## SUBSTITUTED ACETOPHENONES USEFUL AS PDE4 INHIBITORS

## FIELD OF THE INVENTION

This invention relates to novel substituted acetophenones and derivatives thereof, processes for the preparation thereof, to said compounds for use in therapy, to pharmaceutical compositions comprising said compounds, to methods of treating diseases with said compounds, and to the use of said compounds in the manufacture of medicaments.

## BACKGROUND OF THE INVENTION

Phosphodiesterases are enzymes that catalyse the hydrolysis of cyclic AMP and/or cyclic GMP in cells to 5-AMP and 5-GMP, respectively, and as such they are critical to cellular regulation of cAMP or cGMP levels. Of the 11 phosphodiesterases identified so far, phosphodiesterase (PDE) 4, PDE7 and PDE8 are selective for cAMP. PDE4 is the most important modulator of cAMP expressed in immune and inflammatory cells such as neutrophils, macrophages and T-lymphocytes (Z. Huang and J.A. Mancini, *Current Med. Chem.* 13, 2006, pp. 3253-3262). As cAMP is a key second messenger in the modulation of inflammatory responses, PDE4 has been found to regulate inflammatory responses of inflammatory cells by modulating proinflammatory cytokines such as TNF $\alpha$ , IL-2, IFN- $\gamma$ , GM-CSF and LTB $_4$ . Inhibition of PDE4 has therefore become an attractive target for the therapy of inflammatory diseases such as asthma, chronic obstructive pulmonary disease (COPD), rheumatoid arthritis, atopic dermatitis, Crohn's disease etc. (M.D. Houslay et al., *Drug Discovery Today* 10 (22), 2005, pp. 1503-1519). As atopic dermatitis (AD) patients have increased PDE-activity, PDE4-inhibition would also appear to be a viable treatment of AD (*Journal of Investigative Dermatology* (1986), 87(3), 372-6). The PDE4 gene family consists at least of four genes, A, B, C and D, which have a high degree of homology (V. Boswell Smith and D. Spina, *Curr. Opinion Investig. Drugs* 6(11), 2006, pp. 1136-1141). The four PDE4 isoforms are differentially expressed in different tissues and cell types. Thus, PDE4B is predominantly expressed in monocytes and neutrophils, but not in cortex and epithelial cells, while PDE4D is expressed in lung, cortex, cerebellum and T-cells (C. Kroegel and M. Foerster, *Exp. Opinion Investig. Drugs* 16(1), 2007, pp. 109-

124). It has been speculated that inhibition of PDE4D in the brain is associated with the adverse effects found when administering PDE4 inhibitors clinically, primarily nausea and emesis, whereas inhibition of PDE4B is associated with anti-inflammatory effects (B. Lipworth, *Lancet* 365, 2005, pp. 167-175).

- 5 However, the PDE inhibitors developed so far are not believed to be specific for any of the four PDE4 isoforms. Numerous PDE4 inhibitors have been studied for their therapeutic effect on inflammatory diseases, primarily asthma and COPD.

The first of these, theophylline, is a weak, non-selective phosphodiesterase inhibitor used in the treatment of respiratory diseases such as asthma and COPD. Treatment with theophylline may, however, give rise to both mild and severe adverse effects, e.g. arrhythmia and convulsions, restricting the clinical utility of theophylline (Kroegel and Foerster, *supra*). As phosphodiesterase has remained an attractive target for anti-inflammatory therapy, several other, more selective PDE4 inhibitors have been developed and investigated in a clinical setting. The clinical development of many of the first-generation PDE4 inhibitors such as rolipram was discontinued due to dose-limiting side effects, primarily nausea and emesis. Second-generation PDE4 inhibitors with apparently less pronounced adverse effects are currently in clinical trials (Houslay, *supra*). PDE-4 inhibitors are for example disclosed in EP 0771794 and EP 0943613. WO95/20578 and WO 96/31476 disclose structurally different 4-substituted-3,5-dichloropyridines which are inhibitors of cyclic AMP phosphodiesterase.

There is a continued need for developing novel PDE4 inhibitors which have a more favourable therapeutic window, i.e. fewer adverse effects, while retaining their therapeutic anti-inflammatory effect. An overview of preclinical and clinical trials with selective PDE4 inhibitors, including such inhibitors aimed for the treatment of for psoriasis, was recently given in *Inflammation & Allergy: Drug Targets*, 2007, 6(1), 17-26.

## 30 SUMMARY OF THE INVENTION

The inventors have surprisingly found that novel compounds of the present invention exhibit selective PDE4 inhibitory activity (having a >10 times reduced activity against PDE 1, 2, 3, 5, 7, 8, 9, 10, or 11), which may be useful as therapeutic agents for inflammatory allergic diseases such as bronchial asthma,

allergic rhinitis, and nephritis; autoimmune diseases such as rheumatoid arthritis, multiple sclerosis, inflammatory Bowel disease, Crohn's disease, and systemic lupus erythematosus; diseases of the central nervous system such as depression, amnesia, and dementia; organopathy associated with ischemic  
 5 reflux caused by cardiac failure, shock, and cerebrovascular diseases, and the like; insulin-resistant diabetes; wounds; AIDS, and the like.

 10 conditions, such as proliferative and inflammatory skin disorders and in particular psoriasis, epidermal inflammation, alopecia, skin atrophy, steroid induced skin atrophy, skin ageing, photo skin ageing, acne, dermatitis, atopic dermatitis, seborrheic dermatitis, contact dermatitis, urticaria, pruritis, and eczema.

15 Compounds of the present invention may also have advantageous properties such as low cytotoxicity, reduced HERG inhibition, low genotoxicity, reduced skin irritation, improved metabolic stability properties and metabolic elimination properties, dermal delivery properties, systemic exposure characteristics after dermal delivery, all of which may make them especially suitable to be used as  
 20 active pharmaceutical ingredients in drug formulations for the treatment of dermal diseases.

Accordingly, the present invention relates to a compound according to formula I

In one or more embodiments of the present invention, the compounds of formula I as defined above are useful in therapy and in particular useful for treatment of dermal diseases.

In one or more embodiments of the present invention, the dermal disease or condition is selected from proliferative and inflammatory skin disorders,

psoriasis, cancer, epidermal inflammation, alopecia, skin atrophy, steroid induced skin atrophy, skin ageing, photo skin ageing, acne, dermatitis, atopic dermatitis, seborrheic dermatitis, contact dermatitis, urticaria, pruritis, and eczema.

5

The compounds of formula I may be obtained in crystalline form either directly by concentration from an organic solvent or by crystallisation or recrystallisation from an organic solvent or mixture of said solvent and a cosolvent that may be organic or inorganic, such as water. The crystals may be isolated in essentially solvent-free form or as a solvate, such as a hydrate. The invention covers all crystalline forms, such as polymorphs and pseudopolymorphs, and also mixtures thereof.

Compounds of formula I may or may not comprise asymmetrically substituted (chiral) carbon atoms which give rise to the existence of isomeric forms, e.g. enantiomers and possibly diastereomers. The present invention relates to all such isomers, either in pure form or as mixtures thereof (e.g. racemates). Pure stereoisomeric forms of the compounds and the intermediates of this invention may be obtained by the application of procedures known in the art. The various isomeric forms may be separated by physical separation methods such as selective crystallization and chromatographic techniques, e.g. liquid chromatography using chiral stationary phases. Enantiomers may be separated from each other by the selective crystallization of their diastereomeric salts with optically active amines, such as l-ephedrine. Alternatively, enantiomers may be separated by chromatographic techniques using chiral stationary phases. Said pure stereoisomeric forms may also be derived from the corresponding pure stereoisomeric forms of the appropriate starting materials, provided that the reaction occurs stereoselectively or stereospecifically. Preferably, if a specific stereoisomer is desired, said compound will be synthesized by stereoselective or stereospecific methods of preparation. These methods will advantageously employ chiral pure starting materials.

Compounds of the present invention, optionally in combination with other active compounds, would be useful for the treatment of dermal diseases or conditions,

or acute or chronic cutaneous wound disorders, in particular for the treatment of proliferative and inflammatory skin disorders, psoriasis, cancer, epidermal inflammation, alopecia, skin atrophy, steroid induced skin atrophy, skin ageing, photo skin ageing, acne, dermatitis, atopic dermatitis, seborrheic dermatitis, contact dermatitis, urticaria, pruritis, and eczema.

Besides being useful for human treatment, the compounds of the present invention may also be useful for veterinary treatment of animals including mammals such as horses, cattle, sheep, pigs, dogs, and cats.

10

For use in therapy, compounds of the present invention are typically in the form of a pharmaceutical composition. The invention therefore relates to a pharmaceutical composition comprising a compound of formula I, optionally together with one or more other therapeutically active compound(s), together with a pharmaceutically acceptable excipient, vehicle or carrier(s). The excipient must be "acceptable" in the sense of being compatible with the other ingredients of the composition and not deleterious to the recipient thereof.

15

Conveniently, the active ingredient comprises from 0.05-99.9% by weight of the formulation.

20

In the form of a dosage unit, the compound may be administered one or more times a day at appropriate intervals, always depending, however, on the condition of the patient, and in accordance with the prescription made by the medical practitioner. Conveniently, a dosage unit of a formulation contain between 0.1 mg and 1000 mg, preferably between 1 mg and 100 mg, such as 5-50 mg of a compound of formula I.

25

A suitable dosage of the compound of the invention will depend, inter alia, on the age and condition of the patient, the severity of the disease to be treated and other factors well known to the practising physician. The compound may be administered either orally, parenterally or topically according to different dosing schedules, e.g. daily or with weekly intervals. In general a single dose will be in the range from 0.01 to 400 mg/kg body weight. The compound may be

30

administered as a bolus (i.e. the entire daily dosis is administered at once) or in divided doses two or more times a day.

In the context of topical treatment it may be more appropriate to refer to a  
5 "usage unit", which denotes a single dose which is capable of being administered to a patient, and which may be readily handled and packed, remaining as a physically and chemically stable unit dose comprising either the active material as such or a mixture of it with solid or liquid pharmaceutical diluents or carriers.

10 The term "usage unit" in connection with topical use means a unitary, i.e. a single dose, capable of being administered topically to a patient in an application per square centimetre of the infected area of from 0.1 mg to 10 mg and preferably from 0.2 mg to 1 mg of the active ingredient in question.

15 It is also envisaged that in certain treatment regimes, administration with longer intervals, e.g. every other day, every week, or even with longer intervals may be beneficial.

If the treatment involves administration of another therapeutically active  
20 compound it is recommended to consult *Goodman & Gilman's The Pharmacological Basis of Therapeutics*, 9<sup>th</sup> Ed., J.G. Hardman and L.E. Limbird (Eds.), McGraw-Hill 1995, for useful dosages of said compounds.

The administration of a compound of the present invention with one or more  
25 other active compounds may be either concomitantly or sequentially.

The formulations include e.g. those in a form suitable for oral (including sustained or timed release), rectal, parenteral (including subcutaneous, intraperitoneal, intramuscular, intraarticular and intravenous), transdermal,  
30 ophthalmic, topical, nasal or buccal administration.

The formulations may conveniently be presented in dosage unit form and may be prepared by any of the methods well known in the art of pharmacy, e.g. as disclosed in Remington, *The Science and Practice of Pharmacy*, 21ed ed., 2005.

All methods include the step of bringing the active ingredient into association with the carrier, which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired formulation.

Formulations of the present invention suitable for oral administration may be in the form of discrete units as capsules, sachets, tablets or lozenges, each containing a predetermined amount of the active ingredient; in the form of a powder or granules; in the form of a solution or a suspension in an aqueous liquid or non-aqueous liquid, such as ethanol or glycerol; or in the form of an oil-in-water emulsion or a water-in-oil emulsion. Such oils may be edible oils, such as e.g. cottonseed oil, sesame oil, coconut oil or peanut oil. Suitable dispersing or suspending agents for aqueous suspensions include synthetic or natural gums such as tragacanth, alginate, acacia, dextran, sodium carboxymethylcellulose, gelatin, methylcellulose, hydroxypropylmethylcellulose, hydroxypropylcellulose, carbomers and polyvinylpyrrolidone. The active ingredients may also be administered in the form of a bolus, electuary or paste.

A tablet may be made by compressing or moulding the active ingredient optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing, in a suitable machine, the active ingredient(s) in a free-flowing form such as a powder or granules, optionally mixed by a binder, such as e.g. lactose, glucose, starch, gelatine, acacia gum, tragacanth gum, sodium alginate, carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, polyethylene glycol, waxes or the like; a lubricant such as e.g. sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride or the like; a disintegrating agent such as e.g. starch, methylcellulose, agar, bentonite, croscarmellose sodium, sodium starch glycollate, crospovidone or the like or a dispersing agent, such as polysorbate 80. Moulded tablets may be made by moulding, in a suitable machine, a mixture of the powdered active ingredient and suitable carrier moistened with an inert liquid diluent.

Formulations for rectal administration may be in the form of suppositories in which the compound of the present invention is admixed with low melting water soluble or insoluble solids such as cocoa butter, hydrogenated vegetable oils, polyethylene glycol or fatty acids esters of polyethylene glycols, while elixirs  
5 may be prepared using myristyl palmitate.

Formulations suitable for parenteral administration conveniently comprise a sterile oily or aqueous preparation of the active ingredients, which is preferably isotonic with the blood of the recipient, e.g. isotonic saline, isotonic glucose  
10 solution or buffer solution. The formulation may be conveniently sterilised by for instance filtration through a bacteria retaining filter, addition of sterilising agent to the formulation, irradiation of the formulation or heating of the formulation. Liposomal formulations as disclosed in e.g. Encyclopedia of Pharmaceutical  
15 Technology, vol.9, 1994, are also suitable for parenteral administration.

Alternatively, the compounds of formula I may be presented as a sterile, solid preparation, e.g. a freeze-dried powder, which is readily dissolved in a sterile solvent immediately prior to use.

20 Transdermal formulations may be in the form of a plaster or a patch.

Formulations suitable ophthalmic administration may be in the form of a sterile aqueous preparation of the active ingredients, which may be in microcrystalline form, for example, in the form of an aqueous microcrystalline suspension.  
25 Liposomal formulations or biodegradable polymer systems e.g. as disclosed in Encyclopedia of Pharmaceutical Technology, vol.2, 1989, may also be used to present the active ingredient for ophthalmic administration.

30 Formulations suitable for topical or ophthalmic administration include liquid or semi-liquid preparations such as liniments, lotions, gels, applicants, oil-in-water or water-in-oil emulsions such as creams, ointments or pastes; or solutions or suspensions such as drops. Compositions for ophthalmic treatment may preferably additionally contain a cyclodextrin.

For topical administration, the compound of formula I may typically be present in an amount of from 0.01 to 20% by weight of the composition, such as 0.1% to about 10 %, but may also be present in an amount of up to about 50% of the composition.

Formulations suitable for nasal or buccal administration include powder, self-propelling and spray formulations, such as aerosols and atomisers. Such formulations are disclosed in greater detail in e.g. Modern Pharmaceutics, 2<sup>nd</sup> ed., G.S. Banker and C.T. Rhodes (Eds.), page 427-432, Marcel Dekker, New York; Modern Pharmaceutics, 3<sup>th</sup> ed., G.S. Banker and C.T. Rhodes (Eds.), page 618-619 and 718-721, Marcel Dekker, New York and Encyclopedia of Pharmaceutical Technology, vol. 10, J. Swarbrick and J.C. Boylan (Eds), page 191-221, Marcel Dekker, New York.

In addition to the aforementioned ingredients, the formulations of a compound of formula I may include one or more additional ingredients such as diluents, buffers, flavouring agents, colourant, surface active agents, thickeners, preservatives, e.g. methyl hydroxybenzoate (including anti-oxidants), emulsifying agents and the like.

When the active ingredient is administered in the form of salts with pharmaceutically acceptable non-toxic acids or bases, preferred salts are for instance easily water-soluble or slightly soluble in water, in order to obtain a particular and appropriate rate of absorption.

The pharmaceutical composition may additionally comprise one or more other active components conventionally used in the treatment of dermal disease or conditions, e.g. selected from the group consisting of proliferative and inflammatory skin disorders, psoriasis, cancer, epidermal inflammation, alopecia, skin atrophy, steroid induced skin atrophy, skin ageing, photo skin ageing, acne, dermatitis, atopic dermatitis, seborrheic dermatitis, contact dermatitis, urticaria, pruritis, and eczema.

Examples of such additional active components may for example be selected from the group consisting of glucocorticoids, vitamin D and vitamin D analogues, antihistamines, platelet activating factor (PAF) antagonists, anticholinergic agents, methylxanthines,  $\beta$ -adrenergic agents, COX-2 inhibitors, salicylates, indomethacin, flufenamate, naproxen, timegadine, gold salts, penicillamine, serum cholesterol lowering agents, retinoids, zinc salts and salicylazosulfapyridine.

#### METHODS OF PREPARATION

The compounds of the present invention can be prepared in a number of ways well known to those skilled in the art of synthesis. The compounds of formula I may for example be prepared using the reactions and techniques outlined below together with methods known in the art of synthetic organic chemistry, or variations thereof as appreciated by those skilled in the art. Preferred methods include, but are not limited to, those described below. The reactions are carried out in solvents appropriate to the reagents and materials employed and suitable for the transformations being effected. Also, in the synthetic methods described below, it is to be understood that all proposed reaction conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of experiment and work-up procedures, are chosen to be conditions of standard for that reaction, which should be readily recognized by one skilled in the art. Not all compounds falling into a given class may be compatible with some of the reaction conditions required in some of the methods described. Such restrictions to the substituents which are compatible with the reaction conditions will be readily apparent to one skilled in the art and alternative methods can be used. The compounds of the present invention or any intermediate may be purified if required using standard methods well known to a synthetic organic chemist, e.g. methods described in "Purification of Laboratory Chemicals", 5<sup>th</sup> ed. 2003. Starting materials are either known compounds, commercially available, or they may be prepared by routine synthetic methods well known to a person skilled in the art.

#### GENERAL PROCEDURES, PREPARATIONS AND EXAMPLES

Chemical shift values ( $\delta$ , in ppm) are quoted in the specified solvent relative to internal tetramethylsilane ( $\delta = 0.00$ ) or chloroform ( $\delta = 7.25$ ) standards. The value of a multiplet, either defined (doublet (d), triplet (t), quartet (q)) or not (m) at the approximate mid point is given unless a range is quoted. (bs) indicates a broad singlet. The organic solvents used were usually anhydrous. Chromatography was performed on Merck silica gel 60 (0.040 - 0.063 mm). The solvent ratios indicated refer to v:v unless otherwise noted.

The resulting ketone is deprotected either:

Dialkylation of compounds with formula Ia with alkenyl chlorides, bromides, iodides, mesylates or tosylates in the presence of a suitable base, such as  $K_2CO_3$  or  $Et_3N$  in a suitable solvent such as DMF, NMP, THF or DCM at temperatures from rt to  $100^\circ C$  provide compounds of formula Ib. Subsequent deprotection of  
5 compounds with formula Ib in the presence of a suitable Lewis acid, such as  $BCl_3$ ,  $BBr_3$  or  $AlCl_3$  in a suitable solvent, such as dichloromethane at temperatures from  $0^\circ$  to rt, followed by re-alkylation with alkenyl chlorides, bromides, iodides, mesylates or tosylates in the presence of a suitable base, such as  $K_2CO_3$  or  $Et_3N$  in a suitable solvent such as DMF, NMP, THF or DCM at  
10 temperatures from rt to  $100^\circ C$  provide unsymmetrical compounds of formula Ib.

Selective monoalkylation of compounds with formula Ia with alkyl, alkenyl or alkynyl bromides or iodides in the presence of a suitable base, such as  $K_2CO_3$  in a suitable solvent such as DMF or NMP at temperatures from rt to  $100^\circ C$  provide compounds of formula Ic or Id.

15 Alkylation of compounds with formula Id with alkyl chloro or bromoacetate in the presence of suitable base, such as  $K_2CO_3$  in a suitable solvent such as DMF or NMP at temperatures from rt to  $100^\circ C$  followed by hydrolysis of the carboxylic ester under standard conditions (Protective Groups in Organic Chemistry, John Wiley & sons, Ed: T. Greene and P. G. Wuts, 3<sup>rd</sup> edition (1999), p 384-86)  
20 provide compounds of formula Ie.

Alkyl halide: Sodium chlorodifluoroacetate. Heated to 100°C for 30 minutes.

General procedure for preparation of compounds with formula 1h, wherein R<sub>3</sub> (R<sub>3</sub> ≠ hydrogen) is as defined above:

25

2-(3,5-Dichloro-pyridin-4-yl)-1-(2-hydroxy-3,4-methoxy-phenyl)-ethanone (0.035 mmol) from example 1 was dissolved in dry DMSO (0.25 mL). Aqueous K<sub>2</sub>CO<sub>3</sub> (0.025 mL of a 2M) was added followed by 0.053 mmol of an alkyl chloride, bromide or iodide dissolved in 0.025 mL DMSO. The reaction mixture was left at rt for 48 hours. The pure compounds were obtained by standard preparative HPLC purification.

Using this procedure the following compounds were obtained:

30 Preparation 5 (compound 505)

Resin bound 2-(3,5-dichloro-pyridin-4-yl)-1-(2,3-dihydroxy-4-methoxy-phenyl)-ethanone

2-(3,5-Dichloro-pyridin-4-yl)-1-(2,3-dihydroxy-4-methoxy-phenyl)-ethanone (530 mg, 1.6 mmol) from preparation 3 was dissolved in dry NMP (5 mL),  $K_2CO_3$  (210 mg, 1.5 mmol) was added followed by bromomethyl-Wang resin (560 mg, L = 1.45 mmol/g, 0.81 mmol). The reaction mixture was vortexed at rt overnight. The resin was filtered and washed with MeOH:water (4:1, 3x10 mL), NMP (3x25 mL), MeOH (3x25 mL), dry THF (5x25 mL) and dried *in vacuo* to provide 760 mg of resin bound 2-(3,5-dichloro-pyridin-4-yl)-1-(2,3-dihydroxy-4-methoxy-phenyl)-ethanone.

General procedure for preparation of compounds with formula Im, wherein R2 is as defined above:

Resin bound 2-(3,5-dichloro-pyridin-4-yl)-1-(2,3-dihydroxy-4-methoxy-phenyl)-ethanone (90 mg, L = 1.07 mmol/g, 0.1 mmol) from preparation 5 was treated with a 1 mL of a stock solution of R2-OH (0.5 mmol) and  $PBu_3$  (0.5 mmol.)

cooled to 0°C and then treated with 0.5 mL of a stock solution of TBAD (0.5 mmol). After 3 hours at rt the reaction mixture was filtered and 1 mL of the stock solution of R<sup>2</sup>-OH (0.5 mmol) and PBu<sub>3</sub> (0.5 mmol) was added. After cooling to 0°C 0.5 mL of the stock solution of TBAD (0.5 mmol) was added. The  
5 reaction mixture was vortexed at rt overnight. The resin was washed with THF (5x3 mL) and DCE (5x3 mL). Cleavage of the products was performed by addition of a stock solution of DCE-TFA-TIS (90:10:1, 1 mL). After 30 min the cleavage solution was replaced by 1 mL of a fresh cleavage solution. After additional 30 min the combined cleavage solutions was evaporated *in vacuo*. The  
10 pure compounds were obtained by redissolving the reaction mixture in DMSO followed by standard preparative HPLC purification.

Using this procedure the following compounds were obtained:

### Example 303

#### PDE4 assay

25 Human recombinant PDE4 (Gene bank accession no NM\_006203) are incubated for 1 hour, respectively, with the test compound at concentrations up to 10 μM,

with cAMP ( $1 \times 10^{-5} \text{ M}$ ), and with a low amount (0.021 MBq) of radioactively labelled cAMP. At the end of the incubation, the cleavage of the substrate is evaluated by the binding of the AMP product to SPA beads, which generate chemo luminescence when bound to the radioactive tracer. The AMP product  
5 inhibits the binding of the radioactive tracer to the beads, and the luminescent signal is competed.

The results are calculated as the molar concentrations resulting in 50% inhibition of the substrate cleavage compared to controls samples, and are expressed as  $-\log \text{IC}_{50} \text{ (M)}$ .

10 Compounds 101, 103, 104, 106-148, 150-155, 157-206, 208-234, 236-241, 243, 244, 246, 248, 249, 251,-258, 260-272, 274-5, 277-285, 287-290, 292-293, 296, 301 and 302 were shown to be efficient inhibitors with  $-\log \text{IC}_{50} \text{ (M)}$  above 6.

TNF $\alpha$ - release

Human peripheral blood mononuclear cells (PBMC) are isolated from buffy coats. The blood is mixed with saline at a ratio of 1:1, and the PBMC is isolated by the use of Lymphoprep tubes<sup>TM</sup> (Nycomed, Norway). The PBMC is suspended in  
20 RPMI1640 with 2 % foetal calf serum (FCS), pen/strep and 2 mM L-glutamine at a concentration of  $5 \times 10^5 \text{ c/ml}$ . The cells are pre-incubated for 30 minutes with the test compounds in 96 well tissue culture plates and stimulated for 18 hours with lipopolysaccharide 1 mg/ml (Sigma). The level of TNF- $\alpha$  is measured in the culture supernatant by enzyme immuno assays using primary and secondary  
25 biotinylated antibodies from R&D systems. Results are expressed as pIC<sub>50</sub> values calculated from inhibition curves using as positive controls the secretion in LPS stimulated wells and as negative controls the secretion in unstimulated cells.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/DK2007/000564

### Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 26 and 27 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such in extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers allsearchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of additional fees.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- ☐ The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- ☐ No protest accompanied the payment of additional search fees.
