(57) ABSTRACT

The present invention relates to a new and distinct cultivar of raspberry plant named Driscoll Cardinal. The new cultivar is distinguished from other raspberry cultivars by its firm and very consistent fruit with regard to its size and shape throughout its harvest period. The new cultivar is distinguished from its seed parent by having larger fruit and more vigorous canes; it is distinguished from its pollen parent by producing a higher yield of fruit and better flavored fruit.

3 Drawing Sheets

1

Latin name of the genus and species of the plant claimed: The variety is botanically identified as *Rubus idaeus* L.

1. BACKGROUND OF THE INVENTION

The new cultivar of raspberry plant was developed from the hybridization of the selection 'M48.9' (an unpatented variety) as the seed parent with the selection 'Gloria' (U.S. Plant Pat. No. 11,067) as the pollen parent. The parents were crossed in 1994, whereafter fruit and seed were collected to produce seedlings for field planting in Carpenteria, Calif. in 1995. The new cultivar was selected from these seedlings in 1995 for its excellent attractive firm fruit. The new cultivar has been asexually propagated by in vitro shoot tip culture, root sucker division and root cuttings at the Cassin Ranch in Santa Cruz County, Calif. and has been shown to maintain the desired and distinguishing characteristics after propagation over several generations.

2. SUMMARY OF THE INVENTION

The present invention provides a new and distinct cultivar of red raspberry plant named 'Driscoll Cardinal'. The cultivar is botanically identified as *Rubus idaeus* L. The 'Driscoll Cardinal' red raspberry plant produces a primocane crop which begins in mid-July and continues until mid-October. The floricane crop begins in mid-May and continues until mid-July. Both the primocane and floricane yields are high relative to other comparable varieties. The fruit of 'Driscoll Cardinal' is notably quite firm and very consistent with regard to its size and shape throughout its harvest period. The fruit of 'Driscoll Cardinal' separates easily from its receptacle.

3. BRIEF DESCRIPTION OF THE DRAWINGS

The accompanying photographs show typical specimens of the primocane fruit, leaves and shoot of the new cultivar, in color as nearly true as it is reasonably possible to make in color illustrations of these characteristics.

2

FIG. 1 is a photograph of 'Driscoll Cardinal' primocane flower fruit in various stages of development.

FIG. 2 is a photograph of 'Driscoll Cardinal' primocane leaves showing upper and lower leaf surfaces.

FIG. 3 is a photograph of 'Driscoll Cardinal' primocane shoot.

4. DETAILED BOTANICAL DESCRIPTION

The following detailed description of the new raspberry cultivar, 'Driscoll Cardinal', is based upon observations taken of 7 to 17 month old plants and fruit grown in Watsonville, Calif. between 2001 and 2002, and is believed to apply to plants of the 'Driscoll Cardinal' cultivar grown in similar conditions of soil and climate elsewhere.

Throughout this specification, color names beginning with a small letter signify that the name of the color, as used in common speech, is aptly descriptive. Color data followed by an alphanumeric code designates the color according to The R.H.S. Colour Chart published by The Royal Horticultural Society of London, England. Color designations, color descriptions, and other phenotypical descriptions may deviate from the stated values and descriptions depending upon variation in environmental, seasonal, climatic and cultural conditions.

Table 1 provides information on the plant and fruit characteristics of the new cultivar 'Driscoll Cardinal' compared with characteristics of the unpatented raspberry cultivar 'Heritage'. Observations of the cultivars were taken under similar conditions.

The new variety is particularly characterized and distinguished from other cultivars by its fruit firmness, consistent fruit structure and high yield.

The fruit color of 'Driscoll Cardinal' is a medium red at harvest but darkens slightly after harvest to a deeper color. Fruit of 'Driscoll Cardinal' separates easily from the receptacle and is of excellent firmness at harvest. The fruit of 'Driscoll Cardinal' is very consistent in size and shape

3

4

throughout the harvest period. The average plant height is about 200 cm and the average plant spread is about 80 cm. The prickle pigmentation color is 187A. The pedicel pigmentation color is 144A. The pigmentation color of the young shoots is 144A in color and the average number of young shoots per plant is 17.

The reproductive organs of 'Driscoll Cardinal' are variable. The pigmentation color of both surfaces of the petals is 155D and there are five petals per flower. The style pigmentation color is 157D, the average number of styles per flower is about 100, the anther pigmentation color is 155D, and the average number of anthers per flower is about 108. The color of the seeds of 'Driscoll Cardinal' is 161A, the average seed weight is about 1.2 mg, and there are an average of about 94 seeds per fruit.

The primocane and floricane yields of 'Driscoll Cardinal' are high relative to the variety 'Heritage'.

'Driscoll Cardinal' is distinguishable from its pollen parent, selection 'Gloria', by producing a higher yield of fruit and better flavored fruit. The new cultivar is distinguished from its seed parent, selection 'M48.9', by having larger fruit and more vigorous canes.

4.1 DISEASE AND STRESS RESISTANCE

Resistance is unknown to powdery mildew and root rots. Cold tolerance of the new cultivar has not been established. Post harvest fruit rot resistance is good in comparison over many selections and varieties.

TABLE 1

PLANT CHARACTERISTICS OF 'DRISCOLL CARDINAL'				
	Driscoll Cardinal	Heritage		
General				
Plant size Growth habit Productivity Self-fruitfulness Time of bud burst Primocane fruiting	small-med erect High Self-fruitful late	Large erect Medium Self-fruitful late		
Percent of cane length flowering as primocane Percent of total yield Primocanes	30-40 51	20-40 53		
Number of young shoots Young shoot pigmentation Length (cm) Time of shoot emergence Glaucosity (waxy bloom) Strength Cane cross section from mid cane of primocane) Dormant cane color	many medium 2.00 early weak medium rounded dark brown w/quite a lot of purple	medium medium 1.96 very late weak medium rounded brown to purple brown		
Prickles Pigmentation Density on young shoots Attitude of tip	brown to purple medium downward	green- brownish to green dense downward		
Size: Length (base to tip at 1 m height at end of harvest) (mm) Texture Presence and distribution on petioles	smooth present, irregularly	2.3 rigid present irregularly		

TABLE 1-continued

PLANT CHARACTERISTICS OF 'DRISCOLL CARDINAL'				
	Driscoll Cardinal	Heritage		
Pubescence on canes Internodal distance (cm) (at central ½ of cane) LEAVES Color	absent 6.5	distribtuted absent 5.3		
Face Underside Relief between veins Glossiness Petiole length (cm) Stipule orientation Arrangement Number of leaflets Overlapping of lateral leaflets Lateral leaflet: length of stalket (lower pair) Terminal leaflet	147A 148C weak medium 5.4 erect compound sometimes 3, sometimes 5 touching short	147A 148B very weak medium 7.6 erect compound sometimes 3, sometimes 5 free to touching very short		
Length (cm) Width (cm) Shape Tip Base Margin Lateral leaflets (basal pair)	10.7 6.8 ovate acuminate round doubly serrate	14.6 7.8 ovate acuminate acute to rounded doubly serrate

PLANT CHARACTERISTICS OF 'DRISCOLL CARDINAL'			
	Driscoll Cardinal	Heritage	
Dimensions			
Size	medium	small	
Length	20	17	
Width	20	18	
Length:width	1.0	0.94	
Weight (g/fruit)			
Primocane	4.1	3.1	
Floricane	3.8	2.3	
Soluble solids (%)	10.3	10.8	
Titratable acidity	1.60	1.58	
(% as citric acid)			
Seed Weight (mg)	2.3	1.5	
Number druplets/fruit	94	72	
Adherence to plug	medium	medium	
Firmness	med-firm to firm	Firm	
Yield	high	medium	

4.2 NUCLEIC ACID FINGERPRINTING

Distinctive patterns of polymorphism can be detected using a variety of nucleic acid analysis methods. In one non-limiting example, molecular genetic maps can be produced using random amplified polymorphic DNA (RAPD) (Williams et al., 1990, "DNA polymorphisms amplified by arbitrary primers are useful as genetic markers", Nucleic Acids Res. 18(22):6531–5). Using a variety of oligonucleotide primers, alone or in combination, RAPD analysis of Driscoll Cardinal and Heritage yielded DNA fragment patterns that uniquely distinguish each of these genetically distinct genotypes.

We claim:

1. A new and distinctive cultivar of raspberry plant, substantially as shown and described.
