NOVEL THIOPHENE DERIVATIVES AS S1P1/EDG1 RECEPTOR AGONISTS

Field of the invention

The present invention relates to S1P1/EDG1 receptor agonists of Formula (I) and their use as active ingredients in the preparation of pharmaceutical compositions. The invention also concerns related aspects including processes for the preparation of the compounds, pharmaceutical compositions containing a compound of the Formula (I), and their use as compounds improving vascular function and as immunomodulating agents, either alone or in combination with other active compounds or therapies. A further aspect of the invention relates to novel compounds of Formulae (II) and (III) that serve as intermediates to prepare compounds of Formula (I).

Background of the invention

The human immune system is designed to defend the body against foreign microorganisms and substances that cause infection or disease. Complex regulatory mechanisms ensure that the immune response is targeted against the intruding substance or organism and not against the host. In some cases, these control mechanisms are unregulated and autoimmune responses can develop. A consequence of the uncontrolled inflammatory response is severe organ, cell, tissue or joint damage. With current treatment, the whole immune system is usually suppressed and the body’s ability to react to infections is also severely compromised. Typical drugs in this class include azathioprine, chlorambucil, cyclophosphamide, cyclosporin, or methotrexate. Corticosteroids which reduce inflammation and suppress the immune response, may cause side effects when used in long term treatment. Nonsteroidal anti-inflammatory drugs (NSAIDs) can reduce pain and inflammation, however, they exhibit considerable side effects. Alternative treatments include agents that activate or block cytokine signaling.
Orally active compounds with immunomodulating properties, without compromising immune responses and with reduced side effects would significantly improve current treatments of uncontrolled inflammatory disease.

In the field of organ transplantation the host immune response must be suppressed to prevent organ rejection. Organ transplant recipients can experience some rejection even when they are taking immunosuppressive drugs. Rejection occurs most frequently in the first few weeks after transplantation, but rejection episodes can also happen months or even years after transplantation. Combinations of up to three or four medications are commonly used to give maximum protection against rejection while minimizing side effects. Current standard drugs used to treat the rejection of transplanted organs interfere with discrete intracellular pathways in the activation of T-type or B-type white blood cells. Examples of such drugs are cyclosporin, daclizumab, basiliximab, everolimus, or FK506, which interfere with cytokine release or signaling; azathioprine or leflunomide, which inhibit nucleotide synthesis; or 15-deoxyspergualin, an inhibitor of leukocyte differentiation.

The beneficial effects of broad immunosuppressive therapies relate to their effects; however, the generalized immunosuppression which these drugs produce diminishes the immune system's defense against infection and malignancies. Furthermore, standard immunosuppressive drugs are often used at high dosages and can cause or accelerate organ damage.

**Description of the invention**

The present invention provides novel compounds of Formula (I) that are agonists for the G protein-coupled receptor S1P1/EDG1 and have a powerful and long-lasting immunosuppressive effect which is achieved by reducing the number of circulating and infiltrating T- and B-lymphocytes, without affecting their maturation, memory, or expansion. The reduction of circulating T- / B-lymphocytes as a result of S1P1/EDG1 agonism, possibly in combination with the observed improvement of endothelial cell layer function associated with S1P1/EDG1 activation, makes such compounds useful to treat uncontrolled inflammatory disease and to improve vascular functionality.
The compounds of the present invention can be utilized alone or in combination with standard drugs inhibiting T-cell activation, to provide a new immunosuppressive therapy with a reduced propensity for infections when compared to standard immunosuppressive therapy. Furthermore, the compounds of the present invention can be used in combination with reduced dosages of traditional immunosuppressant therapies, to provide on the one hand effective immunosuppressive activity, while on the other hand reducing end organ damage associated with higher doses of standard immunosuppressive drugs. The observation of improved endothelial cell layer function associated with S1P1/EDG1 activation provides additional benefits of compounds to improve vascular function.

The nucleotide sequence and the amino acid sequence for the human S1P1/EDG1 receptor are known in the art and are published in e.g.: Hla, T., and Maciag, T. J. Biol Chem. 265 (1990), 9308-9313; WO 91/15583 published 17 October 1991; WO 99/46277 published 16 September 1999. The potency and efficacy of the compounds of Formula (I) are assessed using a GTPγS assay to determine EC₅₀ values and by measuring the circulating lymphocytes in the rat after oral administration, respectively (see in Examples).

The general terms used hereinbefore and hereinafter preferably have, within this disclosure, the following meanings, unless otherwise indicated:

Where the plural form is used for compounds, salts, pharmaceutical compositions, diseases and the like, this is intended to mean also a single compound, salt, or the like.

Any reference hereinbefore or hereinafter to a compound of Formula (I), (II) or (III) is to be understood as referring also to salts, especially pharmaceutically acceptable salts, of a compound of Formula (I), (II) or (III), as appropriate and expedient.
The term \( \text{Ci}_{-4} \)-alkyl, alone or in combination with other groups, means saturated, branched or preferably straight chain groups with one to four carbon atoms, preferably one to three carbon atoms. Examples of \( \text{Ci}_{-4} \)-alkyl groups are methyl, ethyl, n-propyl, /so-propyl, n-butyl, /so-butyl, sec-butyl, and te/t-butyl.

The term \( \text{Ci}_{-4} \)-alkoxy, alone or in combination with other groups, means an R-O-group, wherein R is a \( \text{Ci}_{-4} \)-alkyl. Preferred examples of \( \text{Ci}_{-4} \)-alkoxy groups are methoxy, ethoxy, propoxy, iso-propoxy, /so-butoxy, sec-butoxy and te/t-butoxy.

The term hydroxy-\( \text{C}_{2-4} \)-alkoxy means a straight or branched alkoxy chain bearing a hydroxy group whereby there are at least two carbon atoms between the hydroxy group and the oxygen of the \( \text{C}_{2-4} \)-alkoxy group. Examples of hydroxy-\( \text{C}_{2-4} \)-alkoxy groups are 2-hydroxy-ethoxy, 3-hydroxy-propoxy, 2-hydroxy-propoxy, 4-hydroxy-butoxy, 3-hydroxy-1-methyl-propoxy, and 3-hydroxy-butoxy.

The term \( \text{Ci}_{-4} \)-alkylamino or di-(\( \text{Ci}_{-4} \)-alkyl)amino, alone or in combination with other groups, means an \( R' \)-NH- or an \( R' \)-NR"- group, wherein \( R' \) and \( R" \) are each independently a \( \text{Ci}_{-4} \)-alkyl group. Preferred examples of \( \text{Ci}_{-4} \)-alkylamino or di-(\( \text{Ci}_{-4} \)-alkyl)amino groups are methylamino, ethylamino, \( N,N \)-dimethylamino, and \( N \)-methyl-\( N \)-ethyl-amino.

The term halogen means fluoro, chloro, bromo or iodo, preferably fluoro or chloro.

Salts are preferably the pharmaceutically acceptable salts of the compounds of Formula (I).

Salt-forming groups are groups or radicals having basic or acidic properties. Compounds having at least one basic group or at least one basic radical, for example amino, a secondary amino group not forming a peptide bond or a pyridyl radical, may form acid addition salts, for example with inorganic acids. When several basic groups are present mono- or poly-acid addition salts may be formed.
Compounds having acidic groups, such as a carboxy group or a phenolic hydroxy group, may form metal or ammonium salts, such as alkali metal or alkaline earth metal salts, for example sodium, potassium, magnesium or calcium salts, or ammonium salts with ammonia or suitable organic amines, such as tertiary monoamines, for example thethylamine or tri-(2-hydroxyethyl)-amine, or heterocyclic bases, for example \(N\)-ethyl-piperidine or \(N,N'\)-dimethylpiperazine. Mixtures of salts are possible.

Compounds having both acidic and basic groups can form internal salts.

For the purposes of isolation or purification, as well as in the case of compounds that are used further as intermediates, it is also possible to use pharmaceutically unacceptable salts, e.g. the picrates. Only pharmaceutically acceptable, non-toxic salts may be used for therapeutic purposes, however, and those salts are therefore preferred.

The expression **pharmaceutically acceptable** salts encompasses either salts with inorganic acids or organic acids like hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid, sulfamic acid, phosphoric acid, nitric acid, phosphorous acid, nitrous acid, citric acid, formic acid, acetic acid, oxalic acid, maleic acid, lactic acid, tartaric acid, fumaric acid, benzoic acid, mandelic acid, cinnamic acid, palmoic acid, stearic acid, glutamic acid, aspartic acid, methanesulfonic acid, ethanesulfonic acid, ethanedisulfonic acid, \(p\)-toluenesulfonic acid, salicylic acid, succinic acid, trifluoroacetic acid, and the like that are non toxic to living organisms or, in case the compound of Formula (I), (II) or (III) is acidic in nature, with an inorganic base like an alkali or earth alkali base, e.g. sodium hydroxide, potassium hydroxide, calcium hydroxide and the like. For other examples of pharmaceutically acceptable salts, reference can be made to "Salt selection for basic drugs", *Int. J. Pharm.* (1986), 33, 201-217.

The compounds of Formula (I) and (III) may contain one or more stereogenic or asymmetric centers, such as one or more asymmetric carbon atoms. Substituents at a double bond or a ring may be present in cis- or trans-form (E- or Z-form) unless
indicated otherwise. The compounds of Formula (I) and (III) may thus be present as mixtures of stereoisomers or preferably as pure stereoisomers. Mixtures of stereoisomers may be separated in a manner known to a person skilled in the art.

Tkachev, Synthetic Communications (2001), 31(2), 233-243).

T. Crisp, A. G. Meyer, J. Org. Chem. 57 (1992) 6972-6975; R. M. Keenan, et al. J. Med. Chem. 35 (1992) 3858-3872) which is then converted to a compound of Structure 16 by treatment with a mercaptoacetic acid ester or mercaptoacetonitrile as described above.

The compounds of Structure 18 may be prepared by acylating a compound of Structure 20 with an appropriate acylating agent such as ethyl or methyl formate, methyl or ethyl acetate, methyl or ethyl propionate, chloroformate, acetyl chloride, etc. in the presence of a base such as K-tert. butylate, NaOMe, NaH, LDA, etc. in a solvent such as THF, toluene, EtOH etc. at temperatures between 0 and 60°C. a) Phosphorus oxychloride (53.7 g, 350 mmol) is slowly added to DMF (60 ml) stirred at 5°C. Upon complete addition, the clear solution is stirred for further 30 min at 5°C before 5-methyl-2-hexanone (20 g, 175 mmol) is added dropwise. The yellow solution is stirred for 30 min at 0°C, then for 90 min at rt. The mixture becomes warm (40°C) and a thick suspension forms. The mixture is cooled to 25°C and stirring is continued for 1 h before it is poured into an aq. solution of NaOAc (80 g)/ice mixture. The mixture is extracted twice with diethyl ether. The organic extracts are washed with water, combined, dried over MgSO₄, filtered and evaporated to give crude 3-chloro-2-isobutyl-but-2-enal (35.4 g) as a yellow oil, LC-MS: \( t_R = 0.97 \) min.

b) Sodium (10.7 g, 467 mmol) is dissolved in ethanol (500 ml) and the resulting solution is diluted with THF (100 ml) before mercapto-acetic acid ethyl ester (33.7 g, 280 mmol) dissolved in THF (70 ml) is slowly added at 5°C. The mixture is stirred at rt for 1 h before a solution of 3-chloro-2-isobutyl-but-2-enal (30 g, 187 mmol) in THF (100 ml) is slowly added at 8°C. The resulting yellow suspension is stirred at rt for 16 h. The reaction mixture is diluted with diethyl ether (500 ml) and is washed with dilute aq. NaOCl solution, followed by aq. 1N HCl and water. The organic extract is dried over MgSO₄, filtered and evaporated. The remaining orange oil is dissolved in ethanol (150 ml) and 2N aq. LiOH (50 mL) is added. The mixture is stirred for 16 h at 50°C, acidified with 2 N aq. HCl and extracted with EA. The organic extract is dried over MgSO₄, filtered and evaporated. The crude product is recrystallized from EA/heptane to give 4-isobutyl-5-methyl-thiophene-2-carboxylic acid (10.5 g) as colourless crystals; LC-MS: \( t_R = 0.92 \) min, \([M+1+\text{CH}_3\text{CN}] = 240.16\); \(^1\)H NMR (CDCl₃): \( \delta 7.59 \) (s, 1H), 2.40-2.37 (m, 5H), 1.84 (hept, J = 7.0 Hz, 1H), 0.90 (d, J = 7.0 Hz, 6H).

Example 113: GTPγS assay to determine EC$_{50}$ values

GTPγS binding assays are performed in 96 well microtiter plates (Nunc, 442587) in a final volume of 200 µl, using membrane preparations of CHO cells expressing recombinant human S1P1 receptor. Assay conditions are 20 mM Hepes (Fluka, 54461), 100 mM NaCl (Fluka, 71378), 5 mM MgCl$_2$ (Fluka, 63064), 0.1 % BSA
(Calbiochem, 126609), 1 µM GDP (Sigma, G-7127), 2.5% DMSO (Fluka, 41644), 50 pM $^{35}$S-GTPγS (Amersham Biosciences, SJ1320). The pH is 7.4. Test compounds are dissolved and diluted in 100% DMSO and pre-incubated at room temperature for 30 min in 150 µl of the above assay buffer, in the absence of $^{35}$S-GTPγS. After addition of 50 µl of $^{35}$S-GTPγS, the assay is incubated for 1 h at rt. The assay is terminated by transfer of the reaction mixture to a Multiscreen plate (Millipore, MAHFC1 H60) using a cell harvester from Packard Biosciences, and the plates are washed with ice-cold 10 mM Na$_2$HPO$_4$/NaH$_2$PO$_4$ (70%/30%), dried, sealed at the bottom and, after addition of 25 µl MicroScint20 (Packard Biosciences, order# 6013621), sealed on the top. Membrane-bound $^{35}$S-GTPγS is measured with a TopCount from Packard Biosciences.

$EC_{50}$ is the concentration of agonist inducing 50% of the maximal specific $^{35}$S-GTPγS binding. Specific binding is determined by subtracting non-specific binding from maximal binding. Maximal binding is the amount of cpm bound to the Multiscreen plate in the presence of 10 µM of S1P. Non-specific binding is the amount of binding in the absence of an agonist in the assay.

Table 1 shows the $EC_{50}$ value of some compounds of the present invention. The $EC_{50}$ values were determined according to the method described above:

Example 114: Assessment of *In vivo* Efficacy

The efficacy of the compounds of Formula (I) is assessed by measuring the circulating lymphocytes after oral administration of 3 to 30 mg/kg of a compound of Formula (I) to normotensive male Wistar rats. The animals are housed in climate-controlled conditions with a 12 h-light/dark cycle, and have free access to normal rat chow and drinking water. Blood is collected before and 3, 6 and 24 h after drug administration. Full blood is subjected to hematology using Advia Hematology system (Bayer Diagnostics, Zurich, Switzerland).

All data are presented as mean ± SEM. Statistical analyses are performed by analysis of variance (ANOVA) using Statistica (StatSoft) and the Student-Newman-Keuls procedure for multiple comparisons. The null hypothesis is rejected when p < 0.05.

As an example, Table 2 shows the effect on lymphocyte counts 6 h after oral administration of 10 mg/kg of compounds of the present invention to normotensive male Wistar rats as compared to a group of animals treated with vehicle only.
