(54) Title: ANTI-TRANSFERRIN RECEPTOR ANTIBODIES AND USES THEREOF

FIG. 1

(57) Abstract: Disclosed herein, in certain embodiments, are anti-transferrin receptor antibodies, anti-transferrin receptor antibody conjugates, and pharmaceutical compositions which comprise the anti-transferrin receptor antibodies or conjugates. In some embodiments, also disclosed herein are methods of delivering a payload utilizing an anti-transferrin receptor antibody described herein, and methods of treatment with use of an anti-transferrin receptor antibody described herein.

ANTI-TRANSFERRIN RECEPTOR ANTIBODIES AND USES THEREOF

CROSS-REFERENCE

[0001] This application claims the benefit of U.S. Provisional Application No. 62/784,181, filed December 21, 2018, which is incorporated herein by reference in its entirety.

BACKGROUND OF THE DISCLOSURE

[0002] The present invention is in the fields of pharmaceutical agents and specifically relates to antibody. This invention provides anti-transferrin receptor antibodies and methods of preparing and using the anti-transferrin receptor antibodies.

[0003] In addition to known uses in diagnostics, antibodies have been shown to be useful as therapeutic agents. For example, immunotherapy, or the use of antibodies for therapeutic purposes has been used in recent years to treat cancer and other disorders. The transferrin receptor is one of the mostly widely targeted receptors for development of targeted cancer diagnostics and therapeutics. This type II transmembrane glycoprotein is responsible for cellular iron transport and is found at low levels on the surface of many normal cell types. There is a need for developing improved anti-transferrin receptor antibody for pharmaceutical uses.

SUMMARY OF THE DISCLOSURE

[0004] Disclosed herein, in certain embodiments, are anti-transferrin receptor antibodies, anti-transferrin receptor antibody conjugates, and pharmaceutical compositions which comprise the anti-transferrin receptor antibodies or conjugates. In some embodiments, also disclosed herein are methods of delivering a payload utilizing an anti-transferrin receptor antibody described herein, and methods of treatment with use of an anti-transferrin receptor antibody described herein.

[0005] Disclosed herein, in certain embodiments, is an anti-transferrin receptor antibody comprising a variable heavy chain (VH) region and a variable light chain (VL) region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3. In some embodiments, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3. In some embodiments, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3. In some embodiments, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3. In some embodiments, the VL region comprises LCDR1 sequence RTSENIYX₃NLA, LCDR2 sequence AX₄TNLAX₅, and LCDR3

sequence QHFWGTPLTX₆, wherein X₃ is selected from N or S, X₄ is selected from A or G, X₅ is selected from D or E, and X₆ is present or absence, and if present, is F. In some embodiments, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence AATNLAX5, and LCDR3 sequence QHFWGTPLTX₆, wherein X₅ is selected from D or E and X₆ is present or absence, and if present, is F. In some embodiments, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8. In some embodiments, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 9, and LCDR3 sequence comprising SEQ ID NO: 10. In some embodiments, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 11, LCDR2 sequence comprising SEQ ID NO: 12, and LCDR3 sequence comprising SEQ ID NO: 10. In some embodiments, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8. In some embodiments, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 9, and LCDR3 sequence comprising SEQ ID NO: 10. In some embodiments, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 11, LCDR2 sequence comprising SEQ ID NO: 12, and LCDR3 sequence comprising SEQ ID NO: 10. In some embodiments, the VH region comprises at least 80%, 85%, 90%, 95%, 99%, or 100% sequence identity to a sequence selected from SEQ ID NOs: 13-16. In some embodiments, the VL region comprises at least 80%, 85%, 90%, 95%, 99%, or 100% sequence identity to a sequence selected from SEQ ID NOs: 18-21. In some embodiments, the anti-transferrin receptor antibody comprises a humanized antibody or binding fragment thereof or a chimeric antibody or binding fragment thereof. In some embodiments, the anti-transferrin receptor antibody comprises a multi-specific antibody or binding fragment thereof. In some embodiments, the anti-transferrin receptor antibody comprises a bispecific antibody or binding fragment thereof. In some embodiments, the anti-transferrin receptor antibody comprises an IgG-scFv, nanobody, BiTE, diabody, DART, TandAb, scDiabody, scDiabody-CH3, triple body, mini-antibody, minibody, TriBi minibody, scFv-CH3 KIH, Fab-scFv-Fc KIH, Fab-scFv, scFv-CH-CL-scFv, F(ab')2, F(ab')2-scFv2, scFv-KIH, Fab-scFv-Fc, tetravalent HCAb, scDiabody-Fc, diabody-Fc, tandem scFv-Fc, or intrabody. In some embodiments, the anti-transferrin receptor antibody comprises an IgG1 framework. In some embodiments, the anti-transferrin receptor antibody comprises an IgG2 framework. In some embodiments, the IgG2 framework is IgG2b framework. In some embodiments, the

anti-transferrin receptor antibody comprises IgG4 framework. In some embodiments, the anti-transferrin receptor antibody further comprises at least one mutation in the Fc region. In some embodiments, the at least one mutation modulates effector function. In some embodiments, the at least one mutation attenuates or eliminates Fc- γ receptor binding. In some embodiments, the at least one mutation is at residue position D265, N297, K322, L328, or P329, wherein the residue position is in reference to IgG1. In some embodiments, the Fc region comprises two or more, three or more, or four or more mutations. In some embodiments, the Fc region comprises mutations at L233 and L234, wherein the residues correspond to position 233 and 234 of SEQ ID NO: 23. In some embodiments, the Fc region comprises mutations at D265 and N297. In some embodiments, the anti-transferrin receptor antibody comprises a heavy chain (HC) sequence selected from SEQ ID NOs: 23-46 and a light chain (LC) sequence selected from SEQ ID NOs: 47-50. In some embodiments, the anti-transferrin receptor antibody specifically binds to human transferrin receptor (TfR).

[0006] Disclosed herein, in certain embodiments, is an anti-transferrin receptor antibody conjugate comprising an anti-transferrin receptor antibody described herein and a payload. In some embodiments, the payload comprises a small molecule, a peptide, a protein, or a polynucleic acid molecule. In some embodiments, the payload comprises a polynucleic acid molecule. In some embodiments, the polynucleic acid molecule comprises short interfering nucleic acid (siNA), short interfering RNA (siRNA), double-stranded RNA (dsRNA), micro-RNA (miRNA), short hairpin RNA (shRNA), antisense oligonucleotide (ASO), a PMO, or mRNA. In some embodiments, the payload comprises a dsRNA. In some embodiments, the payload comprises an antisense oligonucleotide (ASO). In some embodiments, the payload comprises a small molecule, a peptide, or a protein. In some embodiments, the payload comprises a microtubule disrupting agent, a DNA modifying agent, or an Akt inhibitor. In some embodiments, the payload comprises an auristatin or a derivative thereof, a dolastatin or a derivative or analog thereof, a maytansinoid, or a pyrrolobenzodiazepine or a derivative thereof. In some embodiments, the auristatin or derivative thereof is monomethyl auristatin E (MMAE) or monomethyl auristatin F (MMAF). In some embodiments, the maytansinoid is DM1 or DM4. In some embodiments, pyrrolobenzodiazepine is a pyrrolobenzodiazepine dimer. In some embodiments, the payload comprises an immunomodulatory agent or an immune modulator. In some embodiments, the immune modulator comprises a cytokine. In some embodiments, the payload comprises a protein or peptide toxin or fragment thereof. In some embodiments, the payload is conjugated to the anti-transferrin receptor antibody through a linker. In some embodiments, the anti-transferrin receptor antibody is further conjugated to two or more payloads. In some embodiments, a ratio of the payloads to the anti-transferrin receptor antibody is about 1:1, 2:1, 3:1, 4:1, 5:1, 6:1, 7:1, 8:1, 9:1, 10:1, 11:1, or 12:1. In some embodiments, the anti-transferrin conjugate comprises A-(X¹-B)_n (Formula (I)), wherein A comprises the anti-transferring antibody; B comprises the payload; X¹ consists of a bond or linker; and n is an averaged value selected from 1-12. In some embodiments, the payload is a polynucleic acid molecule. In some embodiments, the polynucleic acid molecule comprises a passenger strand and a guide strand. In some embodiments, the guide strand comprises at least one modified internucleotide linkage, at least one

inverted abasic moiety, at least one 5'-vinylphosphonate modified non-natural nucleotide, or a combination thereof. In some embodiments, the at least one 5'-vinylphosphonate modified non-natural nucleotide is located about 1, 2, 3, 4, or 5 bases away from the 5' terminus of the guide strand. In some embodiments, the polynucleic acid molecule further comprises a modification of a sugar moiety at the 2' position. In some embodiments, the modification at the 2'-position is selected from 2'-O-methyl, 2'-O-methoxyethyl (2'-O-MOE), 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl (2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O-dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA) modified nucleotide. In some embodiments, the passenger strand comprises at least 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorodiamidate morpholino oligomer-modified non-natural nucleotides. In some embodiments, the passenger strand is shorter in length than the guide strand, thereby generating a 5' overhang, a 3' overhang, a blunt end at one terminus, or a combination thereof. In some embodiments, the passenger strand is equal in length to the guide strand, thereby generating a blunt end at each terminus of the polynucleic acid molecule. In some embodiments, the passenger strand is conjugated to A- X¹. In some embodiments, A- X¹ is conjugated to the 5' end of the passenger strand. In some embodiments, A- X¹ is conjugated to the 3' end of the passenger strand. In some embodiments, the anti-transferrin conjugate comprises: A-X¹-(B-X²-C)_n (Formula (II)), wherein A comprises the anti-transferrin receptor antibody; B comprises the polynucleic acid molecule; C consists of a polymer; X¹ consists a bond or first linker; X² consists of a bond or second linker; and n is an averaged value selected from 1-12. In some embodiments, C is polyethylene glycol. In some embodiments, the polynucleic acid molecule comprises a passenger strand and a guide strand. In some embodiments, the passenger strand is conjugated to A- X¹ and X²-C. In some embodiments, A- X¹ is conjugated to the 5' end of the passenger strand and X²-C is conjugated to the 3' end of the passenger strand. In some embodiments, X²-C is conjugated to the 5' end of the passenger strand and A- X¹ is conjugated to the 3' end of the passenger strand. In some embodiments, X¹ and X² are each independently a non-polymeric linker. In some embodiments, the anti-transferrin receptor antibody conjugate further comprises D. In some embodiments, D is an endosomolytic moiety.

[0007] Disclosed herein, in certain embodiments, is a nucleic acid polymer encoding an anti-transferrin receptor antibody described herein.

[0008] Disclosed herein, in certain embodiments, is a vector comprising a nucleic acid polymer encoding an anti-transferrin receptor antibody described herein.

[0009] Disclosed herein, in certain embodiments, is a pharmaceutical composition comprising: an anti-transferrin receptor antibody described herein or an anti-transferrin receptor antibody conjugate described herein; and a pharmaceutically acceptable excipient. In some embodiments, the pharmaceutical composition is formulated for systemic administration. In some embodiments, the pharmaceutical composition is formulated for parenteral administration.

[0010] Disclosed herein, in certain embodiments, is a method of delivering a payload to a target site of interest in a subject, comprising: administering to the subject an anti-transferrin receptor antibody

conjugate described herein or a pharmaceutical composition described herein to deliver the payload to the target site of interest. In some embodiments, the target site of interest is a cell comprising an overexpressed causative protein. In some embodiments, the target site of interest is a tumor site. In some embodiments, the target site of interest is a site located with the brain.

[0011] Disclosed herein, in certain embodiments, is a method of treating a cancer in a subject in need thereof, comprising: administering to the subject an anti-transferrin receptor antibody conjugate described herein or a pharmaceutical composition described herein to treat the cancer in the subject. In some embodiments, the cancer is a solid cancer. In some embodiments, the cancer is a hematologic malignancy. In some embodiments, the cancer is bladder cancer, lung cancer, brain cancer, melanoma, breast cancer, Non-Hodgkin lymphoma, cervical cancer, ovarian cancer, colorectal cancer, pancreatic cancer, esophageal cancer, prostate cancer, kidney cancer, skin cancer, leukemia, thyroid cancer, liver cancer, or uterine cancer. In some embodiments, the cancer is a metastatic cancer. In some embodiments, the cancer is a relapsed or refractory cancer.

[0012] Disclosed herein, in certain embodiments, is a method of treating a muscle atrophy or myotonic dystrophy in a subject in need thereof, comprising: administering to the subject an anti-transferrin receptor antibody conjugate described herein or a pharmaceutical composition described herein, wherein the polynucleic acid molecule hybridizes to a target sequence of an atrogene, and wherein the polynucleic acid molecule mediates RNA interference against the atrogene, thereby threatening muscle atrophy in the subject. In some embodiments, the muscle atrophy is a diabetes-associated muscle atrophy or a cancer cachexia-associated muscle atrophy. In some embodiments, the muscle atrophy is associated with insulin deficiency, chronic renal failure, congestive heart failure, chronic respiratory disease, a chronic infection, fasting, denervation, sarcopenia, or myotonic dystrophy type 1 (DM1). In some embodiments, the reticulocyte levels in the subject are not reduced following the administration of anti-transferrin receptor antibody. In some embodiments, the administration of anti-transferrin receptor antibody conjugate downregulates SSB siRNA or SSB mRNA levels in the subject. In some embodiments, the downregulation of SSB siRNA or SSB mRNA is in muscle. In some embodiments, the muscle is skeletal muscle. In some embodiments, the muscle is cardiac muscle.

[0013] In some embodiments, the myotonic dystrophy is DM1. In some embodiments, the atrogene comprises an upregulated gene within the IGF1-Akt-FoxO pathway, the glucocorticoids-GR pathway, the PGC1 α -FoxO pathway, the TNF α -NF κ B pathway, or the myostatin-ActRIIb-Smad2/3 pathway. In some embodiments, the atrogene encodes an E3 ligase. In some embodiments, the atrogene encodes a Forkhead box transcription factor. In some embodiments, the atrogene comprises atrogin-1 gene (*FBXO32*), MuRF1 gene (*TRIM63*), *FOXO1*, *FOXO3*, or *MSTN*. In some embodiments, the atrogene comprises *DMPK*. In some embodiments, the subject is a human.

[0014] Disclosed herein, in certain embodiments, is a method of treating a muscular dystrophy in a subject in need thereof, comprising: administering to the subject an anti-transferrin receptor antibody conjugate described herein or a pharmaceutical composition described herein, thereby treating the muscular dystrophy in the subject. In some embodiments, the muscular dystrophy is Duchenne muscular dystrophy, Becker muscular dystrophy, facioscapulohumeral muscular dystrophy, congenital muscular dystrophy, or myotonic dystrophy. In some embodiments, the muscular dystrophy is Duchenne muscular dystrophy. In some embodiments, the subject is a human.

[0015] Disclosed herein, in certain embodiments, is a kit comprising an anti-transferrin receptor antibody described herein, an anti-transferrin receptor antibody conjugate described herein, a nucleic acid polymer described herein, a vector described herein, or a pharmaceutical composition described herein.

BRIEF DESCRIPTION OF THE DRAWINGS

[0016] Various aspects of the disclosure are set forth with particularity in the appended claims. A better understanding of the features and advantages of the present disclosure will be obtained by reference to the following detailed description that sets forth illustrative embodiments, in which the principles of the disclosure are utilized, and the accompanying drawings below. The patent application file contains at least one drawing executed in color. Copies of this patent application publication with color drawing(s) will be provided by the Office upon request and payment of the necessary fee.

[0017] Fig. 1 illustrates the structure of an exemplary SSB passenger strand.

[0018] Fig. 2 illustrates the structure of an exemplary blunt ended duplex with 19 bases of complementarity and one 3' dinucleotide overhang. Purified single strands were duplexed to get the double stranded siRNA.

[0019] Fig. 3A illustrates *in vitro* binding of TfR1.IgG2 mAb and TfR1.IgG2 mAb-SSB to recombinant human TfR1.

[0020] Fig. 3B illustrates *in vitro* binding of TfR1.IgG2 mAb and TfR1.IgG2 mAb-SSB to recombinant cyno TfR1.

[0041] Fig. 19 shows SSB mRNA levels in muscles of cynomolgus monkeys 21 days post single doses of TfR1 mAb SSB conjugates (n=3).

[0042] Fig. 20A shows SSB siRNA levels in tissues of cynomolgus monkeys 21 days post a single 6 mg/kg dose of hIgG1 TfR-Var2ii-SSB conjugate (n=2).

[0043] Fig. 20B shows SSB mRNA levels in tissues of cynomolgus monkeys 21 days post a single 6 mg/kg dose of hIgG1 TfR-Var2ii-SSB conjugate (n=2).

DETAILED DESCRIPTION OF THE DISCLOSURE

[0044] Transferrin receptors (TfRs) comprise a family of membrane glycoproteins and are encoded by the gene *TFRC*. TfRs are involved in iron metabolism by interacting with the iron-transferrin complex to facilitate iron into cells. There are two subtypes of TfRs, transferrin receptor 1 (TfR1 or CD71) and transferrin receptor 2 (TfR2). TfR1 is ubiquitously expressed in different cell types while TfR2 is specifically expressed in liver cells.

[0045] In some instances, abnormal expression of TfR1 has been noted in various cancers. Indeed, one study has shown that the expression level of TfR1 is elevated in breast cancer cells (Pizzamiglio, et al., “Expression of iron-related proteins differentiate non-cancerous and cancerous breast tumors,” *Int J Mol Sci.* 2017;18). In a separate study, TFR1 has also been shown to be overexpressed in brain cancer (Rosager, et al., “Transferrin receptor-1 and ferritin heavy and light chains in astrocytic brain tumors: Expression and prognostic value,” *PLoS One* 12:e0182954 (2017)). A further study has noted that iron uptake is elevated in tumor-initiating cells (Rychtarikova, et al., “Tumorinitiating cells of breast and

prostate origin show alterations in the expression of genes related to iron metabolism," *Oncotarget*. 8:6376–6398 (2017)).

[0046] In some embodiments, disclosed herein is an anti-transferrin receptor antibody, an anti-transferrin receptor antibody conjugate, and pharmaceutical compositions comprising the same. In additional embodiments, disclosed herein is a method of utilizing the anti-transferrin receptor antibody for delivery of a payload, and method of treating a disease or condition by utilizing the presence of transferrin receptors for targeted delivery.

Anti-Transferrin Receptor Antibodies

[0047] In certain embodiments, disclosed herein is an anti-transferrin receptor antibody. In some instances, the anti-transferrin receptor antibody specifically binds to a transferrin receptor (TfR). In some instances, the anti-transferrin receptor antibody specifically binds to a human transferrin receptor (TfR). In some cases, the anti-transferrin receptor antibody specifically binds to transferrin receptor 1 (TfR1) (or CD71). In some cases, the anti-transferrin receptor antibody specifically binds to human transferrin receptor 1 (TfR1) (or human CD71).

[0048] In some instances, the anti-transferrin receptor antibody comprises a variable heavy chain (VH) region and a variable light chain (VL) region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3.

[0049] In some embodiments, the VH region of the anti-transferring antibody comprises HCDR1, HCDR2, and HCDR3 sequences selected from Table 1.

Table 1.

Name	HCDR1	SEQ ID NO:	HCDR2	SEQ ID NO:	HCDR3	SEQ ID NO:
13E4 VH1	YTFNYWMH	1	EINPINGRSNYAQKFQG	2	GTRAMHY	3
13E4 VH2*	YTFNYWMH	1	EINPINGRSNYAEKFQG	4	GTRAMHY	3
13E4 VH3	YTFNYWMH	1	EINPIQGRSNYAEKFQG	5	GTRAMHY	3

*13E4_VH2 shares the same HCDR1, HCDR2, and HCDR3 sequences with anti-transferrin receptor antibody 13E4_VH4

[0050] In some embodiments, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence comprising SEQ ID NO: 2, 4, or 5; and HCDR3 sequence comprising SEQ ID NO: 3. In some instances, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3. In some instances, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3. In some instances, the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3.

[0051] In some embodiments, the VL region of the anti-transferrin receptor antibody comprises LCDR1 sequence RTSENIYX₃NLA, LCDR2 sequence AX₄TNLAX₅, and LCDR3 sequence QHFWGTPLTX₆, wherein X₃ is selected from N or S, X₄ is selected from A or G, X₅ is selected from D or E, and X₆ is present or absence, and if present, is F.

[0052] In some embodiments, the VL region of the anti-transferrin receptor antibody comprises LCDR1, LCDR2, and LCDR3 sequences selected from Table 2.

*13E4_VL1 shares the same LCDR1, LCDR2, and LCDR3 sequences with anti-transferrin receptor antibody 13E4_VL2

[0053] In some instances, the VL region comprises LCDR1 sequence RTSENIYX₃NLA, LCDR2 sequence comprising SEQ ID NO: 7, 9, or 12, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₃ is selected from N or S.

[0054] In some instances, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence AX₄TNLAX₅, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₄ is selected from A or G, and X₅ is selected from D or E.

[0055] In some instances, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence SEQ ID NO: 7, 9, or 12, and LCDR3 sequence QHFWGTPLTX₆, wherein X₆ is present or absence, and if present, is F.

[0056] In some instances, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence AATNLAX₅, and LCDR3 sequence QHFWGTPLTX₆, wherein X₅ is selected from D or E and X₆ is present or absence, and if present, is F.

[0057] In some instances, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8.

[0058] In some instances, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 9, and LCDR3 sequence comprising SEQ ID NO: 10.

[0059] In some instances, the VL region comprises LCDR1 sequence comprising SEQ ID NO: 11, LCDR2 sequence comprising SEQ ID NO: 12, and LCDR3 sequence comprising SEQ ID NO: 10.

[0060] In some embodiments, the anti-transferrin receptor antibody comprises a VH region and a VL region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence RTSENIYX₃NLA, LCDR2 sequence AX₄TNLAX₅, and LCDR3 sequence QHFWGTPLTX₆, wherein X₃

is selected from N or S, X₄ is selected from A or G, X₅ is selected from D or E, and X₆ is present or absence, and if present, is F.

[0061] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence RTSENIYX₃NLA, LCDR2 sequence comprising SEQ ID NO: 7, 9, or 12, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₃ is selected from N or S.

[0062] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence AX₄TNLAX₅, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₄ is selected from A or G, and X₅ is selected from D or E.

[0063] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence SEQ ID NO: 7, 9, or 12, and LCDR3 sequence QHFWGTPLTX₆, wherein X₆ is present or absence, and if present, is F.

[0064] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence AATNLAX₅, and LCDR3 sequence QHFWGTPLTX₆, wherein X₅ is selected from D or E and X₆ is present or absence, and if present, is F.

[0065] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8.

[0066] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 9, and LCDR3 sequence comprising SEQ ID NO: 10.

[0067] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 11, LCDR2 sequence comprising SEQ ID NO: 12, and LCDR3 sequence comprising SEQ ID NO: 10.

[0068] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence RTSENIYX₃NLA, LCDR2 sequence comprising SEQ ID NO: 7, 9, or 12, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₃ is selected from N or S.

[0069] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence AX₄TNLAX₅, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₄ is selected from A or G, and X₅ is selected from D or E.

[0070] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence SEQ ID NO: 7, 9, or 12, and LCDR3 sequence QHFWGTPLTX₆, wherein X₆ is present or absence, and if present, is F.

[0071] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence AATNLAX₅, and LCDR3 sequence QHFWGTPLTX₆, wherein X₅ is selected from D or E and X₆ is present or absence, and if present, is F.

[0072] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8.

[0073] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 9, and LCDR3 sequence comprising SEQ ID NO: 10.

[0074] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 11, LCDR2 sequence comprising SEQ ID NO: 12, and LCDR3 sequence comprising SEQ ID NO: 10.

[0075] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence RTSENIYX₃NLA, LCDR2 sequence comprising SEQ ID NO: 7, 9, or 12, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₃ is selected from N or S.

[0076] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence AX₄TNLAX₅, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₄ is selected from A or G, and X₅ is selected from D or E.

[0077] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence SEQ ID NO: 7, 9, or 12, and LCDR3 sequence QHFWGTPLTX₆, wherein X₆ is present or absence, and if present, is F.

[0078] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence AATNLAX₅, and LCDR3 sequence QHFWGTPLTX₆, wherein X₅ is selected from D or E and X₆ is present or absence, and if present, is F.

[0079] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8.

[0080] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 9, and LCDR3 sequence comprising SEQ ID NO: 10.

[0081] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 11, LCDR2 sequence comprising SEQ ID NO: 12, and LCDR3 sequence comprising SEQ ID NO: 10.

[0082] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence RTSENIYX₃NLA, LCDR2 sequence comprising SEQ ID NO: 7, 9, or 12, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₃ is selected from N or S.

[0083] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence AX₄TNLAX₅, and LCDR3 sequence comprising SEQ ID NO: 8 or 10, wherein X₄ is selected from A or G, and X₅ is selected from D or E.

[0084] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6 or 11, LCDR2 sequence SEQ ID NO: 7, 9, or 12, and LCDR3 sequence QHFWGTPLTX₆, wherein X₆ is present or absence, and if present, is F.

[0085] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3 and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence AATNLAX₅, and LCDR3 sequence QHFWGTPLTX₆, wherein X₅ is selected from D or E and X₆ is present or absence, and if present, is F.

[0086] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8.

[0087] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 9, and LCDR3 sequence comprising SEQ ID NO: 10.

[0088] In some instances, the anti-transferrin receptor antibody comprises a VH region and a VL region, in which the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 11, LCDR2 sequence comprising SEQ ID NO: 12, and LCDR3 sequence comprising SEQ ID NO: 10.

[0089] In some embodiments, the anti-transferrin receptor antibody comprises a VH region and a VL region in which the sequence of the VH region comprises about 80%, 85%, 90%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to SEQ ID NOs: 13-16 and the sequence of the VL region comprises about 80%, 85%, 90%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to SEQ ID NOs: 18-21.

[0090] In some embodiments, the VH region comprises a sequence selected from SEQ ID NOs: 13-16 (Table 3) and the VL region comprises a sequence selected from SEQ ID NOs: 18-21 (Table 4). The underlined regions in Table 3 and Table 4 denote the respective CDR1, CDR2, or CDR3 sequence.

[0092] In some embodiments, an anti-transferrin receptor antibody described supra is a full-length antibody. In other embodiments, the anti-transferrin receptor antibody is a binding fragment thereof. In some cases, the anti-transferrin receptor antibody is a humanized antibody or binding fragment thereof, a chimeric antibody or binding fragment thereof, a monoclonal antibody or binding fragment thereof, a multi-specific antibody or binding fragment thereof, or a bispecific antibody or binding fragment thereof. In some cases, the anti-transferrin receptor antibody is monovalent Fab', divalent Fab₂, F(ab)'₃ fragments, single-chain variable fragment (scFv), bis-scFv, (scFv)₂, diabody, minibody, nanobody, triabody, tetrabody, disulfide stabilized Fv protein ("dsFv"), single-domain antibody (sdAb), Ig NAR, camelid antibody or binding fragment thereof, or a chemically modified derivative thereof.

[0093] In some embodiments, the anti-transferrin receptor antibody is a multi-specific antibody. In some cases, the multi-specific antibody comprises two or more target binding moieties in which each of the two or more target binding moieties binds specifically to an antigen, and the two or more antigens are different. In some cases, the multi-specific antibody comprises target binding moieties that specifically bind to three or more different antigens, four or more different antigens, or five or more different antigens.

[0094] In some embodiments, the anti-transferrin receptor antibody is a bispecific antibody. In some cases, the bispecific antibody or binding fragment includes a Knobs-into-Holes (KiH), Asymmetric Re-engineering Technology-immunoglobulin (ART-Ig), Triomab quadroma, bispecific monoclonal antibody (BiMAb, BsmAb, BsAb, bsMab, BS-Mab, or Bi-MAb), Fc Δ Adp, XmAb, Azymetric, Bispecific Engagement by Antibodies based on the T-cell receptor (BEAT), Bispecific T-cell Engager (BiTE), Biclonics, Fab-scFv-Fc, Two-in-one/Dual Action Fab (DAF), FinomAb, scFv-Fc-(Fab)-fusion, Dock-aNd-Lock (DNL), Adaptir (previously SCORPION), Tandem diAbody (TandAb), Dual-affinity-ReTargeting (DART), or nanobody.

[0095] In some instances, the bispecific antibody is a trifunctional antibody or a bispecific mini-antibody. In some cases, the bispecific antibody is a trifunctional antibody. In some instances, the

trifunctional antibody is a full length monoclonal antibody comprising binding sites for two different antigens.

[0096] In some cases, the bispecific antibody is a bispecific mini-antibody. In some instances, the bispecific mini-antibody comprises divalent Fab₂, F(ab)^{1,2} fragments, bis-scFv, (scFv)₂, diabody, minibody, triabody, tetrabody or a bi-specific T-cell engager (BiTE). In some embodiments, the bi-specific T-cell engager is a fusion protein that contains two single-chain variable fragments (scFvs) in which the two scFvs target epitopes of two different antigens.

[0097] In some instances, the anti-transferrin receptor antibody is a trispecific antibody. In some instances, the trispecific antibody comprises F(ab)^{1,2,3} fragments or a triabody. In some embodiments, the anti-transferrin receptor antibody is a trispecific antibody as described in Dimas, *et al.*, “Development of a trispecific antibody designed to simultaneously and efficiently target three different antigens on tumor cells,” *Mol. Pharmaceutics*, **12**(9): 3490-3501 (2015).

[0098] In some instances, the anti-transferrin receptor antibody comprises an antibody format illustrated in FIG. 2 of Brinkmann and Kontermann, “The making of bispecific antibodies,” *MABS* **9**(2): 182-212 (2017).

[0099] In some embodiments, an anti-transferrin receptor antibody described herein comprises an IgG framework, an IgA framework, an IgE framework, or an IgM framework. In some instances, the anti-transferrin receptor antibody comprises an IgG framework (e.g., IgG1, IgG2, IgG3, or IgG4). In some cases, the anti-transferrin receptor antibody comprises an IgG1 framework. In some cases, the anti-transferrin receptor antibody comprises an IgG2 (e.g., an IgG2a or IgG2b) framework. In some cases, the anti-transferrin receptor antibody comprises an IgG2a framework. In some cases, the anti-transferrin receptor antibody comprises an IgG2b framework. In some cases, the anti-transferrin receptor antibody comprises an IgG3 framework. In some cases, the anti-transferrin receptor antibody comprises an IgG4 framework.

[0100] In some cases, an anti-transferrin receptor antibody comprises one or more mutations in a framework region, e.g., in the CH1 domain, CH2 domain, CH3 domain, hinge region, or a combination thereof. In some instances, the one or more mutations are to stabilize the antibody and/or to increase half-life. In some instances, the one or more mutations are to modulate Fc receptor interactions, to reduce or eliminate Fc effector functions such as FcγR, antibody-dependent cell-mediated cytotoxicity (ADCC), or complement-dependent cytotoxicity (CDC). In additional instances, the one or more mutations are to modulate glycosylation.

[0101] In some embodiments, the one or more mutations are located in the Fc region. In some instances, the Fc region comprises a mutation at residue position L234, L235, or a combination thereof. In some instances, the mutations comprise L234 and L235. In some instances, the mutations comprise L234A and L235A. In some cases, the residue positions are in reference to IgG1.

[0102] In some instances, the Fc region comprises a mutation at residue position L234, L235, D265, N297, K322, L328, or P329, or a combination thereof. In some instances, the mutations comprise L234 and L235 in combination with a mutation at residue position K322, L328, or P329. In some cases, the Fc

region comprises mutations at L234, L235, and K322. In some cases, the Fc region comprises mutations at L234, L235, and L328. In some cases, the Fc region comprises mutations at L234, L235, and P329. In some cases, the Fc region comprises mutations at D265 and N297. In some cases, the residue position is in reference to IgG1.

[0103] In some instances, the Fc region comprises L234A, L235A, D265A, N297G, K322G, L328R, or P329G, or a combination thereof. In some instances, the Fc region comprises L234A and L235A in combination with K322G, L328R, or P329G. In some cases, the Fc region comprises L234A, L235A, and K322G. In some cases, the Fc region comprises L234A, L235A, and L328R. In some cases, the Fc region comprises L234A, L235A, and P329G. In some cases, the Fc region comprises D265A and N297G. In some cases, the residue position is in reference to IgG1.

[0104] In some instances, the Fc region comprises a mutation at residue position L235, L236, D265, N297, K322, L328, or P329, or a combination of the mutations. In some instances, the Fc region comprises mutations at L235 and L236. In some instances, the Fc region comprises mutations at L235 and L236 in combination with a mutation at residue position K322, L328, or P329. In some cases, the Fc region comprises mutations at L235, L236, and K322. In some cases, the Fc region comprises mutations at L235, L236, and L328. In some cases, the Fc region comprises mutations at L235, L236, and P329. In some cases, the Fc region comprises mutations at D265 and N297. In some cases, the residue position is in reference to IgG2b.

[0105] In some embodiments, the Fc region comprises L235A, L236A, D265A, N297G, K322G, L328R, or P329G, or a combination thereof. In some instances, the Fc region comprises L235A and L236A. In some instances, the Fc region comprises L235A and L236A in combination with K322G, L328R, or P329G. In some cases, the Fc region comprises L235A, L236A, and K322G. In some cases, the Fc region comprises L235A, L236A, and L328R. In some cases, the Fc region comprises L235A, L236A, and P329G. In some cases, the Fc region comprises D265A and N297G. In some cases, the residue position is in reference to IgG2b.

[0106] In some embodiments, the Fc region comprises a mutation at residue position L233, L234, D264, N296, K321, L327, or P328, wherein the residues correspond to positions 233, 234, 264, 296, 321, 327, and 328 of SEQ ID NO: 23. In some instances, the Fc region comprises mutations at L233 and L234. In some instances, the Fc region comprises mutations at L233 and L234 in combination with a mutation at residue position K321, L327, or P328. In some cases, the Fc region comprises mutations at L233, L234, and K321. In some cases, the Fc region comprises mutations at L233, L234, and L327. In some cases, the Fc region comprises mutations at L233, L234, and K321. In some cases, the Fc region comprises mutations at L233, L234, and P328. In some instances, the Fc region comprises mutations at D264 and N296. In some cases, equivalent positions to residue L233, L234, D264, N296, K321, L327, or P328 in an IgG1, IgG2, IgG3, or IgG4 framework are contemplated. In some cases, mutations to a residue that corresponds to residue L233, L234, D264, N296, K321, L327, or P328 of SEQ ID NO: 23 in an IgG1, IgG2, or IgG4 framework are also contemplated.

[0107] In some embodiments, the Fc region comprises L233A, L234A, D264A, N296G, K321G, L327R, or P328G, wherein the residues correspond to positions 233, 234, 264, 296, 321, 327, and 328 of SEQ ID NO: 23. In some instances, the Fc region comprises L233A and L234A. In some instances, the Fc region comprises L233A and L234A in combination with K321G, L327R, or P328G. In some cases, the Fc region comprises L233A, L234A, and K321G. In some cases, the Fc region comprises L233A, L234A, and L327R. In some cases, the Fc region comprises L233A, L234A, and K321G. In some cases, the Fc region comprises L233A, L234A, and P328G. In some instances, the Fc region comprises D264A and N296G.

[0108] In some embodiments, the human IgG constant region is modified to alter antibody-dependent cellular cytotoxicity (ADCC) and/or complement-dependent cytotoxicity (CDC), e.g., with an amino acid modification described in Natsume *et al.*, 2008 *Cancer Res*, **68**(10): 3863-72; Idusogie *et al.*, 2001 *J Immunol*, **166**(4): 2571-5; Moore *et al.*, 2010 *mAbs*, **2**(2): 181- 189; Lazar *et al.*, 2006 *PNAS*, **103**(11): 4005-4010, Shields *et al.*, 2001 *JBC*, **276**(9): 6591- 6604; Stavenhagen *et al.*, 2007 *Cancer Res*, **67**(18): 8882-8890; Stavenhagen *et al.*, 2008 *Advan. Enzyme Regul.*, **48**: 152-164; Alegre *et al*, 1992 *J Immunol*, **148**: 3461-3468; Reviewed in Kaneko and Niwa, 2011 *Biodrugs*, **25**(1): 1-11.

[0109] In some embodiments, an anti-transferrin receptor antibody described herein is a full-length antibody, comprising a heavy chain (HC) and a light chain (LC). In some cases, the heavy chain (HC) comprises a sequence selected from Table 6. In some cases, the light chain (LC) comprises a sequence selected from Table 7. The underlined region denotes the respective CDRs.

[0110] In some embodiments, an anti-transferrin receptor antibody described herein has an improved serum half-life compared to a reference anti-transferrin receptor antibody. In some instances, the improved serum half-life is at least 30 minutes, 1 hour, 1.5 hour, 2 hours, 3 hours, 4 hours, 5 hours, 6 hours, 7 hours, 8 hours, 9 hours, 10 hours, 12 hours, 18 hours, 24 hours, 2 days, 3 days, 4 days, 5 days, 6 days, 7 days, 14 days, 30 days, or longer than reference anti-transferrin receptor antibody.

Production of Antibodies or Binding Fragments Thereof

[0111] In some embodiments, polypeptides described herein (e.g., antibodies and its binding fragments) are produced using any method known in the art to be useful for the synthesis of polypeptides (e.g., antibodies), in particular, by chemical synthesis or by recombinant expression, and are preferably produced by recombinant expression techniques.

[0112] In some instances, an antibody or its binding fragment thereof is expressed recombinantly, and the nucleic acid encoding the antibody or its binding fragment is assembled from chemically synthesized oligonucleotides (e.g., as described in Kutmeier et al., 1994, *BioTechniques* 17:242), which involves the synthesis of overlapping oligonucleotides containing portions of the sequence encoding the antibody, annealing and ligation of those oligonucleotides, and then amplification of the ligated oligonucleotides by PCR.

[0113] Alternatively, a nucleic acid molecule encoding an antibody is optionally generated from a suitable source (e.g., an antibody cDNA library, or cDNA library generated from any tissue or cells expressing the immunoglobulin) by PCR amplification using synthetic primers hybridizable to the 3' and 5' ends of the sequence or by cloning using an oligonucleotide probe specific for the particular gene sequence.

[0114] In some instances, an antibody or its binding is optionally generated by immunizing an animal, such as a rabbit, to generate polyclonal antibodies or, more preferably, by generating monoclonal antibodies, e.g., as described by Kohler and Milstein (1975, *Nature* 256:495-497) or, as described by Kozbor et al. (1983, *Immunology Today* 4:72) or Cole et al. (1985 in *Monoclonal Antibodies and Cancer Therapy*, Alan R. Liss, Inc., pp. 77-96). Alternatively, a clone encoding at least the Fab portion of the

antibody is optionally obtained by screening Fab expression libraries (e.g., as described in Huse et al., 1989, *Science* 246:1275-1281) for clones of Fab fragments that bind the specific antigen or by screening antibody libraries (See, e.g., Clackson et al., 1991, *Nature* 352:624; Hane et al., 1997 *Proc. Natl. Acad. Sci. USA* 94:4937).

[0115] In some embodiments, techniques developed for the production of “chimeric antibodies” (Morrison et al., 1984, *Proc. Natl. Acad. Sci.* 81:851-855; Neuberger et al., 1984, *Nature* 312:604-608; Takeda et al., 1985, *Nature* 314:452-454) by splicing genes from a mouse antibody molecule of appropriate antigen specificity together with genes from a human antibody molecule of appropriate biological activity are used. A chimeric antibody is a molecule in which different portions are derived from different animal species, such as those having a variable region derived from a murine monoclonal antibody and a human immunoglobulin constant region, e.g., humanized antibodies.

[0116] In some embodiments, techniques described for the production of single chain antibodies (U.S. Pat. No. 4,694,778; Bird, 1988, *Science* 242:423-42; Huston et al., 1988, *Proc. Natl. Acad. Sci. USA* 85:5879-5883; and Ward et al., 1989, *Nature* 334:544-54) are adapted to produce single chain antibodies. Single chain antibodies are formed by linking the heavy and light chain fragments of the Fv region via an amino acid bridge, resulting in a single chain polypeptide. Techniques for the assembly of functional Fv fragments in *E. coli* are also optionally used (Skerra et al., 1988, *Science* 242:1038-1041).

[0117] In some embodiments, an expression vector comprising the nucleotide sequence of an antibody or the nucleotide sequence of an antibody is transferred to a host cell by conventional techniques (e.g., electroporation, liposomal transfection, and calcium phosphate precipitation), and the transfected cells are then cultured by conventional techniques to produce the antibody. In specific embodiments, the expression of the antibody is regulated by a constitutive, an inducible or a tissue, specific promoter.

[0118] In some embodiments, a variety of host-expression vector systems is utilized to express an antibody or its binding fragment described herein. Such host-expression systems represent vehicles by which the coding sequences of the antibody is produced and subsequently purified, but also represent cells that are, when transformed or transfected with the appropriate nucleotide coding sequences, express an antibody or its binding fragment in situ. These include, but are not limited to, microorganisms such as bacteria (e.g., *E. coli* and *B. subtilis*) transformed with recombinant bacteriophage DNA, plasmid DNA or cosmid DNA expression vectors containing an antibody or its binding fragment coding sequences; yeast (e.g., *Saccharomyces Pichia*) transformed with recombinant yeast expression vectors containing an antibody or its binding fragment coding sequences; insect cell systems infected with recombinant virus expression vectors (e.g., baculovirus) containing an antibody or its binding fragment coding sequences; plant cell systems infected with recombinant virus expression vectors (e.g., cauliflower mosaic virus (CaMV) and tobacco mosaic virus (TMV)) or transformed with recombinant plasmid expression vectors (e.g., Ti plasmid) containing an antibody or its binding fragment coding sequences; or mammalian cell systems (e.g., COS, CHO, BH, 293, 293T, 3T3 cells) harboring recombinant expression constructs containing promoters derived from the genome of mammalian cells (e.g., metallothionein promoter) or from mammalian viruses (e.g. the adenovirus late promoter; the vaccinia virus 7.5K promoter).

[0119] For long-term, high-yield production of recombinant proteins, stable expression is preferred. In some instances, cell lines that stably express an antibody are optionally engineered. Rather than using expression vectors that contain viral origins of replication, host cells are transformed with DNA controlled by appropriate expression control elements (e.g., promoter, enhancer, sequences, transcription terminators, polyadenylation sites, etc.), and a selectable marker. Following the introduction of the foreign DNA, engineered cells are then allowed to grow for 1-2 days in an enriched media, and then are switched to a selective media. The selectable marker in the recombinant plasmid confers resistance to the selection and allows cells to stably integrate the plasmid into their chromosomes and grow to form foci that in turn are cloned and expanded into cell lines. This method can advantageously be used to engineer cell lines which express the antibody or its binding fragments.

[0120] In some instances, a number of selection systems are used, including but not limited to the herpes simplex virus thymidine kinase (Wigler et al., 1977, *Cell* 11:223), hypoxanthine-guanine phosphoribosyltransferase (Szybalska & Szybalski, 192, *Proc. Natl. Acad. Sci. USA* 48:202), and adenine phosphoribosyltransferase (Lowy et al., 1980, *Cell* 22:817) genes are employed in tk⁻, hprt⁻ or apt⁻ cells, respectively. Also, antimetabolite resistance are used as the basis of selection for the following genes: dhfr, which confers resistance to methotrexate (Wigler et al., 1980, *Proc. Natl. Acad. Sci. USA* 77:357; O'Hare et al., 1981, *Proc. Natl. Acad. Sci. USA* 78:1527); gpt, which confers resistance to mycophenolic acid (Mulligan & Berg, 1981, *Proc. Natl. Acad. Sci. USA* 78:2072); neo, which confers resistance to the aminoglycoside G-418 (*Clinical Pharmacy* 12:488-505; Wu and Wu, 1991, *Biotherapy* 3:87-95; Tolstoshev, 1993, *Ann. Rev. Pharmacol. Toxicol.* 32:573-596; Mulligan, 1993, *Science* 260:926-932; and Morgan and Anderson, 1993, *Ann. Rev. Biochem.* 62:191-217; May, 1993, *TIB TECH* 11(5):155-215) and hygro, which confers resistance to hygromycin (Santerre et al., 1984, *Gene* 30:147). Methods commonly known in the art of recombinant DNA technology which can be used are described in Ausubel et al. (eds., 1993, *Current Protocols in Molecular Biology*, John Wiley & Sons, NY; Kriegler, 1990, *Gene Transfer and Expression, A Laboratory Manual*, Stockton Press, NY; and in Chapters 12 and 13, Dracopoli et al. (eds), 1994, *Current Protocols in Human Genetics*, John Wiley & Sons, NY.; Colberre-Garapin et al., 1981, *J. Mol. Biol.* 150:1).

[0121] In some instances, the expression levels of an antibody are increased by vector amplification (for a review, see Bebbington and Hentschel, *The use of vectors based on gene amplification for the expression of cloned genes in mammalian cells in DNA cloning*, Vol. 3. (Academic Press, New York, 1987)). When a marker in the vector system expressing an antibody is amplifiable, an increase in the level of inhibitor present in culture of host cell will increase the number of copies of the marker gene. Since the amplified region is associated with the nucleotide sequence of the antibody, production of the antibody will also increase (Crouse et al., 1983, *Mol. Cell Biol.* 3:257).

[0122] In some instances, any method known in the art for purification or analysis of an antibody or antibody conjugates is used, for example, by chromatography (e.g., ion exchange, affinity, particularly by affinity for the specific antigen after Protein A, and sizing column chromatography), centrifugation, differential solubility, or by any other standard technique for the purification of proteins. Exemplary

chromatography methods included, but are not limited to, strong anion exchange chromatography, hydrophobic interaction chromatography, size exclusion chromatography, and fast protein liquid chromatography.

Anti-Transferrin Receptor Antibody Conjugate

[0123] In some embodiments, an anti-transferrin receptor antibody described above is further conjugated to a payload. In some instances, the payload comprises a small molecule. In other instances, the payload comprises a protein or a peptide. In additional instances, the payload comprises a polynucleic acid molecule.

[0124] In some instances, a ratio of the payload to the anti-transferrin receptor antibody (drug-to-antibody ratio or DAR ratio) is about 1:1, 2:1, 3:1, 4:1, 5:1, 6:1, 7:1, 8:1, 9:1, 10:1, 11:1, 12:1, 13:1, 14:1, 15:1, or 16:1.

[0125] In some cases, an anti-transferrin receptor antibody conjugate comprises

Formula (I)

wherein,

A comprises the anti-transferrin receptor antibody;

B comprises the payload;

X^1 consists of a bond or linker; and

n is an averaged value selected from 1-12.

[0126] In some instances, the DAR ratio of B to A (the anti-transferrin receptor antibody) is about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, or 16. In some cases, the DAR ratio of B to A is about 1. In some cases, the DAR ratio of B to A is about 2. In some cases, the DAR ratio of B to A is about 3. In some cases, the DAR ratio of B to A is about 4. In some cases, the DAR ratio of B to A is about 6. In some cases, the DAR ratio of B to A is about 8. In some cases, the DAR ratio of B to A is about 10. In some cases, the DAR ratio of B to A is about 12. In some cases, the DAR ratio of B to A is about 16.

[0127] In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, or 16. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 1. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 2. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 3. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 4. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 5. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 6. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 7. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 8. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin

receptor antibody A is about 9. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 10. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 11. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 12. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 13. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 14. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 15. In some instances, the DAR ratio of the polynucleic acid molecule (B) to anti-transferrin receptor antibody A is about 16.

[0128] In some embodiments, B comprises a small molecule, a peptide, or a protein.

[0129] In some embodiments, B comprises a polynucleic acid molecule. In some cases, the polynucleic acid molecule comprises a passenger strand and a guide strand. In some cases, the passenger strand is conjugated to A- X¹. In some cases, A- X¹ is conjugated to the 5' end of the passenger strand. In some cases, A- X¹ is conjugated to the 3' end of the passenger strand.

[0130] In some cases, an anti-transferrin receptor antibody conjugate comprises

Formula (II)

wherein,

A comprises the anti-transferrin receptor antibody;

B comprises the payload;

C consists of a polymer;

X¹ consists a bond or first linker;

X² consists of a bond or second linker; and

n is an averaged value selected from 1-12.

[0131] In some cases, C is a polyethylene glycol.

[0132] In some instances, B is a polynucleic acid molecule. In some cases, the polynucleic acid molecule comprises a passenger strand and a guide strand. In some cases, the passenger strand is conjugated to A- X¹ and X²-C. In some cases, A- X¹ is conjugated to the 5' end of the passenger strand and X²-C is conjugated to the 3' end of the passenger strand. In some cases, X²-C is conjugated to the 5' end of the passenger strand and A- X¹ is conjugated to the 3' end of the passenger strand.

[0133] In some cases, X¹ and X² are each independently a non-polymeric linker.

[0134] In some cases, the conjugate of Formula (II) A-X¹-(B-X²-C)_n further comprises D, an endosomolytic moiety.

Conjugation Chemistry

[0135] In some embodiments, B is conjugated to A by a chemical ligation process. In some instances, B is conjugated to A by a native ligation. In some instances, the conjugation is as described in: Dawson, et al. "Synthesis of proteins by native chemical ligation," *Science* 1994, 266, 776-779; Dawson, et al.

“Modulation of Reactivity in Native Chemical Ligation through the Use of Thiol Additives,” *J. Am. Chem. Soc.* **1997**, 119, 4325–4329; Hackeng, et al. “Protein synthesis by native chemical ligation: Expanded scope by using straightforward methodology,” *Proc. Natl. Acad. Sci. USA* **1999**, 96, 10068–10073; or Wu, et al. “Building complex glycopeptides: Development of a cysteine-free native chemical ligation protocol,” *Angew. Chem. Int. Ed.* **2006**, 45, 4116–4125. In some instances, the conjugation is as described in U.S. Patent No. 8,936,910. In some embodiments, the polynucleic acid molecule is conjugated to the binding moiety either site-specifically or non-specifically via native ligation chemistry.

[0136] In some instances, B is conjugated to A by a site-directed method utilizing a “traceless” coupling technology (Philochem). In some instances, the “traceless” coupling technology utilizes an N-terminal 1,2-aminothiol group on the binding moiety which is then conjugate with a polynucleic acid molecule containing an aldehyde group. (see Casi *et al.*, “Site-specific traceless coupling of potent cytotoxic drugs to recombinant antibodies for pharmacodelivery,” *JACS* **134**(13): 5887-5892 (2012))

[0137] In some instances, B is conjugated to A by a site-directed method utilizing an unnatural amino acid incorporated into the binding moiety. In some instances, the unnatural amino acid comprises *p*-acetylphenylalanine (pAcPhe). In some instances, the keto group of pAcPhe is selectively coupled to an alkoxy-amine derivatived conjugating moiety to form an oxime bond. (see Axup *et al.*, “Synthesis of site-specific antibody-drug conjugates using unnatural amino acids,” *PNAS* **109**(40): 16101-16106 (2012)).

[0138] In some instances, B is conjugated to A by a site-directed method utilizing an enzyme-catalyzed process. In some instances, the site-directed method utilizes SMARTag™ technology (Redwood). In some instances, the SMARTag™ technology comprises generation of a formylglycine (FGly) residue from cysteine by formylglycine-generating enzyme (FGE) through an oxidation process under the presence of an aldehyde tag and the subsequent conjugation of FGly to an alkylhydraine-functionalized polynucleic acid molecule via hydrazino-Pictet-Spengler (HIPS) ligation. (see Wu *et al.*, “Site-specific chemical modification of recombinant proteins produced in mammalian cells by using the genetically encoded aldehyde tag,” *PNAS* **106**(9): 3000-3005 (2009); Agarwal, *et al.*, “A Pictet-Spengler ligation for protein chemical modification,” *PNAS* **110**(1): 46-51 (2013))

[0139] In some instances, the enzyme-catalyzed process comprises microbial transglutaminase (mTG). In some cases, B is conjugated to A utilizing a microbial transglutaminze catalyzed process. In some instances, mTG catalyzes the formation of a covalent bond between the amide side chain of a glutamine within the recognition sequence and a primary amine of a functionalized polynucleic acid molecule. In some instances, mTG is produced from *Streptomyces mobarensis*. (see Strop *et al.*, “Location matters: site of conjugation modulates stability and pharmacokinetics of antibody drug conjugates,” *Chemistry and Biology* **20**(2) 161-167 (2013))

[0140] In some instances, B is conjugated to A by a method as described in PCT Publication No. WO2014/140317, which utilizes a sequence-specific transpeptidase.

[0141] In some instances, B is conjugated to A by a method as described in U.S. Patent Publication Nos. 2015/0105539 and 2015/0105540.

Payloads

Polynucleic Acid Molecules

[0142] In some embodiments, the payload is a polynucleic acid molecule. In some instances, the polynucleic acid molecule is involved in gene therapy, such as in RNA interference (RNAi) or gene silencing (e.g., antisense oligonucleotide) therapies. In some instances, the polynucleic acid molecule modulates the splicing of an mRNA, and thereby modulates subsequent production of the encoded protein.

[0143] In some embodiments, the polynucleic acid molecule comprises a short interfering nucleic acid (siNA), a short interfering RNA (siRNA), a double-stranded RNA (dsRNA), a micro-RNA (miRNA), or a short hairpin RNA (shRNA).

[0144] In other embodiments, the polynucleic acid molecule comprises an antisense oligonucleotide.

[0145] In other embodiments, the polynucleic acid molecule comprises a PMO.

[0146] In additional embodiments, the polynucleic acid molecule comprises an mRNA.

[0147] In some instances, the polynucleic acid molecule hybridizes to a target sequence of an atrophy-related gene (also referred to as an atrogene). Atrogenes, or atrophy-related genes, are genes that are upregulated or downregulated in atrophying muscle. In some instances, upregulated atrogenes include genes that encode ubiquitin ligases, Forkhead box transcription factors, growth factors, deubiquitinating enzymes, or proteins that are involved in glucocorticoid-induced atrophy. In some instances, a polynucleic acid molecule described herein hybridizes to a target sequence of an ubiquitin ligase (e.g., an E3 ubiquitin ligase or a mitochondrial ubiquitin ligase). In some instances, a polynucleic acid molecule described herein hybridizes to a target sequence of a Forkhead box transcription factor. In some instances, a polynucleic acid molecule described herein hybridizes to a target sequence of a growth factor. In some instances, a polynucleic acid molecule described herein hybridizes to a target sequence of a deubiquitinating enzyme.

[0148] In some embodiments, a polynucleic acid molecule described herein hybridizes to a target sequence of *FBXO32*, *TRIM63*, *TRAF6*, *FBXO30*, *FBXO40*, *NEDD4*, *TRIM32*, *MUL1*, *STUB1*, *FOXO1*, *FOXO3*, *MSTN*, *USP14*, *USP19*, *DDIT4*, *CTSL2*, *TGIF*, *MYOG*, *HDAC2*, *HDAC3*, *MT1L*, *MT1B*, or *DMPK*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *FBXO32*, *TRIM63*, *FOXO1*, *FOXO3*, or *MSTN*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *FBXO32*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *TRIM63*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *TRAF6*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *FBXO30*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *FBXO40*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *NEDD4*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *TRIM32*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *MUL1*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *STUB1*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *CTSL2*.

herein hybridizes to a target sequence of *FOXO1*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *FOXO3*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *MSTN*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *USP14*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *USP19*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *DDIT4*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *CTSL2*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *TGIF*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *MYOG*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *HDAC2*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *HDAC3*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *MT1L*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *MT1B*. In some cases, a polynucleic acid molecule described herein hybridizes to a target sequence of *DMPK*.

[0149] In some instances, the polynucleic acid molecule hybridizes to a target region of an incorrectly spliced mRNA which results in a disease or disorder not limited to a neuromuscular disease, a genetic disease, cancer, a hereditary disease, or a cardiovascular disease. In some cases, a neuromuscular disease or disorder is Duchenne muscular dystrophy, Becker muscular dystrophy, facioscapulohumeral muscular dystrophy, congenital muscular dystrophy, or myotonic dystrophy.

[0150] In some instances, the polynucleic acid molecule targets an exon that is mutated in the *DMD* gene that causes Duchenne muscular dystrophy. Exemplary exons that are mutated in the *DMD* gene that causes Duchenne muscular dystrophy include, but not limited to, exon 2, 3, 4, 5, 6, 7, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, and 78.

[0151] In some instances, the polynucleic acid molecule hybridizes to a target region of an oncogene. Exemplary oncogenes include, but are not limited to, *Abl*, *AKT-2*, *ALK*, *AML1* (or *RUNX1*), *AR*, *AXL*, *BCL-2*, 3, 6, *BRAF*, *c-MYC*, *EGFR*, *ErbB-2* (*Her2*, *Neu*), *Fms*, *FOS*, *GLII*, *HPRT1*, *IL-3*, *INTS2*, *JUN*, *KIT*, *K-sam*, *LBC* (*AKAP13*), *LCK*, *LMO1*, *LMO2*, *LYL1*, *MAS1*, *MDM2*, *MET*, *MLL* (*KMT2A*), *MOS*, *MYB*, *MYH11/CBFB*, *NOTCH1* (*TAN1*), *NTRK1* (*TRK*), *OST* (*SLC51B*), *PAX5*, *PIM1*, *PRAD-1*, *RAF*, *RAR/PML*, *HRAS*, *KRAS*, *NRAS*, *REL/NRG*, *RET*, *ROS*, *SKI*, *SRC*, *TIAM1*, or *TSC2*. In some cases, the polynucleic acid molecule hybridizes to a target region of *KRAS*, *EGFR*, *AR*, *HPRT1*, *CNNTB1* (β -catenin), or β -catenin associated genes.

[0152] In some embodiments, the polynucleic acid molecule comprises an mRNA. In some cases, the mRNA encodes a cytotoxic protein or peptide. Exemplary cytotoxic proteins or peptides include a bacterial cytotoxin such as an alpha-pore forming toxin (e.g., cytolsin A from *E. coli*), a beta-pore-forming toxin (e.g., α -Hemolysin, PVL—panton Valentine leukocidin, aerolysin, clostridial Epsilon-toxin, clostridium perfringens enterotoxin), binary toxins (anthrax toxin, edema toxin, *C. botulinum* C2

toxin, C spirofome toxin, C. perfringens iota toxin, C. difficile cyto-lethal toxins (A and B)), prion, paraspordin, a cholesterol-dependent cytolsins (e.g., pneumolysin), a small pore-forming toxin (e.g., Gramicidin A), a cyanotoxin (e.g., microcystins, nodularins), a hemotoxin, a neurotoxin (e.g., botulinum neurotoxin), a cytotoxin, cholera toxin, diphtheria toxin, Pseudomonas exotoxin A, tetanus toxin, or an immunotoxin (idarubicin, ricin A, CRM9, Pokeweed antiviral protein, DT).

[0153] In some instances, the mRNA encodes a cytotoxic peptide or peptide related to the immune system such as a cytotoxic T cell or B cell epitope to stimulate a specific immune response via presentation of such epitope with an MHC I complex, an membrane attack complex protein (MAC) of the complement system, perforin, a granzyme and a granulysin.

[0154] In some cases, the mRNA encodes an apoptotic triggering protein or peptide such as an apoptotic protease activating factor-1 (Apaf-1), cytochrome-c, caspase initiator proteins (CASP2, CASP8, CASP9, CASP10), apoptosis inducing factor (AIF), p53, p73, p63, Bcl-2, Bax, granzyme B, poly-ADP ribose polymerase (PARP), and P 21-activated kinase 2 (PAK2).

[0155] In some embodiments, the polynucleic acid molecule is a nucleic acid decoy. In some instances, the nucleic acid decoy is a mimic of protein-binding nucleic acids such as RNA-based protein-binding mimics. Exemplary nucleic acid decoys include transactivating region (TAR) decoy and Rev response element (RRE) decoy.

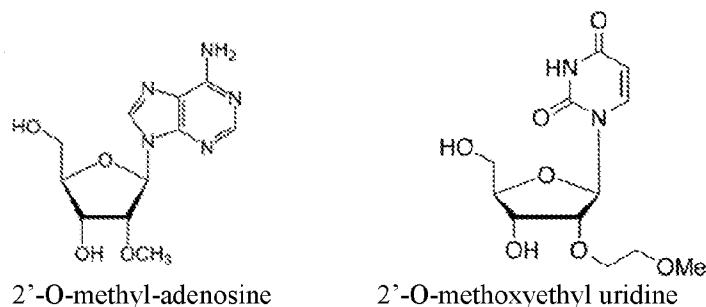

[0156] In some instances, the payload is an aptamer. Aptamers are small oligonucleotide or peptide molecules that bind to specific target molecules. Exemplary nucleic acid aptamers include DNA aptamers, RNA aptamers, or XNA aptamers which are RNA and/or DNA aptamers comprising one or more unnatural nucleotides. Exemplary nucleic acid aptamers include ARC19499 (Archemix Corp.), REG1 (Regado Biosciences), and ARC1905 (Ophthotech).

[0157] In some embodiments, the polynucleic acid molecule comprises natural or synthetic or artificial nucleotide analogues or bases. In some cases, the polynucleic acid molecule comprises combinations of DNA, RNA and/or nucleotide analogues. In some instances, the synthetic or artificial nucleotide analogues or bases comprise modifications at one or more of ribose moiety, phosphate moiety, nucleoside moiety, or a combination thereof.

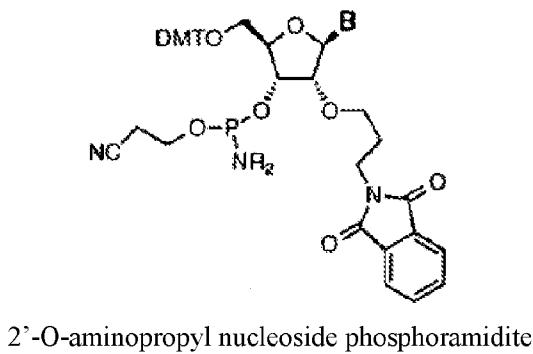

[0158] In some embodiments, nucleotide analogues or artificial nucleotide base comprise a nucleic acid with a modification at a 2' hydroxyl group of the ribose moiety. In some instances, the modification includes an H, OR, R, halo, SH, SR, NH2, NHR, NR2, or CN, wherein R is an alkyl moiety. Exemplary alkyl moiety includes, but is not limited to, halogens, sulfurs, thiols, thioethers, thioesters, amines (primary, secondary, or tertiary), amides, ethers, esters, alcohols and oxygen. In some instances, the alkyl moiety further comprises a modification. In some instances, the modification comprises an azo group, a keto group, an aldehyde group, a carboxyl group, a nitro group, a nitroso, group, a nitrile group, a heterocycle (e.g., imidazole, hydrazino or hydroxylamino) group, an isocyanate or cyanate group, or a sulfur containing group (e.g., sulfoxide, sulfone, sulfide, or disulfide). In some instances, the alkyl moiety further comprises a hetero substitution. In some instances, the carbon of the heterocyclic group is

substituted by a nitrogen, oxygen or sulfur. In some instances, the heterocyclic substitution includes but is not limited to, morpholino, imidazole, and pyrrolidino.

[0159] In some instances, the modification at the 2' hydroxyl group is a 2'-O-methyl modification or a 2'-O-methoxyethyl (2'-O-MOE) modification. In some cases, the 2'-O-methyl modification adds a methyl group to the 2' hydroxyl group of the ribose moiety whereas the 2'-O-methoxyethyl modification adds a methoxyethyl group to the 2' hydroxyl group of the ribose moiety. Exemplary chemical structures of a 2'-O-methyl modification of an adenosine molecule and 2'-O-methoxyethyl modification of an uridine are illustrated below.

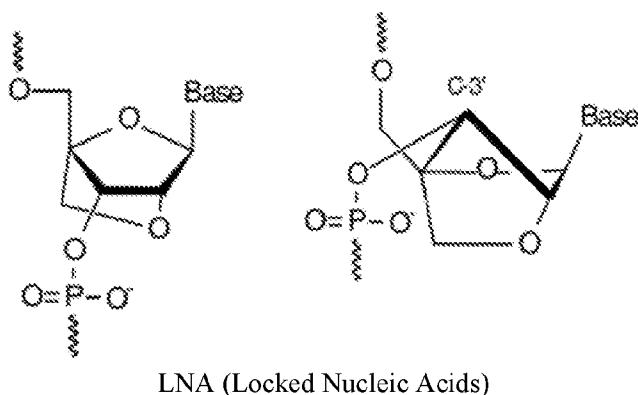

[0160] In some instances, the modification at the 2' hydroxyl group is a 2'-O-aminopropyl modification in which an extended amine group comprising a propyl linker binds the amine group to the 2' oxygen. In some instances, this modification neutralizes the phosphate derived overall negative charge of the oligonucleotide molecule by introducing one positive charge from the amine group per sugar and thereby improves cellular uptake properties due to its zwitterionic properties. An exemplary chemical structure of a 2'-O-aminopropyl nucleoside phosphoramidite is illustrated below.

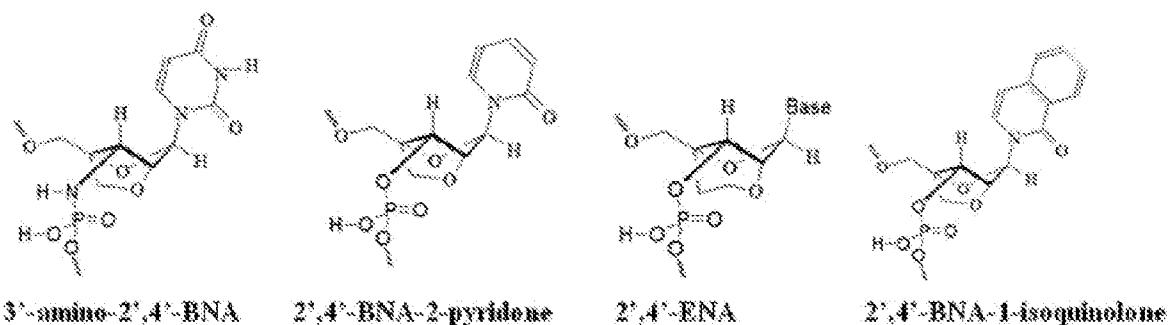

2'-O-aminopropyl nucleoside phosphoramidite

[0161] In some instances, the modification at the 2' hydroxyl group is a locked or bridged ribose modification (e.g., locked nucleic acid or LNA) in which the oxygen molecule bound at the 2' carbon is linked to the 4' carbon by a methylene group, thus forming a 2'-C,4'-C-oxy-methylene-linked bicyclic ribonucleotide monomer. Exemplary representations of the chemical structure of LNA are illustrated below. The representation shown to the left highlights the chemical connectivities of an LNA monomer. The representation shown to the right highlights the locked 3'-endo (³E) conformation of the furanose ring of an LNA monomer.

[0162] In some instances, the modification at the 2' hydroxyl group comprises ethylene nucleic acids (ENA) such as for example 2'-4'-ethylene-bridged nucleic acid, which locks the sugar conformation into a C₃'-endo sugar puckering conformation. ENA are part of the bridged nucleic acids class of modified nucleic acids that also comprises LNA. Exemplary chemical structures of the ENA and bridged nucleic acids are illustrated below.

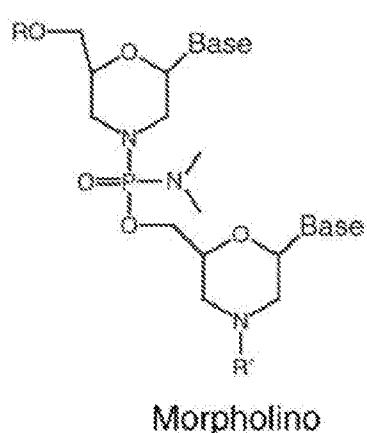

[0163] In some embodiments, additional modifications at the 2' hydroxyl group include 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl (2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O- dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA).

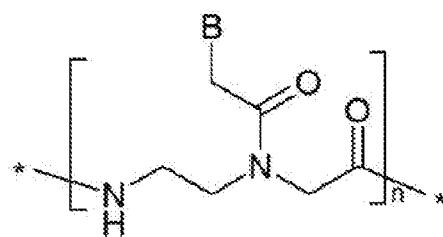

[0164] In some embodiments, nucleotide analogues comprise modified bases such as, but not limited to, 5-propynyluridine, 5-propynylcytidine, 6-methyladenine, 6-methylguanine, N, N, -dimethyladenine, 2-propyladenine, 2propylguanine, 2-aminoadenine, 1-methylinosine, 3-methyluridine, 5-methylcytidine, 5-methyluridine and other nucleotides having a modification at the 5 position, 5- (2- amino) propyl uridine, 5-halocytidine, 5-halouridine, 4-acetylcytidine, 1- methyladenosine, 2-methyladenosine, 3-methylcytidine, 6-methyluridine, 2- methylguanosine, 7-methylguanosine, 2, 2-dimethylguanosine, 5-methylaminoethyluridine, 5-methyloxuryidine, deazanucleotides such as 7-deaza- adenosine, 6-azouridine, 6-azocytidine, 6-azothymidine, 5-methyl-2-thiouridine, other thio bases such as 2-thiouridine and 4-thiouridine and 2-thiocytidine, dihydrouridine, pseudouridine, queuosine, archaeosine, naphthyl and substituted naphthyl groups, any O-and N-alkylated purines and pyrimidines such as N6-methyladenosine, 5-methylcarbonylmethyluridine, uridine 5-oxyacetic acid, pyridine-4-one, pyridine-2-one, phenyl and modified phenyl groups such as aminophenol or 2,4, 6-trimethoxy benzene, modified cytosines that act as G-clamp nucleotides, 8-substituted adenines and guanines, 5-substituted uracils and

thymines, azapyrimidines, carboxyhydroxyalkyl nucleotides, carboxyalkylaminoalkyl nucleotides, and alkylcarbonylalkylated nucleotides. Modified nucleotides also include those nucleotides that are modified with respect to the sugar moiety, as well as nucleotides having sugars or analogs thereof that are not ribosyl. For example, the sugar moieties, in some cases are or be based on, mannoses, arabinoses, glucopyranoses, galactopyranoses, 4'-thioribose, and other sugars, heterocycles, or carbocycles. The term nucleotide also includes what are known in the art as universal bases. By way of example, universal bases include but are not limited to 3-nitropyrrole, 5-nitroindole, or nebularine.

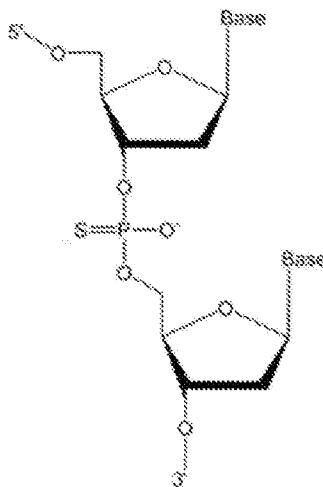

[0165] In some embodiments, nucleotide analogues further comprise morpholinos, peptide nucleic acids (PNAs), methylphosphonate nucleotides, thiolphosphonate nucleotides, 2'-fluoro N3-P5'-phosphoramidites, 1', 5'- anhydrohexitol nucleic acids (HNAs), or a combination thereof. Morpholino or phosphorodiamidate morpholino oligo (PMO) comprises synthetic molecules whose structure mimics natural nucleic acid structure by deviates from the normal sugar and phosphate structures. In some instances, the five member ribose ring is substituted with a six member morpholino ring containing four carbons, one nitrogen and one oxygen. In some cases, the ribose monomers are linked by a phosphordiamidate group instead of a phosphate group. In such cases, the backbone alterations remove all positive and negative charges making morpholinos neutral molecules capable of crossing cellular membranes without the aid of cellular delivery agents such as those used by charged oligonucleotides.

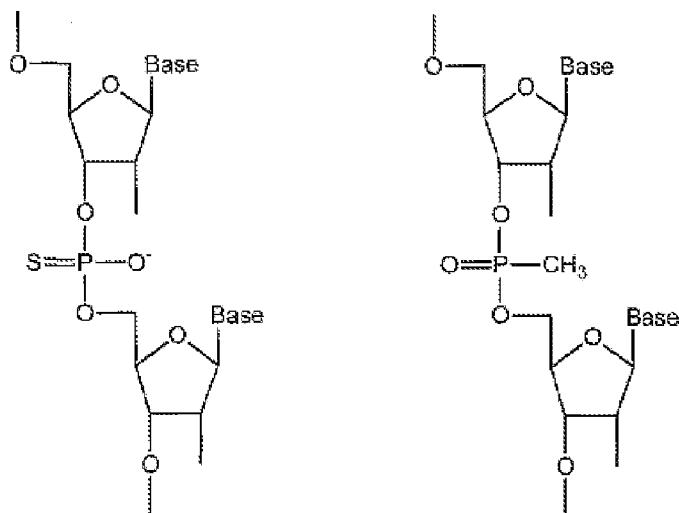

[0166] In some embodiments, peptide nucleic acid (PNA) does not contain sugar ring or phosphate linkage and the bases are attached and appropriately spaced by oligoglycine-like molecules, therefore, eliminating a backbone charge.

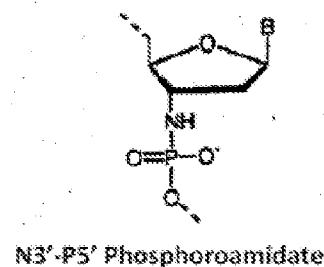

[0167] In some embodiments, one or more modifications optionally occur at the internucleotide linkage. In some instances, modified internucleotide linkage include, but is not limited to, phosphorothioates, phosphorodithioates, methylphosphonates, 5'- alkylene phosphonates, 5'-methylphosphonate, 3'-alkylene phosphonates, borontrifluorides, borano phosphate esters and selenophosphates of 3'-5'linkage or 2'-5'linkage, phosphotriesters, thionoalkylphosphotriesters, hydrogen phosphonate linkages, alkyl phosphonates, alkylphosphonothioates, arylphosphonothioates, phosphoroselenoates, phosphorodiselenoates, phosphinates, phosphoramidates, 3'- alkylphosphoramidates, aminoalkylphosphoramidates, thionophosphoramidates, phosphoropiperazidates, phosphoroanilothioates, phosphoroanilidates, ketones, sulfones, sulfonamides, carbonates, carbamates, methylenehydrazos, methylenedimethylhydrazos, formacetals, thioformacetals, oximes, methyleneiminos, methylenemethyliminos, thioamidates, linkages with riboacetyl groups, aminoethyl glycine, silyl or siloxane linkages, alkyl or cycloalkyl linkages with or without heteroatoms of, for example, 1 to 10 carbons that are saturated or unsaturated and/or substituted and/or contain heteroatoms, linkages with morpholino structures, amides, polyamides wherein the bases are attached to the aza nitrogens of the backbone directly or indirectly, and combinations thereof. Phosphorothioate antisense oligonucleotides (PS ASO) are antisense oligonucleotides comprising a phosphorothioate linkage. An exemplary PS ASO is illustrated below.

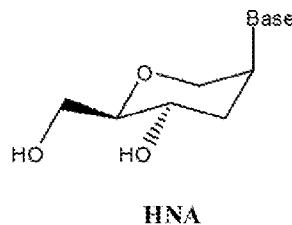

[0168] In some instances, the modification is a methyl or thiol modification such as methylphosphonate or thiophosphonate modification. Exemplary thiophosphonate nucleotide (left) and methylphosphonate nucleotide (right) are illustrated below.

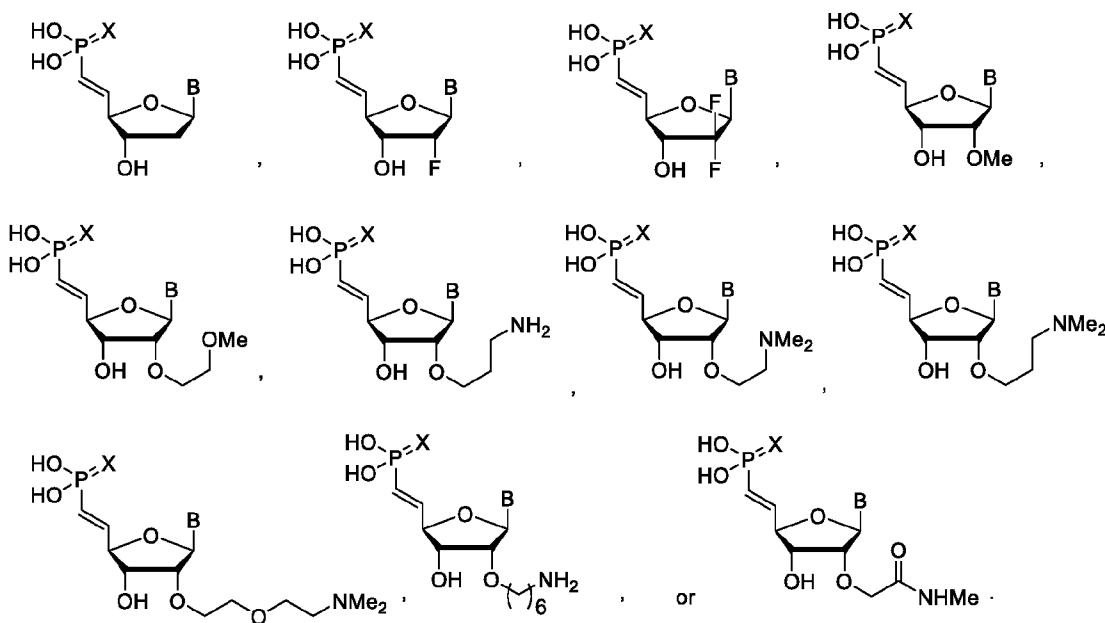

[0169] In some instances, a modified nucleotide includes, but is not limited to, 2'-fluoro N3-P5'-phosphoramidites illustrated as:

[0170] In some instances, a modified nucleotide includes, but is not limited to, hexitol nucleic acid (or 1', 5'-anhydrohexitol nucleic acids (HNA)) illustrated as:

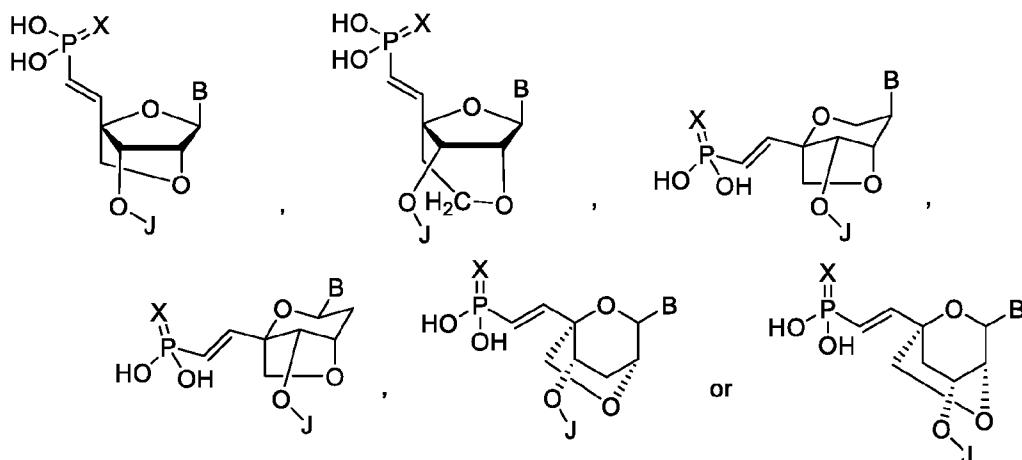

[0171] In some embodiments, a nucleotide analogue or artificial nucleotide base described above comprises a 5'-vinylphosphonate modified nucleotide nucleic acid with a modification at a 5' hydroxyl group of the ribose moiety. In some embodiments, the 5'-vinylphosphonate modified nucleotide is selected from the nucleotide provided below, wherein X is O or S; and B is a heterocyclic base moiety.

[0172] In some instances, the modification at the 2' hydroxyl group is a 2'-O-aminopropyl modification in which an extended amine group comprising a propyl linker binds the amine group to the 2' oxygen. In some instances, this modification neutralizes the phosphate-derived overall negative charge of the oligonucleotide molecule by introducing one positive charge from the amine group per sugar and thereby improves cellular uptake properties due to its zwitterionic properties.

[0173] In some instances, the 5'-vinylphosphonate modified nucleotide is further modified at the 2' hydroxyl group in a locked or bridged ribose modification (e.g., locked nucleic acid or LNA) in which the oxygen molecule bound at the 2' carbon is linked to the 4' carbon by a methylene group, thus forming a 2'-C,4'-C-oxy-methylene-linked bicyclic ribonucleotide monomer. Exemplary representations of the chemical structure of 5'-vinylphosphonate modified LNA are illustrated below, wherein X is O or S; B is a heterocyclic base moiety; and J is an internucleotide linking group linking to the adjacent nucleotide of the polynucleotide.

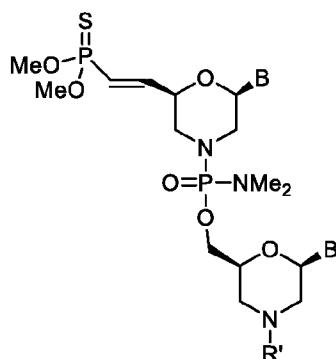

LNA (Locked Nucleic Acids)

[0174] In some embodiments, additional modifications at the 2' hydroxyl group include 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl (2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O- dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA).

[0175] In some embodiments, a nucleotide analogue comprises a modified base such as, but not limited to, 5-propynyluridine, 5-propynylcytidine, 6-methyladenine, 6-methylguanine, N, N, -dimethyladenine, 2-propyladenine, 2propylguanine, 2-aminoadenine, 1-methylinosine, 3-methyluridine, 5-methylcytidine, 5-methyluridine and other nucleotides having a modification at the 5 position, 5- (2- amino) propyl uridine, 5-halocytidine, 5-halouridine, 4-acetylcytidine, 1-methyladenosine, 2-methyladenosine, 3-methylcytidine, 6-methyluridine, 2- methylguanosine, 7-methylguanosine, 2, 2-dimethylguanosine, 5- methylaminoethyluridine, 5-methoxyuridine, deazanucleotides (such as 7-deaza- adenosine, 6-azouridine, 6-azocytidine, or 6-azothymidine), 5-methyl-2-thiouridine, other thio bases (such as 2-thiouridine, 4-thiouridine, and 2-thiocytidine), dihydrouridine, pseudouridine, queuosine, archaeosine, naphthyl and substituted naphthyl groups, any O-and N-alkylated purines and pyrimidines (such as N6-methyladenosine, 5-methylcarbonylmethyluridine, uridine 5-oxyacetic acid, pyridine-4-one, or pyridine-2-one), phenyl and modified phenyl groups such as aminophenol or 2,4, 6-trimethoxy benzene, modified cytosines that act as G-clamp nucleotides, 8-substituted adenines and guanines, 5-substituted uracils and thymines, azapyrimidines, carboxyhydroxyalkyl nucleotides, carboxyalkylaminoalkyl nucleotides, and alkylcarbonylalkylated nucleotides. 5'-Vinylphosphonate modified nucleotides also include those nucleotides that are modified with respect to the sugar moiety, as well as 5'-vinylphosphonate modified nucleotides having sugars or analogs thereof that are not ribosyl. For example, the sugar moieties, in some cases are or are based on, mannoses, arabinoses, glucopyranoses, galactopyranoses, 4'-thioribose, and other sugars, heterocycles, or carbocycles. The term nucleotide also includes what are known in the art as universal bases. By way of example, universal bases include but are not limited to 3-nitropyrrole, 5-nitroindole, or nebularine.

[0176] In some embodiments, a 5'-vinylphosphonate modified nucleotide analogue further comprises a morpholino, a peptide nucleic acid (PNA), a methylphosphonate nucleotide, a thiolphosphonate nucleotide, a 2'-fluoro N3-P5'-phosphoramidite, or a 1', 5'- anhydrohexitol nucleic acid (HNA). Morpholino or phosphorodiamidate morpholino oligo (PMO) comprises synthetic molecules whose structure mimics natural nucleic acid structure but deviates from the normal sugar and phosphate structures. In some instances, the five member ribose ring is

substituted with a six member morpholino ring containing four carbons, one nitrogen, and one oxygen. In some cases, the ribose monomers are linked by a phosphordiamidate group instead of a phosphate group. In such cases, the backbone alterations remove all positive and negative charges making morpholinos neutral molecules capable of crossing cellular membranes without the aid of cellular delivery agents such as those used by charged oligonucleotides. A non-limiting example of a 5'-vinylphosphonate modified morpholino oligonucleotide is illustrated below, wherein X is O or S; and B is a heterocyclic base moiety.

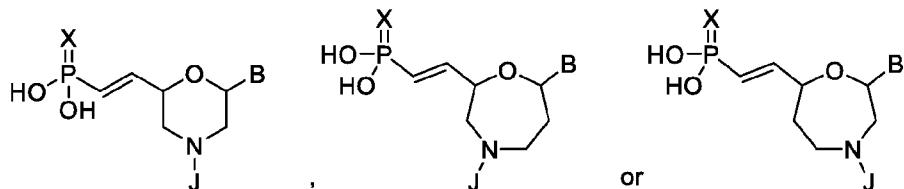

[0177] In some embodiments, a 5'-vinylphosphonate modified morpholino or PMO described above is a PMO comprising a positive or cationic charge. In some instances, the PMO is PMO*plus* (Sarepta). PMO*plus* refers to phosphorodiamidate morpholino oligomers comprising any number of (1-piperazino)phosphinylideneoxy, (1-(4-(omega-guanidino-alkanoyl))-piperazino)phosphinylideneoxy linkages (e.g., as such those described in PCT Publication No. WO2008/036127. In some cases, the PMO is a PMO described in U.S. Patent No. 7943762.

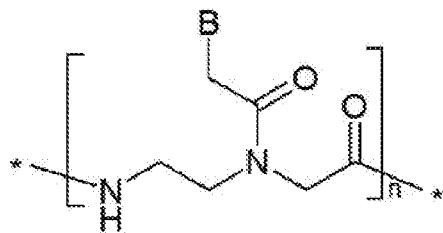

[0178] In some embodiments, a morpholino or PMO described above is a PMO-X (Sarepta). In some cases, PMO-X refers to phosphorodiamidate morpholino oligomers comprising at least one linkage or at least one of the disclosed terminal modifications, such as those disclosed in PCT Publication No. WO2011/150408 and U.S. Publication No. 2012/0065169.

[0179] In some embodiments, a morpholino or PMO described above is a PMO as described in Table 5 of U.S. Publication No. 2014/0296321.

[0180] Exemplary representations of the chemical structure of 5'-vinylphosphonate modified nucleic acids are illustrated below, wherein X is O or S; B is a heterocyclic base moiety; and J is an internucleotide linkage.

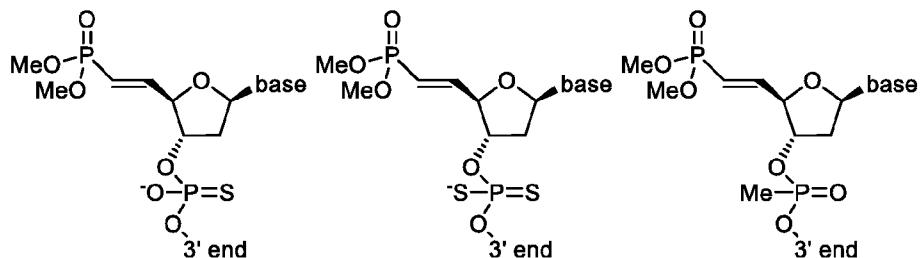

[0181] In some embodiments, peptide nucleic acid (PNA) does not contain sugar ring or phosphate linkage and the bases are attached and appropriately spaced by oligoglycine-like molecules, therefore, eliminating a backbone charge.

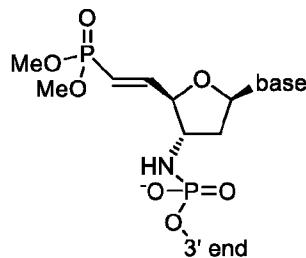

PNA

[0182] In some embodiments, one or more modifications of the 5'-vinylphosphonate modified oligonucleotide optionally occur at the internucleotide linkage. In some instances, modified internucleotide linkage includes, but is not limited to, phosphorothioates; phosphorodithioates; methylphosphonates; 5'-alkylenephosphonates; 5'-methylphosphonate; 3'-alkylene phosphonates; borontrifluoridates; borano phosphate esters and selenophosphates of 3'-5'linkage or 2'-5'linkage; phosphotriesters; thionoalkylphosphotriesters; hydrogen phosphonate linkages; alkyl phosphonates; alkylphosphonothioates; arylphosphonothioates; phosphoroselenoates; phosphorodiselenoates; phosphinates; phosphoramidates; 3'-alkylphosphoramidates; aminoalkylphosphoramidates; thionophosphoramidates; phosphoropiperazidates; phosphoroanilothioates; phosphoroanilidates; ketones; sulfones; sulfonamides; carbonates; carbamates; methylenehydrazos; methylenedimethylhydrazos; formacetals; thioformacetics; oximes; methyleneiminos; methylenemethyliminos; thioamidates; linkages with riboacetyl groups; aminoethyl glycine; silyl or siloxane linkages; alkyl or cycloalkyl linkages with or without heteroatoms of, for example, 1 to 10 carbons that are saturated or unsaturated and/or substituted and/or contain heteroatoms; linkages with morpholino structures, amides, or polyamides wherein the bases are attached to the aza nitrogens of the backbone directly or indirectly; and combinations thereof.

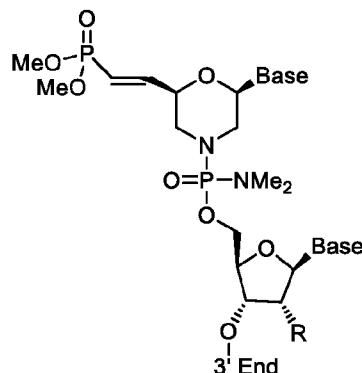

[0183] In some instances, the modification is a methyl or thiol modification such as methylphosphonate or thiolphosphonate modification. Exemplary thiolphosphonate nucleotide (left), phosphorodithioates (center) and methylphosphonate nucleotide (right) are illustrated below.

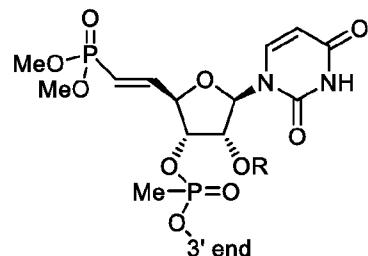

[0184] In some instances, a 5'-vinylphosphonate modified nucleotide includes, but is not limited to, phosphoramidites illustrated as:

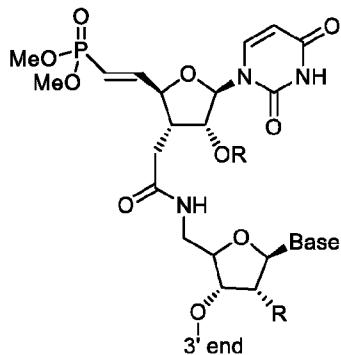

[0185] In some instances, the modified internucleotide linkage is a phosphorodiamidate linkage. A non-limiting example of a phosphorodiamidate linkage with a morpholino system is shown below.

[0186] In some instances, the modified internucleotide linkage is a methylphosphonate linkage. A non-limiting example of a methylphosphonate linkage is shown below.

[0187] In some instances, the modified internucleotide linkage is a amide linkage. A non-limiting example of an amide linkage is shown below.

[0188] In some instances, a 5'-vinylphosphonate modified nucleotide includes, but is not limited to, the modified nucleic acid illustrated below.

[0189] In some embodiments, one or more modifications comprise a modified phosphate backbone in which the modification generates a neutral or uncharged backbone. In some instances, the phosphate backbone is modified by alkylation to generate an uncharged or neutral phosphate backbone. As used herein, alkylation includes methylation, ethylation, and propylation. In some cases, an alkyl group, as used herein in the context of alkylation, refers to a linear or branched saturated hydrocarbon group containing from 1 to 6 carbon atoms. In some instances, exemplary alkyl groups include, but are not limited to, methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, tert-butyl, n-pentyl, isopentyl, neopentyl, hexyl, isohexyl, 1, 1 -dimethylbutyl, 2,2-dimethylbutyl, 3,3- dimethylbutyl, and 2-ethylbutyl groups. In some cases, a modified phosphate is a phosphate group as described in U.S. Patent No. 9481905.

[0190] In some embodiments, additional modified phosphate backbones comprise methylphosphonate, ethylphosphonate, methylthiophosphonate, or methoxyphosphonate. In some cases, the modified phosphate is methylphosphonate. In some cases, the modified phosphate is ethylphosphonate. In some cases, the modified phosphate is methylthiophosphonate. In some cases, the modified phosphate is methoxyphosphonate.

[0191] In some embodiments, one or more modifications further optionally include modifications of the ribose moiety, phosphate backbone and the nucleoside, or modifications of the nucleotide analogues at the 3' or the 5' terminus. For example, the 3' terminus optionally include a 3' cationic group, or by inverting the nucleoside at the 3'-terminus with a 3'-3' linkage. In another alternative, the 3'-terminus is optionally conjugated with an aminoalkyl group, e.g., a 3' C5-aminoalkyl dT. In an additional alternative, the 3'-terminus is optionally conjugated with an abasic site, e.g., with an apurinic or apyrimidinic site. In some instances, the 5'-terminus is conjugated with an aminoalkyl group, e.g., a 5'-O-alkylamino substituent. In some cases, the 5'-terminus is conjugated with an abasic site, e.g., with an apurinic or apyrimidinic site.

[0192] In some embodiments, the polynucleic acid molecule comprises one or more of the artificial nucleotide analogues described herein. In some instances, the polynucleic acid molecule comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 25, or more of the artificial nucleotide analogues

described herein. In some embodiments, the artificial nucleotide analogues include 2'-O-methyl, 2'-O-methoxyethyl (2'-O-MOE), 2'-O-aminopropyl, 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl (2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O-dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA) modified, LNA, ENA, PNA, HNA, morpholino, methylphosphonate nucleotides, thiolphosphonate nucleotides, 2'-fluoro N3-P5'-phosphoramidites, or a combination thereof. In some instances, the polynucleic acid molecule comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 25, or more of the artificial nucleotide analogues selected from 2'-O-methyl, 2'-O-methoxyethyl (2'-O-MOE), 2'-O-aminopropyl, 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl (2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O-dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA) modified, LNA, ENA, PNA, HNA, morpholino, methylphosphonate nucleotides, thiolphosphonate nucleotides, 2'-fluoro N3-P5'-phosphoramidites, or a combination thereof. In some instances, the polynucleic acid molecule comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 25, or more of 2'-O-methyl modified nucleotides. In some instances, the polynucleic acid molecule comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 25, or more of 2'-O-methoxyethyl (2'-O-MOE) modified nucleotides. In some instances, the polynucleic acid molecule comprises 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 25, or more of thiolphosphonate nucleotides.

[0193] In some embodiments, the polynucleic acid molecule comprises a plurality of phosphorodiamidate morpholino oligomers or a plurality of peptide nucleic acid-modified non-natural nucleotides, and optionally comprises at least one inverted abasic moiety. In some instances, the polynucleic acid molecule comprises at least 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorodiamidate morpholino oligomer-modified non-natural nucleotides. In some instances, the polynucleic acid molecule comprises 100% phosphorodiamidate morpholino oligomer-modified non-natural nucleotides.

[0194] In some instances, the polynucleic acid molecule comprises at least 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more peptide nucleic acid-modified non-natural nucleotides. In some instances, the polynucleic acid molecule comprises 100% peptide nucleic acid-modified non-natural nucleotides.

[0195] In some embodiments, the polynucleic acid molecule comprises one or more nucleotide analogs in which each nucleotide analog is in a stereochemically isomeric form. In such instance, the polynucleic acid molecule is a chiral molecule. In some cases, the nucleotide analog comprises a backbone stereochemistry. In additional cases, the nucleotide analog comprises a chiral analog as described in U.S. Patent 9,982,257, 9,695,211, or 9,605,019.

[0196] In some instances, the polynucleic acid molecule comprises at least one of: from about 5% to about 100% modification, from about 10% to about 100% modification, from about 20% to about 100% modification, from about 30% to about 100% modification, from about 40% to about 100% modification, from about 50% to about 100% modification, from about 60% to about 100% modification, from about

70% to about 100% modification, from about 80% to about 100% modification, and from about 90% to about 100% modification.

[0197] In some cases, the polynucleic acid molecule comprises at least one of: from about 10% to about 90% modification, from about 20% to about 90% modification, from about 30% to about 90% modification, from about 40% to about 90% modification, from about 50% to about 90% modification, from about 60% to about 90% modification, from about 70% to about 90% modification, and from about 80% to about 100% modification.

[0198] In some cases, the polynucleic acid molecule comprises at least one of: from about 10% to about 80% modification, from about 20% to about 80% modification, from about 30% to about 80% modification, from about 40% to about 80% modification, from about 50% to about 80% modification, from about 60% to about 80% modification, and from about 70% to about 80% modification.

[0199] In some instances, the polynucleic acid molecule comprises at least one of: from about 10% to about 70% modification, from about 20% to about 70% modification, from about 30% to about 70% modification, from about 40% to about 70% modification, from about 50% to about 70% modification, and from about 60% to about 70% modification.

[0200] In some instances, the polynucleic acid molecule comprises at least one of: from about 10% to about 60% modification, from about 20% to about 60% modification, from about 30% to about 60% modification, from about 40% to about 60% modification, and from about 50% to about 60% modification.

[0201] In some cases, the polynucleic acid molecule comprises at least one of: from about 10% to about 50% modification, from about 20% to about 50% modification, from about 30% to about 50% modification, and from about 40% to about 50% modification.

[0202] In some cases, the polynucleic acid molecule comprises at least one of: from about 10% to about 40% modification, from about 20% to about 40% modification, and from about 30% to about 40% modification.

[0203] In some cases, the polynucleic acid molecule comprises at least one of: from about 10% to about 30% modification, and from about 20% to about 30% modification.

[0204] In some cases, the polynucleic acid molecule comprises from about 10% to about 20% modification.

[0205] In some cases, the polynucleic acid molecule comprises from about 15% to about 90%, from about 20% to about 80%, from about 30% to about 70%, or from about 40% to about 60% modifications.

[0206] In additional cases, the polynucleic acid molecule comprises at least about 15%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 95%, or 99% modification.

[0207] In some embodiments, the polynucleic acid molecule comprises at least about 1, about 2, about 3, about 4, about 5, about 6, about 7, about 8, about 9, about 10, about 11, about 12, about 13, about 14, about 15, about 16, about 17, about 18, about 19, about 20, about 21, about 22 or more modifications.

[0208] In some instances, the polynucleic acid molecule comprises at least about 1, about 2, about 3, about 4, about 5, about 6, about 7, about 8, about 9, about 10, about 11, about 12, about 13, about 14,

about 15, about 16, about 17, about 18, about 19, about 20, about 21, about 22 or more modified nucleotides.

[0209] In some instances, from about 5 to about 100% of the polynucleic acid molecule comprise the artificial nucleotide analogues described herein. In some instances, about 5%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95% or 100% of the polynucleic acid molecule comprise the artificial nucleotide analogues described herein. In some instances, about 5% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 10% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 15% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 20% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 25% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 30% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 35% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 40% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 45% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 50% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 55% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 60% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 65% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 70% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 75% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 80% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 85% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 90% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 95% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 96% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 97% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 98% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 99% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some instances, about 100% of a polynucleic acid molecule comprises the artificial nucleotide analogues described herein. In some embodiments, the artificial nucleotide analogues include 2'-O-methyl, 2'-O-methoxyethyl (2'-O-MOE), 2'-O-aminopropyl, 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl

(2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O- dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA) modified, LNA, ENA, PNA, HNA, morpholino, methylphosphonate nucleotides, thiolphosphonate nucleotides, 2'-fluoro N3-P5'-phosphoramidites, or a combination thereof.

[0210] In some embodiments, the polynucleic acid molecule comprises from about 1 to about 25 modifications in which the modification comprises an artificial nucleotide analogues described herein. In some embodiments, a polynucleic acid molecule comprises about 1 modification in which the modification comprises an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 2 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 3 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 4 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 5 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 6 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 7 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 8 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 9 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 10 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 11 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 12 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 13 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 14 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 15 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 16 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 17 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 18 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 19 modifications in which the modifications

comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 20 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 21 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 22 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 23 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 24 modifications in which the modifications comprise an artificial nucleotide analogue described herein. In some embodiments, a polynucleic acid molecule comprises about 25 modifications in which the modifications comprise an artificial nucleotide analogue described herein.

[0211] In some embodiments, a polynucleic acid molecule is assembled from two separate polynucleotides wherein one polynucleotide comprises the sense strand and the second polynucleotide comprises the antisense strand of the polynucleic acid molecule. In other embodiments, the sense strand is connected to the antisense strand via a linker molecule, which in some instances is a polynucleotide linker or a non-nucleotide linker.

[0212] In some embodiments, a polynucleic acid molecule comprises a sense strand and antisense strand, wherein pyrimidine nucleotides in the sense strand comprises 2'-O-methylpyrimidine nucleotides and purine nucleotides in the sense strand comprise 2'-deoxy purine nucleotides. In some embodiments, a polynucleic acid molecule comprises a sense strand and antisense strand, wherein pyrimidine nucleotides present in the sense strand comprise 2'-deoxy-2'-fluoro pyrimidine nucleotides and wherein purine nucleotides present in the sense strand comprise 2'-deoxy purine nucleotides.

[0213] In some embodiments, a polynucleic acid molecule comprises a sense strand and antisense strand, wherein the pyrimidine nucleotides when present in said antisense strand are 2'-deoxy-2'-fluoro pyrimidine nucleotides and the purine nucleotides when present in said antisense strand are 2'-O-methyl purine nucleotides.

[0214] In some embodiments, a polynucleic acid molecule comprises a sense strand and antisense strand, wherein the pyrimidine nucleotides when present in said antisense strand are 2'-deoxy-2'-fluoro pyrimidine nucleotides and wherein the purine nucleotides when present in said antisense strand comprise 2'-deoxy-purine nucleotides.

[0215] In some embodiments, a polynucleic acid molecule comprises a sense strand and antisense strand, wherein the sense strand includes a terminal cap moiety at the 5'-end, the 3'-end, or both of the 5' and 3' ends of the sense strand. In other embodiments, the terminal cap moiety is an inverted deoxy abasic moiety.

[0216] In some embodiments, a polynucleic acid molecule comprises a sense strand and an antisense strand, wherein the antisense strand comprises a phosphate backbone modification at the 3' end of the antisense strand. In some instances, the phosphate backbone modification is a phosphorothioate. In some cases, the passenger strand comprises more phosphorothioate modifications than the guide strand. In

other cases, the guide strand comprises more phosphorothioate modifications than the passenger strand. In additional cases, the passenger strand comprises about 2, 3, 4, 5, 6, 7, 8, 9, 10, or more phosphorothioate modifications. In additional cases, the guide strand comprises about 2, 3, 4, 5, 6, 7, 8, 9, 10, or more phosphorothioate modifications.

[0217] In some embodiments, a polynucleic acid molecule comprises a sense strand and an antisense strand, wherein the antisense strand comprises a glyceryl modification at the 3' end of the antisense strand.

[0218] In some embodiments, a polynucleic acid molecule comprises a sense strand and an antisense strand, in which the sense strand comprises one or more, for example, about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorothioate internucleotide linkages, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) 2'-deoxy, 2'-O-methyl, 2'-deoxy-2'-fluoro, and/or about one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) universal base modified nucleotides, and optionally a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends of the sense strand; and in which the antisense strand comprises about 1 to about 10 or more, specifically about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorothioate internucleotide linkages, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) 2'-deoxy, 2'-O-methyl, 2'-deoxy-2'-fluoro, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) universal base modified nucleotides, and optionally a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends of the antisense strand. In other embodiments, one or more, for example about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, or more, pyrimidine nucleotides of the sense and/or antisense strand are chemically-modified with 2'-deoxy, 2'-O-methyl and/or 2'-deoxy-2'-fluoro nucleotides, with or without one or more, for example about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, or more, phosphorothioate internucleotide linkages and/or a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends, being present in the same or different strand.

[0219] In some embodiments, a polynucleic acid molecule comprises a sense strand and an antisense strand, in which the sense strand comprises about 1 to about 25, for example, about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorothioate internucleotide linkages, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, or more) 2'-deoxy, 2'-O-methyl, 2'-deoxy-2'-fluoro, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, or more) universal base modified nucleotides, and optionally a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends of the sense strand; and in which the antisense strand comprises about 1 to about 25 or more, for example about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorothioate internucleotide linkages, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) 2'-deoxy, 2'-O-methyl, 2'-deoxy-2'-fluoro, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) universal base modified nucleotides, and optionally a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends of the antisense strand. In other embodiments, one or more, for example about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, or more, pyrimidine nucleotides of the sense and/or antisense strand are chemically-modified with 2'-deoxy, 2'-O-methyl and/or 2'-deoxy-2'-fluoro nucleotides, with or without about 1 to

about 25 or more, for example about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorothioate internucleotide linkages and/or a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends, being present in the same or different strand.

[0220] In some embodiments, a polynucleic acid molecule comprises a sense strand and an antisense strand, in which the antisense strand comprises one or more, for example, about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorothioate internucleotide linkages, and/or about one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) 2'-deoxy, 2'-O-methyl, 2'-deoxy-2'-fluoro, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) universal base modified nucleotides, and optionally a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends of the sense strand; and wherein the antisense strand comprises about 1 to about 10 or more, specifically about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more phosphorothioate internucleotide linkages, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) 2'-deoxy, 2'-O-methyl, 2'-deoxy-2'-fluoro, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) universal base modified nucleotides, and optionally a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends of the antisense strand. In other embodiments, one or more, for example about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more pyrimidine nucleotides of the sense and/or antisense strand are chemically-modified with 2'-deoxy, 2'-O-methyl and/or 2'-deoxy-2'-fluoro nucleotides, with or without one or more, for example, about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more phosphorothioate internucleotide linkages and/or a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3' and 5'-ends, being present in the same or different strand.

[0221] In some embodiments, a polynucleic acid molecule comprises a sense strand and an antisense strand, in which the antisense strand comprises about 1 to about 25 or more, for example, about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorothioate internucleotide linkages, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) 2'-deoxy, 2'-O-methyl, 2'-deoxy-2'-fluoro, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) universal base modified nucleotides, and optionally a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends of the sense strand; and wherein the antisense strand comprises about 1 to about 25 or more, for example about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorothioate internucleotide linkages, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) 2'-deoxy, 2'-O-methyl, 2'-deoxy-2'-fluoro, and/or one or more (e.g., about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more) universal base modified nucleotides, and optionally a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends of the antisense strand. In other embodiments, one or more, for example about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more pyrimidine nucleotides of the sense and/or antisense strand are chemically-modified with 2'-deoxy, 2'-O-methyl and/or 2'-deoxy-2'-fluoro nucleotides, with or without about 1 to about 5, for example about 1, 2, 3, 4, 5 or more phosphorothioate internucleotide linkages and/or a terminal cap molecule at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends, being present in the same or different strand.

[0222] In some embodiments, a polynucleic acid molecule is a duplex polynucleic acid molecule with one or more of the following properties: a greater hepatocyte stability, reduced overall charge, reduced hepatocyte uptake, or extended pharmacokinetics. In some embodiments, the duplex polynucleic acid molecule comprises a passenger strand (e.g., a sense strand) and a guide strand (e.g., an antisense strand) comprising a plurality of modifications.

[0223] In some embodiments, the duplex polynucleic acid molecule comprises a guide strand (e.g., an antisense strand) with one or more of the modification described above, and a passenger strand (e.g., a sense strand) with a plurality of phosphorodiamidate morpholino oligomers or a plurality of peptide nucleic acid-modified non-natural nucleotides.

[0224] In some embodiments, a polynucleic acid molecule described herein is a chemically-modified short interfering nucleic acid molecule having about 1 to about 25, for example, about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20 or more phosphorothioate internucleotide linkages in each strand of the polynucleic acid molecule.

[0225] In another embodiment, a polynucleic acid molecule described herein comprises 2'-5' internucleotide linkages. In some instances, the 2'-5' internucleotide linkage(s) is at the 3'-end, the 5'-end, or both of the 3'- and 5'-ends of one or both sequence strands. In addition instances, the 2'-5' internucleotide linkage(s) is present at various other positions within one or both sequence strands, for example, about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, or more including every internucleotide linkage of a pyrimidine nucleotide in one or both strands of the polynucleic acid molecule comprise a 2'-5' internucleotide linkage, or about 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, or more including every internucleotide linkage of a purine nucleotide in one or both strands of the polynucleic acid molecule comprise a 2'-5' internucleotide linkage.

[0226] In some cases, the polynucleic acid molecule is a polynucleotide with a duplex, asymmetric duplex, hairpin or asymmetric hairpin secondary structure, having self-complementary sense and antisense regions, wherein the antisense region comprises nucleotide sequence that is complementary to nucleotide sequence in a separate target nucleic acid molecule or a portion thereof and the sense region having nucleotide sequence corresponding to the target nucleic acid sequence or a portion thereof. In other cases, the polynucleic acid molecule is a circular single-stranded polynucleotide having two or more loop structures and a stem comprising self-complementary sense and antisense regions, wherein the antisense region comprises nucleotide sequence that is complementary to nucleotide sequence in a target nucleic acid molecule or a portion thereof and the sense region having nucleotide sequence corresponding to the target nucleic acid sequence or a portion thereof, and wherein the circular polynucleotide is processed either in vivo or in vitro to generate an active polynucleic acid molecule capable of mediating RNAi. In additional cases, the polynucleic acid molecule also comprises a single stranded polynucleotide having nucleotide sequence complementary to nucleotide sequence in a target nucleic acid molecule or a portion thereof (for example, where such polynucleic acid molecule does not require the presence within the polynucleic acid molecule of nucleotide sequence corresponding to the target nucleic acid sequence or a portion thereof), wherein the single stranded polynucleotide further

comprises a terminal phosphate group, such as a 5'-phosphate (see for example Martinez et al., 2002, *Cell.*, 110, 563-574 and Schwarz et al., 2002, *Molecular Cell*, 10, 537-568), or 5',3'-diphosphate.

[0227] In some embodiments, a polynucleic acid molecule is a single stranded polynucleic acid molecule that mediates RNAi activity in a cell or reconstituted in vitro system, wherein the polynucleic acid molecule comprises a single stranded polynucleotide having complementarity to a target nucleic acid sequence, and wherein one or more pyrimidine nucleotides present in the polynucleic acid are 2'-deoxy-2'-fluoro pyrimidine nucleotides (e.g., wherein all pyrimidine nucleotides are 2'-deoxy-2'-fluoro pyrimidine nucleotides or alternately a plurality of pyrimidine nucleotides are 2'-deoxy-2'-fluoro pyrimidine nucleotides), and wherein any purine nucleotides present in the polynucleic acid are 2'-deoxy purine nucleotides (e.g., wherein all purine nucleotides are 2'-deoxy purine nucleotides or alternately a plurality of purine nucleotides are 2'-deoxy purine nucleotides), and a terminal cap modification, that is optionally present at the 3'-end, the 5'-end, or both of the 3' and 5'-ends of the antisense sequence, the polynucleic acid molecule optionally further comprising about 1 to about 4 (e.g., about 1, 2, 3, or 4) terminal 2'-deoxynucleotides at the 3'-end of the polynucleic acid molecule, wherein the terminal nucleotides further comprise one or more (e.g., 1, 2, 3, or 4) phosphorothioate internucleotide linkages, and wherein the polynucleic acid molecule optionally further comprises a terminal phosphate group, such as a 5'-terminal phosphate group.

[0228] In some instances, an asymmetric duplex is a linear polynucleic acid molecule comprising an antisense region, a loop portion that comprises nucleotides or non-nucleotides, and a sense region that comprises fewer nucleotides than the antisense region to the extent that the sense region has enough complimentary nucleotides to base pair with the antisense region and form a duplex with loop. For example, an asymmetric hairpin polynucleic acid molecule comprises an antisense region having length sufficient to mediate RNAi in a cell or in vitro system (e.g. about 19 to about 22 nucleotides) and a loop region comprising about 4 to about 8 nucleotides, and a sense region having about 3 to about 18 nucleotides that are complementary to the antisense region. In some cases, the asymmetric hairpin polynucleic acid molecule also comprises a 5'-terminal phosphate group that is chemically modified. In additional cases, the loop portion of the asymmetric hairpin polynucleic acid molecule comprises nucleotides, non-nucleotides, linker molecules, or conjugate molecules.

[0229] In some embodiments, an asymmetric duplex is a polynucleic acid molecule having two separate strands comprising a sense region and an antisense region, wherein the sense region comprises fewer nucleotides than the antisense region to the extent that the sense region has enough complimentary nucleotides to base pair with the antisense region and form a duplex. For example, an asymmetric duplex polynucleic acid molecule comprises an antisense region having length sufficient to mediate RNAi in a cell or in vitro system (e.g. about 19 to about 22 nucleotides) and a sense region having about 3 to about 18 nucleotides that are complementary to the antisense region.

[0230] In some cases, one or more of the artificial nucleotide analogues described herein are resistant toward nucleases such as for example ribonuclease such as RNase H, deoxyribunuclease such as DNase, or exonuclease such as 5'-3' exonuclease and 3'-5' exonuclease when compared to natural polynucleic

acid molecules. In some instances, artificial nucleotide analogues comprising 2'-O-methyl, 2'-O-methoxyethyl (2'-O-MOE), 2'-O-aminopropyl, 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl (2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O-dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA) modified, LNA, ENA, PNA, HNA, morpholino, methylphosphonate nucleotides, thiolphosphonate nucleotides, 2'-fluoro N3-P5'-phosphoramidites, or combinations thereof are resistant toward nucleases such as for example ribonuclease such as RNase H, deoxyribunuclease such as DNase, or exonuclease such as 5'-3' exonuclease and 3'-5' exonuclease. In some instances, 2'-O-methyl modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, 2'-O-methoxyethyl (2'-O-MOE) modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, 2'-O-aminopropyl modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, 2'-deoxy modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, T-deoxy-2'-fluoro modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, 2'-O-aminopropyl (2'-O-AP) modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, 2'-O-dimethylaminoethyl (2'-O-DMAOE) modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, 2'-O-dimethylaminopropyl (2'-O-DMAP) modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, T-O-dimethylaminoethoxyethyl (2'-O-DMAEOE) modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, 2'-O-N-methylacetamido (2'-O-NMA) modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, LNA modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, ENA modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, HNA modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, morpholinos is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, PNA modified polynucleic acid molecule is resistant to nucleases (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, methylphosphonate nucleotides modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, thiolphosphonate nucleotides modified polynucleic acid molecule is nuclease resistance (e.g., RNase H, DNase, 5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, polynucleic acid molecule comprising 2'-fluoro N3-P5'-phosphoramidites is nuclease resistance (e.g., RNase H, DNase,

5'-3' exonuclease or 3'-5' exonuclease resistance). In some instances, the 5' conjugates described herein inhibit 5'-3' exonucleolytic cleavage. In some instances, the 3' conjugates described herein inhibit 3'-5' exonucleolytic cleavage.

[0231] In some embodiments, one or more of the artificial nucleotide analogues described herein have increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. The one or more of the artificial nucleotide analogues comprising 2'-O-methyl, 2'-O-methoxyethyl (2'-O-MOE), 2'-O-aminopropyl, 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl (2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O-dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA) modified, LNA, ENA, PNA, HNA, morpholino, methylphosphonate nucleotides, thiolphosphonate nucleotides, or 2'-fluoro N3-P5'-phosphoramidites have increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, 2'-O-methyl modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, 2'-O-methoxyethyl (2'-O-MOE) modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, 2'-O-aminopropyl modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, 2'-deoxy modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, T-deoxy-2'-fluoro modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, 2'-O-aminopropyl (2'-O-AP) modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, 2'-O-dimethylaminoethyl (2'-O-DMAOE) modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, 2'-O-dimethylaminopropyl (2'-O-DMAP) modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, T-O-dimethylaminoethoxyethyl (2'-O-DMAEOE) modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, 2'-O-N-methylacetamido (2'-O-NMA) modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, LNA modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, ENA modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, PNA modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, HNA modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural

polynucleic acid molecule. In some instances, morpholino modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, methylphosphonate nucleotides modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, thiolphosphonate nucleotides modified polynucleic acid molecule has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some instances, polynucleic acid molecule comprising 2'-fluoro N3-P5'-phosphoramidites has increased binding affinity toward their mRNA target relative to an equivalent natural polynucleic acid molecule. In some cases, the increased affinity is illustrated with a lower Kd, a higher melt temperature (Tm), or a combination thereof.

[0232] In some embodiments, a polynucleic acid molecule described herein is a chirally pure (or stereo pure) polynucleic acid molecule, or a polynucleic acid molecule comprising a single enantiomer. In some instances, the polynucleic acid molecule comprises L-nucleotide. In some instances, the polynucleic acid molecule comprises D-nucleotides. In some instance, a polynucleic acid molecule composition comprises less than 30%, 25%, 20%, 15%, 10%, 5%, 4%, 3%, 2%, 1%, or less of its mirror enantiomer. In some cases, a polynucleic acid molecule composition comprises less than 30%, 25%, 20%, 15%, 10%, 5%, 4%, 3%, 2%, 1%, or less of a racemic mixture. In some instances, the polynucleic acid molecule is a polynucleic acid molecule described in: U.S. Patent Publication Nos: 2014/194610 and 2015/211006; and PCT Publication No.: WO2015107425.

[0233] In some embodiments, a polynucleic acid molecule described herein is further modified to include an aptamer conjugating moiety. In some instances, the aptamer conjugating moiety is a DNA aptamer conjugating moiety. In some instances, the aptamer conjugating moiety is Alphamer (Centauri Therapeutics), which comprises an aptamer portion that recognizes a specific cell-surface target and a portion that presents a specific epitope for attaching to circulating antibodies. In some instance, a polynucleic acid molecule described herein is further modified to include an aptamer conjugating moiety as described in: U.S. Patent Nos: 8,604,184, 8,591,910, and 7,850,975.

[0234] In additional embodiments, a polynucleic acid molecule described herein is modified to increase its stability. In some embodiment, the polynucleic acid molecule is RNA (e.g., siRNA). In some instances, the polynucleic acid molecule is modified by one or more of the modifications described above to increase its stability. In some cases, the polynucleic acid molecule is modified at the 2' hydroxyl position, such as by 2'-O-methyl, 2'-O-methoxyethyl (2'-O-MOE), 2'-O-aminopropyl, 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl (2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O-dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA) modification or by a locked or bridged ribose conformation (e.g., LNA or ENA). In some cases, the polynucleic acid molecule is modified by 2'-O-methyl and/or 2'-O-methoxyethyl ribose. In some cases, the polynucleic acid molecule also includes morpholinos, PNAs, HNA, methylphosphonate nucleotides, thiolphosphonate nucleotides, and/or 2'-fluoro N3-P5'-phosphoramidites to increase its stability. In some instances, the polynucleic acid molecule is a chirally

pure (or stereo pure) polynucleic acid molecule. In some instances, the chirally pure (or stereo pure) polynucleic acid molecule is modified to increase its stability. Suitable modifications to the RNA to increase stability for delivery will be apparent to the skilled person.

[0235] In some cases, a universal base refers to nucleotide base analogs that form base pairs with each of the natural DNA/RNA bases with little discrimination between them. Non-limiting examples of universal bases include C-phenyl, C-naphthyl and other aromatic derivatives, inosine, azole carboxamides, and nitroazole derivatives such as 3-nitropyrrole, 4-nitroindole, 5-nitroindole, and 6-nitroindole as known in the art (see for example Loakes, 2001, *Nucleic Acids Research*, 29, 2437-2447).

Small Molecules, Proteins, and Peptides

[0236] In some embodiment, the payload is a small molecule. In some instances, the small molecule is a cytotoxic payload. Exemplary cytotoxic payloads include, but are not limited to, microtubule disrupting agents, DNA modifying agents, or Akt inhibitors.

[0237] In some embodiments, the payload comprises a microtubule disrupting agent. Exemplary microtubule disrupting agents include, but are not limited to, 2-methoxyestradiol, auristatin, chalcones, colchicine, combretastatin, cryptophycin, dictyostatin, discodermolide, dolastatin, eleutherobin, epothilone, halichondrin, laulimalide, maytansine, noscapinoid, paclitaxel, peloruside, phomopsin, podophyllotoxin, rhizoxin, spongistatin, taxane, tubulysin, vinca alkaloid, vinorelbine, or derivatives or analogs thereof.

[0238] In some embodiments, the tubulysin is a tubulysin analog or derivative such as described in U.S. Patent Nos. 8580820 and 8980833 and in U.S. Publication Nos. 20130217638, 20130224228, and 201400363454.

[0239] In some embodiments, the maytansine is a maytansinoid. In some embodiments, the maytansinoid is DM1, DM4, or ansamitocin. In some embodiments, the maytansinoid is DM1. In some embodiments, the maytansinoid is DM4. In some embodiments, the maytansinoid is ansamitocin. In some embodiments, the maytansinoid is a maytansinoid derivative or analog such as described in U.S. Patent Nos. 5208020, 5416064, 7276497, and 6716821 or U.S. Publication Nos. 2013029900 and US20130323268.

[0240] In some embodiments, the payload is a dolastatin, or a derivative or analog thereof. In some embodiments, the dolastatin is dolastatin 10 or dolastatin 15, or derivatives or analogs thereof. In some embodiments, the dolastatin 10 analog is auristatin, soblidotin, symplostatin 1, or symplostatin 3. In some embodiments, the dolastatin 15 analog is cemadotin or tasidotin.

[0241] In some embodiments, the dolastatin 10 analog is auristatin or an auristatin derivative. In some embodiments, the auristatin or auristatin derivative is auristatin E (AE), auristatin F (AF), auristatin E5-benzoylvaleric acid ester (AEVB), monomethyl auristatin E (MMAE), monomethyl auristatin F (MMAF), or monomethyl auristatin D (MMAD), auristatin PE, or auristatin PYE. In some embodiments, the auristatin derivative is monomethyl auristatin E (MMAE). In some embodiments, the auristatin derivative is monomethyl auristatin F (MMAF). In some embodiments, the auristatin is an auristatin

derivative or analog such as described in U.S. Patent No. 6884869, 7659241, 7498298, 7964566, 7750116, 8288352, 8703714 and 8871720.

[0242] In some embodiments, the payload comprises a DNA modifying agent. In some embodiments, the DNA modifying agent comprises DNA cleavers, DNA intercalators, DNA transcription inhibitors, or DNA cross-linkers. In some instances, the DNA cleaver comprises bleomycine A2, calicheamicin, or derivatives or analogs thereof. In some instances, the DNA intercalator comprises doxorubicin, epirubicin, PNU-159682, duocarmycin, pyrrolobenzodiazepine, oligomycin C, daunorubicin, valrubicin, topotecan, or derivatives or analogs thereof. In some instances, the DNA transcription inhibitor comprises dactinomycin. In some instances, the DNA cross-linker comprises mitomycin C.

[0243] In some embodiments, the DNA modifying agent comprises amsacrine, anthracycline, camptothecin, doxorubicin, duocarmycin, enediyne, etoposide, indolinobenzodiazepine, netropsin, teniposide, or derivatives or analogs thereof.

[0244] In some embodiments, the anthracycline is doxorubicin, daunorubicin, epirubicin, idarubicin, mitomycin-C, dactinomycin, mithramycin, nemorubicin, pixantrone, sabarubicin, or valrubicin.

[0245] In some embodiments, the analog of camptothecin is topotecan, irinotecan, sultecan, cositecan, exatecan, lurtotecan, gimatecan, belotecan, rubitecan, or SN-38.

[0246] In some embodiments, the duocarmycin is duocarmycin A, duocarmycin B1, duocarmycin B2, duocarmycin C1, duocarmycin C2, duocarmycin D, duocarmycin SA, or CC-1065. In some embodiments, the enediyne is a calicheamicin, esperamicin, or dynemicin A.

[0247] In some embodiments, the pyrrolobenzodiazepine is anthramycin, abbeymycin, chicamycin, DC-81, mazethramycin, neothramycins A, neothramycin B, porothramycin, prothracarcin, sibanomicin (DC-102), sibiromycin, or tomaymycin. In some embodiments, the pyrrolobenzodiazepine is a tomaymycin derivative, such as described in U.S. Patent Nos. 8404678 and 8163736. In some embodiments, the pyrrolobenzodiazepine is such as described in U.S. Patent Nos. 8426402, 8802667, 8809320, 6562806, 6608192, 7704924, 7067511, US7612062, 7244724, 7528126, 7049311, 8633185, 8501934, and 8697688 and U.S. Publication No. US20140294868.

[0248] In some embodiments, the pyrrolobenzodiazepine is a pyrrolobenzodiazepine dimer. In some embodiments, the PBD dimer is a symmetric dimer. Examples of symmetric PBD dimers include, but are not limited to, SJG-136 (SG-2000), ZC-423 (SG2285), SJG-720, SJG-738, ZC-207 (SG2202), and DSB-120 (Table 2). In some embodiments, the PBD dimer is an unsymmetrical dimer. Examples of unsymmetrical PBD dimers include, but are not limited to, SJG-136 derivatives such as described in U.S. Patent Nos. 8697688 and 9242013 and U.S. Publication No. 20140286970.

[0249] In some embodiments, the payload comprises an Akt inhibitor. In some cases, the Akt inhibitor comprises ipatasertib (GDC-0068) or derivatives thereof.

[0250] In some embodiments, the payload comprises a polymerase inhibitor, including, but not limited to polymerase II inhibitors such as a-amanitin, and poly(ADP-ribose) polymerase (PARP) inhibitors. Exemplary PARP inhibitors include, but are not limited to Iniparib (BSI 201), Talazoparib (BMN-673),

Olaparib (AZD-2281), Olaparib, Rucaparib (AG014699, PF-01367338), Veliparib (ABT-888), CEP 9722, MK 4827, BGB-290, or 3-aminobenzamide.

[0251] In some embodiments, the payload is an imaging agent. In some instances, the payload comprises a "radio-opaque" label, *e.g.* a label visualized using x-rays. Radio-opaque materials are well known to those of skill in the art. Exemplary radio-opaque materials include iodide, bromide or barium salts. Additional radiopaque materials include, but are not limited to, organic bismuth derivatives {see, *e.g.*, U.S. Patent 5,939,045), radio-opaque polyurethanes (see, *e.g.*, U.S. Patent 5,346,981), organobismuth composites (see, *e.g.*, U.S. Patent 5,256,334), radio-opaque barium polymer complexes (see, *e.g.*, U.S. Patent 4,866,132), and the like.

[0252] In some instances, the payload comprises a detectable label, for example, for use in immunoconjugates include any composition detectable by spectroscopic, photochemical, biochemical, immunochemical, electrical, optical or chemical means. Useful labels in the include magnetic beads (*e.g.*, DYNABEADSTM), fluorescent dyes (*e.g.*, fluorescein isothiocyanate, texas red, rhodamine, green fluorescent protein, and the like), radiolabels (*e.g.*, ³H, ¹²⁵I, ³⁵S, ¹⁴C, or ³²P), enzymes (*e.g.*, horse radish peroxidase, alkaline phosphatase and others commonly used in an ELISA), and colorimetric labels such as colloidal gold or colored glass or plastic (*e.g.* polystyrene, polypropylene, latex, *etc.*) beads, nanoparticles, quantum dots, and the like.

[0253] In some embodiments, suitable radiolabels include, but are not limited to, ⁹⁹Tc, ²⁰³Pb, ⁶⁷Ga, ⁶⁸Ga, ⁷²As, ¹¹¹In, ^{113m}In, ⁹⁷Ru, ⁶²Cu, ⁶⁴Cu, ⁵²Fe, ^{52m}Mn, ⁵¹Cr, ¹⁸⁶Re, ¹⁸⁸Re, ⁷⁷As, ⁹⁰Y, ⁶⁷Cu, ¹⁶⁹Er, ¹²¹Sn, ¹²⁷Te, ¹⁴²Pr, ¹⁴³Pr, ¹⁹⁸Au, ¹⁹⁹Au, ¹⁶¹Tb, ¹⁰⁹Pd, ¹⁶⁵Dy, ¹⁴⁹Pm, ¹⁵¹Pm, ¹⁵³Sm, ¹⁵⁷Gd, ¹⁵⁹Gd, ¹⁶⁶Ho, ¹⁷²Tm, ¹⁶⁹Yb, ¹⁷⁵Yb, ¹⁷⁷Lu, ¹⁰⁵Rh, and ¹¹¹Ag.

[0254] In some instances, the payload comprises a radiosensitizer that enhances the cytotoxic effect of ionizing radiation (*e.g.*, such as might be produced by ⁶⁰Co or an x-ray source) on a cell. Numerous radiosensitizing agents are known and include, but are not limited to benzoporphyrin derivative compounds (see, *e.g.*, U.S. Patent 5,945,439), 1,2,4-benzotriazine oxides (see, *e.g.*, U.S. Patent 5,849,738), compounds containing certain diamines (see, *e.g.*, U.S. Patent 5,700,825), BCNT (see, *e.g.*, U.S. Patent 5,872,107), radiosensitizing nitrobenzoic acid amide derivatives (see, *e.g.*, U.S. Patent 4,474,814), various heterocyclic derivatives (see, *e.g.*, U.S. Patent 5,064,849), platinum complexes (see, *e.g.*, U.S. Patent 4,921,963), and the like.

[0255] In some instances, the payload comprises an alpha emitter, *i.e.* a radioactive isotope that emits alpha particles. Alpha-emitters have recently been shown to be effective in the treatment of cancer (see, *e.g.*, McDevitt *et al.* (2001) Science 294: 1537-1540; Ballangrud *et al.* (2001) Cancer Res. 61 : 2008-2014; Borchardt *et al.* (2003) Cancer Res. 63: 5084-50). Suitable alpha emitters include, but are not limited to ²¹³Bi, ²¹¹At, and the like.

[0256] In some instances, the payload comprises an immunomodulatory agent. Useful immunomodulatory agents include anti-hormones that block hormone action on tumors and immunosuppressive agents that suppress cytokine production, down-regulate self-antigen expression, or mask MHC antigens. Representative anti-hormones include anti-estrogens including, for example,

tamoxifen, raloxifene, aromatase inhibiting 4(5)-imidazoles, 4-hydroxytamoxifen, trioxifene, keoxifene, LY 117018, onapnstone, and toremifene; and anti-androgens such as flutamide, nilutamide, bicalutamide, leuprolide, and goserelin; and anti-adrenal agents. Illustrative immunosuppressive agents include, but are not limited to 2-amino-6-aryl-5-substituted pyrimidines, azathioprine, cyclophosphamide, bromocryptine, danazol, dapsone, glutaraldehyde, anti-idiotypic antibodies for MHC antigens and MHC fragments, cyclosporin A, steroids such as glucocorticosteroids, streptokinase, or rapamycin.

[0257] In some embodiments, the payload comprises a protein or peptide toxin or fragment thereof. Exemplary enzymatically active toxins and fragments thereof include, but are not limited to, diphtheria toxin A fragment, nonbinding active fragments of diphtheria toxin, exotoxin A (from *Pseudomonas aeruginosa*), ricin A chain, abrin A chain, modeccin A chain, a-sacrin, certain A leurites fordii proteins, certain Dianthin proteins, *Phytolacca americana* proteins (PAP, PAPII and PAP-S), *Morodica charantia* inhibitor, curcin, crotin, *Saponaria officinalis* inhibitor, gelonin, mitogillin, restrictocin, phenomycin, enomycin, and trichothecenes.

[0258] In some instances, the payload is an immune modulator. Exemplary immune modulators include, but are not limited to, gancyclovier, etanercept, tacrolimus, sirolimus, voclosporin, cyclosporine, rapamycin, cyclophosphamide, azathioprine, mycophenolgate mofetil, methotrexrate, glucocorticoid and its analogs, xanthines, stem cell growth factors, lymphotoxins, hematopoietic factors, tumor necrosis factor (TNF) (*e.g.*, TNF α), interleukins (*e.g.*, interleukin-1 (IL-1), IL-2, IL-3, IL-6, IL-10, IL-12, IL-18, and IL-21), colony stimulating factors (*e.g.*, granulocyte-colony stimulating factor (G-CSF) and granulocyte macrophage-colony stimulating factor (GM-CSF)), interferons (*e.g.*, interferons-alpha, interferon-beta, interferon-gamma), the stem cell growth factor designated “S1 factor,” erythropoietin and thrombopoietin, or a combination thereof.

[0259] In some instances, the payload comprises a cytokine. In some embodiments, the cytokine comprises IL-2, IL-2, IL-3, IL-6, IL-10, IL-12, IL-18, IL-21, interferon (*e.g.*, IFN α , IFN β), or TNF α .

Polymers

[0260] In some embodiments, an anti-transferrin receptor antibody conjugate described herein further comprises a polymer (polymer moiety C). In some instances, the polymer is a natural or synthetic polymer, consisting of long chains of branched or unbranched monomers, and/or cross-linked network of monomers in two or three dimensions. In some instances, the polymer includes a polysaccharide, lignin, rubber, or polyalkylen oxide (*e.g.*, polyethylene glycol). In some instances, the at least one polymer includes, but is not limited to, alpha-, omega-dihydroxylpolyethyleneglycol, biodegradable lactone-based polymer, *e.g.* polyacrylic acid, polylactide acid (PLA), poly(glycolic acid) (PGA), polypropylene, polystyrene, polyolefin, polyamide, polycyanoacrylate, polyimide, polyethylenterephthalat (PET, PETG), polyethylene terephthalate (PETE), polytetramethylene glycol (PTG), or polyurethane as well as mixtures thereof. As used herein, a mixture refers to the use of different polymers within the same compound as well as in reference to block copolymers. In some cases, block copolymers are polymers wherein at least one section of a polymer is build up from monomers of another polymer. In some

instances, the polymer comprises polyalkylene oxide. In some instances, the polymer comprises PEG. In some instances, the polymer comprises polyethylene imide (PEI) or hydroxy ethyl starch (HES).

[0261] In some instances, C is a PEG moiety. In some instances, the PEG moiety is conjugated at the 5' terminus of the polynucleic acid molecule while the binding moiety is conjugated at the 3' terminus of the polynucleic acid molecule. In some instances, the PEG moiety is conjugated at the 3' terminus of the polynucleic acid molecule while the binding moiety is conjugated at the 5' terminus of the polynucleic acid molecule. In some instances, the PEG moiety is conjugated to an internal site of the polynucleic acid molecule. In some instances, the PEG moiety, the binding moiety, or a combination thereof, are conjugated to an internal site of the polynucleic acid molecule. In some instances, the conjugation is a direct conjugation. In some instances, the conjugation is via native ligation.

[0262] In some embodiments, the polyalkylene oxide (e.g., PEG) is a polydisperse or monodispers compound. In some instances, polydisperse material comprises disperse distribution of different molecular weight of the material, characterized by mean weight (weight average) size and dispersity. In some instances, the monodisperse PEG comprises one size of molecules. In some embodiments, C is poly- or monodispersed polyalkylene oxide (e.g., PEG) and the indicated molecular weight represents an average of the molecular weight of the polyalkylene oxide, e.g., PEG, molecules.

[0263] In some embodiments, the molecular weight of the polyalkylene oxide (e.g., PEG) is about 200, 300, 400, 500, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, 1450, 1500, 1600, 1700, 1800, 1900, 2000, 2100, 2200, 2300, 2400, 2500, 2600, 2700, 2800, 2900, 3000, 3250, 3350, 3500, 3750, 4000, 4250, 4500, 4600, 4750, 5000, 5500, 6000, 6500, 7000, 7500, 8000, 10,000, 12,000, 20,000, 35,000, 40,000, 50,000, 60,000, or 100,000 Da.

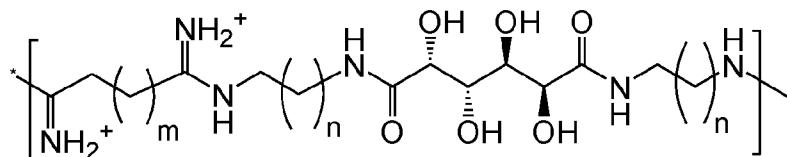

[0264] In some embodiments, C is polyalkylene oxide (e.g., PEG) and has a molecular weight of about 200, 300, 400, 500, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, 1450, 1500, 1600, 1700, 1800, 1900, 2000, 2100, 2200, 2300, 2400, 2500, 2600, 2700, 2800, 2900, 3000, 3250, 3350, 3500, 3750, 4000, 4250, 4500, 4600, 4750, 5000, 5500, 6000, 6500, 7000, 7500, 8000, 10,000, 12,000, 20,000, 35,000, 40,000, 50,000, 60,000, or 100,000 Da. In some embodiments, C is PEG and has a molecular weight of about 200, 300, 400, 500, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, 1450, 1500, 1600, 1700, 1800, 1900, 2000, 2100, 2200, 2300, 2400, 2500, 2600, 2700, 2800, 2900, 3000, 3250, 3350, 3500, 3750, 4000, 4250, 4500, 4600, 4750, 5000, 5500, 6000, 6500, 7000, 7500, 8000, 10,000, 12,000, 20,000, 35,000, 40,000, 50,000, 60,000, or 100,000 Da. In some instances, the molecular weight of C is about 200 Da. In some instances, the molecular weight of C is about 300 Da. In some instances, the molecular weight of C is about 400 Da. In some instances, the molecular weight of C is about 500 Da. In some instances, the molecular weight of C is about 600 Da. In some instances, the molecular weight of C is about 700 Da. In some instances, the molecular weight of C is about 800 Da. In some instances, the molecular weight of C is about 900 Da. In some instances, the molecular weight of C is about 1000 Da. In some instances, the molecular weight of C is about 1100 Da. In some instances, the molecular weight of C is about 1200 Da. In some instances, the molecular weight of C is about 1300 Da. In some instances, the molecular weight of C is about 1400 Da. In some instances, the molecular weight of C is

about 1450 Da. In some instances, the molecular weight of C is about 1500 Da. In some instances, the molecular weight of C is about 1600 Da. In some instances, the molecular weight of C is about 1700 Da. In some instances, the molecular weight of C is about 1800 Da. In some instances, the molecular weight of C is about 1900 Da. In some instances, the molecular weight of C is about 2000 Da. In some instances, the molecular weight of C is about 2100 Da. In some instances, the molecular weight of C is about 2200 Da. In some instances, the molecular weight of C is about 2300 Da. In some instances, the molecular weight of C is about 2400 Da. In some instances, the molecular weight of C is about 2500 Da. In some instances, the molecular weight of C is about 2600 Da. In some instances, the molecular weight of C is about 2700 Da. In some instances, the molecular weight of C is about 2800 Da. In some instances, the molecular weight of C is about 2900 Da. In some instances, the molecular weight of C is about 3000 Da. In some instances, the molecular weight of C is about 3250 Da. In some instances, the molecular weight of C is about 3350 Da. In some instances, the molecular weight of C is about 3500 Da. In some instances, the molecular weight of C is about 3750 Da. In some instances, the molecular weight of C is about 4000 Da. In some instances, the molecular weight of C is about 4250 Da. In some instances, the molecular weight of C is about 4500 Da. In some instances, the molecular weight of C is about 4600 Da. In some instances, the molecular weight of C is about 4750 Da. In some instances, the molecular weight of C is about 5000 Da. In some instances, the molecular weight of C is about 5500 Da. In some instances, the molecular weight of C is about 6000 Da. In some instances, the molecular weight of C is about 6500 Da. In some instances, the molecular weight of C is about 7000 Da. In some instances, the molecular weight of C is about 7500 Da. In some instances, the molecular weight of C is about 8000 Da. In some instances, the molecular weight of C is about 10,000 Da. In some instances, the molecular weight of C is about 12,000 Da. In some instances, the molecular weight of C is about 20,000 Da. In some instances, the molecular weight of C is about 35,000 Da. In some instances, the molecular weight of C is about 50,000 Da. In some instances, the molecular weight of C is about 60,000 Da. In some instances, the molecular weight of C is about 100,000 Da.

[0265] In some embodiments, the polyalkylene oxide (e.g., PEG) is a discrete PEG, in which the discrete PEG is a polymeric PEG comprising more than one repeating ethylene oxide units. In some instances, a discrete PEG (dPEG) comprises from 2 to 60, from 2 to 50, or from 2 to 48 repeating ethylene oxide units. In some instances, a dPEG comprises about 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 24, 26, 28, 30, 35, 40, 42, 48, 50 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 2 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 3 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 4 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 5 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 6 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 7 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 8 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 9 or more repeating ethylene oxide units. In some instances, a dPEG comprises

about 10 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 11 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 12 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 13 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 14 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 15 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 16 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 17 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 18 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 19 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 20 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 22 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 24 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 26 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 28 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 30 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 35 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 40 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 42 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 48 or more repeating ethylene oxide units. In some instances, a dPEG comprises about 50 or more repeating ethylene oxide units. In some cases, a dPEG is synthesized as a single molecular weight compound from pure (e.g., about 95%, 98%, 99%, or 99.5%) starting material in a step-wise fashion. In some cases, a dPEG has a specific molecular weight, rather than an average molecular weight. In some cases, a dPEG described herein is a dPEG from Quanta Biodesign, LMD.

[0266] In some embodiments, the polymer moiety C comprises a cationic mucic acid-based polymer (cMAP). In some instances, cMAP comprises one or more subunit of at least one repeating subunit, and the subunit structure is represented as Formula (III):

Formula III

[0267] wherein m is independently at each occurrence 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10, preferably 4-6 or 5; and n is independently at each occurrence 1, 2, 3, 4, or 5. In some embodiments, m and n are, for example, about 10.

[0268] In some instances, cMAP is further conjugated to a PEG moiety, generating a cMAP-PEG copolymer, an mPEG-cMAP-PEGm triblock polymer, or a cMAP-PEG-cMAP triblock polymer. In some instances, the PEG moiety is in a range of from about 500 Da to about 50,000 Da. In some instances, the PEG moiety is in a range of from about 500 Da to about 1000 Da, greater than 1000 Da to about 5000 Da, greater than 5000 Da to about 10,000 Da, greater than 10,000 to about 25,000 Da, greater than 25,000 Da to about 50,000 Da, or any combination of two or more of these ranges.

[0269] In some instances, C is cMAP-PEG copolymer, an mPEG-cMAP-PEGm triblock polymer, or a cMAP-PEG-cMAP triblock polymer. In some cases, C is cMAP-PEG copolymer. In other cases, C is an mPEG-cMAP-PEGm triblock polymer. In additional cases, C is a cMAP-PEG-cMAP triblock polymer.

Endosomolytic Moiety

[0270] In some embodiments, an anti-transferrin receptor antibody conjugate further comprises an additional conjugating moiety. In some instances, the additional conjugating moiety is an endosomolytic moiety. In some cases, the endosomolytic moiety is a cellular compartmental release component, such as a compound capable of releasing from any of the cellular compartments known in the art, such as the endosome, lysosome, endoplasmic reticulum (ER), golgi apparatus, microtubule, peroxisome, or other vesicular bodies with the cell. In some cases, the endosomolytic moiety comprises an endosomolytic polypeptide, an endosomolytic polymer, an endosomolytic lipid, or an endosomolytic small molecule. In some cases, the endosomolytic moiety comprises an endosomolytic polypeptide. In other cases, the endosomolytic moiety comprises an endosomolytic polymer.

Endosomolytic Polypeptides

[0271] In some embodiments, the anti-transferrin receptor antibody conjugate is further conjugated with an endosomolytic polypeptide. In some embodiments, a conjugate of Formula (I): A-(X¹-B)_n or Formula (II): A-X¹-(B-X²-C)_n is further conjugated with an endosomolytic polypeptide. In some cases, the endosomolytic polypeptide is a pH-dependent membrane active peptide. In some cases, the endosomolytic polypeptide is an amphipathic polypeptide. In additional cases, the endosomolytic polypeptide is a peptidomimetic. In some instances, the endosomolytic polypeptide comprises INF, melittin, meucin, or their respective derivatives thereof. In some instances, the endosomolytic polypeptide comprises INF or its derivatives thereof. In other cases, the endosomolytic polypeptide comprises melittin or its derivatives thereof. In additional cases, the endosomolytic polypeptide comprises meucin or its derivatives thereof.

[0272] In some instances, INF7 is a 24 residue polypeptide those sequence comprises CGIFGEIEELIEEGLENLIDWGNA (SEQ ID NO: 51), or GLFEAIEGFIENGWEGMIDGWYGC (SEQ ID NO: 52). In some instances, INF7 or its derivatives comprise a sequence of: GLFEAIEGFIENGWEGMIWDYGS GSCG (SEQ ID NO: 53), GLFEAIEGFIENGWEGMIDG WYG-(PEG)6-NH2 (SEQ ID NO: 54), or GLFEAIEGFIENGWEGMIWDYG-SGSC-K(GalNAc)2 (SEQ ID NO: 55).

[0273] In some cases, melittin is a 26 residue polypeptide those sequence comprises CLIGAILKVLATGLPTLISWIKNKRKQ (SEQ ID NO: 56), or GIGAVLKVLTGLPALISWIKRKRQQ (SEQ ID NO: 57). In some instances, melittin comprises a polypeptide sequence as described in U.S. Patent No. 8,501,930.

[0274] In some instances, meucin is an antimicrobial peptide (AMP) derived from the venom gland of the scorpion *Mesobuthus eupeus*. In some instances, meucin comprises of meucin-13 those sequence

comprises IFGAIAGLLKNIF-NH₂ (SEQ ID NO: 58) and meucin-18 those sequence comprises FFGHLFKLATKIIIPSLFQ (SEQ ID NO: 59).

[0275] In some instances, the endosomolytic polypeptide comprises a polypeptide in which its sequence is at least 50%, 60%, 70%, 80%, 90%, 95%, or 99% sequence identity to INF7 or its derivatives thereof, melittin or its derivatives thereof, or meucin or its derivatives thereof. In some instances, the endosomolytic moiety comprises INF7 or its derivatives thereof, melittin or its derivatives thereof, or meucin or its derivatives thereof.

[0276] In some instances, the endosomolytic moiety comprises a sequence as illustrated in Table 8.

Table 8

Name	Origin	Amino Acid Sequence	SEQ ID NO:	Type
Pep-1	NLS from Simian Virus 40 large antigen and Reverse transcriptase of HIV	KETWWETWWTEWSQPKKKRKV	60	Primary amphipathic
pVEC	VE-cadherin	LLIILRRRRIRKQAHAAHSK	61	Primary amphipathic
VT5	Synthetic peptide	DPKGDPKGVTVTVTVTGK GDPKPD	62	β-sheet amphipathic
C105Y	1-antitrypsin	CSIPPEVKFNKPFVYLI	63	-
Transportan	Galanin and mastoparan	GWTLNSAGYLLGKINLKALA ALAKKIL	64	Primary amphipathic
TP10	Galanin and mastoparan	AGYLLGKINLKALAALAKKIL	65	Primary amphipathic
MPG	A hydrophobic domain from the fusion sequence of HIV gp41 and NLS of SV40 T antigen	GALFLGFLGAAGSTMGA	66	β-sheet amphipathic
gH625	Glycoprotein gH of HSV type I	HGLASTLTRWAHYNALIRAF	67	Secondary amphipathic α-helical
CADY	PPTG1 peptide	GLWRALWRLRLSLWRLLWRA	68	Secondary amphipathic α-helical
GALA	Synthetic peptide	WEAALAEALAEALAEHLAEA LAEALEALAA	69	Secondary amphipathic α-helical
INF	Influenza HA2 fusion peptide	GLFEAIEGFIENGWEGMIDGW YGC	70	Secondary amphipathic α-helical/ pH-dependent membrane active peptide
HA2E5-TAT	Influenza HA2 subunit of influenza virus X31 strain fusion peptide	GLFGAIAGFIENGWEGMIDGW YG	71	Secondary amphipathic α-helical/ pH-dependent membrane active peptide
HA2-	Influenza HA2 subunit	GLFGAIAGFIENGWEGMIDGR	72	pH-dependent

penetratin	of influenza virus X31 strain fusion peptide	QIKIWFQNRRMKW KK-amide		membrane active peptide
HA-K4	Influenza HA2 subunit of influenza virus X31 strain fusion peptide	GLFGAIAGFIENGWEGMIDG-SSKKKK	73	pH-dependent membrane active peptide
HA2E4	Influenza HA2 subunit of influenza virus X31 strain fusion peptide	GLFEAIAGFIENGWEGMIDGG GYC	74	pH-dependent membrane active peptide
H5WYG	HA2 analogue	GLFHAIAHFIHGGWH GLIHGWYG	75	pH-dependent membrane active peptide
GALA-INF3-(PEG)6-NH	INF3 fusion peptide	GLFEAIEGFIENGWEGLAEALA EALEALAA-(PEG)6-NH2	76	pH-dependent membrane active peptide
CM18-TAT11	Cecropin-A-Melittin ₂₋₁₂ (CM ₁₈) fusion peptide	KWKLFKKIGAVLKVLTTG-YGRKKRRQRRR	77	pH-dependent membrane active peptide

[0277] In some cases, the endosomolytic moiety comprises a Bak BH3 polypeptide which induces apoptosis through antagonization of suppressor targets such as Bcl-2 and/or Bcl-x_L. In some instances, the endosomolytic moiety comprises a Bak BH3 polypeptide described in Albarran, *et al.*, “Efficient intracellular delivery of a pro-apoptotic peptide with a pH-responsive carrier,” *Reactive & Functional Polymers* 71: 261-265 (2011).

[0278] In some instances, the endosomolytic moiety comprises a polypeptide (e.g., a cell-penetrating polypeptide) as described in PCT Publication Nos. WO2013/166155 or WO2015/069587.

Endosomolytic Polymers

[0279] In some embodiments, a conjugate of Formula (I): A-(X¹-B)_n or Formula (II): A-X¹-(B-X²-C)_n is further conjugated with an endosomolytic polymer. As used herein, an endosomolytic polymer comprises a linear, a branched network, a star, a comb, or a ladder type of polymer. In some instances, an endosomolytic polymer is a homopolymer or a copolymer comprising two or more different types of monomers. In some cases, an endosomolytic polymer is a polycation polymer. In other cases, an endosomolytic polymer is a polyanion polymer.

[0280] In some instances, a polycation polymer comprises monomer units that are charge positive, charge neutral, or charge negative, with a net charge being positive. In other cases, a polycation polymer comprises a non-polymeric molecule that contains two or more positive charges. Exemplary cationic polymers include, but are not limited to, poly(L-lysine) (PLL), poly(L-arginine) (PLA), polyethyleneimine (PEI), poly[α -(4-aminobutyl)-L-glycolic acid] (PAGA), 2-(dimethylamino)ethyl methacrylate (DMAEMA), or N,N-Diethylaminoethyl Methacrylate (DEAEMA).

[0281] In some cases, a polyanion polymer comprises monomer units that are charge positive, charge neutral, or charge negative, with a net charge being negative. In other cases, a polyanion polymer comprises a non-polymeric molecule that contains two or more negative charges. Exemplary anionic polymers include p(alkylacrylates) (e.g., poly(propyl acrylic acid) (PPAA)) or poly(N-

isopropylacrylamide) (NIPAM). Additional examples include PP75, a L-phenylalanine-poly(L-lysine isophthalamide) polymer described in Khormaei, *et al.*, “Edosomolytic anionic polymer for the cytoplasmic delivery of siRNAs in localized in vivo applications,” *Advanced Functional Materials* **23**: 565-574 (2013).

[0282] In some embodiments, an endosomolytic polymer described herein is a pH-responsive endosomolytic polymer. A pH-responsive polymer comprises a polymer that increases in size (swell) or collapses depending on the pH of the environment. Polyacrylic acid and chitosan are examples of pH-responsive polymers.

[0283] In some instances, an endosomolytic moiety described herein is a membrane-disruptive polymer. In some cases, the membrane-disruptive polymer comprises a cationic polymer, a neutral or hydrophobic polymer, or an anionic polymer. In some instances, the membrane-disruptive polymer is a hydrophilic polymer.

[0284] In some instances, an endosomolytic moiety described herein is a pH-responsive membrane-disruptive polymer. Exemplary pH-responsive membrane-disruptive polymers include p(alkylacrylic acids), poly(N-isopropylacrylamide) (NIPAM) copolymers, succinylated p(glycidols), and p(β -malic acid) polymers.

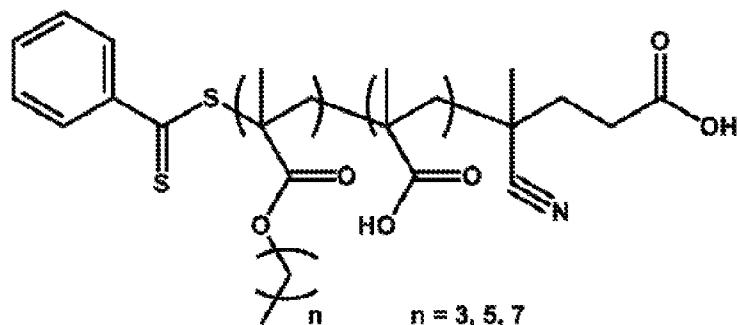

[0285] In some instances, p(alkylacrylic acids) include poly(propylacrylic acid) (polyPAA), poly(methacrylic acid) (PMAA), poly(ethylacrylic acid) (PEAA), and poly(propyl acrylic acid) (PPAA). In some instances, a p(alkylacrylic acid) include a p(alkylacrylic acid) described in Jones, *et al.*, *Biochemistry Journal* **372**: 65-75 (2003).

[0286] In some embodiments, a pH-responsive membrane-disruptive polymer comprises p(butyl acrylate-co-methacrylic acid). (see Bulmus, *et al.*, *Journal of Controlled Release* **93**: 105-120 (2003); and Yessine, *et al.*, *Biochimica et Biophysica Acta* **1613**: 28-38 (2003))

[0287] In some embodiments, a pH-responsive membrane-disruptive polymer comprises p(styrene-alt-maleic anhydride). (see Henry, *et al.*, *Biomacromolecules* **7**: 2407-2414 (2006))

[0288] In some embodiments, a pH-responsive membrane-disruptive polymer comprises pyridyldisulfide acrylate (PDSA) polymers such as poly(MAA-*co*-PDSA), poly(EAA-*co*-PDSA), poly(PAA-*co*-PDSA), poly(MAA-*co*-BA-*co*-PDSA), poly(EAA-*co*-BA-*co*-PDSA), or poly(PAA-*co*-BA-*co*-PDSA) polymers. (see El-Sayed, *et al.*, “Rational design of composition and activity correlations for pH-responsive and glutathione-reactive polymer therapeutics,” *Journal of Controlled Release* **104**: 417-427 (2005); or Flanary *et al.*, “Antigen delivery with poly(propylacrylic acid) conjugation enhanced MHC-1 presentation and T-cell activation,” *Bioconjugate Chem.* **20**: 241-248 (2009))

[0289] In some embodiments, a pH-responsive membrane-disruptive polymer comprises a lytic polymer comprising the base structure of:

[0290] In some instances, an endosomolytic moiety described herein is further conjugated to an additional conjugate, e.g., a polymer (e.g., PEG), or a modified polymer (e.g., cholesterol-modified polymer).

[0291] In some instances, the additional conjugate comprises a detergent (e.g., Triton X-100). In some instances, an endosomolytic moiety described herein comprises a polymer (e.g., a poly(amidoamine)) conjugated with a detergent (e.g., Triton X-100). In some instances, an endosomolytic moiety described herein comprises poly(amidoamine)-Triton X-100 conjugate (Duncan, *et al.*, “A polymer-Triton X-100 conjugate capable of pH-dependent red blood cell lysis: a model system illustrating the possibility of drug delivery within acidic intracellular compartments,” *Journal of Drug Targeting* 2: 341-347 (1994)).

Endosomolytic Lipids

[0292] In some embodiments, the endosomolytic moiety is a lipid (e.g., a fusogenic lipid). In some embodiments, a conjugate of Formula (I): A-(X¹-B)_n or Formula (II): A-X¹-(B-X²-C)_n is further conjugated with an endosomolytic lipid (e.g., fusogenic lipid). Exemplary fusogenic lipids include 1,2-dileoyl-sn-3-phosphoethanolamine (DOPE), phosphatidylethanolamine (POPE), palmitoyloleoylphosphatidylcholine (POPC), (6Z,9Z,28Z,31Z)-heptatriaconta-6,9,28,31-tetraen-19-ol (Di-Lin), N-methyl(2,2-di((9Z,12Z)-octadeca-9,12-dienyl)-1,3-dioxolan-4-yl)methanamine (DLin-k-DMA) and N-methyl-2-(2,2-di((9Z,12Z)-octadeca-9,12-dienyl)-1,3-dioxolan-4-yl)ethanamine (XTC).

[0293] In some instances, an endosomolytic moiety is a lipid (e.g., a fusogenic lipid) described in PCT Publication No. WO09/126,933.

Endosomolytic Small Molecules

[0294] In some embodiments, the endosomolytic moiety is a small molecule. In some embodiments, a molecule of Formula (I): A-(X¹-B)_n or Formula (II): A-X¹-(B-X²-C)_n is further conjugated with an endosomolytic small molecule. Exemplary small molecules suitable as endosomolytic moieties include, but are not limited to, quinine, chloroquine, hydroxychloroquines, amodiaquins (carnoquines), amopyroquines, primaquines, mefloquines, nivaquines, halofantrines, quinone imines, or a combination thereof. In some instances, quinoline endosomolytic moieties include, but are not limited to, 7-chloro-4-(4-diethylamino-1-methylbutyl-amino)quinoline (chloroquine); 7-chloro-4-(4-ethyl-(2-hydroxyethyl)-amino-1-methylbutyl-amino)quinoline (hydroxychloroquine); 7-fluoro-4-(4-diethylamino-1-methylbutyl-amino)quinoline; 4-(4-diethylamino-1-methylbutylamino) quinoline; 7-hydroxy-4-(4-diethyl-amino-1-

methylbutylamino)quinoline; 7-chloro-4-(4-diethylamino-1-butylamino)quinoline (desmethylchloroquine); 7-fluoro-4-(4-diethylamino-1-butylamino)quinoline); 4-(4-diethyl-amino-1-butylamino)quinoline; 7-hydroxy-4-(4-diethylamino-1-butylamino)quinoline; 7-chloro-4-(1-carboxy-4-diethylamino-1-butylamino)quinoline; 7-fluoro-4-(1-carboxy-4-diethylamino-1-butylamino)quinoline; 4-(1-carboxy-4-diethylamino-1-butylamino) quinoline; 7-hydroxy-4-(1-carboxy-4-diethylamino-1-butylamino)quinoline; 7-chloro-4-(1-carboxy-4-diethylamino-1-methylbutylamino)quinoline; 7-fluoro-4-(1-carboxy-4-diethylamino-1-methylbutylamino)quinoline; 4-(1-carboxy-4-diethylamino-1-methylbutylamino)quinoline; 7-hydroxy-4-(1-carboxy-4-diethylamino-1-methylbutylamino)quinoline; 7-fluoro-4-(4-ethyl-(2-hydroxyethyl)-amino-1-methylbutylamino)quinoline; 4-(4-ethyl-(2-hydroxyethyl)-amino-1-methylbutylamino-)quinoline; 7-hydroxy-4-(4-ethyl-(2-hydroxyethyl)-amino-1-methylbutylamino)quinoline; hydroxychloroquine phosphate; 7-chloro-4-(4-ethyl-(2-hydroxyethyl-1)-amino-1-butylamino)quinoline (desmethylhydroxychloroquine); 7-fluoro-4-(4-ethyl-(2-hydroxyethyl)-amino-1-butylamino)quinoline; 4-(4-ethyl-(2-hydroxyethyl)-amino-1-butylamino)quinoline; 7-hydroxy-4-(4-ethyl-(2-hydroxyethyl)-amino-1-butylamino) quinoline; 7-chloro-4-(1-carboxy-4-ethyl-(2-hydroxyethyl)-amino-1-butylamino)quinoline; 7-fluoro-4-(1-carboxy-4-ethyl-(2-hydroxyethyl)-amino-1-butylamino)quinoline; 4-(1-carboxy-4-ethyl-(2-hydroxyethyl)-amino-1-butylamino)quinoline; 7-hydroxy-4-(1-carboxy-4-ethyl-(2-hydroxyethyl)-amino-1-butylamino)quinoline; 7-chloro-4-(1-carboxy-4-ethyl-(2-hydroxyethyl)-amino-1-methylbutylamino)quinoline; 7-fluoro-4-(1-carboxy-4-ethyl-(2-hydroxyethyl)-amino-1-methylbutylamino)quinoline; 4-(1-carboxy-4-ethyl-(2-hydroxyethyl)-amino-1-methylbutylamino)quinoline; 7-hydroxy-4-(1-carboxy-4-ethyl-(2-hydroxyethyl)-amino-1-methylbutylamino)quinoline; 8-[(4-aminopentyl)amino-6-methoxydihydrochloride quinoline; 1-acetyl-1,2,3,4-tetrahydroquinoline; 8-[(4-aminopentyl)amino]-6-methoxyquinoline dihydrochloride; 1-butyryl-1,2,3,4-tetrahydroquinoline; 3-chloro-4-(4-hydroxy-alpha,alpha'-bis(2-methyl-1-pyrrolidinyl)-2,5-xylidinoquinoline, 4-[(4-diethyl-amino)-1-methylbutyl-amino]-6-methoxyquinoline; 3-fluoro-4-(4-hydroxy-alpha,alpha'-bis(2-methyl-1-pyrrolidinyl)-2,5-xylidinoquinoline, 4-[(4-diethylamino)-1-methylbutyl-amino]-6-methoxyquinoline; 4-(4-hydroxy-alpha,alpha'-bis(2-methyl-1-pyrrolidinyl)-2,5-xylidinoquinoline; 4-[(4-diethylamino)-1-methylbutyl-amino]-6-methoxyquinoline; 3,4-dihydro-1-(2H)-quinoliniccarboxyaldehyde; 1,1'-pentamethylene diquinoleinium diiodide; 8-quinolinol sulfate and amino, aldehyde, carboxylic, hydroxyl, halogen, keto, sulfhydryl and vinyl derivatives or analogs thereof. In some instances, an endosomolytic moiety is a small molecule described in Naisbitt et al (1997, *J Pharmacol Exp Therapy* 280:884-893) and in U.S. Patent No. 5,736,557.

[0295] In some embodiments, the endosomolytic moiety is nigericin or a conjugate thereof, e.g., such as a folate-nigericin ester conjugate, a folate-nigericin amide conjugate, or a folate-nigericin carbamate conjugate. In some instances, the endosomolytic moiety is nigericin described in Rangasamy, *et. al.*, “New mechanism for release of endosomal contents: osmotic lysis via nigericin-mediated K+/H+ exchange,” *Bioconjugate Chem.* **29**:1047-1059 (2018).

Linkers

[0296] In some embodiments, a linker described herein is a cleavable linker or a non-cleavable linker. In some instances, the linker is a cleavable linker. In other instances, the linker is a non-cleavable linker.

[0297] In some cases, the linker is a non-polymeric linker. A non-polymeric linker refers to a linker that does not contain a repeating unit of monomers generated by a polymerization process. Exemplary non-polymeric linkers include, but are not limited to, C₁-C₆ alkyl group (e.g., a C₅, C₄, C₃, C₂, or C₁ alkyl group), homobifunctional cross linkers, heterobifunctional cross linkers, peptide linkers, traceless linkers, self-immolative linkers, maleimide-based linkers, or combinations thereof. In some cases, the non-polymeric linker comprises a C₁-C₆ alkyl group (e.g., a C₅, C₄, C₃, C₂, or C₁ alkyl group), a homobifunctional cross linker, a heterobifunctional cross linker, a peptide linker, a traceless linker, a self-immolative linker, a maleimide-based linker, or a combination thereof. In additional cases, the non-polymeric linker does not comprise more than two of the same type of linkers, e.g., more than two homobifunctional cross linkers, or more than two peptide linkers. In further cases, the non-polymeric linker optionally comprises one or more reactive functional groups.

[0298] In some instances, the non-polymeric linker does not encompass a polymer that is described above. In some instances, the non-polymeric linker does not encompass a polymer encompassed by the polymer moiety C. In some cases, the non-polymeric linker does not encompass a polyalkylene oxide (e.g., PEG). In some cases, the non-polymeric linker does not encompass a PEG.

[0299] In some instances, the linker comprises a homobifunctional linker. Exemplary homobifunctional linkers include, but are not limited to, Lomant's reagent dithiobis (succinimidylpropionate) DSP, 3'3'-dithiobis(sulfosuccinimidyl propionate) (DTSSP), disuccinimidyl suberate (DSS), bis(sulfosuccinimidyl)suberate (BS), disuccinimidyl tartrate (DST), disulfosuccinimidyl tartrate (sulfo DST), ethylene glycobi(succinimidylsuccinate) (EGS), disuccinimidyl glutarate (DSG), N,N'-disuccinimidyl carbonate (DSC), dimethyl adipimidate (DMA), dimethyl pimelimidate (DMP), dimethyl suberimidate (DMS), dimethyl-3,3'-dithiobispropionimidate (DTBP), 1,4-di-3'-(2'-pyridyldithio)propionamido)butane (DPDPB), bismaleimidohexane (BMH), aryl halide-containing compound (DFDNB), such as e.g. 1,5-difluoro-2,4-dinitrobenzene or 1,3-difluoro-4,6-dinitrobenzene, 4,4'-difluoro-3,3'-dinitrophenylsulfone (DFDNPS), bis-[β-(4-azidosalicylamido)ethyl]disulfide (BASED), formaldehyde, glutaraldehyde, 1,4-butanediol diglycidyl ether, adipic acid dihydrazide, carbohydrazide, o-toluidine, 3,3'-dimethylbenzidine, benzidine, α,α'-p-diaminodiphenyl, diiodo-p-xylene sulfonic acid, N,N'-ethylene-bis(iodoacetamide), or N,N'-hexamethylene-bis(iodoacetamide).

[0300] In some embodiments, the linker comprises a heterobifunctional linker. Exemplary heterobifunctional linker include, but are not limited to, amine-reactive and sulphydryl cross-linkers such as N-succinimidyl 3-(2-pyridyldithio)propionate (sPDP), long-chain N-succinimidyl 3-(2-pyridyldithio)propionate (LC-sPDP), water-soluble-long-chain N-succinimidyl 3-(2-pyridyldithio)propionate (sulfo-LC-sPDP), succinimidylloxycarbonyl-α-methyl-α-(2-pyridyldithio)toluene (sMPT), sulfosuccinimidyl-6-[α-methyl-α-(2-pyridyldithio)toluamido]hexanoate (sulfo-LC-sMPT), succinimidyl-4-(N-maleimidomethyl)cyclohexane-1-carboxylate (sMCC), sulfosuccinimidyl-4-(N-maleimidomethyl)cyclohexane-1-carboxylate (sulfo-sMCC), m-maleimidobenzoyl-N-

hydroxysuccinimide ester (MBs), m-maleimidobenzoyl-N-hydroxysulfosuccinimide ester (sulfo-MBs), N-succinimidyl(4-iodoacetyl)aminobenzoate (sIAB), sulfosuccinimidyl(4-iodoacetyl)aminobenzoate (sulfo-sIAB), succinimidyl-4-(p-maleimidophenyl)butyrate (sMPB), sulfosuccinimidyl-4-(p-maleimidophenyl)butyrate (sulfo-sMPB), N-(γ -maleimidobutyryloxy)succinimide ester (GMBs), N-(γ -maleimidobutyryloxy)sulfosuccinimide ester (sulfo-GMBs), succinimidyl 6-((iodoacetyl)amino)hexanoate (sIAX), succinimidyl 6-[6-((iodoacetyl)amino)hexanoyl]amino]hexanoate (sIAXX), succinimidyl 4-(((iodoacetyl)amino)methyl)cyclohexane-1-carboxylate (sIAC), succinimidyl 6-(((4-iodoacetyl)amino)methyl)cyclohexane-1-carbonyl)amino) hexanoate (sIACX), p-nitrophenyl iodoacetate (NPIA), carbonyl-reactive and sulphydryl-reactive cross-linkers such as 4-(4-N-maleimidophenyl)butyric acid hydrazide (MPBH), 4-(N-maleimidomethyl)cyclohexane-1-carboxyl-hydrazide-8 (M₂C₂H), 3-(2-pyridyldithio)propionyl hydrazide (PDPH), amine-reactive and photoreactive cross-linkers such as N-hydroxysuccinimidyl-4-azidosalicylic acid (NHs-AsA), N-hydroxysulfosuccinimidyl-4-azidosalicylic acid (sulfo-NHs-AsA), sulfosuccinimidyl-(4-azidosalicylamido)hexanoate (sulfo-NHs-LC-AsA), sulfosuccinimidyl-2-(ρ -azidosalicylamido)ethyl-1,3'-dithiopropionate (sAsD), N-hydroxysuccinimidyl-4-azidobenzoate (HsAB), N-hydroxysulfosuccinimidyl-4-azidobenzoate (sulfo-HsAB), N-succinimidyl-6-(4'-azido-2'-nitrophenylamino)hexanoate (sANPAH), sulfosuccinimidyl-6-(4'-azido-2'-nitrophenylamino)hexanoate (sulfo-sANPAH), N-5-azido-2-nitrobenzoyloxysuccinimide (ANB-NOs), sulfosuccinimidyl-2-(m-azido- ρ -nitrobenzamido)-ethyl-1,3'-dithiopropionate (sAND), N-succinimidyl-4(4-azidophenyl)1,3'-dithiopropionate (sADP), N-sulfosuccinimidyl(4-azidophenyl)-1,3'-dithiopropionate (sulfo-sADP), sulfosuccinimidyl 4-(ρ -azidophenyl)butyrate (sulfo-sAPB), sulfosuccinimidyl 2-(7-azido-4-methylcoumarin-3-acetamide)ethyl-1,3'-dithiopropionate (sAED), sulfosuccinimidyl 7-azido-4-methylcoumarin-3-acetate (sulfo-sAMCA), ρ -nitrophenyl diazopyruvate (ρ NPDP), ρ -nitrophenyl-2-diazo-3,3,3-trifluoropropionate (PNP-DTP), sulphydryl-reactive and photoreactive cross-linkers such as 1-(ρ -Azidosalicylamido)-4-(iodoacetamido)butane (AsIB), N-[4-(ρ -azidosalicylamido)butyl]-3'-(2'-pyridyldithio)propionamide (APDP), benzophenone-4-iodoacetamide, benzophenone-4-maleimide carbonyl-reactive and photoreactive cross-linkers such as 4-(ρ -azidosalicylamido)butylamine (AsBA), and arginine-reactive and photoreactive cross-linkers such as ρ -azidophenyl glyoxal (APG).

[0301] In some instances, the linker comprises a reactive functional group. In some cases, the reactive functional group comprises a nucleophilic group that is reactive to an electrophilic group present on a binding moiety. Exemplary electrophilic groups include carbonyl groups—such as aldehyde, ketone, carboxylic acid, ester, amide, enone, acyl halide or acid anhydride. In some embodiments, the reactive functional group is aldehyde. Exemplary nucleophilic groups include hydrazide, oxime, amino, hydrazine, thiosemicarbazone, hydrazine carboxylate, and arylhydrazide.

[0302] In some embodiments, the linker comprises a maleimide group. In some instances, the maleimide group is also referred to as a maleimide spacer. In some instances, the maleimide group further encompasses a caproic acid, forming maleimidocaproyl (mc). In some cases, the linker comprises

maleimidocaproyl (mc). In some cases, the linker is maleimidocaproyl (mc). In other instances, the maleimide group comprises a maleimidomethyl group, such as succinimidyl-4-(N-maleimidomethyl)cyclohexane-1-carboxylate (sMCC) or sulfosuccinimidyl-4-(N-maleimidomethyl)cyclohexane-1-carboxylate (sulfo-sMCC) described above.

[0303] In some embodiments, the maleimide group is a self-stabilizing maleimide. In some instances, the self-stabilizing maleimide utilizes diaminopropionic acid (DPR) to incorporate a basic amino group adjacent to the maleimide to provide intramolecular catalysis of tiosuccinimide ring hydrolysis, thereby eliminating maleimide from undergoing an elimination reaction through a retro-Michael reaction. In some instances, the self-stabilizing maleimide is a maleimide group described in Lyon, *et al.*, “Self-hydrolyzing maleimides improve the stability and pharmacological properties of antibody-drug conjugates,” *Nat. Biotechnol.* **32**(10):1059-1062 (2014). In some instances, the linker comprises a self-stabilizing maleimide. In some instances, the linker is a self-stabilizing maleimide.

[0304] In some embodiments, the linker comprises a peptide moiety. In some instances, the peptide moiety comprises at least 2, 3, 4, 5, or 6 more amino acid residues. In some instances, the peptide moiety comprises at most 2, 3, 4, 5, 6, 7, or 8 amino acid residues. In some instances, the peptide moiety comprises about 2, about 3, about 4, about 5, or about 6 amino acid residues. In some instances, the peptide moiety is a cleavable peptide moiety (e.g., either enzymatically or chemically). In some instances, the peptide moiety is a non-cleavable peptide moiety. In some instances, the peptide moiety comprises Val-Cit (valine-citrulline), Gly-Gly-Phe-Gly, Phe-Lys, Val-Lys, Gly-Phe-Lys, Phe-Phe-Lys, Ala-Lys, Val-Arg, Phe-Cit, Phe-Arg, Leu-Cit, Ile-Cit, Trp-Cit, Phe-Ala, Ala-Leu-Ala-Leu, or Gly-Phe-Leu-Gly. In some instances, the linker comprises a peptide moiety such as: Val-Cit (valine-citrulline), Gly-Gly-Phe-Gly, Phe-Lys, Val-Lys, Gly-Phe-Lys, Phe-Phe-Lys, Ala-Lys, Val-Arg, Phe-Cit, Phe-Arg, Leu-Cit, Ile-Cit, Trp-Cit, Phe-Ala, Ala-Leu-Ala-Leu, or Gly-Phe-Leu-Gly. In some cases, the linker comprises Val-Cit. In some cases, the linker is Val-Cit.

[0305] In some embodiments, the linker comprises a benzoic acid group, or its derivatives thereof. In some instances, the benzoic acid group or its derivatives thereof comprise paraaminobenzoic acid (PABA). In some instances, the benzoic acid group or its derivatives thereof comprise gamma-aminobutyric acid (GABA).

[0306] In some embodiments, the linker comprises one or more of a maleimide group, a peptide moiety, and/or a benzoic acid group, in any combination. In some embodiments, the linker comprises a combination of a maleimide group, a peptide moiety, and/or a benzoic acid group. In some instances, the maleimide group is maleimidocaproyl (mc). In some instances, the peptide group is val-cit. In some instances, the benzoic acid group is PABA. In some instances, the linker comprises a mc-val-cit group. In some cases, the linker comprises a val-cit-PABA group. In additional cases, the linker comprises a mc-val-cit-PABA group.

[0307] In some embodiments, the linker is a self-immolative linker or a self-elimination linker. In some cases, the linker is a self-immolative linker. In other cases, the linker is a self-elimination linker (e.g., a

cyclization self-elimination linker). In some instances, the linker comprises a linker described in U.S. Patent No. 9,089,614 or PCT Publication No. WO2015038426.

[0308] In some embodiments, the linker is a dendritic type linker. In some instances, the dendritic type linker comprises a branching, multifunctional linker moiety. In some instances, the dendritic type linker is used to increase the molar ratio of polynucleotide B to the binding moiety A. In some instances, the dendritic type linker comprises PAMAM dendrimers.

[0309] In some embodiments, the linker is a traceless linker or a linker in which after cleavage does not leave behind a linker moiety (e.g., an atom or a linker group) to a binding moiety A, a polynucleotide B, a polymer C, or an endosomolytic moiety D. Exemplary traceless linkers include, but are not limited to, germanium linkers, silicium linkers, sulfur linkers, selenium linkers, nitrogen linkers, phosphorus linkers, boron linkers, chromium linkers, or phenylhydrazide linker. In some cases, the linker is a traceless aryl-triazene linker as described in Hejesen, *et al.*, “A traceless aryl-triazene linker for DNA-directed chemistry,” *Org Biomol Chem* **11**(15): 2493-2497 (2013). In some instances, the linker is a traceless linker described in Blaney, *et al.*, “Traceless solid-phase organic synthesis,” *Chem. Rev.* **102**: 2607-2024 (2002). In some instances, a linker is a traceless linker as described in U.S. Patent No. 6,821,783.

[0310] In some instances, the linker is a linker described in U.S. Patent Nos. 6,884,869; 7,498,298; 8,288,352; 8,609,105; or 8,697,688; U.S. Patent Publication Nos. 2014/0127239; 2013/028919; 2014/286970; 2013/0309256; 2015/037360; or 2014/0294851; or PCT Publication Nos. WO2015057699; WO2014080251; WO2014197854; WO2014145090; or WO2014177042.

[0311] In some embodiments, X¹ and X² are each independently a bond or a non-polymeric linker. In some instances, X¹ and X² are each independently a bond. In some cases, X¹ and X² are each independently a non-polymeric linker.

[0312] In some instances, X¹ is a bond or a non-polymeric linker. In some instances, X¹ is a bond. In some instances, X¹ is a non-polymeric linker. In some instances, the linker is a C₁-C₆ alkyl group. In some cases, X¹ is a C₁-C₆ alkyl group, such as for example, a C₅, C₄, C₃, C₂, or C₁ alkyl group. In some cases, the C₁-C₆ alkyl group is an unsubstituted C₁-C₆ alkyl group. As used in the context of a linker, and in particular in the context of X¹, alkyl means a saturated straight or branched hydrocarbon radical containing up to six carbon atoms. In some instances, X¹ includes a homobifunctional linker or a heterobifunctional linker described *supra*. In some cases, X¹ includes a heterobifunctional linker. In some cases, X¹ includes sMCC. In other instances, X¹ includes a heterobifunctional linker optionally conjugated to a C₁-C₆ alkyl group. In other instances, X¹ includes sMCC optionally conjugated to a C₁-C₆ alkyl group. In additional instances, X¹ does not include a homobifunctional linker or a heterobifunctional linker described *supra*.

[0313] In some instances, X² is a bond or a linker. In some instances, X² is a bond. In other cases, X² is a linker. In additional cases, X² is a non-polymeric linker. In some embodiments, X² is a C₁-C₆ alkyl group. In some instances, X² is a homobifunctional linker or a heterobifunctional linker described *supra*. In some instances, X² is a homobifunctional linker described *supra*. In some instances, X² is a heterobifunctional linker described *supra*. In some instances, X² comprises a maleimide group, such as

maleimidocaproyl (mc) or a self-stabilizing maleimide group described above. In some instances, X^2 comprises a peptide moiety, such as Val-Cit. In some instances, X^2 comprises a benzoic acid group, such as PABA. In additional instances, X^2 comprises a combination of a maleimide group, a peptide moiety, and/or a benzoic acid group. In additional instances, X^2 comprises a mc group. In additional instances, X^2 comprises a mc-val-cit group. In additional instances, X^2 comprises a val-cit-PABA group. In additional instances, X^2 comprises a mc-val-cit-PABA group.

Methods of Use

[0314] In some embodiments, described herein are methods delivering a payload to a target site of interest with use of an anti-transferrin receptor antibody described herein. In some instances, the target site of interest is a cell that overexpresses a causative protein that is associated with a disease or condition. In some instances, the target site of interest is a cell that comprises an incorrectly processed mRNA, which encodes a non-functional protein or a reduced expression of a protein leading to a disease or condition. In some instances, the target site of interest is a tumor site. In additional instances, the target site of interest is a site located with the brain.

[0315] In some embodiments, described herein is a method of treating a disease or disorder characterized with an overexpressed protein. In some instances, the disease or disorder is a muscle atrophy. In some instances, the disease or disorder is myotonic dystrophy.

[0316] In one embodiment, muscle atrophy refers to a significant loss in muscle strength. By significant loss in muscle strength is meant a reduction of strength in diseased, injured, or unused muscle tissue in a subject relative to the same muscle tissue in a control subject. In an embodiment, a significant loss in muscle strength is a reduction in strength of at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, or more relative to the same muscle tissue in a control subject. In another embodiment, by significant loss in muscle strength is meant a reduction of strength in unused muscle tissue relative to the muscle strength of the same muscle tissue in the same subject prior to a period of nonuse. In an embodiment, a significant loss in muscle strength is a reduction of at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, or more relative to the muscle strength of the same muscle tissue in the same subject prior to a period of nonuse.

[0317] In another embodiment, muscle atrophy refers to a significant loss in muscle mass. By significant loss in muscle mass is meant a reduction of muscle volume in diseased, injured, or unused muscle tissue in a subject relative to the same muscle tissue in a control subject. In an embodiment, a significant loss of muscle volume is at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, or more relative to the same muscle tissue in a control subject. In another embodiment, by significant loss in muscle mass is meant a reduction of muscle volume in unused muscle tissue relative to the muscle volume of the same muscle tissue in the same subject prior to a period of nonuse. In an embodiment, a significant loss in muscle tissue is at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, or more

relative to the muscle volume of the same muscle tissue in the same subject prior to a period of nonuse. Muscle volume is optionally measured by evaluating the cross-section area of a muscle such as by Magnetic Resonance Imaging (e.g., by a muscle volume/cross-section area (CSA) MRI method).

[0318] In some embodiments, the muscle atrophy comprises or is associated with cachexia, denervation, myopathy, motor neuron diseases, diabetes, chronic obstructive pulmonary disease, liver disease, congestive heart failure, chronic renal failure, chronic infection, sepsis, fasting, sarcopenia, glucocorticoid-associated muscle atrophy, or disuse-associated muscle atrophy.

[0319] Cachexia is an acquired, accelerated loss of muscle caused by an underlying disease. In some instances, cachexia refers to a loss of body mass that cannot be reversed nutritionally, and is generally associated with an underlying disease, such as cancer, COPD, AIDS, heart failure, and the like. When cachexia is seen in a patient with end-stage cancer, it is called “cancer cachexia”. Cancer cachexia affects the majority of patients with advanced cancer and is associated with a reduction in treatment tolerance, response to therapy, quality of life and duration of survival. In some instances, cancer cachexia is defined as a multifactorial syndrome characterized by an ongoing loss of skeletal muscle mass, with or without loss of fat mass, which cannot be fully reversed by conventional nutritional support and leads to progressive functional impairment. In some cases, skeletal muscle loss appears to be the most significant event in cancer cachexia. In addition, the classification of cancer cachexia suggests that the diagnostic criteria takes into account not only that weight loss is a signal event of the cachectic process but that the initial reserve of the patient should also be considered, such as low BMI or low level of muscularity.

[0320] Denervation is an injury to the peripheral motoneurons with a partial or complete interruption of the nerve fibers between an organ and the central nervous system, resulting in an interruption of nerve conduction and motoneuron firing which, in turn, prevents the contractability of skeletal muscles. This loss of nerve function is either localized or generalized due to the loss of an entire motor neuron unit. The resulting inability of skeletal muscles to contract leads to muscle atrophy. In some instances, denervation is associated with or as a result of degenerative, metabolic, or inflammatory neuropathy (e.g., Guillain-Barre syndrome, peripheral neuropathy, or exposure to environmental toxins or drugs). In additional instances, denervation is associated with a physical injury, e.g., a surgical procedure.

[0321] Myopathy is an umbrella term that describes a disease of the muscle. In some instances, myopathy includes myotonia; congenital myopathy such as nemaline myopathy, multi/minicore myopathy and myotubular (centronuclear) myopathy; mitochondrial myopathy; familial periodic paralysis; inflammatory myopathy; metabolic myopathy, for example, caused by a glycogen or lipid storage disease; dermatomyositis; polymyositis; inclusion body myositis; myositis ossificans; rhabdomyolysis; and myoglobinurias. In some instances, myopathy is caused by a muscular dystrophy syndrome, such as Duchenne, Becker, myotonic, fascioscapulohumeral, Emery-Dreifuss, oculopharyngeal, scapulohumeral, limb girdle, Fukuyama, a congenital muscular dystrophy, or hereditary distal myopathy. In some instances, myopathy is caused by myotonic dystrophy (e.g., myotonic dystrophy type 1 or DM1). In some instances, myopathy is caused by DM1.

[0322] Motor neuron disease (MND) encompasses a neurological disorder that affects motor neurons, cells that control voluntary muscles of the body. Exemplary motor neuron diseases include, but are not limited to, adult motor neuron diseases, infantile spinal muscular atrophy, amyotrophic lateral sclerosis, juvenile spinal muscular atrophy, autoimmune motor neuropathy with multifocal conductor block, paralysis due to stroke or spinal cord injury, or skeletal immobilization due to trauma.

[0323] Diabetes (diabetes mellitus, DM) comprises type 1 diabetes, type 2 diabetes, type 3 diabetes, type 4 diabetes, double diabetes, latent autoimmune diabetes (LAD), gestational diabetes, neonatal diabetes mellitus (NDM), maturity onset diabetes of the young (MODY), Wolfram syndrome, Alström syndrome, prediabetes, or diabetes insipidus. Type 2 diabetes, also called non-insulin dependent diabetes, is the most common type of diabetes accounting for 95% of all diabetes cases. In some instances, type 2 diabetes is caused by a combination of factors, including insulin resistance due to pancreatic beta cell dysfunction, which in turn leads to high blood glucose levels. In some cases, increased glucagon levels stimulate the liver to produce an abnormal amount of unneeded glucose, which contributes to high blood glucose levels. Type 1 diabetes, also called insulin-dependent diabetes, comprises about 5% to 10% of all diabetes cases. Type 1 diabetes is an autoimmune disease where T cells attack and destroy insulin-producing beta cells in the pancreas. In some embodiments, Type 1 diabetes is caused by genetic and environmental factors. Type 4 diabetes is a type of diabetes affecting about 20% of diabetic patients age 65 and over. In some embodiments, type 4 diabetes is characterized by age-associated insulin resistance. Type 3 diabetes is used as a term for Alzheimer's disease resulting in insulin resistance in the brain.

[0324] Chronic obstructive pulmonary disease (COPD) is a type of obstructive lung disease characterized by long-term breathing problems and poor airflow. Chronic bronchitis and emphysema are two different types of COPD.

[0325] Liver disease (or hepatic disease) comprises fibrosis, cirrhosis, hepatitis, alcoholic liver disease, hepatic steatosis, a hereditary disease, or primary liver cancer.

[0326] Congestive heart failure is a condition in which the heart is unable to pump enough blood and oxygen to the body's tissues.

[0327] Chronic renal failure or chronic kidney disease is a condition characterized by a gradual loss of kidney function over time.

[0328] In some embodiments, chronic infection such as AIDS further leads to muscle atrophy.

[0329] Sepsis is an immune response to an infection leading to tissue damage, organ failure, and/or death.

[0330] Fasting is a willing abstinence or reduction from some or all food, drinks, or both, for a period of time.

[0331] Sarcopenia is the continuous process of muscle atrophy in the course of regular aging that is characterized by a gradual loss of muscle mass and muscle strength over a span of months and years. A regular aging process means herein an aging process that is not influenced or accelerated by the presence of disorders and diseases which promote skeletomuscular neurodegeneration.

[0332] In some instances, treatment with a glucocorticoid further results in muscle atrophy. Exemplary glucocorticoids include, but are not limited to, cortisol, dexamethasone, betamethasone, prednisone, methylprednisolone, and prednisolone.

[0333] Disuse-associated muscle atrophy results when a limb is immobilized (e.g., due to a limb or joint fracture or an orthopedic surgery such as a hip or knee replacement surgery). As used herein, “immobilization” or “immobilized” refers to the partial or complete restriction of movement of limbs, muscles, bones, tendons, joints, or any other body parts for an extended period of time (e.g., for 2 days, 3 days, 4 days, 5 days, 6 days, a week, two weeks, or more). In some instances, a period of immobilization includes short periods or instances of unrestrained movement, such as to bathe, to replace an external device, or to adjust an external device. Limb immobilization is optionally carried out by any variety of external devices including, but are not limited to, braces, slings, casts, bandages, and splints (any of which is optionally composed of hard or soft material including but not limited to cloth, gauze, fiberglass, plastic, plaster, or metal), as well as any variety of internal devices including surgically implanted splints, plates, braces, and the like. In the context of limb immobilization, the restriction of movement involves a single joint or multiple joints (e.g., simple joints such as the shoulder joint or hip joint, compound joints such as the radiocarpal joint, and complex joints such as the knee joint, including but not limited to one or more of the following: articulations of the hand, shoulder joints, elbow joints, wrist joints, auxiliary articulations, sternoclavicular joints, vertebral articulations, temporomandibular joints, sacroiliac joints, hip joints, knee joints, and articulations of the foot), a single tendon or ligament or multiple tendons or ligaments (e.g., including but not limited to one or more of the following: the anterior cruciate ligament, the posterior cruciate ligament, rotator cuff tendons, medial collateral ligaments of the elbow and knee, flexor tendons of the hand, lateral ligaments of the ankle, and tendons and ligaments of the jaw or temporomandibular joint), a single bone or multiple bones (e.g., including but not limited to one or more of the following: the skull, mandible, clavicle, ribs, radius, ulna, humerus, pelvis, sacrum, femur, patella, phalanges, carpals, metacarpals, tarsals, metatarsals, fibula, tibia, scapula, and vertebrae), a single muscle or multiple muscles (e.g., including but not limited to one or more of the following: latissimus dorsi, trapezius, deltoid, pectorals, biceps, triceps, external obliques, abdominals, gluteus maximus, hamstrings, quadriceps, gastrocnemius, and diaphragm); a single limb or multiple limbs (one or more of the arms and legs), or the entire skeletal muscle system or portions thereof (e.g., in the case of a full body cast or spica cast).

[0334] Myotonic dystrophy is a multisystemic neuromuscular disease comprising two main types: myotonic dystrophy type 1 (DM1) and myotonic dystrophy type 2 (DM2). DM1 is caused by a dominantly inherited “CTG” repeat expansion in the gene DM protein kinase (*DMPK*), which when transcribed into mRNA, forms hairpins that bind with high affinity to the Muscleblind-like (MBNL) family of proteins. MBNL proteins are involved in post-transcriptional splicing and polyadenylatin site regulation and loss of the MBNL protein functions lead to downstream accumulation of nuclear foci and increase in mis-splicing events and subsequently to myotonia and other clinical symptoms.

[0335] In some embodiments, described herein is a method of treating a disease or disorder characterized with an incorrectly spliced mRNA. In some embodiments, an anti-transferrin receptor antibody described herein delivers a polynucleic acid molecule to the site of the incorrectly spliced mRNA transcript to induce exon skipping or exon inclusion.

[0336] In some instances, a disease or disorder resulting from improperly spliced or partially spliced mRNA includes, but not limited to, a neuromuscular disease, a genetic disease, cancer, a hereditary disease, or a cardiovascular disease.

[0337] In some instances, genetic diseases or disorders include an autosomal dominant disorder, an autosomal recessive disorder, X-linked dominant disorder, X-linked recessive disorder, Y-linked disorder, mitochondrial disease, or multifactorial or polygenic disorder.

[0338] In some instances, cardiovascular disease such as hypercholesterolemia results from improperly spliced or partially spliced mRNA. In hypercholesterolemia, it has been shown that a single nucleotide polymorphism in exon 12 of the low density lipoprotein receptor (LDLR) promotes exon skipping.

[0339] In some instances, improperly spliced or partially spliced mRNA results in cancer. For example, improperly spliced or partially spliced mRNA affects cellular processes involved in cancer including, but not limited to, proliferation, motility, and drug response. In some instances is a solid cancer or a hematologic cancer. In some instances, the cancer is bladder cancer, lung cancer, brain cancer, melanoma, breast cancer, Non-Hodgkin lymphoma, cervical cancer, ovarian cancer, colorectal cancer, pancreatic cancer, esophageal cancer, prostate cancer, kidney cancer, skin cancer, leukemia, thyroid cancer, liver cancer, or uterine cancer.

[0340] Improperly spliced or partially spliced mRNA in some instances causes a neuromuscular disease or disorder. Exemplary neuromuscular diseases include muscular dystrophy such as Duchenne muscular dystrophy, Becker muscular dystrophy, facioscapulohumeral muscular dystrophy, congenital muscular dystrophy, or myotonic dystrophy. In some instances, muscular dystrophy is genetic. In some instances, muscular dystrophy is caused by a spontaneous mutation. Becker muscular dystrophy and Duchenne muscular dystrophy have been shown to involve mutations in the *DMD* gene, which encodes the protein dystrophin. Facioscapulohumeral muscular dystrophy has been shown to involve mutations in double homeobox, 4 (*DUX4*) gene.

[0341] In some instances, improperly spliced or partially spliced mRNA causes Duchenne muscular dystrophy. Duchenne muscular dystrophy results in severe muscle weakness and is caused by mutations in the *DMD* gene that abolishes the production of functional dystrophin. In some instances, Duchenne muscular dystrophy is a result of a mutation in an exon in the *DMD* gene. In some instances, Duchenne muscular dystrophy is a result of a mutation in at least one of exon 1, 2, 3, 4, 5, 6, 7, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78 and 79 in the *DMD* gene. In some instances, Duchenne muscular dystrophy is a result of a mutation in at least one of exon 3, 4, 5, 6, 7, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, and 63 in

the *DMD* gene. In some instances, Duchenne muscular dystrophy is a result of a mutation in at least one of exon 8, 23, 35, 43, 44, 45, 50, 51, 52, 53, and 55 in the *DMD* gene. In some instances, multiple exons are mutated. For example, mutation of exons 48-50 is common in Duchenne muscular dystrophy patients. In some instances, Duchenne muscular dystrophy is a result of mutation of exon 51. In some instances, Duchenne muscular dystrophy is a result of mutation of exon 23. In some instances, a mutation involves a deletion of one or multiple exons. In some instances, a mutation involves a duplication of one or multiple exons. In some instances, a mutation involves a point mutation in an exon. For example, it has been shown that some patients have a nonsense point mutation in exon 51 of the *DMD* gene.

Pharmaceutical Formulation

[0342] In some embodiments, the pharmaceutical formulations described herein are administered to a subject by multiple administration routes, including but not limited to, parenteral (e.g., intravenous, subcutaneous, intramuscular), oral, intranasal, buccal, rectal, or transdermal administration routes. In some instances, the pharmaceutical composition described herein is formulated for parenteral (e.g., intravenous, subcutaneous, intramuscular, intra-arterial, intraperitoneal, intrathecal, intracerebral, intracerebroventricular, or intracranial) administration. In other instances, the pharmaceutical composition described herein is formulated for oral administration. In still other instances, the pharmaceutical composition described herein is formulated for intranasal administration.

[0343] In some embodiments, the pharmaceutical formulations include, but are not limited to, aqueous liquid dispersions, self-emulsifying dispersions, solid solutions, liposomal dispersions, aerosols, solid dosage forms, powders, immediate release formulations, controlled release formulations, fast melt formulations, tablets, capsules, pills, delayed release formulations, extended release formulations, pulsatile release formulations, multiparticulate formulations (e.g., nanoparticle formulations), and mixed immediate and controlled release formulations.

[0344] In some instances, the pharmaceutical formulation includes multiparticulate formulations. In some instances, the pharmaceutical formulation includes nanoparticle formulations. In some instances, nanoparticles comprise cMAP, cyclodextrin, or lipids. In some cases, nanoparticles comprise solid lipid nanoparticles, polymeric nanoparticles, self-emulsifying nanoparticles, liposomes, microemulsions, or micellar solutions. Additional exemplary nanoparticles include, but are not limited to, paramagnetic nanoparticles, superparamagnetic nanoparticles, metal nanoparticles, fullerene-like materials, inorganic nanotubes, dendrimers (such as with covalently attached metal chelates), nanofibers, nanohorns, nano-onions, nanorods, nanoropes and quantum dots. In some instances, a nanoparticle is a metal nanoparticle, e.g., a nanoparticle of scandium, titanium, vanadium, chromium, manganese, iron, cobalt, nickel, copper, zinc, yttrium, zirconium, niobium, molybdenum, ruthenium, rhodium, palladium, silver, cadmium, hafnium, tantalum, tungsten, rhenium, osmium, iridium, platinum, gold, gadolinium, aluminum, gallium, indium, tin, thallium, lead, bismuth, magnesium, calcium, strontium, barium, lithium, sodium, potassium, boron, silicon, phosphorus, germanium, arsenic, antimony, and combinations, alloys or oxides thereof.

[0345] In some instances, a nanoparticle includes a core or a core and a shell, as in a core-shell nanoparticle.

[0346] In some instances, a nanoparticle is further coated with molecules for attachment of functional elements (e.g., with one or more of a polynucleic acid molecule or binding moiety described herein). In some instances, a coating comprises chondroitin sulfate, dextran sulfate, carboxymethyl dextran, alginic acid, pectin, carrageenan, fucoidan, agarpectin, porphyran, karaya gum, gellan gum, xanthan gum, hyaluronic acids, glucosamine, galactosamine, chitin (or chitosan), polyglutamic acid, polyaspartic acid, lysozyme, cytochrome C, ribonuclease, trypsinogen, chymotrypsinogen, α -chymotrypsin, polylysine, polyarginine, histone, protamine, ovalbumin or dextrin or cyclodextrin. In some instances, a nanoparticle comprises a graphene-coated nanoparticle.

[0347] In some cases, a nanoparticle has at least one dimension of less than about 500nm, 400nm, 300nm, 200nm, or 100nm.

[0348] In some instances, the nanoparticle formulation comprises paramagnetic nanoparticles, superparamagnetic nanoparticles, metal nanoparticles, fullerene-like materials, inorganic nanotubes, dendrimers (such as with covalently attached metal chelates), nanofibers, nanohorns, nano-onions, nanorods, nanoropes or quantum dots. In some instances, a polynucleic acid molecule or a binding moiety described herein is conjugated either directly or indirectly to the nanoparticle. In some instances, at least 1, 5, 10, 15, 20, 30, 40, 50, 60, 70, 80, 90, 100 or more polynucleic acid molecules or binding moieties described herein are conjugated either directly or indirectly to a nanoparticle.

[0349] In some embodiments, the pharmaceutical formulation comprise a delivery vector, e.g., a recombinant vector, the delivery of the polynucleic acid molecule into cells. In some instances, the recombinant vector is DNA plasmid. In other instances, the recombinant vector is a viral vector. Exemplary viral vectors include vectors derived from adeno-associated virus, retrovirus, adenovirus, or alphavirus. In some instances, the recombinant vectors capable of expressing the polynucleic acid molecules provide stable expression in target cells. In additional instances, viral vectors are used that provide for transient expression of polynucleic acid molecules.

[0350] In some embodiments, the pharmaceutical formulations include a carrier or carrier materials selected on the basis of compatibility with the composition disclosed herein, and the release profile properties of the desired dosage form. Exemplary carrier materials include, e.g., binders, suspending agents, disintegration agents, filling agents, surfactants, solubilizers, stabilizers, lubricants, wetting agents, diluents, and the like. Pharmaceutically compatible carrier materials include, but are not limited to, acacia, gelatin, colloidal silicon dioxide, calcium glycerophosphate, calcium lactate, maltodextrin, glycerine, magnesium silicate, polyvinylpyrrolidone (PVP), cholesterol, cholesterol esters, sodium caseinate, soy lecithin, taurocholic acid, phosphatidylcholine, sodium chloride, tricalcium phosphate, dipotassium phosphate, cellulose and cellulose conjugates, sugars sodium stearoyl lactylate, carrageenan, monoglyceride, diglyceride, pregelatinized starch, and the like. See, e.g., *Remington: The Science and Practice of Pharmacy*, Nineteenth Ed (Easton, Pa.: Mack Publishing Company, 1995); Hoover, John E., *Remington's Pharmaceutical Sciences*, Mack Publishing Co., Easton, Pennsylvania 1975; Liberman,

H.A. and Lachman, L., Eds., *Pharmaceutical Dosage Forms*, Marcel Decker, New York, N.Y., 1980; and *Pharmaceutical Dosage Forms and Drug Delivery Systems*, Seventh Ed. (Lippincott Williams & Wilkins 1999).

[0351] In some instances, the pharmaceutical formulations further include pH adjusting agents or buffering agents which include acids such as acetic, boric, citric, lactic, phosphoric and hydrochloric acids; bases such as sodium hydroxide, sodium phosphate, sodium borate, sodium citrate, sodium acetate, sodium lactate and tris-hydroxymethylaminomethane; and buffers such as citrate/dextrose, sodium bicarbonate and ammonium chloride. Such acids, bases and buffers are included in an amount required to maintain pH of the composition in an acceptable range.

[0352] In some instances, the pharmaceutical formulation includes one or more salts in an amount required to bring osmolality of the composition into an acceptable range. Such salts include those having sodium, potassium or ammonium cations and chloride, citrate, ascorbate, borate, phosphate, bicarbonate, sulfate, thiosulfate or bisulfite anions; suitable salts include sodium chloride, potassium chloride, sodium thiosulfate, sodium bisulfite and ammonium sulfate.

Therapeutic Regimens

[0353] In some embodiments, the pharmaceutical compositions described herein are administered for therapeutic applications. In some embodiments, the pharmaceutical composition is administered once per day, twice per day, three times per day or more. The pharmaceutical composition is administered daily, every day, every alternate day, five days a week, once a week, every other week, two weeks per month, three weeks per month, once a month, twice a month, three times per month, or more. The pharmaceutical composition is administered for at least 1 month, 2 months, 3 months, 4 months, 5 months, 6 months, 7 months, 8 months, 9 months, 10 months, 11 months, 12 months, 18 months, 2 years, 3 years, or more.

[0354] In some embodiments, one or more pharmaceutical compositions are administered simultaneously, sequentially, or at an interval period of time. In some embodiments, one or more pharmaceutical compositions are administered simultaneously. In some cases, one or more pharmaceutical compositions are administered sequentially. In additional cases, one or more pharmaceutical compositions are administered at an interval period of time (e.g., the first administration of a first pharmaceutical composition is on day one followed by an interval of at least 1, 2, 3, 4, 5, or more days prior to the administration of at least a second pharmaceutical composition).

[0355] In some embodiments, two or more different pharmaceutical compositions are coadministered. In some instances, the two or more different pharmaceutical compositions are coadministered simultaneously. In some cases, the two or more different pharmaceutical compositions are coadministered sequentially without a gap of time between administrations. In other cases, the two or more different pharmaceutical compositions are coadministered sequentially with a gap of about 0.5 hour, 1 hour, 2 hour, 3 hour, 12 hours, 1 day, 2 days, or more between administrations.

[0356] In the case wherein the patient's status does improve, upon the doctor's discretion the administration of the composition is given continuously; alternatively, the dose of the composition being administered is temporarily reduced or temporarily suspended for a certain length of time (i.e., a "drug holiday"). In some instances, the length of the drug holiday varies between 2 days and 1 year, including by way of example only, 2 days, 3 days, 4 days, 5 days, 6 days, 7 days, 10 days, 12 days, 15 days, 20 days, 28 days, 35 days, 50 days, 70 days, 100 days, 120 days, 150 days, 180 days, 200 days, 250 days, 280 days, 300 days, 320 days, 350 days, or 365 days. The dose reduction during a drug holiday is from 10%-100%, including, by way of example only, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95%, or 100%.

[0357] Once improvement of the patient's conditions has occurred, a maintenance dose is administered if necessary. Subsequently, the dosage or the frequency of administration, or both, can be reduced, as a function of the symptoms, to a level at which the improved disease, disorder or condition is retained.

[0358] In some embodiments, the amount of a given agent that correspond to such an amount varies depending upon factors such as the particular compound, the severity of the disease, the identity (e.g., weight) of the subject or host in need of treatment, but nevertheless is routinely determined in a manner known in the art according to the particular circumstances surrounding the case, including, e.g., the specific agent being administered, the route of administration, and the subject or host being treated. In some instances, the desired dose is conveniently presented in a single dose or as divided doses administered simultaneously (or over a short period of time) or at appropriate intervals, for example as two, three, four or more sub-doses per day.

[0359] The foregoing ranges are merely suggestive, as the number of variables in regard to an individual treatment regime is large, and considerable excursions from these recommended values are not uncommon. Such dosages is altered depending on a number of variables, not limited to the activity of the compound used, the disease or condition to be treated, the mode of administration, the requirements of the individual subject, the severity of the disease or condition being treated, and the judgment of the practitioner.

[0360] In some embodiments, toxicity and therapeutic efficacy of such therapeutic regimens are determined by standard pharmaceutical procedures in cell cultures or experimental animals, including, but not limited to, the determination of the LD50 (the dose lethal to 50% of the population) and the ED50 (the dose therapeutically effective in 50% of the population). The dose ratio between the toxic and therapeutic effects is the therapeutic index and it is expressed as the ratio between LD50 and ED50. Compounds exhibiting high therapeutic indices are preferred. The data obtained from cell culture assays and animal studies are used in formulating a range of dosage for use in human. The dosage of such compounds lies preferably within a range of circulating concentrations that include the ED50 with minimal toxicity. The dosage varies within this range depending upon the dosage form employed and the route of administration utilized.

Kits/Article of Manufacture

[0361] Disclosed herein, in certain embodiments, are kits and articles of manufacture for use with one or more of the compositions and methods described herein. Such kits include a carrier, package, or container that is compartmentalized to receive one or more containers such as vials, tubes, and the like, each of the container(s) comprising one of the separate elements to be used in a method described herein. Suitable containers include, for example, bottles, vials, syringes, and test tubes. In one embodiment, the containers are formed from a variety of materials such as glass or plastic.

[0362] The articles of manufacture provided herein contain packaging materials. Examples of pharmaceutical packaging materials include, but are not limited to, blister packs, bottles, tubes, bags, containers, bottles, and any packaging material suitable for a selected formulation and intended mode of administration and treatment.

[0363] For example, the container(s) include anti-transferrin receptor receptor antibodies and optionally one or more target nucleic acid molecules described herein. Such kits optionally include an identifying description or label or instructions relating to its use in the methods described herein.

[0364] A kit typically includes labels listing contents and/or instructions for use, and package inserts with instructions for use. A set of instructions will also typically be included.

[0365] In one embodiment, a label is on or associated with the container. In one embodiment, a label is on a container when letters, numbers or other characters forming the label are attached, molded or etched into the container itself; a label is associated with a container when it is present within a receptacle or carrier that also holds the container, e.g., as a package insert. In one embodiment, a label is used to indicate that the contents are to be used for a specific therapeutic application. The label also indicates directions for use of the contents, such as in the methods described herein.

[0366] In certain embodiments, the pharmaceutical compositions are presented in a pack or dispenser device which contains one or more unit dosage forms containing a compound provided herein. The pack, for example, contains metal or plastic foil, such as a blister pack. In one embodiment, the pack or dispenser device is accompanied by instructions for administration. In one embodiment, the pack or dispenser is also accompanied with a notice associated with the container in form prescribed by a governmental agency regulating the manufacture, use, or sale of pharmaceuticals, which notice is reflective of approval by the agency of the form of the drug for human or veterinary administration. Such notice, for example, is the labeling approved by the U.S. Food and Drug Administration for prescription drugs, or the approved product insert. In one embodiment, compositions containing a compound provided herein formulated in a compatible pharmaceutical carrier are also prepared, placed in an appropriate container, and labeled for treatment of an indicated condition.

Certain Terminology

[0367] Unless defined otherwise, all technical and scientific terms used herein have the same meaning as is commonly understood by one of skill in the art to which the claimed subject matter belongs. It is to be understood that the foregoing general description and the following detailed description are exemplary and explanatory only and are not restrictive of any subject matter claimed. In this application, the use of

the singular includes the plural unless specifically stated otherwise. It must be noted that, as used in the specification and the appended claims, the singular forms “a,” “an” and “the” include plural referents unless the context clearly dictates otherwise. In this application, the use of “or” means “and/or” unless stated otherwise. Furthermore, use of the term “including” as well as other forms, such as “include”, “includes,” and “included,” is not limiting.

[0368] As used herein, ranges and amounts can be expressed as “about” a particular value or range.

About also includes the exact amount. Hence “about 5 μ L” means “about 5 μ L” and also “5 μ L.”

Generally, the term “about” includes an amount that would be expected to be within experimental error.

[0369] The section headings used herein are for organizational purposes only and are not to be construed as limiting the subject matter described.

[0370] “Antibodies” and “immunoglobulins” (Igs) are glycoproteins having the same structural characteristics. The terms are used synonymously. In some instances, the antigen specificity of the immunoglobulin is known.

[0371] The term “antibody” is used in the broadest sense and covers fully assembled antibodies, antibody fragments that can bind antigen (e.g., Fab, F(ab')₂, Fv, single chain antibodies, diabodies, antibody chimeras, hybrid antibodies, bispecific antibodies, humanized antibodies, and the like), and recombinant peptides comprising the forgoing.

[0372] The terms “monoclonal antibody” and “mAb” as used herein refer to an antibody obtained from a substantially homogeneous population of antibodies, i.e., the individual antibodies comprising the population are identical except for possible naturally occurring mutations that may be present in minor amounts.

[0373] Native antibodies” and “native immunoglobulins” are usually heterotetrameric glycoproteins of about 150,000 daltons, composed of two identical light (L) chains and two identical heavy (H) chains. Each light chain is linked to a heavy chain by one covalent disulfide bond, while the number of disulfide linkages varies among the heavy chains of different immunoglobulin isotypes. Each heavy and light chain also has regularly spaced intrachain disulfide bridges. Each heavy chain has at one end a variable domain (V_H) followed by a number of constant domains. Each light chain has a variable domain at one end (V_L) and a constant domain at its other end; the constant domain of the light chain is aligned with the first constant domain of the heavy chain, and the light chain variable domain is aligned with the variable domain of the heavy chain. Particular amino acid residues are believed to form an interface between the light and heavy-chain variable domains.

[0374] The term “variable” refers to the fact that certain portions of the variable domains differ extensively in sequence among antibodies. Variable regions confer antigen-binding specificity. However, the variability is not evenly distributed throughout the variable domains of antibodies. It is concentrated in three segments called complementarity determining regions (CDRs) or hypervariable regions, both in the light chain and the heavy-chain variable domains. The more highly conserved portions of variable domains are celled in the framework (FR) regions. The variable domains of native heavy and light chains each comprise four FR regions, largely adopting a β -pleated-sheet configuration, connected by three

CDRs, which form loops connecting, and in some cases forming part of, the β -pleated-sheet structure. The CDRs in each chain are held together in close proximity by the FR regions and, with the CDRs from the other chain, contribute to the formation of the antigen-binding site of antibodies (see, Kabat et al. (1991) NIH PubL. No. 91-3242, Vol. I, pages 647-669). The constant domains are not involved directly in binding an antibody to an antigen, but exhibit various effector functions, such as Fc receptor (FcR) binding, participation of the antibody in antibody-dependent cellular toxicity, initiation of complement dependent cytotoxicity, and mast cell degranulation.

[0375] The term “hypervariable region,” when used herein, refers to the amino acid residues of an antibody that are responsible for antigen-binding. The hypervariable region comprises amino acid residues from a “complementarily determining region” or “CDR” (i.e., residues 24-34 (L1), 50-56 (L2), and 89-97 (L3) in the light-chain variable domain and 31-35 (H1), 50-65 (H2), and 95-102 (H3) in the heavy-chain variable domain; Kabat et al. (1991) Sequences of Proteins of Immunological Interest, 5th Ed. Public Health Service, National Institute of Health, Bethesda, Md.) and/or those residues from a “hypervariable loop” (i.e., residues 26-32 (L1), 50-52 (L2), and 91-96 (L3) in the light-chain variable domain and (H1), 53-55 (H2), and 96-101 (13) in the heavy chain variable domain; Clothia and Lesk, (1987) J. Mol. Biol., 196:901-917). “Framework” or “FR” residues are those variable domain residues other than the hypervariable region residues, as herein deemed.

[0376] “Antibody fragments” comprise a portion of an intact antibody, preferably the antigen-binding or variable region of the intact antibody. Examples of antibody fragments include Fab, Fab', F(ab')₂, and Fv fragments; diabodies; linear antibodies (Zapata et al. (1995) Protein Eng. 10:1057-1062); single-chain antibody molecules; and multispecific antibodies formed from antibody fragments. Papain digestion of antibodies produces two identical antigen-binding fragments, called “Fab” fragments, each with a single antigen-binding site, and a residual “Fc” fragment, whose name reflects its ability to crystallize readily. Pepsin treatment yields an F(ab')₂ fragment that has two antigen-combining sites and is still capable of cross-linking antigen.

[0377] “Fv” is the minimum antibody fragment that contains a complete antigen recognition and binding site. This region consists of a dimer of one heavy- and one light-chain variable domain in tight, non-covalent association. It is in this configuration that the three CDRs of each variable domain interact to define an antigen-binding site on the surface of the V_H-V_L dimer. Collectively, the six CDRs confer antigen-binding specificity to the antibody. However, even a single variable domain (or half of an Fv comprising only three CDRs specific for an antigen) has the ability to recognize and bind antigen, although at a lower affinity than the entire binding site.

[0378] The Fab fragment also contains the constant domain of the light chain and the first constant domain (C_{H1}) of the heavy chain. Fab fragments differ from Fab' fragments by the addition of a few residues at the carboxy terminus of the heavy chain C_{H1} domain including one or more cysteines from the antibody hinge region. Fab'-SH is the designation herein for Fab' in which the cysteine residue(s) of the constant domains bear a free thiol group. Fab' fragments are produced by reducing the F(ab')₂

fragment's heavy chain disulfide bridge. Other chemical couplings of antibody fragments are also known.

[0379] The "light chains" of antibodies (immunoglobulins) from any vertebrate species can be assigned to one of two clearly distinct types, called kappa (κ) and lambda (λ), based on the amino acid sequences of their constant domains.

[0380] Depending on the amino acid sequence of the constant domain of their heavy chains, immunoglobulins can be assigned to different classes. There are five major classes of human immunoglobulins: IgA, IgD, IgE, IgG, IgM, and IgY, and several of these may be further divided into subclasses (isotypes), e.g., IgG1, IgG2, IgG3, IgG4, IgA1, and IgA2. The heavy-chain constant domains that correspond to the different classes of immunoglobulins are called alpha, delta, epsilon, gamma, and mu, respectively. The subunit structures and three-dimensional configurations of different classes of immunoglobulins are well known. Different isotypes have different effector functions. For example, human IgG1 and IgG3 isotypes have ADCC (antibody dependent cell-mediated cytotoxicity) activity.

[0381] In some instances, the CDRs of an antibody is determined according to (i) the Kabat numbering system (Kabat *et al.* (197) Ann. NY Acad. Sci. 190:382-391 and, Kabat *et al.* (1991) Sequences of Proteins of Immunological Interest Fifth Edition, U.S. Department of Health and Human Services, NIH Publication No. 91-3242); or (ii) the Chothia numbering scheme, which will be referred to herein as the "Chothia CDRs" (see, e.g., Chothia and Lesk, 1987, *J. Mol. Biol.*, **196**:901-917; Al-Lazikani *et al.*, 1997, *J. Mol. Biol.*, **273** :927-948; Chothia *et al.*, 1992, *J. Mol. Biol.*, **227**:799-817; Tramontano A *et al.* , 1990, *J. Mol. Biol.* **215**(1): 175-82; and U.S. Patent No. 7,709,226); or (iii) the ImMunoGeneTics (IMGT) numbering system, for example, as described in Lefranc, M.-P., 1999, *The Immunologist*, **7**: 132-136 and Lefranc, M.-P. *et al.*, 1999, *Nucleic Acids Res.*, **27**:209-212 ("IMGT CDRs"); or (iv) MacCallum *et al.*, 1996, *J. Mol. Biol.*, **262**:732-745. See also, e.g., Martin, A., "Protein Sequence and Structure Analysis of Antibody Variable Domains," in Antibody Engineering, Kontermann and Diibel, eds., Chapter 31, pp. 422-439, Springer- Verlag, Berlin (2001).

[0382] With respect to the Kabat numbering system, CDRs within an antibody heavy chain molecule are typically present at amino acid positions 31 to 35, which optionally can include one or two additional amino acids, following 35 (referred to in the Kabat numbering scheme as 35 A and 35B) (CDR1), amino acid positions 50 to 65 (CDR2), and amino acid positions 95 to 102 (CDR3). Using the Kabat numbering system, CDRs within an antibody light chain molecule are typically present at amino acid positions 24 to 34 (CDR1), amino acid positions 50 to 56 (CDR2), and amino acid positions 89 to 97 (CDR3). As is well known to those of skill in the art, using the Kabat numbering system, the actual linear amino acid sequence of the antibody variable domain can contain fewer or additional amino acids due to a shortening or lengthening of a FR and/or CDR and, as such, an amino acid's Kabat number is not necessarily the same as its linear amino acid number.

[0383] With respect to the Chotia numbering system, CDRs within an antibody heavy chain molecule are typically present at amino acid positions 26 to 31, which optionally can include one or two additional amino acids, following 31 (referred to in the Chotia numbering scheme as 31A and 31 B) (CDR1), amino

acid positions 52 to 56 (CDR2), and amino acid positions 95 to 102 (CDR3). Using the Chotia numbering system, CDRs within an antibody light chain molecule are typically present at amino acid positions 24 to 34 (CDR1), amino acid positions 50 to 56 (CDR2), and amino acid positions 89 to 97 (CDR3). As is well known to those of skill in the art, using the Chotia numbering system, the actual linear amino acid sequence of the antibody variable domain can contain fewer or additional amino acids due to a shortening or lengthening of a FR and/or CDR and, as such, an amino acid's Chotia number is not necessarily the same as its linear amino acid number.

[0384] The term "chimeric" antibody refers to an antibody in which a portion of the heavy and/or light chain is derived from a particular source or species, while the remainder of the heavy and/or light chain is derived from a different source or species.

[0385] The term "humanized antibody" refers to antibodies in which the framework or the CDRs have been modified to comprise the CDR of an immunoglobulin of different specificity as compared to that of the parent immunoglobulin.

[0386] As used herein, the terms "individual(s)", "subject(s)" and "patient(s)" mean any mammal. In some embodiments, the mammal is a human. In some embodiments, the mammal is a non-human. None of the terms require or are limited to situations characterized by the supervision (e.g. constant or intermittent) of a health care worker (e.g. a doctor, a registered nurse, a nurse practitioner, a physician's assistant, an orderly or a hospice worker).

EXAMPLES

[0387] These examples are provided for illustrative purposes only and not to limit the scope of the claims provided herein.

Example 1: Humanized anti-TfR antibody production and characterization

[0388] Nucleic acids encoding exemplary anti-TfR antibodies were stably transfected into CHOK1SV GSKO cells to create 3 stable pools per product. The stable pools were monitored for cell growth and Protein A titre from day 8 post transfection. Once cultures reached a threshold of 0.6×10^6 cells/mL at 70% viability, the stable pools were passaged. When the viability of the cells was in excess of 97%, the highest producing pools among the tested pools were used to seed a 600 mL fed batch overgrow culture (FOG) per product, at 0.2×10^6 cells/mL. The FOG cultures were fed on days 4 and 8 and harvested on day 11 by centrifugation and sterile filtration. Sterile cell culture supernatant was purified by Protein A purification using 3 x 5ml MabSelectSuRE columns in tandem on an AKTA purifier (run at 10 mL/min). Columns were equilibrated with 50 mM sodium phosphate; 250 mM sodium chloride, pH 7.0, washed with 50 mM sodium phosphate and 1 M sodium chloride, pH 7.0, and eluted with 10 mM sodium formate, pH 3.5. Eluted fractions were neutralized by diluting 1:2 with 2x PBS, then pH adjusted to 7.4 using diluted NaOH.

[0389] The antibodies were analyzed by SE-HPLC and SDS-PAGE. Duplicate samples were analyzed by SE-HPLC using a Zorbax GF-2509.4 mm ID x 25 cm column (Agilent). 80 μ l aliquots of 1mg/ml samples were injected and run in 50mM sodium phosphate, 150mM sodium chloride, 500mM L-arginine,

pH 6.0 at 1ml/min for 15 minutes. All variants showed small peaks <16.89% with a retention time of ~7.66 min, consistent with soluble aggregates. Soluble aggregate levels were analyzed using Empower v3 software.

[0390] Table 9 illustrates the construct design and HPLC analysis of the tested anti-TfR antibodies.

Antibody Name	HC Name	LC Name	Retention Time (Min)	% Monomer
13E4-Variant 2i	13E VH2 a	13E4 VL1	8.315	95.44

[0391] The binding kinetics of nine exemplary humanized anti-TfR antibodies and the parent chimeric antibody were characterized. Studies were run on a BioRad ProteOn XPR36 optical biosensor using a GLM sensor chip coated with Protein A for mAb capture. Running buffer included 10 mM HEPES, 150 mM NaCl, pH 7.4 with 0.05% tween-20 with 0.2 mg/ml BSA. Data were collected at 25 degrees C. All mAbs were diluted into running buffer to 2 ug/ml based on the stock concentration provided. Each was then captured for 40 seconds over a Protein A surface.

[0392] hTfR (100 ug) was dissolved into 300 uL of water to yield a 4.3 uM stock concentration. hTfR was diluted to 43 nM as the highest concentration and tested in a 3 fold dilution series. hTfR was injected at 200 ul/min for 2 minutes followed by a one-hour dissociation phase.

[0393] Response data were processed by subtracting data from the inner-spot reference surfaces, as well as double referenced with a buffer injection.

[0394] Table 10 illustrates the binding constants determined at 25°C.

*Number in parentheses represents the standard error in the last reported digit based on a fit of the data set.

**Number in brackets represent the experiment standard deviation based on replicate data sets. For example, 9[1]e5 represents (9 ± 1)e5.

Example 2

[0395] *In vivo* gene downregulation using a hIgG2 TfR1 chimeric antibody siRNA (SSB) conjugate

[0396] The CDRs of a mouse IgG2 antibody against hTfR1 were subcloned into a human IgG2 background and transfected, see Example 4 for sequence, into CHO-K1SP cells. Stable cell pools were selected, amplified and seeded in Dynamis medium (GIBCO) in cellbags (GE Healthcare) at 37°C with 5% CO₂ using a Wave Bioreactor (GE Healthcare). 8% of final culture volume (25 liters) was fed every two days starting at day 4 for a total of 14 days incubation. The culture supernatant was harvested, depth filtered, and purified using a Monofinity A Resin (GenScript) at a flow rate of 30 ml/min. The buffer of the eluted protein was changed to PBS, and the purified protein was analyzed by SDS-PAGE under reducing and non-reducing conditions and SEC-HPLC for molecular weight and purity. The final protein was >98% pure.

[0397] Conjugation of the TfR1-IgG2 mAb chimera to SSB siRNA using a bis-maleimide (BisMal) linker

[0398] For the conjugate used in this experiment a SSB siRNA duplex was used. The sequence of the 21mer SSB guide/antisense strand was (5' to 3') UUACAUUAAGUCUGUUGUUU. Single strands were fully assembled on solid phase using standard phosphoramidite chemistry and purified using HPLC. Base, sugar and phosphate modifications that are well described in the field of RNAi were used to optimize the potency of the duplex and reduce immunogenicity. The siRNA passenger strand contained a C6-NH₂ conjugation handle on the 5' end, see Fig. 1. The siRNA duplex was designed as a blunt ended duplex with 19 bases of complementarity and one 3' dinucleotide overhang. The conjugation handle was connected to siRNA passenger strand via a phosphodiester on the terminal base, see Fig. 2.

[0399] Step 1: Antibody reduction with TCEP

[0400] Antibody was buffer exchanged with 25mM borate buffer (pH 8) with 1mM DTPA and made up to 10mg/ml concentration. To this solution, 4 equivalents of TCEP in the same borate buffer were added and incubated for 2 hours at 37°C. The resultant reaction mixture was combined with a solution of BisMal-siRNA (1.25 equivalents) in pH 6.0 10 mM acetate buffer at room temperature (RT) and kept at 4 °C overnight. Analysis of the reaction mixture by analytical SAX column chromatography showed antibody siRNA conjugate along with unreacted antibody and siRNA. The reaction mixture was treated with 10 EQ of N-ethylmaleimide (in DMSO at 10 mg/mL) to cap any remaining free cysteine residues.

[0401] Step 2: Purification

[0402] The crude reaction mixture was purified by AKTA Pure FPLC using anion exchange chromatography (SAX) method-1. Fractions containing DAR1 antibody-siRNA conjugates were isolated, concentrated and buffer exchanged with pH 7.4 PBS.

[0403] Anion exchange chromatography method (SAX)-1.

[0404] Column: Tosoh Bioscience, TSKGel SuperQ-5PW, 21.5 mm ID X 15 cm, 13 μ m

[0405] Solvent A: 20 mM TRIS buffer, pH 8.0; Solvent B: 20 mM TRIS, 1.5 M NaCl, pH 8.0; Flow Rate: 6.0 ml/min

TfR-SSB DAR 1	9.41	99

[0412] Analytical data table of conjugates used in this example: HPLC retention time (RT) in minutes and % purity by chromatographic peak area.

[0413] *In vitro* activity of hTfR1-IgG2 mAb siRNA DAR1 conjugates

[0414] The ability of the hTfR1-IgG2 mAb siRNA conjugates to bind human and cynoTfR1 was assessed using an ELISA assay. Half-well high-binding 96-well plates (Costar #3690) were coated with recombinant human transferrin receptor protein (Sino Biological 11020-H07H) or recombinant cyno transferrin receptor protein (Sino Biological 90253-C07H) at 1 ng/ μ L in PBS (Gibco 14190) and

incubated overnight at 4 °C. Plates were washed four times with 100 µL of Tris buffered saline + Tween (20x TBST, Cell Signaling 9997S). 100 µL of Superblock (ThermoFisher PI-37535) was added to each well and incubated for 1 hour at room temperature. The wash step was repeated before the addition of the samples. Samples were added at concentrations up to 10 nM, 50 µL/well. Plates were incubated for another hour at room temp and wash step repeated. Secondary antibody (Peroxidase AffiniPure Goat Anti-Human IgG, Fcγ Fragment Specific, Jackson Immunoresearch, 109-035-098) was diluted 1:5000 in Superblock and 50 µL/well added. Plates were incubated for 1 hour at room temperature and washed one more time. Binding was measured by the addition of 50 µL of 1-Step™ Ultra TMB-ELISA (ThermoFisher, 34028), incubated for 5 minutes, and the reaction was stopped with the addition of 25 µL of Stop Solution 2N sulfuric Acid (R&D Systems DY994). Absorbance was measured at 450 nm, with reference wavelength 570 nm subtracted. Binding constants were determined using GraphPad Prism Specific Binding with Hill Slope.

[0415] The non-conjugated and conjugated hTfR1.IgG2 mAb antibody binds recombinant human and cyno TfR1 with similar affinity (Fig. 3A-Fig. 3B).

[0416] The ability of the TfR1.IgG2 mAb-SSB conjugate to downregulate SSB expression was monitored in HEL92.1.7 and human skeletal muscle cells. HEL92.1.7 cells (ATCC® TIB-180™) were cultured in RPMI 1640 containing 10% fetal bovine serum (Nucleus Biologics FBS1824). Cells were diluted to 100,000/mL and 100 µL was added to each well of the plate. Antibody conjugates were diluted for a maximum concentration of 100 nM. 20 µL of conjugates or PBS as negative control were added to wells of a 96-well plate, the treated cells were placed at 37°C and 5% CO₂ for 72 hours.

[0417] Immortalized human skeletal muscle cells (Institute of Myology, Paris) were plated in 500 µL Skeletal Muscle Cell Growth Medium (PromoCell C-23260) on 24-well collagen plates (Thermo Fisher A1142802) and incubated at 37°C in 5% CO₂ until myoblasts became confluent. At this point differentiation to myotubes was induced by incubation in 500 µL differentiation medium (DMEM (Gibco 10566-016) supplemented with 10 µg/ml Insulin and 50 µg/ml gentamycin) for 4 days. The medium was refreshed and 50 µL TfR1.IgG2 mAb-SSB conjugates diluted in PBS were added. The treated cells were incubated for 72 hours. For harvesting and analysis of either cell type, media was removed from wells and 150 µL of Trizol (Ambion 15596018) was added. Plates were frozen at -80°C for overnight or longer before analysis. RNA was isolated using a Direct-zol 96 RNA kit following manufacturer's instructions and quantified spectrophotometrically. RNA (100-200 ng) was reverse transcribed according to manufacturer's instructions using the High Capacity cDNA kit (Thermo Fisher #4368813). mRNA levels were quantified using TaqMan qPCR, using the appropriately designed primers and probes. PPIB (housekeeping gene) was used as an internal RNA loading control. % mRNA was calculated using the ΔΔC_t method, with PBS treated cells set to 100% expression. In these experiments the TfR1.IgG2 mAb-SSB conjugate downregulated SSB by up to 60%, whereas SSB were maximally 25% downregulated in cells treated with an TfR1.IgG2 mAb-MSTN conjugate (negative control) (Fig. 4A-Fig. 4B).

[0418] Activity and safety of the hTfR1-IgG2 mAb SSB siRNA conjugate in cynomolgus monkeys

[0419] The PK, PD, and safety features of the hIgG2 TfR1.mAb-siSSB conjugate were assessed in cynomolgus monkeys. Animals were male, 2-3 years old and weighed between 2-3 kg. Animals were dosed with the conjugate at 30 mg/kg or 60 mg/kg (mAb concentration), or PBS by 30 minutes (+/- 3 minutes) intravenous (IV) infusion. Blood specimens and muscle biopsies were collected from peripheral veins of restrained, conscious animals or gastrocnemius and quadriceps of sedated animals, respectively, at different times as outlined in Table 12.

[0420] Table 12: Schedule of sampling cynomolgus monkeys treated with hTfR1.IgG2 mAb siRNA conjugates.

Time Point (Study Week)	Hematology	Serum Chemistry	PK	Muscle Biopsy ^c
Acclimation (Week -2)	1x	1x	-	1x (Gastroc)
Acclimation (Week -1)	1x	1x	-	1x (Gastroc)
Dosing Day 1	1x	1x	3x (5', 4h)	-
Day 2	1x	1x	1x	-
Day 3			1x	-
Day 4	1x	1x	1x	-
Day 8	1x	1x	1x	-
Day 15	1x	1x	1x	-
Day 22	1x	1x	1x	1x (Gastroc)
Day 29	1x	1x	1x	2x (Gastroc, Quad)

[0421] The plasma concentration of hIgG2 TfR1.mAb-siSSB conjugate was determined using a stem-loop qPCR assay. Briefly, plasma samples were directly diluted in TE buffer + 0.1% v/v Triton X-100. Standard curves were generated by spiking siRNA into plasma from untreated animals and then serially diluting with TE buffer + 0.1% v/v Triton X-100. The antisense strand of the siRNA was reverse transcribed using a TaqMan MicroRNA reverse transcription kit (Applied Biosystems) with 25 nM of a sequence-specific stem-loop RT primer. The cDNA from the RT step was utilized for real-time PCR using TaqMan Fast Advanced Master Mix (Applied Biosystems) with 1.5 μ M of forward primer, 0.75 μ M of reverse primer, and 0.2 μ M of probe. The sequences of the SSB siRNA antisense strands and all primers and probes used to measure them are shown in Table 13. Quantitative PCR reactions were performed using standard cycling conditions in a QuantStudio 7 Flex Real-Time PCR System (Life Technologies). The Ct values were transformed into plasma or tissue concentrations using the linear equations derived from the standard curves.

Table 13. Sequences for all siRNA antisense strands, primers, and probes used in the stem-loop qPCR assay.

Target	Name	Sequence (5' - 3')
SSB	Antisense (guide)	UUACAUUAAGUCUGUUGUUU
SSB	RT	GTCGTATCCAGTGCAGGGTCCGAGGTATTCGCACTGGATACGACAAAC AAC
SSB	Forward	GGCGGCTTACATTAAGTCTGT
SSB	Reverse	AGTGCAGGGTCCGAG
SSB	Probe	(6FAM)-TGGATACGACAAACAA-(NFQ-MGB)

[0422] The clearance and half-life of the conjugates are shown in Table 14. The PK properties of these conjugates were similar to mouse anti-transferrin mAb conjugates tested in mice.

Table 14: PK parameter estimates for the hTfR1.IgG2 mAb-SSB conjugate following administration at 30 and 60 mg/kg by 30 min infusion in cynomolgus monkeys (n=3).

		AUC _{0-29d}	Dose	CL	CL	alpha t _{1/2}	beta t _{1/2}
AOC	Dose (mg/kg)	(mg/mL)*min	mg/kg	mL/min/kg	uL/min/kg	h	h
hTfR1.IgG2 mAb-SSB (DAR1)	3	82.89	3	0.036	36	12.9	230
hTfR1.IgG2 mAb-SSB (DAR1)	6	155.2	6	0.039	39	13.8	269

[0423] To assess the siRNA concentration and the activity of the conjugate in muscle, muscle biopsies (gastrocnemius and quadriceps) were obtained according to the schedule shown in Table 12. Muscle biopsies were taken by 6 mm punches, weighed and snap-frozen in liquid nitrogen. Frozen tissue samples were homogenized in 1 ml cold TRIZOL (vendor). To determine mRNA knockdown, total RNA was extracted from the tissue using a Direct-zol 96 RNA kit following manufacturer's instructions and quantified spectrophotically. RNA (100-200 ng) was reverse transcribed according to manufacturer's instructions using the High Capacity cDNA kit (Thermo Fisher #4368813). SSB mRNA levels were quantified using TaqMan qPCR, using the appropriately designed primers and probes. PPIB (housekeeping gene) was used as an internal RNA loading control. % mRNA was calculated using the $\Delta\Delta Ct$ method, with either SSB mRNA levels in the same animal pre-treatment or SSB levels in animals treated with PBS set to 100% expression.

[0424] Quantitation of tissue siRNA concentrations was determined using a stem-loop qPCR assay. Briefly, 15-50 mg tissue pieces were homogenized in 500 uL of Trizol using a TissueLyser II plate-based homogenizer (Qiagen) and then diluted in TE buffer + 0.1% v/v Triton X-100. Standard curves were generated by spiking siRNA into homogenized tissue from untreated animals and then serially diluting with TE buffer + 0.1% v/v Triton X-100. The antisense strand of the siRNA was reverse transcribed using a TaqMan MicroRNA reverse transcription kit (Applied Biosystems) with 25 nM of a sequence-specific stem-loop RT primer. The cDNA from the RT step was utilized for real-time PCR using TaqMan Fast Advanced Master Mix (Applied Biosystems) with 1.5 μ M of forward primer, 0.75 μ M of reverse primer, and 0.2 μ M of probe. The sequences of the SSB siRNA antisense strands and all primers and probes used to measure them are shown in Table 13. Quantitative PCR reactions were performed using standard cycling conditions in a QuantStudio 7 Flex Real-Time PCR System (Life Technologies). The Ct values were transformed into plasma or tissue concentrations using the linear equations derived from the standard curves.

[0425] Treatment of cynomolgus monkeys with the conjugate resulted in downregulation of SSB mRNA in gastrocnemius up to 62% and in quadriceps up to 75% (Fig. 5A and Fig. 5B). The siRNA concentration in these tissues was dose-dependent and between 0.6-1.9 nM and 2.0-6.5 nM for the 30

mg/kg and 60 mg/kg dose, respectively. The activity of the conjugates and the siRNA concentration in the tissues were similar when probed at 21 or 28 days post-dose. These results demonstrate that the chosen TfR1 antibody can effectively deliver siRNAs into primate muscle tissues and that the activity of transferrin receptor-targeting AOCs translate between species.

[0426] To monitor the safety of the chosen anti hTfR1 antibody in primates, hematology and clinical chemistry were analyzed according to the schedule shown in table x. With exception of a dose-dependent but transient depletion of reticulocytes (Fig. 6) no treatment-related effects were observed on any hematology or clinical chemistry parameters up to 28 days post dose. The observed transient downregulation of reticulocytes has been described as a side-effect of TfR1 antibodies. Murine TfR1 antibodies with intact effector function or complement binding capabilities have been shown to severely deplete TfR-expressing reticulocytes (Daniels-Wells, *et al.*, “Transferrin receptor 1: a target for antibody-mediated cancer therapy,” *Immunotherapy* 8(9): 991-994 (2016)). Since in primates the fraction of reticulocytes expressing high TfR1 levels is low, depletion of reticulocytes is only transient and less pronounced than in rodents. Importantly, studies by others have shown that this activity can be successfully suppressed by mutations that remove the ADCC/CDC activity of the antibody (WO 2014/189973 A2).

Example 3

[0427] Generation, characterization and humanization of human/cyno cross-reactive anti-TfR1 antibodies

[0428] Using modern *in silico* antibody humanisation and deimmunisation programs that are well described in the art, 16 variants of the chimeric anti-transferrin 1 mAb tested in the NHP study in example 1 were designed, see table XYZ for the sequences of the variants. As part of the design, an assessment of manufacturability by identification of high risk post-translational modifications (PTMs) was undertaken, and where feasible their removal *via* amino acid substitution was performed as part of the humanisation activities. An assessment of Immunogenicity risk was also undertaken to identify and, where feasible, remove high risk epitopes. Introduction of mutations into the Fc domain of the variants were also undertaken to remove effector functions (ADCC and CDC). The 16 variants were then expressed in mammalian cell culture using techniques well described in the art and were purified using affinity chromatography based on Protein A resin. The mAb variants were then fully characterized and siRNA conjugates made as described below.

[0429] Human and cyno TfR1 ELISA assay

[0430] The goal of these assays was to verify that the 16 variant human anti-TfR1 antibodies bind to both human and cyno TfR1. The Human or Cyno Transferrin Receptor ELISA Assay Protocols are described below:

[0431] Half-well high-binding 96-well plates (Costar #3690) were coated with recombinant human transferrin receptor protein (Sino Biological 11020-H07H) or recombinant cyno transferrin receptor protein (Sino Biological 90253-C07H) at 1 ng/µL in PBS (Gibco 14190) and incubated overnight at 4 °C.

Plates were washed four times with 100 μ L of Tris buffered saline + Tween (20x TBST, Cell Signaling 9997S). 100 μ L of Superblock (ThermoFisher PI-37535) was added to each well and incubated for 1 hour at room temperature. The wash step was repeated before the addition of the samples. Samples were added at concentrations up to 10 nM, 50 μ L/well. Plates were incubated for another hour at room temp and wash step repeated. Secondary antibody (Peroxidase AffiniPure Goat Anti-Human IgG, Fc γ Fragment Specific, Jackson Immunoresearch, 109-035-098) was diluted 1:5000 in Superblock and 50 μ L/well added. Plates were incubated for 1 hour at room temperature and washed one more time. Binding was measured by the addition of 50 μ L of 1-StepTM Ultra TMB-ELISA (ThermoFisher, 34028), incubated for 5 minutes, and the reaction was stopped with the addition of 25 μ L of Stop Solution 2N sulfuric Acid (R&D Systems DY994). Absorbance was measured at 450 nm, with reference wavelength 570 nm subtracted. Binding constants were determined using GraphPad Prism Specific Binding with Hill Slope.

[0432] Fig. 7 and Fig. 8 illustrate the binding results to cyno CD71 and human CD71, respectively.

[0433] Tf-TfR blocking ELISA assay

[0434] The goal of this assay was to verify that the TfR antibodies bind to TfR in the presence of holo-transferrin.

[0435] Antibodies were biotinylated using 50 fold molar excess of EZ-Link No weigh NHS-Biotin (Thermo Scientific A39256) following manufacturer's instructions. Half-well high-bind plates (Costar #3690) were coated with 500 ng/mL purified human holo-transferrin (R&D Systems 2914-HT) in PBS at 4°C overnight. For comparison, plates were coated directly with hTfR. Plates were washed four times with 100 μ L of Tris buffered saline + Tween (20x TBST, Cell Signaling 9997S). 100 μ L of Superblock (ThermoFisher PI-37535) was added to each well and incubated for 1 hour at room temperature. The wash step was repeated before the addition of the hTfR (200 ng/mL in 25 μ L) to the transferrin plates, or Superblock to the hTfR plates, and incubated for 30 minutes. Biotinylated antibodies were diluted to 20 nM for the high concentration and added to the plates with 3-fold serial dilution. 25 μ L/well was added to the 25 μ L already in the plate. Plates were incubated for 1 hour, and wash step was repeated. Streptavidin-HRP (R&D Systems DY998) was added following recommended dilution on the package insert, and a final wash step was done. Binding was measured by the addition of 50 μ L of 1-StepTM Ultra TMB-ELISA (ThermoFisher, 34028), incubated for 5 minutes, and the reaction was stopped with the addition of 25 μ L of Stop Solution 2N sulfuric Acid (R&D Systems DY994). Absorbance was measured at 450 nm, with reference wavelength 570 nm subtracted. Binding constants were determined using GraphPad Prism Specific Binding with Hill Slope. Change in antibody binding constants in the presence versus absence of transferrin is considered relative to the commercially available antibody which is known to have an overlapping epitope with transferrin (AF2474, R&D Systems). See Fig. 9A-Fig. 9B.

[0436] HFE-TfR binding ELISA assay

[0437] The goal of this assay was to verify that the TfR antibodies maintain binding when TfR is bound to HFE.

[0438] This assay is run following the same method as the TfR binding in the presence of transferrin, with the transferrin replaced by the cofactor HFE (hereditary hemochromatosis protein, mybiosource.com, MBS953891). See Fig. 10A-Fig. 10B.

[0439] Fc γ RIIIA (CD16a) ELISA

[0440] The goal of this assay was to determine the potential for ADCC activity of antibodies by measuring binding to Fc γ RIIIA (CD16a) genotype V158. Half-well high-binding 96-well plates (Costar #3690) were coated with recombinant CD16a protein (Sino Biological 10389-H27H1) at 2 ng/ μ L in PBS (Gibco 14190) and incubated overnight at 4 °C. Plates were washed four times with 100 μ L of Tris buffered saline + Tween (20x TBST, Cell Signaling 9997S). 100 μ L of Superblock (ThermoFisher PI-37535) was added to each well and incubated for 1 hour at room temperature. The wash step was repeated before the addition of the samples. Samples were added at concentrations up to 1 μ M, 50 μ L/well. Plates were incubated for another hour at room temp and wash step repeated. Secondary antibody (Peroxidase AffiniPure Goat Anti-Human IgG, Fc γ Fragment Specific, Jackson Immunoresearch, 109-035-098) was diluted 1:5000 in Superblock and 50 μ L/well added. Plates were incubated for 1 hour at room temperature and washed one more time. Binding was measured by the addition of 50 μ L of 1-Step™ Ultra TMB-ELISA (ThermoFisher, 34028), incubated for 5 minutes, and the reaction was stopped with the addition of 25 μ L of Stop Solution 2N sulfuric Acid (R&D Systems DY994). Absorbance was measured at 450 nm, with reference wavelength 570 nm subtracted. Binding constants were determined using GraphPad Prism Specific Binding with Hill Slope. See Fig. 11.

[0441] *In vitro* potency assay in HEL92.1.7 cells

[0442] The goal of this assay was to demonstrate that the TfR mAb conjugates are capable of delivery of siRNA and gene specific downregulation. The mAb variants were either conjugated to an active siRNA (SSB) or a scrambled control (Scr). The HEL92.1.7 cells line (ATCC® TIB-180™) were cultured in RPMI 1640 (Gibco A10491) containing 10% fetal bovine serum (Nucleus Biologics FBS1824). Antibody-siRNA conjugates were diluted for a maximum dose of 100 nM. 20 μ L of conjugates were added to wells of a 96-well plate. 20 μ L of PBS was added to some wells as an additional negative control. Cells were diluted to 100,000/mL and 100 μ L was added to each well of the plate. Cells were placed at 37°C and 5% CO₂ for 72 hours. Media was removed from wells and 150 μ L of Trizol (Ambion 15596018) was added. Plates were frozen at -80°C for overnight or longer before analysis. RNA was isolated using Direct-zol 96 RNA isolation kit (Zymo Research R2056) following manufacturer's instructions. RNA was reverse transcribed according to manufacturer's instructions using High Capacity cDNA kit (Applied biosystems 4368814) and qPCR was done with Taqman Fast Advanced Master Mix (Applied Biosystems 4444558) with SSB and PPIB Taqman probe sets (ThermoFisher Hs04187362_g1 and Hs00168719_m1). % mRNA was calculated using $\Delta\Delta$ Ct method, with PBS treated cells set to 100% expression.

[0443] The DAR1 conjugates containing an active siRNA (SSB) or an inactive or scrambled siRNA (Scr) and were made and characterized as described in Example 2. For these conjugates, the SSB siRNA contained a Cy5 fluorescent tag conjugated on position 11 of the passenger strand on the ribose 2'

hydroxyl. This was introduced during the solid phase synthesis and did not inhibit the activity of the guide strand but allowed uptake assay to be conducted. The purity of the conjugates was assessed by analytical HPLC using anion exchange chromatography method-2 and the chromatographic retention times and purity are described in the Table 15 below.

Table 15

Conjugate	SAX retention time (min)	% purity (by peak area)
hIgG1 TfRVar2i-SSB DAR 1	9.106	98.2
hIgG1 TfR-Var2i-Scr DAR 1	8.905	98.0
hIgG1 TfR-Var2ii-SSB DAR 1	9.059	98.3
hIgG1 TfR-Var2ii-Scr DAR 1	8.863	98.4
hIgG1 TfR-Var2iii-SSB DAR 1	9.069	98.2
hIgG1 TfR-Var2iii-Scr DAR 1	8.871	98.5
hIgG1 TfR-Var9i-SSB DAR 1	9.066	98.4
hIgG1 TfR-Var9i-Scr DAR 1	8.867	98.5
hIgG1 TfR-Var9ii-SSB DAR 1	9.048	98.6
hIgG1 TfR-Var9ii-Scr DAR 1	8.855	98.8
hIgG1 TfR-Var9iii-SSB DAR 1	9.069	98.6
hIgG1 TfR-Var9iii-Scr DAR 1	8.862	99.0
hIgG1 TfR-Var15i-SSB DAR 1	9.097	98.8
hIgG1 TfR-Var15i-Scr DAR 1	8.892	98.6
hIgG1 TfR-Var15ii-SSB DAR 1	9.082	98.2
hIgG1 TfR-Var15ii-Scr DAR 1	8.882	98.8
hIgG1 TfR-Var15iii-SSB DAR 1	9.078	98.3
hIgG1 TfR-Var15iii-Scr DAR 1	8.877	98.6
hIgG1 TfR-WT-SSB DAR 1	9.045	98.6
hIgG1 TfR-WT-Scr DAR 1	8.847	98.9

[0444] Analytical data table of conjugates used in this example: HPLC retention time (RT) in minutes and % purity by chromatographic peak area.

[0445] Antibody-dependent cellular cytotoxicity (ADCC) mediated by TfR1 antibodies and antibody siRNA conjugates (ASCs) in PBMCs

[0446] Studies in mice and nonhuman primates (NHPs) have demonstrated that antibodies binding murine/cyno TfR with effector function and/or complement binding capabilities selectively deplete TfR-expressing reticulocytes. To ascertain whether the variants had effector function, ADCC assays were carried out using peripheral blood mononuclear cells (PBMCs) from healthy human donors as effector cells.

[0447] Materials:

[0448] PBMC from BUYPBMC.COM, lot#2010113378 with STRONG ADCC activity.

[0449] Target cells: HEL-92.1.7 (ATCC, #TIB-180); HEL (#JCRB0062)

[0450] Cytotoxicity LDH kit, Pierce (ThermoFisher), #88953

[0451] Tissue culture medium with serum (complete medium) RPMI 1640 (Life Technologies) containing 10% heat-inactivated FBS (30 minutes at 56°C) and 2% L-glutamine

[0452] hIgG1 mAb variants

[0453] Procedure:

[0454] Thaw PBMC cells with gentle agitation in a 37°C water bath. Once thawed, add 1 mL of warm culture media to the vial drop by drop over 30 seconds to allow the cells to adjust to the change in environment. Slowly add the cells to a 15- or 50-mL conical tube containing 9 mL of warm culture media. Rinse the original vial with 1 mL of the cell-containing media to recover cells that may have adhered to the sides; add the rinse media to the conical tube. Pellet the cells by centrifugation at 350 x g for 8-12 minutes. Discard the supernatant. Re-suspend the cell pellet by gently tapping (avoid excessive shear forces). Rinse the cells again by adding 10 mL of warm culture media to the conical tube. Pellet the cells by centrifugation at 350 x g for 8-12 minutes. Discard the supernatant from the second wash. Re-suspend the cell pellet by gently tapping (avoid excessive shear forces). Resuspend the cells in 10 mL of warm media as required. Incubate at 37°C overnight in a T75 to acclimate the cells.

[0455] Harvest and wash target cell HEL-92 with cold assay media 2x; ensure high viability. Seed target cells in cold 50 μ L (8×10^5) assay medium (RPMI-1640 with 1% BSA and 100 units/mL penicillin and streptomycin) in a 96-well, round-bottom plate at 4×10^4 /well on ice. Dilutions (6x, starting at 10 μ g/ml) of test and control antibodies/ASCs (10 μ L) will be added to the plates containing the target cells as in following table, followed by incubation on ice for 30 minutes to allow opsonization. 10 μ L of media will be added to control wells to maintain volume.

[0456] Controls:

[0457] -Background low control: Target Cell Spontaneous LDH Release Control corrects for spontaneous release from target cells (low control). Add the same number of target cells used in the experimental wells. Adjust the final volume to 100 μ L/well with culture medium.

[0458] -Positive high control: Target Cell Maximum LDH Release Control is required in calculations to determine 100% release of LDH. Add the same number of target cells used in experimental wells. The final volume must be 100 μ L/well (Step 5 adds 10 μ L of 10X Lysis Buffer).

[0459] -Antibody-independent cellular cytotoxicity (AICC) will be measured in wells containing target and effector cells without the addition of antibody.

[0460] The following two controls are for monitoring assay conditions, not needed for ADCC calculations.

[0461] -Effector Cell Spontaneous LDH Release Control corrects for spontaneous release of LDH from effector cells. Add effector cells at various numbers used in the experimental wells. Adjust the final volume to 100 μ L/well with culture medium.

[0462] -Culture Medium Background Control is required to correct for the contributions caused by LDH activity that may be present in serum containing culture medium. Add 100 μ L of culture medium to a triplicate set of wells (without cells).

[0463] After the 30 min incubation on ice, 8×10^5 PBMC effector cells in 50 μ L warm assay medium (RPMI-1640 with 1% BSA and 100 units/mL penicillin and streptomycin) will be added to each well to give a ratio of 20:1 effector: target cells, incubate the plates for an additional 4 hours at 37°C.

[0464] Forty-five minutes before harvesting the supernatant, add 10 μ L of Lysis Buffer (10X) to Target Cell Maximal LDH Release Control (positive control) and Volume Correction Control. Add 10 μ L of PBS to Background low controls with cells, samples and other controls. Centrifuge the plates after incubation (350g, 10 min). Transfer 50 μ L supernatants to a 96-well clear flat-bottom plate and add 50 μ L of Reaction Mixture to each sample well and mix by gentle tapping. Incubate the plate at room temperature for 30 minutes protected from light. Add 50 μ L of Stop Solution to each sample well and mix by gentle tapping. Measure the absorbance at 490 nm and 680 nm. To determine LDH activity, subtract the 680 nm absorbance value (background signal from instrument) from the 490 nm absorbance value.

[0465] Specific ADCC activity was calculated as follows:

[0466] % ADCC = 100x ((A₄₉₀(sample)-A₄₉₀(AICC))/(A₄₉₀(high control)-A₄₉₀(low control))

[0467] Result is illustrated in Fig. 14.

[0468] Complement-dependent cytotoxicity (ADCC) mediated by TfR1 antibodies and antibody siRNA conjugates (ASCs) in rabbit serum

[0469] Materials:

[0470] Rabbit Complement, Lyophilized. Reconstitute with ice cold distilled water. Gently agitate to ensure that all lyophilized material is dissolved. Use within one hour of reconstitution. Keep reconstituted material on ice at all times. Discard aliquots if not fully active at $\frac{1}{2}$ dilution.

[0471] Target cells: HEL-92.1.7 (ATCC, #TIB-180)

[0472] Viability 405/452 fixable dye

[0473] Tissue culture medium with serum (complete medium) RPMI 1640 (Life Technologies) containing 10% heat-inactivated FBS (30 minutes at 56°C) and 2% L-glutamine

[0474] hIgG1 variants

[0475] Procedure:

[0476] HEL92.1.7 target cells were harvested and washed twice with cold assay media. Cells were seeded in cold 25 μ L assay medium (RPMI-1640 with 1% BSA and 100 units/mL penicillin and streptomycin) in a 96-well, round-bottom plate at 5 \times 10⁴/well. Dilutions (5x, starting at 100 μ g/ml for final 50 μ g/ml) of test and control antibodies (25 μ L) were added to the plates containing the 25 μ L target cells, followed by incubation on ice for 30 minutes to allow opsonization.

[0477] Controls:

[0478] -Background low control: Target Cell Spontaneous LDH Release Control corrects for spontaneous release from target cells (low control). Add the same number of target cells used in the experimental wells. Adjust the final volume to 100 μ L/well with culture medium.

[0479] -Antibody-independent cellular cytotoxicity (AICC) will be measured in wells containing target and CDC without the addition of antibody.

[0480] After the 30 min incubation, 50 μ L complement was added to each well, except media and low controls (with 50 μ L media), and the plates were incubated for an additional 60 min at 37°C. The plates

were centrifuged at the end of incubation (350g, 10 min). Diluted Viability 405/452 dye (0.5 μ L dye in 100 μ L staining buffer) was added. Plate was at room temperature for 15 minutes protected from light. Cells were washed and fixed. Flow analysis was done to measure dead cells

[0481] Specific CDC activity will be calculated as follows:

[0482] % CDC = %dead cells in samples-%dead cells in control

[0483] Result is illustrated in Fig. 15.

[0484] In vitro uptake of human anti-TfR1 IgG1 siRNA conjugates (ASCs) in to human skeletal myotubes

[0485] To monitor uptake of the ASCs into muscle cells, primary human skeletal myoblasts (Thermo Fisher Scientific A11440) were plated on 24-well collagen plates (Thermo Fisher A1142802) in 1 mL DMEM (ATCC 30-2002) supplemented with 10% FBS (Nucleus Biologics FBS1824) and 1x ITS (Thermo Fisher Scientific 41400045). Cells were incubated at 37°C in 5% CO₂ until myoblasts became confluent. At this point differentiation to myotubes was induced by incubation in 1000 μ l 1 mL DMEM (ATCC 30-2002) supplemented with 2% horse serum (ATCC 30-2040) and 1x ITS (Thermo Fisher Scientific 41400045) for 2 days. The medium was replaced by 500 μ l differentiation medium and 50 μ l TfR1.IgG2 mAb-SSB(Cy5) conjugates diluted in PBS were added to a final concentration of 1 and 10 nM. Cells were incubated for 24 hours at 37°C in 5% CO₂, then washed 3x with 500 μ l PBS and lysed in 150 μ l T-PER lysis buffer (Thermo Fisher Scientific 78510) using a freeze-thaw cycle. 75 μ l of the lysed cells were diluted with 75 μ l nuclease free water and the fluorescence determined (Ex 635 nM- Em 675 nM) using a TECAN plate reader. The results are presented as the fluorescence in cells relative to input (Fig. 16).

[0486] In vitro gene downregulation mediated by human anti-TfR1 IgG1 siRNA conjugates (ASCs) in human skeletal myotubes

[0487] To monitor the ability of TfR1.mAb-SSB conjugates to downregulate SSB mRNA levels, primary human skeletal myoblasts (Thermo Fisher Scientific A11440) were plated on 24-well collagen plates (Thermo Fisher A1142802) in 1 mL DMEM (ATCC 30-2002) supplemented with 10% FBS (Nucleus Biologics FBS1824) and 1x ITS (Thermo Fisher Scientific 41400045). Cells were incubated at 37°C in 5% CO₂ until myoblasts became confluent. At this point differentiation to myotubes was induced by incubation in 1000 μ l 1 mL DMEM (ATCC 30-2002) supplemented with 2% horse serum (ATCC 30-2040) and 1x ITS (Thermo Fisher Scientific 41400045) for 2 days. The medium was refreshed and 100 μ l TfR1.IgG2 mAb-SSB conjugates diluted in PBS were added. The treated cells were incubated for 72 hours. For harvesting, media was removed from wells and 150 μ L of Trizol (Ambion 15596018) was added. Plates were frozen at -80°C for overnight or longer before analysis. RNA was isolated using a Direct-zol 96 RNA kit following manufacturer's instructions and quantified spectrophotometrically. RNA (100-200 ng) was reverse transcribed according to manufacturer's instructions using the High Capacity cDNA kit (Thermo Fisher #4368813). mRNA levels were quantified using TaqMan qPCR, using the appropriately designed primers and probes. PPIB (housekeeping gene) was used as an internal RNA loading control. % mRNA was calculated using the $\Delta\Delta Ct$ method, with PBS

treated cells set to 100% expression. All tested SSB siRNA conjugates downregulated SSB by 50% with similar potency (Fig. 17).

Example 5: SSB siRNA knockdown of exemplary anti-TfR antibodies in a cyno study

[0494] Treatment of cynomolgus monkeys with exemplary anti-TfR antibodies will be tested to determine the percentage of SSB mRNA downregulation in gastrocnemius. Doses of 30 mg/kg, 10 mg/kg, and 3 mg/kg will be tested. The activity of the antibody conjugates will be probed at 21 and/or 28 days post-dose. The safety of the primates will also be monitored via hematology and clinical chemistry analysis.

Example 6: SSB Conjugates of hIgG1 TfR-Var2ii and hIgG1 TfR-Var9ii do not affect absolute reticulocyte levels in cynomolgus monkeys

[0495] hIgG1 TfR-Var2ii and hIgG1 TfR-Var9ii are humanized IgG1 antibodies targeting hTfR1 that contain mutations in the hinge region of the IgG1 heavy chain, designed to remove the effector function (LALA+L328R). Contrary to the chimeric hIgG2 TfR1 antibody, SSB conjugates of hIgG1 TfR-Var2ii and hIgG1 TfR-Var9ii do not reduce reticulocyte levels after dosing in cynomolgus monkeys. This result is consistent with studies by others demonstrating that the depletion of immature reticulocytes by TfR1

targeting antibodies can be successfully suppressed by mutations that remove the ADCC/CDC activity of the antibody (WO 2014/189973 A2).

[0496] Method:

[0497] Cynomolgus monkeys (male; 2-3 years old; BW 2-3 kg) were dosed by 30 minutes (+/- 3 minutes) intravenous (IV) infusion at day one. Blood specimens were collected from peripheral veins of restrained, conscious animals at different timepoints post dosing as indicated in Fig. 18.

Example 7: SSB Conjugates of hIgG1 TfR-Var2ii Ab and hIgG1 TfR-Var9ii Ab downregulate SSB RNA levels in muscles of cynomolgus monkeys

[0498] Compared to pre-dose SSB mRNA levels, single doses of 1 or 6 mg/kg (siRNA) of the hIgG1 TfR-Var2ii or hIgG1 TfR-Var9ii SSB conjugates downregulated SSB mRNA levels in gastrocnemius and quadriceps by up to 72% at 21 days post dose (Fig. 19). The activity of the humanized antibodies is similar to that of the parental chimeric IgG2 TfR1 antibody. An unconjugated TfR-Var2ii Ab dosed at 60 mg/kg (this equals a 6 mg/kg AOC dose) showed no significant downregulation of SSB.

[0499] Method:

[0500] Cynomolgus monkeys (male; 2-3 years old; BW 2-3 kg) were dosed by 30 minutes (+/- 3 minutes) intravenous (IV) infusion at day one. Muscle biopsies (gastrocnemius and quadriceps) were taken by 6 mm punches from sedated animals at day -10 and +21 post dose, weighed and snap-frozen in liquid nitrogen. Frozen tissue samples were homogenized in 1 ml cold TRIzol (Thermo Fisher # 15596026). To determine mRNA knockdown, total RNA was extracted from the tissue using a Direct-zol 96 RNA kit following manufacturer's instructions and quantified spectrophotically. RNA (100-200 ng) was reverse transcribed according to manufacturer's instructions using the High Capacity cDNA kit (Thermo Fisher #4368813). SSB mRNA levels were quantified using TaqMan qPCR, using the appropriately designed primers and probes. PPIB (housekeeping gene) was used as an internal RNA loading control. % mRNA was calculated using the $\Delta\Delta Ct$ method, with either SSB mRNA levels in the same animal pre-treatment or SSB levels in animals treated with PBS set to 100% expression.

Example 8: AOC mediated SSB knockdown but not siRNA delivery is muscle-specific

[0501] At 21 days post a single 6 mg/kg dose of hIgG1 TfR-Var2ii-SSB most tissues displayed SSB siRNA concentrations between 10-100 nM. The highest siRNA levels were in the liver and adrenal gland (≥ 1000 nM); the lowest in brain (2 nM). siRNA concentrations in skeletal muscles were 3-20 nM. Despite relatively low siRNA exposure, only skeletal muscles and heart displayed >50% reduction in SSB mRNA levels. This result demonstrates that the delivery of oligonucleotide payloads by TfR1 targeting antibodies is muscle-specific and driven by cell-specific trafficking pathways rather than siRNA exposure.

[0502] Method:

[0503] Cynomolgus monkeys (male; 2-3 years old; BW 2-3 kg) were dosed by 30 minutes (+/- 3 minutes) intravenous (IV) infusion at day one. At day 21 post dose, muscle biopsies were taken by 6 mm

punches from sedated animals. All other tissue samples were collected within 30 min post-mortem. Tissue samples were processed and SSB mRNA levels determined as described above (Fig. 20B). Tissue SSB siRNA concentrations were determined using a stem-loop qPCR assay as described in the methods section (Fig. 20A). The antisense strand of the siRNA was reverse transcribed using a TaqMan MicroRNA reverse transcription kit using a sequence-specific stem-loop RT primer. The cDNA from the RT step was then utilized for real-time PCR and Ct values were transformed into plasma or tissue concentrations using the linear equations derived from the standard curves.

[0504] While preferred embodiments of the present disclosure have been shown and described herein, it will be obvious to those skilled in the art that such embodiments are provided by way of example only. Numerous variations, changes, and substitutions will now occur to those skilled in the art without departing from the disclosure. It should be understood that various alternatives to the embodiments of the disclosure described herein may be employed in practicing the disclosure. It is intended that the following claims define the scope of the disclosure and that methods and structures within the scope of these claims and their equivalents be covered thereby.

CLAIMS**WHAT IS CLAIMED IS:**

1. An anti-transferrin receptor antibody comprising a variable heavy chain (VH) region and a variable light chain (VL) region, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1; HCDR2 sequence EINPIX₁GRSNYAX₂KFQG, wherein X₁ is selected from N or Q and X₂ is selected from Q or E; and HCDR3 sequence comprising SEQ ID NO: 3.
2. The anti-transferrin receptor antibody of claim 1, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3.
3. The anti-transferrin receptor antibody of claim 1, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3.
4. The anti-transferrin receptor antibody of claim 1, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3.
5. The anti-transferrin receptor antibody of any one of the claims 1-4, wherein the VL region comprises LCDR1 sequence RTSENIYX₃NLA, LCDR2 sequence AX₄TNLAX₅, and LCDR3 sequence QHFWGTPLTX₆, wherein X₃ is selected from N or S, X₄ is selected from A or G, X₅ is selected from D or E, and X₆ is present or absence, and if present, is F.
6. The anti-transferrin receptor antibody of any one of the claims 1-5, wherein the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence AATNLAX₅, and LCDR3 sequence QHFWGTPLTX₆, wherein X₅ is selected from D or E and X₆ is present or absence, and if present, is F.
7. The anti-transferrin receptor antibody of any one of the claims 1-6, wherein the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8.
8. The anti-transferrin receptor antibody of any one of the claims 1-5, wherein the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 9, and LCDR3 sequence comprising SEQ ID NO: 10.
9. The anti-transferrin receptor antibody of any one of the claims 1-5, wherein the VL region comprises LCDR1 sequence comprising SEQ ID NO: 11, LCDR2 sequence comprising SEQ ID NO: 12, and LCDR3 sequence comprising SEQ ID NO: 10.
10. The anti-transferrin receptor antibody of any one of the claims 1-9, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 2, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ ID NO: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8.

11. The anti-transferrin receptor antibody of any one of the claims 1-9, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ IDN O: 6, LCDR2 sequence comprising SEQ ID NO: 7, and LCDR3 sequence comprising SEQ ID NO: 8.
12. The anti-transferrin receptor antibody of any one of the claims 1-9, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 5, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ IDN O: 6, LCDR2 sequence comprising SEQ ID NO: 9, and LCDR3 sequence comprising SEQ ID NO: 10.
13. The anti-transferrin receptor antibody of any one of the claims 1-9, wherein the VH region comprises HCDR1 sequence comprising SEQ ID NO: 1, HCDR2 sequence comprising SEQ ID NO: 4, and HCDR3 sequence comprising SEQ ID NO: 3; and the VL region comprises LCDR1 sequence comprising SEQ IDN O: 11, LCDR2 sequence comprising SEQ ID NO: 12, and LCDR3 sequence comprising SEQ ID NO: 10.
14. The anti-transferrin receptor antibody of any one of the claims 1-13, wherein the VH region comprises at least 80%, 85%, 90%, 95%, 99%, or 100% sequence identity to a sequence selected from SEQ ID NOs: 13-16.
15. The anti-transferrin receptor antibody of any one of the claims 1-14, wherein the VL region comprises at least 80%, 85%, 90%, 95%, 99%, or 100% sequence identity to a sequence selected from SEQ ID NOs: 18-21.
16. The anti-transferrin receptor antibody of any one of the claims 1-15, wherein the anti-transferrin receptor antibody comprises a humanized antibody or binding fragment thereof or a chimeric antibody or binding fragment thereof.
17. The anti-transferrin receptor antibody of any one of the claims 1-16, wherein the anti-transferrin receptor antibody comprises a multi-specific antibody or binding fragment thereof.
18. The anti-transferrin receptor antibody of any one of the claims 1-17, wherein the anti-transferrin receptor antibody comprises a bispecific antibody or binding fragment thereof.
19. The anti-transferrin receptor antibody of any one of the claims 1-18, wherein the anti-transferrin receptor antibody comprises an IgG-scFv, nanobody, BiTE, diabody, DART, TandAb, scDiabody, scDiabody-CH3, triple body, mini-antibody, minibody, TriBi minibody, scFv-CH3 KIH, Fab-scFv-Fc KIH, Fab-scFv, scFv-CH-CL-scFv, F(ab')2, F(ab')2-scFv2, scFv-KIH, Fab-scFv-Fc, tetravalent HCAb, scDiabody-Fc, diabody-Fc, tandem scFv-Fc, or intrabody.
20. The anti-transferrin receptor antibody of any one of the claims 1-19, wherein the anti-transferrin receptor antibody comprises an IgG1 framework.
21. The anti-transferrin receptor antibody of any one of the claims 1-19, wherein the anti-transferrin receptor antibody comprises an IgG2 framework.

22. The anti-transferrin receptor antibody of claim 21, wherein the IgG2 framework is IgG2b framework.
23. The anti-transferrin receptor antibody of any one of the claims 1-19, wherein the anti-transferrin receptor antibody comprises IgG4 framework.
24. The anti-transferrin receptor antibody of any one of the claims 1-23, wherein the anti-transferrin receptor antibody further comprises at least one mutation in the Fc region.
25. The anti-transferrin receptor antibody of claim 24, wherein the at least one mutation modulates effector function.
26. The anti-transferrin receptor antibody of claim 24 or 25, wherein the at least one mutation attenuates or eliminates Fc- γ receptor binding.
27. The anti-transferrin receptor antibody of any one of the claims 24-26, wherein the at least one mutation is at residue position D265, N297, K322, L328, or P329, wherein the residue position is in reference to IgG1.
28. The anti-transferrin receptor antibody of any one of the claims 24-27, wherein the Fc region comprises two or more, three or more, or four or more mutations.
29. The anti-transferrin receptor antibody of any one of the claims 24-28, wherein the Fc region comprises mutations at L233 and L234, wherein the residues correspond to position 233 and 234 of SEQ ID NO: 23.
30. The anti-transferrin receptor antibody of any one of the claims 24-28, wherein the Fc region comprises mutations at D265 and N297.
31. The anti-transferrin receptor antibody of any one of the claims 1-30, wherein the anti-transferrin receptor antibody comprises a heavy chain (HC) sequence selected from SEQ ID NOs: 23-46 and a light chain (LC) sequence selected from SEQ ID NOs: 47-50.
32. The anti-transferrin receptor antibody of any one of the claims 1-31, wherein the anti-transferrin receptor antibody specifically binds to human transferrin receptor (TfR).
33. An anti-transferrin receptor antibody conjugate comprising an anti-transferrin receptor antibody of claims 1-32 and a payload.
34. The anti-transferrin receptor antibody conjugate of claim 33, wherein the payload comprises a small molecule, a peptide, a protein, or a polynucleic acid molecule.
35. The anti-transferrin receptor antibody conjugate of claim 33, wherein the payload comprises a polynucleic acid molecule.
36. The anti-transferrin receptor antibody conjugate of claim 35, wherein the polynucleic acid molecule comprises short interfering nucleic acid (siNA), short interfering RNA (siRNA), double-stranded RNA (dsRNA), micro-RNA (miRNA), short hairpin RNA (shRNA), antisense oligonucleotide (ASO), a PMO, or mRNA.
37. The anti-transferrin receptor antibody conjugate of any one of the claims 34-36, wherein the payload comprises a dsRNA.

38. The anti-transferrin receptor antibody conjugate of any one of the claims 34-36, wherein the payload comprises an antisense oligonucleotide (ASO).
39. The anti-transferrin receptor antibody conjugate of claim 33, wherein the payload comprises a small molecule, a peptide, or a protein.
40. The anti-transferrin receptor antibody conjugate of claim 39, wherein the payload comprises a microtubule disrupting agent, a DNA modifying agent, or an Akt inhibitor.
41. The anti-transferrin receptor antibody conjugate of claim 39, wherein the payload comprises an auristatin or a derivative thereof, a dolastatin or a derivative or analog thereof, a maytansinoid, or a pyrrolobenzodiazepine or a derivative thereof.
42. The anti-transferrin receptor antibody conjugate of claim 41, wherein the auristatin or derivative thereof is monomethyl auristatin E (MMAE) or monomethyl auristatin F (MMAF).
43. The anti-transferrin receptor antibody conjugate of claim 41, wherein the maytansinoid is DM1 or DM4.
44. The anti-transferrin receptor antibody conjugate of claim 41, wherein pyrrolobenzodiazepine is a pyrrolobenzodiazepine dimer.
45. The anti-transferrin receptor antibody conjugate of claim 39, wherein the payload comprises an immunomodulatory agent or an immune modulator.
46. The anti-transferrin receptor antibody conjugate of claim 45, wherein the immune modulator comprises a cytokine.
47. The anti-transferrin receptor antibody conjugate of claim 39, wherein the payload comprises a protein or peptide toxin or fragment thereof.
48. The anti-transferrin receptor antibody conjugate of any one of the claims 33-47, wherein the payload is conjugated to the anti-transferrin receptor antibody through a linker.
49. The anti-transferrin receptor antibody conjugate of any one of the claims 33-48, wherein the anti-transferrin receptor antibody is further conjugated to two or more payloads.
50. The anti-transferrin receptor antibody conjugate of any one of the claims 33-49, wherein a ratio of the payloads to the anti-transferrin receptor antibody is about 1:1, 2:1, 3:1, 4:1, 5:1, 6:1, 7:1, 8:1, 9:1, 10:1, 11:1, or 12:1.
51. The anti-transferrin receptor antibody conjugate of any one of the claims 33-50, wherein the anti-transferrin conjugate comprises

Formula (I)

wherein,

A comprises the anti-transferring antibody;

B comprises the payload;

X^1 consists of a bond or linker; and

n is an averaged value selected from 1-12.

52. The anti-transferrin receptor antibody conjugate of claim 51, wherein the payload is a polynucleic acid molecule.
53. The anti-transferrin receptor antibody conjugate of claim 52, wherein the polynucleic acid molecule comprises a passenger strand and a guide strand.
54. The anti-transferrin receptor antibody conjugate of claim 53, wherein the guide strand comprises at least one modified internucleotide linkage, at least one inverted abasic moiety, at least one 5'-vinylphosphonate modified non-natural nucleotide, or a combination thereof.
55. The anti-transferrin receptor antibody conjugate of claim 54, wherein the at least one 5'-vinylphosphonate modified non-natural nucleotide is located about 1, 2, 3, 4, or 5 bases away from the 5' terminus of the guide strand.
56. The anti-transferrin receptor antibody conjugate of any one of the claims 51-55, wherein the polynucleic acid molecule further comprises a modification of a sugar moiety at the 2' position.
57. The anti-transferrin receptor antibody conjugate of claim 56, wherein the modification at the 2' position is selected from 2'-O-methyl, 2'-O-methoxyethyl (2'-O-MOE), 2'-deoxy, T-deoxy-2'-fluoro, 2'-O-aminopropyl (2'-O-AP), 2'-O-dimethylaminoethyl (2'-O-DMAOE), 2'-O-dimethylaminopropyl (2'-O-DMAP), T-O-dimethylaminoethoxyethyl (2'-O-DMAEOE), or 2'-O-N-methylacetamido (2'-O-NMA) modified nucleotide.
58. The anti-transferrin receptor antibody conjugate of claim 53, wherein the passenger strand comprises at least 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more phosphorodiamidate morpholino oligomer-modified non-natural nucleotides.
59. The anti-transferrin receptor antibody conjugate of any one of the claims 52-58, wherein the passenger strand is shorter in length than the guide strand, thereby generating a 5' overhang, a 3' overhang, a blunt end at one terminus, or a combination thereof.
60. The anti-transferrin receptor antibody conjugate of any one of the claims 52-58, wherein the passenger strand is equal in length to the guide strand, thereby generating a blunt end at each terminus of the polynucleic acid molecule.
61. The anti-transferrin receptor antibody conjugate of any one of the claims 52-60, wherein the passenger strand is conjugated to A- X¹.
62. The anti-transferrin receptor antibody conjugate of claim 61, wherein A- X¹ is conjugated to the 5' end of the passenger strand.
63. The anti-transferrin receptor antibody conjugate of claim 61, wherein A- X¹ is conjugated to the 3' end of the passenger strand.
64. The anti-transferrin receptor antibody conjugate of any one of the claims 33-50, wherein the anti-transferrin conjugate comprises:

Formula (II)

wherein,

A comprises the anti-transferrin receptor antibody;

B comprises the polynucleic acid molecule;

C consists of a polymer;

X¹ consists a bond or first linker;

X² consists of a bond or second linker; and

n is an averaged value selected from 1-12.

65. The anti-transferrin receptor antibody conjugate of claim 64, wherein C is polyethylene glycol.
66. The anti-transferrin receptor antibody conjugate of claim 64, wherein the polynucleic acid molecule comprises a passenger strand and a guide strand.
67. The anti-transferrin receptor antibody conjugate of claim 66, wherein the passenger strand is conjugated to A- X¹ and X²-C.
68. The anti-transferrin receptor antibody conjugate of claim 67, wherein A- X¹ is conjugated to the 5' end of the passenger strand and X²-C is conjugated to the 3' end of the passenger strand.
69. The anti-transferrin receptor antibody conjugate of claim 67, wherein X²-C is conjugated to the 5' end of the passenger strand and A- X¹ is conjugated to the 3' end of the passenger strand.
70. The anti-transferrin receptor antibody conjugate of any one of the claims 51-69, wherein X¹ and X² are each independently a non-polymeric linker.
71. The anti-transferrin receptor antibody conjugate of claim 64, further comprising D.
72. The anti-transferrin receptor antibody conjugate of claim 71, wherein D is an endosomolytic moiety.
73. A nucleic acid polymer encoding an anti-transferrin receptor antibody of claims 1-32.
74. A vector comprising a nucleic acid polymer of claim 73.
75. A pharmaceutical composition comprising:
 - an anti-transferrin receptor antibody of claims 1-32 or an anti-transferrin receptor antibody conjugate of claims 33-72; and
 - a pharmaceutically acceptable excipient.
76. The pharmaceutical composition of claim 75, wherein the pharmaceutical composition is formulated for systemic administration.
77. The pharmaceutical composition of claim 75 or 76, wherein the pharmaceutical composition is formulated for parenteral administration.
78. A method of delivering a payload to a target site of interest in a subject, comprising:
 - administering to the subject an anti-transferrin receptor antibody conjugate of claims 33-72 or a pharmaceutical composition of claims 75-77 to deliver the payload to the target site of interest.
79. The method of claim 78, wherein the target site of interest is a cell comprising an overexpressed causative protein.
80. The method of claim 78, wherein the target site of interest is a tumor site.
81. The method of claim 78, wherein the target site of interest is a site located with the brain.
82. A method of treating a cancer in a subject in need thereof, comprising:

administering to the subject an anti-transferrin receptor antibody conjugate of claims 33–72 or a pharmaceutical composition of claims 75–77 to treat the cancer in the subject.

83. The method of claim 82, wherein the cancer is a solid cancer.

84. The method of claim 82, wherein the cancer is a hematologic malignancy.

85. The method of any one of the claims 82–84, wherein the cancer is bladder cancer, lung cancer, brain cancer, melanoma, breast cancer, Non-Hodgkin lymphoma, cervical cancer, ovarian cancer, colorectal cancer, pancreatic cancer, esophageal cancer, prostate cancer, kidney cancer, skin cancer, leukemia, thyroid cancer, liver cancer, or uterine cancer.

86. The method of any one of the claims 82–85, wherein the cancer is a metastatic cancer.

87. The method of any one of the claims 82–85, wherein the cancer is a relapsed or refractory cancer.

88. A method of treating a muscle atrophy or myotonic dystrophy in a subject in need thereof, comprising:

administering to the subject an anti-transferrin receptor antibody conjugate of claims 33–72 or a pharmaceutical composition of claims 75–77, wherein the polynucleic acid molecule hybridizes to a target sequence of an atrogene, and wherein the polynucleic acid molecule mediates RNA interference against the atrogene, thereby treating muscle atrophy in the subject.

89. The method of claim 88, wherein the muscle atrophy is a diabetes-associated muscle atrophy or a cancer cachexia-associated muscle atrophy.

90. The method of claim 88, wherein the muscle atrophy is associated with insulin deficiency, chronic renal failure, congestive heart failure, chronic respiratory disease, a chronic infection, fasting, denervation, sarcopenia, or myotonic dystrophy type 1 (DM1).

91. The method of claim 88, wherein the myotonic dystrophy is DM1.

92. The method of claim 88, wherein reticulocyte levels in the subject are not reduced following the administration of anti-transferrin receptor antibody.

93. The method of claim 88, wherein the administration of anti-transferrin receptor antibody conjugate downregulates SSB siRNA or SSB mRNA levels in the subject.

94. The method of claim 93, wherein downregulation of SSB siRNA or SSB mRNA is in muscle.

95. The method of claim 94, wherein the muscle is skeletal muscle.

96. The method of claim 94, wherein the muscle is cardiac muscle.

97. The method of claim 88, wherein the atrogene comprises an upregulated gene within the IGF1-Akt-FoxO pathway, the glucocorticoids-GR pathway, the PGC1 α -FoxO pathway, the TNF α -NF κ B pathway, or the myostatin-ActRIIb-Smad2/3 pathway.

98. The method of claim 88, wherein the atrogene encodes an E3 ligase.

99. The method of claim 88, wherein the atrogene encodes a Forkhead box transcription factor.

100. The method of claim 88, wherein the atrogene comprises atrogin-1 gene (*FBXO32*), MuRF1 gene (*TRIM63*), *FOXO1*, *FOXO3*, or *MSTN*.

101. The method of claim 88, wherein the atrogene comprises *DMPK*.

102. A method of treating a muscular dystrophy in a subject in need thereof, comprising:

administering to the subject an anti-transferrin receptor antibody conjugate of claims 33–72 or a pharmaceutical composition of claims 75-77, thereby treating the muscular dystrophy in the subject.

103. The method of claim 102, wherein the muscular dystrophy is Duchenne muscular dystrophy, Becker muscular dystrophy, facioscapulohumeral muscular dystrophy, congenital muscular dystrophy, or myotonic dystrophy.
104. The method of claim 102, wherein the muscular dystrophy is Duchenne muscular dystrophy.
105. The method of any of the preceding claims, wherein the subject is a human.
106. A kit comprising an anti-transferrin receptor antibody of claims 1-32, an anti-transferrin receptor antibody conjugate of claims 33–72, a nucleic acid polymer of claim 73, a vector of claim 74, or a pharmaceutical composition of claims 75-77.
