group 1.

A study was also conducted to analyze the effect of the RNAs encoding BMP7 variants on treating diabetic nephropathy. Specifically, the vehicle animals from Group 1 (Prevention arm, n=18) were randomized based on body weight, glucose and urine albumin (Groups 6, n=20; 7, n=10;). Animals received either Vehicle or BMP7 variant-encoding RNAs (intradermal, 2x/week, Mon and Thur), groups 6 and 7, respectively. After 4 weeks of treatment, animals were euthanized with CO_2 asphyxiation and a blood draw will be performed via cardiac puncture to collect serum for BUN, creatinine and glucose, and plasma for compound exposure and biomarker analysis. Both kidneys were dissected and fixed for histology. As shown in **FIG. 36**, treatment with RNA encoding BMP7 Variant A decreased urine albumin level in rats afflicted with diabetic nephropathy, indicating superior kidney function in the treated animals. This result suggested that BMP7 variant-encoding RNA effectively treated diabetic nephropathy and promoted superior kidney function compared to the control animals (placebo group).

Altogether, these results suggested that RNAs encoding BMP-7 variants effectively prevented the development of diabetic nephropathy in rats. In addition, these RNAs also effectively treated and restored kidney functions in rats already afflicted with diabetic nephropathy. RNA encoding BMP7 Variant A was particularly effective at preventing and treating diabetic nephropathy in rats.

Example 43: Transfection of Human Keratinocytes with RNA Encoding BDNF, BMP-2, BMP-6, IL-2, IL-6, IL-15, IL-22, LIF or FGF-21

100,000 human epidermal keratinocytes (HEK, Gibco) were plated in EpiLife + Supplement S7. Cells were transfected according to Example 3 with 2 µg of RNA encoding BDNF, BMP-2, BMP-6, IL-2, IL-6, IL-15, IL-22, LIF or FGF-21. 24 hours after transfection, the medium was sampled and secreted protein levels were measured using a human ELISA kit (see Table below) according the manufacturer's instructions. Secreted protein levels were determined by measuring 450 nm absorbance using a microplate reader (EMax Plus, Molecular Devices). Secreted protein levels are shown in **FIG. 34**, panels A-I.

Example 44: Transfection of Human Keratinocytes with RNA Encoding IL-15 and/or IL-15RA

100,000 human epidermal keratinocytes (HEK, Gibco) were plated in EpiLife + Supplement S7. Cells were transfected according to Example 3 with 2 µg of RNA encoding IL-15 or 1 µg each of RNA encoding IL-15 and RNA encoding IL-15RA. 24 hours after transfection, the medium was sampled and secreted IL-15 levels were measured using a human IL-15 ELISA kit (D1500, R&D Systems) according the manufacturer's instructions. Secreted IL-15 levels were determined by measuring 450 nm absorbance using a microplate reader (EMax Plus, Molecular Devices). Secreted IL-15 levels are shown in **FIG. 35**. As demonstrated in **FIG. 35**, co-transfection of IL-15 and IL-15RA significantly increased secreted IL-15 levels compared to transfection with IL-15 alone.

[b]Animals, euthanized on Day 3 without examination or necropsy

Intradermal = ID

For the study, the animals were treated with either 4 ug of RNA. All groups were dosed via intradermal injection. Each dose was administered in four intradermal injections of 50 µL/injection for a total of 200 uL per animal. Injections occurred into previously marked sites near the midline of the dorsal lumbar area (upper left, upper right, lower left and lower right quadrants). Dose time (after the last injection) was recorded. Additional markings were made as needed to allow for identification of the dose site. Animals were administered with the RNAs on day 1 and euthanized on day 3. Clinical observations were made on the rats twice daily. Food consumption and body weight were also monitored.

During the study, approximately 1 ml of blood samples was collected from the jugular vein for pharmacokinetic analysis as follows:

Time Point	PK[a]
Acclimation	-
Day 1	12 hours postdose
Day 2	24 hours postdose
Day 3	48 hours postdose

[a]Time points for blood collection (n = 3 animals/Group/Time point)
PK = Pharmacokinetics

Results indicate that following administration of RNAs encoding FGF21, IL15, IL15 and IL15R, IL6, IL22, and NOVEPOEITIN, these proteins were readily detected in the blood with protein levels peaking at approximately 12 hours post injection (**FIG. 39**). Of note, the proteins tested in this study can be taken up by cells and tissues and/or can exert an effect near the site of expression without appreciable accumulation in systemic circulation.
