Title: BIO-BASED POLYETHYLENE TEREPTHALATE POLYMER AND METHOD OF MAKING THE SAME

Abstract: A bio-based polyethylene terephthalate polymer comprising from about 25 to about 75 weight percent of a terephthalate component and from about 20 to about 50 weight percent of a diol component, wherein at least about one weight percent of at least one of the terephthalate and/or the diol component is derived from at least one bio-based material. A method of producing a bio-based polyethylene terephthalate polymer comprising obtaining a diol component comprising ethylene glycol, obtaining a terephthalate component comprising terephthalic acid, wherein at least one of the diol component and/or the diol component is derived from at least one bio-based material, and reacting the diol component and the terephthalate component to form a bio-based polyethylene terephthalate polymer comprising from about 25 to about 75 weight percent of the terephthalate component and from about 20 to about 50 weight percent of the diol component.

Bio-based Polyethylene Terephthalate Polymer and Method of Making the Same

RELATED APPLICATION DATA

FIELD OF INVENTION

[0002] This invention relates generally to a bio-based polyethylene terephthalate polymer that contains a terephthalate and/or a diol component that derives partially or totally from bio-based materials.

BACKGROUND

[0003] Polyethylene terephthalate and its copolyesters (hereinafter referred to collectively as "PET" or "polyethylene terephthalate") is a widely used raw material for making packaging articles in part due to their excellent combination of clarity, mechanical, and gas barrier properties. Examples of PET products include, but are not limited to, bottles and containers for packaging food products, soft drinks, alcoholic beverages, detergents, cosmetics, pharmaceutical products and edible oils.

[0004] Most commercial methods produce PET with petrochemically derived raw materials. Therefore, the cost of production is closely tied to the price of petroleum. Petrochemically-derived PET contributes to greenhouse emissions due to its high petroleum derived carbon content. Furthermore, petrochemicals take hundreds of thousands of years to form naturally, making petrochemically-derived products non-renewable, which means they cannot be re-made, re-grown, or regenerated at a rate comparative to its consumption.

[0005] One approach to substituting petrochemically-derived PET has been the production of polylactic acid (PLA) bioplastics from bio-based materials such as corn, rice, or other sugar and starch-producing plants. See e.g. U.S. Pat. No. 6,569,989. As described in U.S. Pat. No. 5,409,751 and U.S. Pat. App. No. 20070187876, attempts have been made to use PLA resins in injection stretch molding processes for producing
containers. However, it is often difficult to adapt PLA into current PET production lines or to satisfactorily substitute PET with PLA in many applications due to the significantly different properties between PLA and PET. For example, PLA typically has a lower gas barrier property than PET, which makes PLA containers less suitable for storing items such as carbonated beverages or beverages sensitive to oxygen. Furthermore, most recycling systems currently in use are designed for PET, which would be contaminated if PLA was introduced. This problem could be overcome by costly solutions such as using distinctive bottle types between PLA and PET or by investing in suitable sorting technology or new recycling streams.

Thus, there exists a need for a PET derived from renewable resources that shares similar properties as petroleum-derived PET. It would be also desirable in some applications if the PET derived from renewable resources can be processed through existing PET manufacturing facilities and/or can be readily recycled through the systems designed for recycling petroleum-derived PET.

Other objects, features, and advantages of this invention will be apparent from the following detailed description, drawings, and claims.

BRIEF DESCRIPTION OF THE DRAWING

Fig. 1 is a flowchart illustration of the method of making a bio-based polyethylene terephthalate product that partially or totally derives from bio-based materials.

DETAILED DESCRIPTION OF THE PRESENT INVENTION

The term "bio-based," as used in this application, indicates the inclusion of some component that derives from at least one bio-based material. For example, a "bio-based PET polymer" would be a PET polymer that comprises at least one component that partially or totally derives from at least one bio-based material.

Bio-Based PET Polymer

One embodiment of the present invention encompasses a bio-based PET polymer that comprises from about 25 to about 75 weight percent of a terephthalate component and from about 20 to about 50 weight percent of a diol component, wherein at
least about one weight percent of at least one of the terephthalate component and/or the
diol component is derived from at least one bio-based material. In a more particular
embodiment, at least about 20 weight percent of at least one of the terephthalate
component and/or the diol component is derived from at least one bio-based material.

In one embodiment, the bio-based PET polymer comprises from about 30
to about 70 weight percent of the terephthalate component. In a more particular
embodiment, the bio-based PET polymer comprises from about 40 to about 65 weight
percent of the terephthalate component. In another embodiment, the bio-based PET
polymer comprises from about 25 to about 45 weight percent of the diol component. In a
more particular embodiment, the bio-based PET polymer comprises from about 25 to
about 35 weight percent of the diol component.

According to a particular embodiment of the invention, the terephthalate
component is selected from terephthalic acid, dimethyl terephthalate, isophthalic acid, and
a combination thereof. In a more particular embodiment, at least about ten weight percent
of the terephthalate component is derived from at least one bio-based material. In one
embodiment, the terephthalate component comprises at least about 70 weight percent of
terephthalic acid. In a more particular embodiment, at least about one weight percent,
preferably at least about ten weight percent, of the terephthalic acid is made from at least
one bio-based material.

In another embodiment, the diol component is selected from ethylene
glycol, cyclohexane dimethanol, and a combination thereof. In a more particular
embodiment, the diol component comprises at least about one weight percent of
cyclohexane dimethanol. In another embodiment, at least about ten weight percent of the
diol component is derived from at least one bio-based material.

Other ingredients may be added to the bio-based PET polymer. Those of
ordinary skill in the art would readily be able to select the suitable ingredient(s) to add to
the bio-based PET polymer to improve the desired properties, which may depend on the
type of application intended. In a particular embodiment, the bio-based PET polymer may
further comprise a supplemental component selected from at least one coloring agent, at
least one fast reheat additive, at least one gas barrier additive, at least one UV blocking
additive, and a combination thereof.

Bio-based PET polymers may be used to form bio-based resins, which may
be further processed into bio-based containers using methods including, but not limited to,
injection molding and stretch blow molding. Embodiments of the present invention encompass bio-based containers that comprise the bio-based PET polymers of the above-described embodiments. To be suitable for certain applications, containers have a certain intrinsic viscosity to withstand movements, shelving, and other requirements. In a more particular embodiment of the present invention, the bio-based container has an intrinsic viscosity from about 0.45 dL/g to about 1.0 dL/g.

[0016] It is known in the art that carbon-14 (C-14), which has a half life of about 5,700 years, is found in bio-based materials but not in fossil fuels. Thus, "bio-based materials" refer to organic materials in which the carbon comes from non-fossil biological sources. Examples of bio-based materials include, but are not limited to, sugars, starches, corns, natural fibers, sugarcanes, beets, citrus fruits, woody plants, cellulosics, lignocellulosics, hemicelluloses, potatoes, plant oils, other polysaccharides such as pectin, chitin, levan, and pullulan, and a combination thereof. According to a particular embodiment, the at least one bio-based material is selected from corn, sugarcane, beet, potato, starch, citrus fruit, woody plant, cellulosic lignin, plant oil, natural fiber, oily wood feedstock, and a combination thereof.

[0017] As explained previously, the detection of C-14 is indicative of a bio-based material. C-14 levels can be determined by measuring its decay process (disintegrations per minute per gram carbon or dpm/gC) through liquid scintillation counting. In one embodiment of the present invention, the bio-based PET polymer comprises at least about 0.1 dpm/gC (disintegrations per minute per gram carbon) of C-14.

[0018] The invention is further illustrated by the following example, which is not to be construed in any way as imposing limitations on the scope thereof. On the contrary, it is to be clearly understood that resort may be had to various other embodiments, modifications, and equivalents thereof which, after reading the description herein, may suggestion themselves to those skilled in the art without departing from the spirit of the present invention and/or scope of the appended claims.

Example 1

[0019] The following samples were measured, in a blind test fashion, to determine the presence of C-14 content by liquid scintillation counting. The levels detected were normalized to existing data available at University of Georgia that correlates the C-14 level to the bio-based percentage. The results are shown in Table 1.
As shown in Table 1, samples totally derived from petroleum (samples 2, 3, and 4) contain a negligible amount of C-14, indicating that about zero percent of the sample is made from bio-based materials. In contrast, samples that contain materials known to be partially or totally derived from a bio-based material (corn or sugar) show a much higher level of C-14. Based on the data, about 0.14 dpm/gC corresponds to about one percent of bio-based material in the sample.

**Method of Making Polyethylene Terephthalate Polymer**
Referring to Fig. 1, embodiments of the present invention also encompass a process for producing a bio-based PET polymer comprising obtaining a diol component comprising ethylene glycol [step 20], obtaining a terephthalate component comprising terephthalic acid [step 22], wherein at least about one weight percent of one of the diol component and/or the terephthalate component (12, 14) is derived from at least one bio-based material 10, reacting the diol component 12 and the terephthalate component 14 to form a bio-based PET polymer [step 24], wherein the bio-based PET polymer comprises from about 25 to about 75 weight percent of the terephthalate component 14 and from about 20 to about 50 weight percent of the diol component 12. In a more particular embodiment, as illustrated in Reaction I, step 24 further comprises reacting the diol component 12 and the terephthalate component 14 through an esterification reaction to form bio-based PET monomers 16a, which then undergo polymerization to form the bio-based PET polymer 16.

**Reaction I**

In a particular embodiment, at least about one weight percent of the diol component 12 is derived from at least one bio-based material 10. In a more particular embodiment, at least ten weight percent of the diol component 12 is derived from at least one bio-based material 10. In still a more particular embodiment, at least 30 weight percent of the diol component 12 is derived from at least one bio-based material 10.

The diol component 12 may be partially or totally derived from at least one bio-based material using any process. In one embodiment, step 20 comprises obtaining a sugar or derivatives thereof from at least one bio-based material and fermenting the sugar or derivatives thereof to ethanol. In another embodiment, step 20 comprises gasification of at least one bio-based material 10 to produce syngas, which is converted to ethanol. In a more particular embodiment, as illustrated by Reaction II, step 20 further comprises dehydrating ethanol to ethylene, oxidizing ethylene to ethylene oxide, and converting ethylene oxide to ethylene glycol.
In another embodiment, step 20 comprises obtaining a sugar or derivatives thereof from at least one bio-based material and converting the sugar or derivatives thereof to a mixture comprising ethylene glycol and at least one glycol excluding the ethylene glycol. Step 20 further comprises isolating the ethylene glycol from the mixture. The mixture may be repeatedly reacted to obtain higher yields of ethylene glycol. In a more particular embodiment, the at least one glycol is selected from butanediols, propandiols, and glycerols.

According to another embodiment, at least about one weight percent of the terephthalate component 14 is derived from at least one bio-based material 10. In a more particular embodiment, at least ten weight percent of the terephthalate component 14 is derived from at least one bio-based material 10. In still a more particular embodiment, at least 30 weight percent of the terephthalate component 14 is derived from at least one bio-based material 10.

The terephthalate component 14 may be partially or totally derived from at least one bio-based material using any process. In one embodiment, as illustrated in Reaction III, step 22 comprises extracting carene from an oily wood feedstock, converting the carene to m-cymene and m-cymene by dehydrogenation and aromatization, and oxidizing p-cymene and w-cymene to terephthalic acid and isophthalic acid.

In another embodiment, as illustrated in Reaction IV, step 22 comprises extracting limonene from at least one bio-based material, converting the limonene to at least one terpene, converting the terpene to p-cymene and oxidizing the p-cymene to terephthalic acid. In a more particular embodiment, the at least one terpene is selected from terpinene, dipentene, terpinolene, and combinations thereof. In still a more particular embodiment,
the at least one bio-based material is selected from a citrus fruit, a woody plant, or a combination thereof.

\[ \text{Reaction IV} \]

200 [0025] In one embodiment of the present invention, as described in Reaction V, step 22 comprises extracting hydroxymethylfurfural from a bio-based material, converting hydroxymethylfurfural to a first intermediate, reacting the first intermediate with ethylene to form a second intermediate, treating the second intermediate with an acid in the presence of a catalyst to form hydroxymethyl benzaldehyde, and oxidizing hydroxymethyl benzaldehyde to terephthalic acid. In a more particular embodiment, the hydroxymethylfurfural is extracted from a bio-based material selected from corn syrup, sugars, cellulose, and a combination thereof. In still a more particular embodiment, the ethylene is derived from at least one bio-based material.

\[ \text{Reaction V} \]

In another embodiment, step 22 comprises gasification of at least one bio-based material 10 to produce syngas, converting syngas \( p \)-xylene, and oxidizing \( \beta \)-xylene in acid to form terephthalic acid.

[0026] In one embodiment, at least about one weight percent of the terephthalate component 14 is derived from at least one bio-based material 10 and at least about one weight percent of the diol component 12 is derived from at least one bio-based material 10. In a more particular embodiment, at least about 25 weight percent of the terephthalate
component 14 is derived from at least one bio-based material 10. In still a more particular embodiment, at least about 70 weight percent of the diol component 12 is derived from at least one bio-based material 10. According to a particular embodiment, the bio-based material is selected from corn, sugarcane, beet, potato, starch, citrus fruit, woody plant, cellulosic lignra, plant oil, natural fiber, oily wood feedstock, and a combination thereof.

[0027] In another embodiment, the method further comprises making a bio-based PET product 18 from the bio-based PET polymer 16. The bio-based PET product 18 may be used in various applications, including, but not limited to, as a beverage container. In another embodiment, the bio-based PET product 18 may be recycled or reused through recycling systems [step 26] designed for petroleum-derived PET products.

[0028] It should be understood that the foregoing relates to particular embodiments of the present invention, and that numerous changes may be made therein without departing from the scope of the invention as defined from the following claims.
CLAIMS

1. A bio-based polyethylene terephthalate polymer comprising
   from about 25 to about 75 weight percent of a terephthalate component,
   wherein the terephthalate component is selected from terephthalic acid, dimethyl
   terephthalate, isophthalic acid, and a combination thereof; and
   from about 20 to about 50 weight percent of a diol component, wherein the
   diol component is selected from ethylene glycol, cyclohexane dimethanol, and a
   combination thereof;
   wherein at least about one weight percent of at least one of the terephthalate
   and/or the diol component is derived from at least one bio-based material.

2. The bio-based polyethylene terephthalate polymer of claim 1, wherein at least
   about ten weight percent of the diol component is derived from at least one bio-
   based material.

3. The bio-based polyethylene terephthalate polymer of claims 1-2, wherein at least
   about ten weight percent of the terephthalate component is derived from at least
   one bio-based material.

4. The bio-based polyethylene terephthalate polymer of claims 1-2, wherein the
   terephthalate component comprises at least about 70 weight percent of terephthalic
   acid and wherein at least about ten weight percent of the terephthalic acid is
   derived from at least one bio-based material.

5. The bio-based polyethylene terephthalate polymer of claims 1-4, wherein the at
   least one bio-based material is selected from corn, sugarcane, beet, potato, starch,
   citrus fruit, woody plant, cellulosic lignin, plant oil, natural fiber, oily wood
   feedstock, and a combination thereof.

6. The bio-based polyethylene terephthalate polymer of claims 1-5, further
   comprising a supplemental component selected from at least one coloring agent, at
   least one fast reheat resistant additive, at least one gas barrier additive, at least one
   UV blocking additive, and a combination thereof.
7. A bio-based container comprising the bio-based polyethylene terephthalate polymer of claims 1-6.

8. The bio-based container of claim 7, wherein the bio-based polyethylene terephthalate polymer comprises at least about 0.1 dpm/gC of carbon-14.

9. A bio-based container comprising a bio-based polyethylene terephthalate polymer, wherein at least one weight percent of the polyethylene terephthalate polymer is derived from at least one bio-based material, wherein the bio-based container has an intrinsic viscosity from about 0.45 dL/g to about 1.0 dL/g.

10. The bio-based container of claim 9, wherein the bio-based polyethylene terephthalate polymer comprises from about 25 to about 75 weight percent of a terephthalate component, wherein the terephthalate component is selected from terephthalic acid, dimethyl terephthalate, isophthalic acid, and a combination thereof; and

    from about 20 to about 50 weight percent of a diol component, wherein the diol component is selected from ethylene glycol, cyclohexane dimethanol, and a combination thereof;

    wherein at least about ten weight percent of the diol component is derived from at least one bio-based material.

11. A method of producing a bio-based polyethylene terephthalate polymer comprising

    a. obtaining a diol component comprising ethylene glycol;
    b. obtaining a terephthalate component comprising terephthalic acid,

wherein at least one of the diol and/or the terephthalate component is derived from at least one bio-based material; and

    c. reacting the diol component and the terephthalate component to form a bio-based polyethylene terephthalate polymer, wherein the bio-based polyethylene terephthalate polymer comprises from about 25 to about 75 weight percent of the terephthalate component and from about 20 to about 50 weight percent of the diol component.
12. The method of claims 11, wherein the at least one bio-based material is selected from corn, sugarcane, beet, potato, starch, citrus fruit, woody plant, cellulosic lignin, oily wood feedstock, and a combination thereof.

13. The method of claims 11-12, wherein step (a) further comprises
   i. obtaining sugar or derivatives thereof from at least one bio-based material;
   ii. fermenting sugar or derivatives thereof to ethanol;
   iii. dehydrating ethanol to ethylene;
   iv. oxidizing ethylene to ethylene oxide; and
   v. converting ethylene oxide to ethylene glycol.

14. The method of claims 11-12, wherein step (a) further comprises
   i. obtaining sugar or derivatives thereof from at least one bio-based material;
   ii. reacting sugar or derivatives to form a mixture comprising ethylene glycol and at least one glycol excluding the ethylene glycol; and
   iii. separating ethylene glycol from the mixture.

15. The method of claims 11-14, wherein step (b) further comprises
   i. obtaining carene from at least one bio-based material;
   ii. converting carene to cymene; and
   iii. oxidizing cymene to terephthalic acid.

16. The method of claims 11-14, wherein step (b) further comprises
   i. obtaining limonene from at least one bio-based material;
   ii. converting the limonene to at least one terpene;
   iii. converting the at least one terpene to cymene; and
   iv. oxidizing cymene to terephthalic acid.

17. The bio-based polyethylene terephthalate polymer produced by the method of claims 11-16.
Figure 1
