ABSTRACT
A method is provided for forming a package assembly for individual elongate consumable products. A flat blank is provided. The blank includes a back wall, a foldable front wall and a foldable flap extending from the back wall. An adhesive location is placed on the foldable front wall. An array of elongate consumable products is placed on the back wall. The foldable front wall is folded to place the consumable products in releasable adhesive engagement therewith.
METHOD FOR FORMING A PACKAGE ASSEMBLY FOR DISPENSING AND RETAINING GUM SLABS WITH ADHESIVE SECUREMENT

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application is a continuation of and claims priority to U.S. application Ser. No. 12/005,761, filed Dec. 28, 2007, which is a continuation of Ser. No. 11/124,922, filed May 9, 2005, now U.S. Pat. No. 7,325,686, and U.S. Provisional Application No. 60/570,004, filed May 11, 2004; and U.S. Provisional Application No. 60/570,015, filed May 11, 2004; which are incorporated herein by reference.

FIELD OF THE INVENTION

[0002] The present invention relates generally to a package for containing an array of consumable products and retaining the products in the package until such time as it is desired to dispense the individual products. More particularly, the present invention relates to a package for retaining and dispensing gum slabs using adhesive securement.

BACKGROUND OF THE INVENTION

[0003] It is well known to house consumable products such as gum slabs in a package or housing which retains the gum slabs and allows for dispensing of an individual slab therefrom. The gum slabs are typically arranged in an array, so that a single gum slab may be removed from the array leaving the remaining gum slabs in the package. Often, the gum slabs may be wrapped individually in an outer wrapper.

[0004] Certain of the gum slab packages are of the type which maintain their outer configuration even after removal of one of the gum slabs. This creates a space in the package which allows adjacent gum slabs to become displaced. Therefore, it may become difficult to remove additional gum slabs from the package if one or more of the remaining gum slabs tilts or falls over within the package. Also, by creating such a space, the remaining gum slabs may slide or move in the package and may even fall out of the package.

[0005] One attempt to retain and dispense individual gum slabs from a package is shown in U.S. Patent Application Publication No. 2003/0080020 to Kopecky, the disclosure of which is incorporated by reference herein for all purposes. The Kopecky disclosure discloses a gum slab package housing formed from a die cut paperboard blank having a generally rectangular configuration. The housing includes a front cover which opens to expose a plurality of gum slabs. The gum slabs are contained in a side-by-side array by a sheet which wraps around the gum slabs. The sheet, including the gum slab array, is placed into the package housing such that the gum slabs are exposed once the front cover is opened. In order to retain the gum slabs in an upright condition and maintain the gum slabs within the package once one or more of the slabs are removed from the array, the gum slabs are adhesively secured to the sheet. The adhesive securement may take the form of wax areas on the inner surface of the sheet. Once the wrapped slabs are inserted into the sheet, heat is applied to the sheet to cause the wax to melt. The array of gum slabs secured to the sheet may then be placed in the package for retention and dispensing.

SUMMARY OF THE INVENTION

[0007] The present invention provides a method for forming a package assembly for individual elongate consumable products. A blank is provided. The blank includes a back wall, a foldable front wall and a foldable flap extending from the back wall. An adhesive location is placed on the foldable front wall. An array of elongate consumable products is placed on the back wall. The foldable front wall is folded to place the consumable products in releasable adhesive engagement with the front wall.

[0008] In a preferred embodiment the adhesive location is a longitudinal strip.

[0009] The package assembly of the present invention may also include a band surrounding the array of products. The band holds the product array in removable frictional retention. The adhesive location may be in engagement with the band for adhesively supporting the band in the package housing.

[0010] The package housing may also include an adhesive strip along the back wall thereof. The adhesive strip along the back wall may be positioned for engagement with the products.

BRIEF DESCRIPTION OF THE DRAWINGS

[0011] FIG. 1 is a perspective showing of the package assembly of the present invention shown in the closed condition.

[0012] FIG. 2 is a perspective showing of the package assembly of FIG. 1 shown in the opened condition with an array of products supported therein.

[0013] FIG. 3 shows the package housing of the package assembly of FIG. 1 in its preassembled condition.

[0014] FIG. 4 shows the package housing of FIG. 3 with an array of products supported therein.

[0015] FIG. 5 shows another embodiment of the package housing of FIG. 1 in its preassembled condition with an array of products therein.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0016] The present invention is directed to a package assembly which contains a plurality of consumable products in a package housing. The package housing is openable to allow dispensing of one or more products therefrom and is reclosable to contain and maintain the products therein. While the present invention is useful with a wide variety of consumable product, it is particularly useful with respect to elongate gum slabs which are arranged in a side-by-side array.

entitled “Gum Package Design with Two Separate Compartments”, both of which are incorporated by reference herein for all purposes.

[0018] Moreover, the present invention discloses consumable product packages of the type shown in commonly assigned U.S. patent application Ser. No. 11/124,906, filed May 9, 2005, now U.S. Pat. No. 7,811,614, entitled “Gum Slab Package Having Insertable Product Retention Member” and identified as Attorney Docket No. 1421-18, and also shown in commonly assigned U.S. patent application Ser. No. 11/124,921, filed May 9, 2005, now U.S. Pat. No. 7,901,719, entitled “Gum Slab Package With Flap Retention” and identified as Attorney Docket No. 1421-19, both of which are incorporated by reference herein for all purposes.

[0019] Referring now to FIGS. 1 and 2, the present invention provides a packaging assembly 10 which supports therein an array 12 of gum slabs 14. Gum slabs 14 are typically elongate rectangularly shaped members which may optionally include wrappers (not shown in FIG. 2) individually around each gum slab. The gum slabs are arranged in a side-by-side fashion to form array 12. The gum slabs 14 are supported in the array in a package housing 16. The package housing 16 includes a front wall 18, an opposed back wall 20, a bottom wall 22, and opposed side walls 24 and 26. As will be described in further detail hereinbelow, the package housing is formed from die cut paperboard, which is folded in a well known manner to form the configuration shown in FIGS. 1 and 2. The package housing 16 is folded such that it provides an open upper end 28 which defines a dispensing opening. The back wall 20 includes an upwardly extending foldable cover 30 which may be folded over the open upper end to close the opening and contain the slabs 14 within the package housing 16. A slit 32 positioned in the front wall 18 allows the distal edge 34 of cover 30 to be inserted therein for reclosing purposes. Additionally, it is contemplated that the package is provided in the condition shown in FIG. 1 with the cover 30 adhesively secured to the front wall 18. Once the adhesive securement is removed to dispense the first gum slab, the flap may be reclosed by inserting it into the slit 32.

[0020] It is also contemplated that the package housing 16 may be covered by a plastic wrap (not shown) which encloses and protects the package and during shipping and prior to sale and use.

[0021] As will be described in further detail hereinbelow, it is contemplated that the array 12 of slabs 14 will be removably retainably supported within the package housing 16 so that it permits easy removal of one or more gum slabs while maintaining the remainder of the gum slabs in the package housing. Furthermore, it is contemplated that the technique for releasably supporting the slabs 14 within the package housing will permit the slabs 14 to maintain their position within the housing even after removal of one or more of the adjacent gum slabs so as to prevent the gum slabs from tilting or falling over in the package or falling out from the package.

[0022] Referring now to FIGS. 3 and 4, a preferred embodiment of the present invention is shown. With respect to the present embodiment, similar reference numerals denote similar elements with 100 added to the reference numerals of FIGS. 1 and 2 to denote the present embodiment.

[0023] FIG. 3 shows package housing 116 of the package assembly 110 in its preassembled condition. Package housing 116 is formed from a die cut paperboard and is provided in a flat configuration which may be folded from the flat configuration shown in FIG. 3 into the configuration shown in FIGS. 1 and 2. The package housing 116 is shown to have the back wall 120, a foldable front wall 118, foldable side walls 124 and 126 and a foldable cover 130.

[0024] As particularly shown in FIG. 4, package assembly 110 includes an array 112 of gum slabs 114 which are supported within package housing 116. The gum slabs 114 are further contained within a band 131. Band 131 may be formed of a wide variety of materials including paper, foil or combinations thereof.

[0025] In the present illustrative, the band 131 is formed into a pouch or U-shaped configuration having opposed front and back walls, side walls and a bottom wall. The array 112 of gum slabs 114 is positioned within the band with the aligned lower ends thereof contained within the U-shaped band. While a U-shaped band is shown herein, other configurations may be employed.

[0026] Referring again to FIG. 3, back wall 120 has positioned thereacross an adhesive location in the form of a longitudinal adhesive wall strip 125. The wall strip 125 extends across the back wall 120 so as to be engageable with the array 112 of gum slabs 114 so as to provide adhesively securement thereto. The wall strip 125 is preferably positioned adjacent the upper portion of back wall 120 so as to engage the slabs 114 along an upper end thereof. It is contemplated that the adhesive provided for the adhesive location is a releasable adhesive which will retainly support the slabs 114 therein, but which can be easily overcome so as to permit removal of the gum slabs therefrom. Wax is a well known releasable adhesive.

[0027] Furthermore, a front foldable cover 118 may also include an adhesive location defined by an adhesive flaps 127. The flap strip is positioned so that when the front wall 118 folded in a manner shown in FIG. 2, the flap strip 127 is engageable with the gum slabs 114 in the U-shaped band 131. Again, the flap strip 127 extends transversely across the cover so as to be engageable mutually across the array 112 of gum slabs 114. It is contemplated that the positioning and width of the flap strip 127 may be selected so that the strip can engage the individual gum slabs 114 extending from the band 131 alone without engaging the band 131, or can be positioned so that it engages the band 131 alone without engaging the gum slabs or, in the further alternative, can be of sufficient width that it mutually engages both the band 131 and the gum slabs 114 simultaneously.

[0028] In addition, as shown in dotted lines in FIG. 1, the adhesive wall strip 125a may be positioned and be of sufficient width to engage both the gum slabs 114 and the band 131 simultaneously.

[0029] The use of the adhesive strips 125 and 127 independently result in holding of the array 112 of gum slabs 114 within package housing 116 and permit individual removal therefrom.

[0030] While the adhesive is a releasable adhesive permitting easy removal of the gum slabs therefrom, the adhesive retention is such that even where adjacent gum slabs are removed, the remaining gum slabs will not tilt or tend to fall out of the package.

[0031] Referring now to FIG. 5, a further embodiment of the present invention is shown. With respect to the present embodiment, similar reference numerals denote similar elements with 200 added to the reference numerals of FIGS. 1 and 2 to denote the present embodiment.

[0032] FIG. 5 shows the package assembly 210 of package housing 216 in its preassembled condition. Package housing
216 is formed from a die cut paperboard which may be folded from its flat configuration shown in FIG. 5 into the configuration shown in FIGS. 1 and 2. The package housing 216 is shown to have the back wall 220, a foldable front wall 218, foldable side walls 224 and 226 and a foldable cover 230.  [0033] The package housing 216 supports an array 212 of gum slabs 214 against the interior surface of the back wall 220. In the present illustrative embodiment, the gum slabs may be either unwrapped or individually wrapped with wrappers. The gum slabs 214 are supported against the interior surface of back wall 220 without the benefit of any adhesive securement thereto. The front wall 218 includes an adhesive location in the form of a longitudinal adhesive strip 227 therealong. When the reassembled housing is assembled into the configuration of FIG. 2 and the front wall 218 is folded, the adhesive strip 227 will make adhesive contact with the gum slabs transversely thereacross.  [0034] As the adhesive forming the adhesive location is releasable adhesive, it will allow for removable retentive engagement of the individual gum slabs from the package housing 216. Such releasable retention allows the gum slabs to be individually removed from the package while retaining gum slabs in place even after removal of an adjacent gum slab.  [0035] The embodiment of FIG. 5 employs a single adhesive location on the front wall 218 and achieves adhesive retention without the need of a band (FIG. 3) supporting the array 212 of gum slabs 214.  [0036] Having described the preferred embodiments herein, it should now be appreciated that variations may be made thereto without departing from the contemplated scope of the invention. Accordingly, the preferred embodiments described herein are deemed illustrative rather than limiting, the true scope of the invention being set forth in the claims appended hereto.

What is claimed is:

1. A method of forming a package assembly for individual elongate consumable products comprising the steps of:
   - providing a flat blank having a back wall, a foldable front wall and a foldable flap extending from said back wall; and
   - placing an array of said elongate consumable products on said back wall;
   - folding said foldable front wall to place said consumable product in releasable adhesive engagement therewith.
2. A method of claim 1 further including the step of folding said foldable flaps over said foldable front wall.
3. A method of claim 1 wherein said adhesive location is a first longitudinal adhesive strip extending across said foldable flap.
4. A method of claim 3 wherein said first adhesive strip is placed in engagement with said products.
5. A method of claim 3 further including the step of surrounding said array of products with a band, said band holding said products in removable frictional retention.
6. A method of claim 5 wherein said first longitudinal adhesive strip is placed in engagement with said band for adhesively supporting said band in said package housing.
7. A method of claim 5 further including the step of placing a second adhesive strip along said back wall of package housing.
8. A method of claim 7 wherein said second adhesive strip is engagable with said product array extending from said band for adhesively retaining said products therein.
9. A method of claim 7 wherein said second adhesive strip is engagable with said band for supporting said band in said package housing.
10. A method of claim 7 wherein said second adhesive strip is mutually engagable with said products extending from said band and with said band.
11. A method of claim 5 wherein said band is in the form of a U-shaped pouch, said pouch supporting the end of said products of said array.
12. A method of claim 5 wherein said band is formed from material including paper, foil and combinations thereof.
13. A method of claim 1 wherein said adhesive location includes a releasable adhesive.
15. A method of claim 3 wherein said first adhesive strip is mutually engagable with said band and said products extending from said band upon said folding of said front wall.
