(54) Title: SYNTHESIS AND PURIFICATION OF PTEROIC ACID AND CONJUGATES THEREOF

(57) Abstract: Methods for purifying pterioic acid, analogs of pterioic acid, and derivatives of pterioic acid are described. Methods for synthesizing and purifying conjugates of vitamins, including FTTC conjugates of folic acid, folic acid analogs, and derivatives of folic acid and folic acid analogs are also described. Purified forms of pterioic acid, derivatives and analogs of pterioic acid, and conjugates thereof are also described.

-1-

## SYNTHESIS AND PURIFICATION OF PTEROIC ACID AND CONJUGATES THEREOF

### CROSS REFERENCE TO RELATED APPLICATION

5                   This application claims the benefit under 35 U.S.C. § 119(e) of U.S. Provisional Application Serial No. 60/662,277, filed March 16, 2005, the disclosure of which is hereby incorporated by reference.

### TECHNICAL FIELD

10                   This invention pertains to the purification of pterioic acid and derivatives of pterioic acid, and to the purification of pterioic acid, and analogs and derivatives of pterioic acid, conjugated to other compounds. This invention also pertains to methods for preparing pterioic acid, and analogs and derivatives of pterioic acid, conjugated to other compounds. This invention also pertains to methods for  
15   treating patients with pterioic acid, and analogs and derivatives of pterioic acid, conjugated to other compounds.

### BACKGROUND

                  Pterioic acid is a convenient starting material for making folate  
20   derivatives that can be conjugated to drugs for use as conjugates in therapies that include vitamin receptor-based targeting. Vitamin-drug conjugates can be targeted, for example, to cancer cells that uniquely express, over-express, or preferentially express vitamin receptors. Illustratively, pterioic acid has been used as the starting material for the preparation of a conjugate comprising a folic acid derivative linked to  
25   fluorescein via a gamma carboxyl-linked ethylene diamine bridge. This conjugate is described in U.S. Patent Application Serial No. 09/822,379, the disclosure of which is incorporated herein by reference. The conjugate is used to label pathogenic cells, such as cancer cells, with fluorescein to make the cancer cells antigenic resulting in their recognition and elimination by the host immune system.

30                   Pterioic acid may be prepared by a variety of conventional means including by synthesis, microbial degradation of folic acid, enzymatic degradation of folic acid, hydrolysis of folic acid, and other conventional methods. Generally, pterioic acid prepared by these methods is contaminated by folic acid, often in

-2-

substantial amounts. For example, pteronic acid prepared by enzymatic degradation can contain as much as 25% folic acid. Accordingly, efficient methods are needed to remove folic acid contaminants and other impurities from preparations of pteronic acid.

Vitamin-drug conjugates, including conjugates of pteronic acid may be prepared using synthetic methods. In some cases, those synthetic methods may also lead to the formation of side products, impurities, or other contaminants. Accordingly, synthetic and/or purification methods are needed to either avoid the formation of these side products, impurities, or other contaminants, or to remove these side products, impurities, or other contaminants from the vitamin-drug conjugates.

10

## SUMMARY OF THE INVENTION

Methods for purifying pteronic acid, derivatives of pteronic acid, and combinations thereof are described. In one illustrative embodiment for purifying pteronic acid, derivatives of pteronic acid, and combinations thereof by chromatography, methods are described herein that include the steps of (a) contacting a solution comprising pteronic acid, the derivative of pteronic acid, or the combination thereof with an ion exchange chromatographic support; (b) eluting a first fraction comprising pteronic acid, the derivative of pteronic acid, or the combination thereof with a mobile phase having a pH of about 10 or greater; (c) lowering the pH of the first fraction to about 3 or less; and (d) precipitating pteronic acid, the derivative of pteronic acid, or the combination thereof.

In another illustrative embodiment for purifying pteronic acid, derivatives of pteronic acid, and combinations thereof by chromatography, methods are described herein that include the steps of (a) contacting a solution comprising pteronic acid, the derivative of pteronic acid, or the combination thereof, with an anion exchange chromatographic support; and (b) eluting a first fraction comprising pteronic acid, the derivative of pteronic acid, or the combination thereof.

The methods described herein may also optionally include the step of (e) eluting a second fraction comprising folic acid, a derivative of folic acid, or a combination thereof, where the first fraction and the second fraction are substantially separated. Substantial separation includes separation as determined by time, by a predetermined number of fractions, or other quantitative or qualitative assessment

-3-

indicating that the first and second fraction are not substantially overlapping during the elution of the first and second fractions.

Chromatographic supports for the chromatography methods described herein include but are not limited to ion-exchange resins, anion-exchange resins, 5 saccharide-based resins, saccharide-based ion-exchange resins, saccharide-based anion-exchange resins, and the like. Mobile phases for the chromatography methods described herein include but are not limited to aqueous phases having a pH of about 10 or greater, about 11 or greater, or having a pH in the range from about 11 to about 13. In one illustrative variation, the mobile phase is free of or substantially free of 10 ammonia or salts thereof. Mobile phases for the chromatography methods described herein may also optionally include organic cosolvents, such as acetone, tetrahydrofuran, acetonitrile, alcohols, including MeOH, EtOH, and the like, and others.

In another illustrative embodiment, methods for purifying conjugates 15 comprising pteric acid or a derivative thereof, and fluorescein or a derivative thereof are described. In one aspect, those methods include the steps of (a) contacting a solution comprising the conjugate with a first reversed phase chromatographic support; (b) eluting a first fraction comprising a phosphate complex of the conjugate with a mobile phase, said mobile phase comprising a phosphate salt and having a pH 20 in the range from about 6 to about 8; (c) contacting the first fraction with a second reversed phase chromatographic support; and (d) eluting a second fraction comprising the conjugate with a mobile phase comprising water, where the second fraction is substantially free of phosphate.

Chromatographic supports for the chromatography methods described 25 herein include but are not limited to reverse-phase resins, such as C8 resins, C18, resins, capped versions thereof, and the like. Mobile phases for the chromatography methods described herein include but are not limited to aqueous phases having a pH near neutrality, or slightly above neutrality, including a pH in the range from about 7.1 to about 7.7, and illustratively a pH of about 7.4. In one illustrative variation, the 30 mobile phase includes one or more phosphate salts. In another illustrative variation, the mobile phase is free of or substantially free of phosphate. Mobile phases for the chromatography methods described herein may also optionally include organic cosolvents, such as MeOH, EtOH, acetone, tetrahydrofuran, acetonitrile, and the like.

-4-

In another illustrative embodiment, the methods described herein are performed to give purified compounds and compositions, including pterioic acid, derivatives of pterioic acid, and combinations thereof, and conjugates comprising pterioic acid or a derivative thereof, and fluorescein or a derivative thereof having  
5 predetermined purities, including purities of about 95% or greater, 98% or greater, and 99% or greater. As used herein, purity determinations may be based on weight percentage, mole percentage, and the like. In addition, purity determinations may be based on the absence or substantial absence of certain predetermined components, such as folic acid, fluorescein components, bisfluorescein components, and the like.  
10 It is also to be understood that purity determinations are applicable to solutions of the compounds and compositions purified by the methods described herein. In those instances, purity measurements, including weight percentage and mole percentage measurements, are related to the components of the solution exclusive of the solvent.

In another illustrative embodiment, processes for preparing conjugates  
15 of pterioic acid or derivatives thereof, and fluorescein or derivatives thereof are described.

In another illustrative embodiment, compounds and compositions having certain predetermined purity requirements are described. In one aspect, the compounds and/or compositions include pterioic acid, derivatives of pterioic acid, and  
20 combinations thereof. In another aspect, the compounds and/or compositions include conjugates of pterioic acid or derivatives thereof, and fluorescein or derivatives thereof. In one variation, purity requirements of illustrative compounds and/or compositions described herein include including purities of about 95% or greater, 98% or greater, and 99% or greater, and may be based on weight percentage, mole  
25 percentage, and the like. In another variation, purity requirements of illustrative compounds and/or compositions described herein include purity determinations based on the absence or substantial absence of certain predetermined components, such as folic acid, fluorescein components, bisfluorescein components, and the like.

In another illustrative embodiment, methods for treating patients,  
30 mammals, or animals in need of relief from disease states responsive to the mediation or elimination of pathogenic cells are described. In one aspect, methods for enhancing an endogenous immune response-mediated elimination of a population of pathogenic cells in a patient, mammal, or animal is described. Illustrative methods

-5-

described herein include the steps of administering to the patient, mammal, or animal in need of relief an effective amount of a composition comprising a ligand-fluorescein conjugate. In another illustrative aspect, methods are described herein where the composition administered to the patient, mammal, or animal in need of relief, includes  
5 a predetermined maximum level of one or more bisfluorescein components, such as no more than 0.1% or 0.05%, or is free of or, substantially free of one or more bisfluorescein components.

It is appreciated that the synthetic methods described herein may be used alone or in combination with the purification methods described herein for  
10 providing vitamin-drug conjugates.

#### BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1A shows the UV absorption at 280 nm of fractions eluted from a DEAE cellulose column (DE32) in the purification of pterioic acid.

15 FIG. 1B shows the C18 reverse phase HPLC trace of fraction 38 eluted from a DEAE cellulose column (DE32) in the purification of pterioic acid.

FIG. 2 shows the effect of isolated folate-fluorescein conjugates on the growth of solid tumors.

#### 20 DETAILED DESCRIPTION

Methods for purifying pterioic acid, derivatives and analogs of pterioic acid, and/or combinations thereof are described herein. In one embodiment, the methods include the steps of (a) contacting a solution comprising pterioic acid, derivatives or analogs of pterioic acid, and/or combinations thereof, with an ion  
25 exchange chromatographic support; (b) eluting a first fraction comprising pterioic acid, derivatives or analogs of pterioic acid, and/or combinations thereof, with a mobile phase having a pH of about 10 or greater; and (c) lowering the pH of the first fraction to about 3 or less; and (d) precipitating pterioic acid, derivatives or analogs of pterioic acid, and/or combinations thereof.

30 In one variation, the methods described herein may also include the step of (e) eluting a second fraction comprising folic acid, derivatives of folic acid, or combinations thereof, where the first fraction and the second fraction are substantially separated. Substantial separation may be determined by any number of objective

-6-

quantitative or qualitative criteria, including but not limited to elapsed time, fraction number, baseline evaluation, or other method that assesses the degree of overlap between the eluting fractions, and therefore the likelihood and degree of possible cross-contamination of the first and/or second fractions. It has been observed that for  
5 certain saccharide-based chromatographic supports or resins, the folic acid fraction elutes prior in time to the pteronic acid fraction, which elutes later in time.

Illustratively, for DEAE cellulose chromatographic supports, the folic acid fraction has been observed to elute prior in time to the pteronic acid fraction, which elutes later in time. However, it is to be understood that for different chromatographic supports,  
10 including different saccharide-based chromatographic supports, it is contemplated herein that the order of elution of the first and second fractions as described herein may change.

In another embodiment, the methods described herein include the steps of (a) contacting a solution comprising pteronic acid, derivatives of pteronic acid, or  
15 combinations thereof, with an anion exchange chromatographic support; and (b) eluting a first fraction comprising pteronic acid, derivatives of pteronic acid, or combinations thereof.

In one variation, the eluting step includes a mobile phase having a pH of about 11 or greater, or a pH of about 11.5 or greater. In another variation, the pH is  
20 in the range from about 11 to about 13. The pH of the mobile phase may be adjusted or obtained by the addition of a wide variety of bases, including but not limited to NaOH, KOH, Na<sub>2</sub>CO<sub>3</sub>, NaHCO<sub>3</sub>, KHCO<sub>3</sub>, K<sub>2</sub>CO<sub>3</sub>, NH<sub>4</sub>OH, and the like.

In one aspect, chromatographic supports for the chromatography methods described herein include but are not limited to ion-exchange resins, anion-  
25 exchange resins, saccharide-based resins, saccharide-based ion-exchange resins, saccharide-based anion-exchange resins, and the like. Saccharide-based chromatographic supports include one or more cellulose, amylose, agarose, sepharose, and sephadex resins, and combinations thereof. In another aspect, saccharide-based chromatographic supports include ion-exchange resins, such as an anionic exchange  
30 resins and cationic exchange resins. Illustrative saccharide-based ion-exchange resins include diethylaminoethyl (DEAE) cellulose or quaternary amine (QA) cellulose solid supports, such as DE23, DE32, DE51, DE52, DE53, and QA52, each available from Whatman and/or Sigma. In one illustrative variation, the chromatographic support is

-7-

a pre-swollen microgranular DE52 anion exchanger (Whatman Cat. No. 4057-200). In another illustrative variation, the chromatographic support is a pre-swollen microgranular DE32 anion exchanger. Additional solid supports include DEAE Sephadex, CM Sephadex, Sephadex QA, Sepharose QA, and the like.

5 In another embodiment, the mobile phase is a reverse phase mobile phase comprising water. In another embodiment, the mobile phase is a reverse phase mobile phase comprising water and a salt. In another embodiment, the mobile phase is a reverse phase mobile phase comprising water and an organic solvent. In another embodiment, the mobile phase is a reverse phase mobile phase comprising water, a  
10 salt, and an organic solvent. In another aspect, the mobile phase is substantially free or completely free of ammonia, or salts thereof.

In another embodiment, the mobile phase is a reverse phase mobile phase comprising water at a specified pH, including a neutral or near neutral pH. In one variation, the pH is slightly above neutrality, such as a pH in the range from about  
15 7.1 to about 7.7. In one aspect, the pH of the mobile phase is in the range from about 7.3 to about 7.5, or at a pH of about 7.4. In another embodiment, the mobile phase is a reverse phase mobile phase comprising water and a salt. In another embodiment, the mobile phase is a reverse phase mobile phase comprising water and an organic solvent. In another embodiment, the mobile phase is a reverse phase mobile phase  
20 comprising water, a salt, and an organic solvent. In another aspect, the mobile phase is substantially free or completely free of ammonia, or salts thereof.

The chromatography profile may use the mobile phase at a fixed relative composition or in a varying relative composition, including, but not limited to, isocratic profiles, step functions, simple gradients, complex gradients, linear  
25 gradients, logarithmic gradients, combinations of such profiles, and the like.

In another embodiment, the mobile phases used in the methods described herein may also optionally include an organic solvent as a component, such as an acetone, tetrahydrofuran, acetonitrile, alcohols, including MeOH, EtOH, and the like, and others. When the mobile phase includes two components, such as the  
30 aqueous component having a basic pH and an organic solvent component, the mobile phase may be eluted through the chromatographic support in an isocratic mode, or in a gradient mode. It is appreciated that gradient modes may follow a wide variety of

-8-

profiles, including linear, logarithmic, hyperbolic, parabolic, exponential, step, and combinations thereof.

In another embodiment, the eluent from the column chromatography is monitored by any conventional technique including, but not limited to, ultraviolet (UV) absorbance, fluorescence, refractive index (RI), liquid chromatography mass spectrometry (LCMS), tandem mass spectrometry (MS/MS), and the like. Illustratively, the eluent is divided into one or more fractions based on the monitoring, and the fractions containing the desired product and having a purity at or above a predetermined threshold are pooled. The pooled fractions are included in the precipitating step.

In another embodiment of the precipitating step, the pterioic acid, or analog or derivative thereof, contained in fractions or pooled fractions of the eluent is precipitated from the solution by lowering the pH of the solution to a pH of about 3.5 or less, about 3 or less, about 2.5 or less, or about 2 or less. The pH may be lowered by the addition of any variety of acids or any combination of acids capable of lowering the pH to about 3.5 or less, about 3 or less, about 2.5 or less, or about 2 or less. Illustrative acids include, but are not limited to, hydrochloric acid, hydrobromic acid, sulfuric acid and salts thereof, phosphoric acid and salts thereof, nitric acid, and the like.

In one aspect, the precipitated and/or purified pterioic acid or analog or derivative thereof is purified to about 95% purity or greater, about 96% purity or greater, about 97% purity or greater, about 98% purity or greater, about 99% purity or greater, or about 100% purity. In another aspect, the precipitated pterioic acid or analog or derivative thereof is substantially free of folic acid. The purity of the precipitated pterioic acid or analog or derivative thereof may be measured using any conventional technique, including various chromatography or spectroscopic techniques, such as high pressure or high performance liquid chromatography (HPLC), nuclear magnetic resonance spectroscopy, TLC, UV absorbance spectroscopy, fluorescence spectroscopy, and the like.

In another aspect, the precipitated or purified pterioic acid, pterioic acid analogs, and/or pterioic acid derivatives have purities understood as being substantially pure, or substantially purified from one or more undesired or unwanted components, impurities, or contaminants. Illustratively, the purity of these

-9-

compounds may be understood as having less than a percentage of one or more components, such as about 5% or less of an impurity, about 4% or less of an impurity, about 3% or less of an impurity, about 2% or less of an impurity, or about 1% or less of an impurity. Similarly, the purity of these compounds may be understood as  
5 having less than a percentage of a specific component, such as about 5% or less, about 4% or less, about 3% or less, about 2% or less, or about 1% or less of folic acid.

In another embodiment, pteronic acid, pteronic acid analogs, and pteronic acid derivatives are prepared by synthetic methods described herein. These synthetic methods result in compounds that have high overall percentage purities, such as about  
10 95% pure or greater, about 96% pure or greater, about 97% pure or greater, about 98% pure or greater, about 99% pure or greater, or about 100% pure. Similarly, the purity of such pteronic acid, pteronic acid analogs, and pteronic acid derivatives are prepared by synthetic methods described herein may be understood as having less than a percentage of a specific component, such as about 5% or less, about 4% or less,  
15 about 3% or less, about 2% or less, or about 1% or less of folic acid, as a result of the synthetic method used, alone or in combination with a purification method described herein.

It is appreciated that specific components in the resulting pteronic acid, pteronic acid analog, pteronic acid derivative, or combination thereof may be either  
20 avoided or removed. Those components may be avoided by using the synthetic processes described herein. In addition, those components may be removed by using the purification methods described herein. Therefore, it is to be understood that the invention also includes materials that are prepared by the synthetic processes described herein, are produced from or result from use of the purification methods  
25 described herein, or result from a combination of these synthetic processes and purification methods.

In one embodiment, the pteronic acid or the derivative of pteronic acid is derived from a degradation process, such as a degradation of a folic acid or a derivative of folic acid. In one aspect, the pteronic acid or the derivative of pteronic  
30 acid is derived from an enzymatic degradation process, such as an enzymatic degradation of a folic acid or a derivative of folic acid. In another aspect, the pteronic acid or the derivative of pteronic acid is derived from a microbial degradation process, such as a microbial degradation of a folic acid or a derivative of folic acid. In another

aspect, the pteronic acid or the derivative of pteronic acid is derived from a chemical degradation process, such as a chemical degradation of a folic acid or a derivative of folic acid. In another embodiment, the pteronic acid or the derivative of pteronic acid is derived from a chemical synthesis.

5                   In one embodiment of the microbial degradation processes, folic acid or derivatives thereof are hydrolyzed to pteronic acid by contacting a sample of the folic acid or derivative thereof with *Alcaligenes faecalis*, *Pseudomonad*, *Pseudomonad* ATCC 25301, *flavobacterium*, *flavobacterium baccalis*, and the like. Illustrative conditions for performing microbial degradation of folic acid are  
10 described by Houlihan et al., *Anal. Biochem.*, 46:1-6 (1972), Pratt et al., *J. Biol. Chem.*, 243:6367 (1968); Levy et al., *J. Biol. Chem.*, 242:2933 (1967); Scott, *Methods in Enzymology*, 66:657-60 (1980); Lemon et al., "Conversion of pterolyglutamic acid to pteronic acid by bacterial degradation" *Archives of Biochemistry* 19:311-16 (1948), the disclosures of which are incorporated herein by reference.

15                   In one embodiment of the enzymatic degradation processes, folic acid or derivatives thereof are hydrolyzed to pteronic acid by contacting a sample of the folic acid or derivative thereof with one or more enzymes such as carboxypeptidases, including carboxypeptidase G, carboxypeptidase A, amidases, lipases, esterases, and proteases, and combinations thereof. In the case of carboxypeptidase G, folic acid is  
20 contacted with the enzyme at slightly basic pH, illustratively a pH of about 7.3. Illustrative conditions for performing enzymatic degradation of folic acid is described by Harvison & Kalman, *J. Med. Chem.* 35:1227-33 (1992); Nomura et al., *J. Org. Chem.*, 65:5016-21 (2000); U.S. Patent No. 4,337,339, the disclosures of which are incorporated herein by reference.

25                   In one embodiment of the chemical degradation processes, folic acid or derivatives thereof are hydrolyzed to pteronic acid by contacting a sample of the folic acid or derivative thereof under acid or basic hydrolysis, or saponification conditions, generally in an aqueous medium, optionally supplemented with a miscible organic cosolvent.

30                   In another embodiment, the pteronic acid, or analog or derivative of pteronic acid that is purified using the methods described herein is one resulting from a conventional degradation or synthetic process and is contaminated with a folic acid, or analog or derivative thereof. Illustratively, enzymatic degradation processes that

-11-

convert folic acids, or analogs or derivatives thereof, to pteronic acids, or the corresponding analogs or derivatives thereof, may not proceed to complete conversion. Therefore, the resulting mixture may include the pteronic acid or derivative thereof, the folic acid or derivative thereof, and/or one or more partially degraded or hydrolyzed intermediate products or side products formed during the enzymatic degradation process or hydrolysis process. Illustratively, the relative amount of the folic acid or derivative thereof is in the range from about 1% to about 50%, or from about 1% to about 25%.

In one embodiment of a chemical synthesis of the pteronic acid or the derivative of pteronic acid, pteronic acid or a derivative or analog of pteronic acid, is coupled with another molecule to form a vitamin-drug conjugate. In one aspect, the vitamin-drug conjugate is illustratively a conjugate described in U.S. Patent Application Serial No. 10/765,336. In another aspect, the vitamin-drug conjugate is illustratively a conjugate of pteronic acid, or an analog or derivative of pteronic acid, and an antigenic component, and includes the conjugates described in U.S. Patent Application Serial No. 09/822,379, the disclosure of which is incorporated herein by reference.

In another aspect, the vitamin-drug conjugate may be described by the formula

$$V-L-D$$

where V is a vitamin, or an analog or a derivative thereof, and L is an optional bivalent linker having a length of about 1 to about 100 atoms. The atoms are selected from carbon, nitrogen, oxygen, silicon, phosphorus, sulfur, and the like. Each of these atoms is optionally substituted with hydrogen, halogen, and/or one or more functional groups. Illustrative functional groups include, but are not limited to, hydroxy, cyano, nitro, oxo, thiono, optionally substituted imino, optionally substituted hydroxylimino, optionally substituted hydrazino, azido, optionally substituted alkyl, optionally substituted alkenyl, optionally substituted alkynyl, optionally substituted alkoxy, optionally substituted alkylthio, optionally substituted alkylsulfonyl, optionally substituted alkylsulfonyloxy, optionally substituted alkylsulfonylamino, optionally substituted amino, optionally substituted aldehydes and derivatives thereof, optionally substituted ketones and derivatives thereof, carboxylic acids and derivatives thereof, optionally substituted aryl, side chains of amino acids, peptides,

-12-

combinations thereof, and the like. Such functional groups may be taken together to form cyclic structures attached to the atoms. Such functional groups may also be taken together to form cyclic structures with the atoms.

In another aspect, the vitamin-drug conjugate is a conjugate of pterioic  
 5 acid or an analog or derivative thereof, and fluorescein or an analog or derivative thereof. In another aspect, the vitamin-drug conjugate is a compound of formula **I**

(I)

wherein  $R^1$ ,  $R^2$ ,  $R^3$ , and  $R^4$  are each independently hydrogen, alkyl, acyl, or a suitably selected nitrogen protecting group, or  $R^1$  and  $R^2$  are taken together to form a nitrogen  
 10 protecting group;  $R^5$  is hydrogen, alkyl, or a suitably selected carboxyl protecting group;  $m$  is an integer from 0-4; and  $n$  is an integer from 1-4. In another aspect, the vitamin-drug conjugate is compound **8a** (the compound of formula **I**, wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^4$ , and  $R^5$  are hydrogen,  $m$  is 1, and  $n$  is 1).

One illustrative chemical synthesis of fluorescein conjugates of pterioic  
 15 acid, and derivatives thereof, is shown in Scheme 1.

-13-

Scheme 1

(a) amide coupling reagent; (b) selective deprotection of  $\alpha$ -carboxyl group;  
 (c)  $H_2NCH_2(CH_2)_nNH_2$ ,  $n=1-4$  (**5**); (d) 1. FITC (**7**); 2. optional deprotection of any of  
 5  $R^1$  to  $R^5$ .

where  $R^1, R^2, R^3$ , and  $R^4$  are each independently hydrogen, alkyl, acyl, or a suitably selected nitrogen protecting group, or  $R^1$  and  $R^2$  are taken together to form a nitrogen protecting group;  $R^5$  is hydrogen, alkyl, or a suitably selected carboxyl protecting group;  $m$  is an integer from 0-4; and  $n$  is an integer from 1-4.

10 Protected pterioic acid analog **1** is reacted with protected amino acid analog **2** to form amide **3**. Suitable protecting groups  $R^1, R^2, R^3$ , and  $R^4$  for pterioic acid **1** include amide protecting groups, such as acetyl, trifluoroacetyl, and the like, carbamate protecting groups, such as *tert*-Boc, Teoc, Cbz, Fmoc, and the like, and  
 15 others. Suitable protecting groups  $R^5$  for amino acid analog **2** include ester protecting groups, such as methyl, trimethylsilylethyl, *tert*-butyl, and the like, and others. In one aspect, where  $R^5$  is *tert*-butyl, resulting amide **3** is selectively deprotected with acid to give amide **4**. It is appreciated that in this aspect, the protecting groups present on pterioic acid analog **1** and amino acid analog **2** are suitably selected to allow the  
 20 selective deprotection of the  $\alpha$ -carboxylate protecting group in the presence of the  $\gamma$ -carboxylate protecting group.

Either amide **3** or the corresponding deprotected analog **4** is treated with an alkylene diamine of the formula  $H_2NCH_2(CH_2)_nNH_2$ , where  $n=1-4$  to give

amine 6. The terminal methyl ester is displaced to form an amide bond. Amine 6 is treated with fluorescein isothiocyanate (FITC, 7) to form vitamin-drug conjugate 8.

A wide variety of amide coupling reagents and conditions are applicable to the syntheses described herein, including but not limited to carboxylic acid derivatives, such as acid chlorides and the like; activated esters, such as pentafluorophenyl esters, hydroxybenzotriazole esters, and the like; coupling reagents, such as (benzotriazol-1-yloxy)tripyrrolidinophosphonium hexafluorophosphate (PyBOP), BOP, BOPCl, DCC, EDC, HBTU, TBTU, PyBrOP, and the like. Suitable solvents for the amide coupling steps described herein include but are not limited to N,N-dimethylformamide (DMF), dimethylsulfoxide (DMSO), chloroform, dichloromethane (DCM), N-methylpyrrolidinone (NMP), and the like. The amide coupling steps described herein may be performed at many temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature.

The deprotecting steps described herein may be performed in any conventional manner, such as using the reagents and reaction conditions described in Greene & Wuts "Protective Groups in Organic Synthesis," 2d Ed., John Wiley & Sons, New York, 1991, the disclosure of which is incorporated herein by reference. It is appreciated that the choice of deprotecting reagents and conditions is made to allow the deprotecting step to proceed without unintentionally affecting other functional groups, including other protecting groups, present on the compounds being deprotected. For example, in Scheme 1, protecting group R<sup>5</sup> is removed in the presence of and without affecting protecting group R<sup>4</sup>. In one illustrative embodiment, protecting group R<sup>5</sup> is a *tert*-butyl ester, and protecting group R<sup>4</sup> is a trifluoroacetyl amide. Illustrative deprotecting agents for deprotecting acid sensitive protecting groups include but are not limited to trifluoroacetic acid (TFA), HCl, HBr, AcOH, HCO<sub>2</sub>H, and the like. The deprotecting reaction may be performed in a variety of solvents, including but not limited to water, DCM, EtOAc, AcOH, and the like. It is appreciated that cation scavengers may also be included in the reaction conditions to improve the rate and/or overall yield of the deprotecting reactions, including with the use of AcOH as a solvent. The deprotecting reactions described herein may be performed at a variety of temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature.

-15-

Step (c) in Scheme 1 may be performed in a variety of solvents, including but not limited to THF, ether, DMF, DMSO, chloroform, DCM, NMP, and the like, and may be performed at a variety of temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature.

5 Similarly, step (d) in Scheme 1 may be performed in a variety of solvents, including but not limited to THF, DMF, DMSO, chloroform, CH<sub>2</sub>Cl<sub>2</sub>, NMP, water, and the like, and may be performed at a variety of temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature. Additional bases may be added to the reaction illustrated in step (d), including but not limited to  
10 amine bases generally represented by R<sup>1</sup>R<sup>2</sup>R<sup>3</sup>N, Et<sub>3</sub>N, N,N-diisopropylethylamine (DIPEA), pyridine, lutidine, collidine, 4-dimethylaminopyridine (DMAP), and the like.

It is appreciated that certain protecting groups may be contemporaneously and conveniently removed during step (c) upon reaction with the  
15 diamine H<sub>2</sub>NCH<sub>2</sub>(CH<sub>2</sub>)<sub>n</sub>NH<sub>2</sub>. For example, when R<sup>4</sup> is an amide protecting group, such as trifluoroacetyl and the like, both the methyl ester is replaced to form the amide of the gamma- glutamate, and the amide protecting group is removed at N(10). In one variation, the group R<sub>4</sub> is selected to be stable to reaction with diamine  
H<sub>2</sub>NCH<sub>2</sub>(CH<sub>2</sub>)<sub>n</sub>NH<sub>2</sub>.

20 In another variation, the reaction of pterioic acid analog 1 and amino acid analog 2 is accomplished by converting protected pterioic acid analog 1 to a corresponding carboxylic acid derivative having a leaving group. The leaving group is displaced by the amine of amino acid analog 2 to form amide 3. It is appreciated that the synthesis shown in Scheme 1, and variations thereof, may also be used to  
25 prepare fluorescein conjugates of pterioic acid analogs, and derivatives of pterioic acid analogs, as described herein.

Another illustrative chemical synthesis of conjugates of pterioic acid, and derivatives thereof, is shown in Scheme 2.

-16-

Scheme 2

(a) amide coupling reagent; (b) selective deprotection of amino acid amine group;

(c) amide coupling reagent; (d) selective deprotection of alkylenediamine;

5 (e) 1. FITC (7); 2. optional deprotection of any of  $R^1$  to  $R^5$ .

where  $R^1$ ,  $R^2$ ,  $R^3$ , and  $R^4$  are each independently hydrogen, alkyl, acyl, or a suitably selected nitrogen protecting group;  $R^5$  is hydrogen, alkyl, or a suitably selected carboxyl protecting group;  $m$  is an integer from 0-4;  $n$  is an integer from 1-4; and  $R^6$ ,  $R^7$ , and  $R^8$  are each independently hydrogen or a suitably selected nitrogen protecting group.

Protected amino acid analog 9 is reacted with protected alkylenediamine 10 to form amide 11. Illustrative protecting groups  $R^6$  for amino acid analog 7 include Fmoc, Cbz, *tert*-Boc, and the like. Illustrative protecting groups  $R^7$  for alkylenediamine 10 include *tert*-Boc, Fmoc, Cbz, and the like. It is appreciated that the protecting groups are chosen to allow for the selective removal of one or more in the presence of the remaining protecting groups, and without altering the nature of the other functional groups remaining on the molecule being deprotected. Resulting amide 11 is deprotected to give amino acid amine 12, which is coupled with protected pterioic acid analog 1, where illustrative protecting groups  $R^4$  for pterioic acid analog 1 are as described herein, to form amide 13. Resulting amide 13 is deprotected to give alkylenediamine amine 6. In some variations, depending upon the nature of the carboxyl protecting group  $R^5$ , the conditions used to remove the terminal amine protection groups  $R^7$  and  $R^8$  may also remove the carboxyl protection group  $R^5$ . For

-17-

example, when R<sup>5</sup> is a tert-butyl group, R<sup>7</sup> is a *tert*-Boc protection group, and R<sup>8</sup> is hydrogen, treatment with acid in a dipolar solvent may remove both protecting groups. Amine 6 is reacted with FITC to give pterioic acid-linked FITC conjugate 8.

As described herein, a wide variety of amide coupling reagents and  
5 conditions are also applicable to the synthesis described in Scheme 2, including but not limited to carboxylic acid derivatives, such as acid chlorides and the like; activated esters, such as pentafluorophenyl esters, hydroxybenzotriazole esters, and the like; coupling reagents, such as PyBOP, BOP, BOPCl, DCC, EDC, HBTU, TBTU, PyBrOP, and the like. Suitable solvents for the amide coupling steps  
10 described herein include but are not limited to DMF, DMSO, chloroform, CH<sub>2</sub>Cl<sub>2</sub>, NMP, and the like. The amide coupling steps described herein may be performed at many temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature.

The deprotecting steps described herein may be performed in any  
15 conventional manner, such as using the reagents and reaction conditions described in Greene & Wuts. It is appreciated that the choice of deprotecting reagents and conditions is made to allow the deprotecting step to proceed without unintentionally affecting other functional groups, including other protecting groups, present on the compounds being deprotected. For example, in Scheme 2, protecting group R<sup>6</sup> is  
20 removed in the presence of and without affecting protecting groups R<sup>5</sup>, R<sup>7</sup>, and R<sup>8</sup>. In one illustrative embodiment, protecting group R<sup>6</sup> is a Fmoc group, and protecting group R<sup>5</sup> is a *tert*-Bu ester, protecting group R<sup>7</sup> is a *tert*-Boc, and R<sup>8</sup> is hydrogen. Illustrative deprotecting agents for deprotecting base sensitive protecting groups include but are not limited to DBU, piperidine, morpholine, TBAF, and the like. The  
25 deprotecting reaction may be performed in a variety of solvents, including but not limited to water, THF, ether, DMF, NMP, CH<sub>2</sub>Cl<sub>2</sub>, EtOAc, and the like. The deprotecting reactions described herein may be performed at a variety of temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature.

30 Coupling step (c) in Scheme 2 may be performed in similarly to that in step (a), with the coupling agents, and reaction conditions, described herein. A variety of solvents, including but not limited to THF, ether, DMF, DMSO, chloroform, CH<sub>2</sub>Cl<sub>2</sub>, NMP, and the like, and may be performed at a variety of

-18-

temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature. Similarly, step (d) in Scheme 1 may be performed in a variety of solvents, including but not limited to THF, DMF, DMSO, chloroform, CH<sub>2</sub>Cl<sub>2</sub>, NMP, water, and the like, and may be performed at a variety of  
5 temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature. Additional bases may be added to the reaction illustrated in step (d), including but not limited to amine bases generally represented by R<sup>1</sup>R<sup>2</sup>R<sup>3</sup>N, Et<sub>3</sub>N, DIPEA, pyridine, lutidine, collidine, DMAP, and the like.

Deprotecting step (d) may be performed in any conventional manner.

10 In one illustrative embodiment, protecting group R<sup>7</sup> is a *tert*-Boc group, which is chemically sensitive to acid, whereas the other protecting groups are not, such as R<sup>4</sup> as a trifluoroacetyl amide, or R<sup>5</sup> as a methyl ester. In another illustrative embodiment, protecting group R<sup>5</sup> is a *tert*-butyl ester and protecting group R<sup>7</sup> is a *tert*-Boc group, which are both chemically sensitive to acid, whereas the other protecting groups are  
15 not. Illustrative deprotecting agents for deprotecting such acid sensitive protecting groups include but are not limited to TFA, HCl, HBr, AcOH, HCO<sub>2</sub>H, and the like. The deprotecting reaction may be performed in a variety of solvents, including but not limited to water, CH<sub>2</sub>Cl<sub>2</sub>, EtOAc, AcOH, and the like. It is appreciated that cation scavengers may also be included in the reaction conditions to improve the rate and/or  
20 overall yield of the deprotecting reactions, including with the use of AcOH as a solvent. The deprotecting reactions described herein may be performed at a variety of temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature.

Optional deprotecting step (e) may be included in the synthesis  
25 described in Scheme 2 to remove any remaining protecting groups on the compounds 8. For example, when R<sup>4</sup> is an amide protecting group and R<sup>5</sup> is a carboxylic acid protecting group, such groups may be removed to prepare the free amino acid derivative illustrated by compound 8. In one illustrative embodiment, coupling step (e) in Scheme 2 gives a protected form of compound 8, where R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, and R<sup>5</sup> are  
30 hydrogen, and R<sup>4</sup> is trifluoroacetyl. Protecting group R<sup>5</sup> may be contemporaneously removed by contacting the protected compound 8 with a base, including but not limited to NH<sub>4</sub>OH, including 0.5 M NH<sub>4</sub>OH, LiOH, NaOH, KOH, K<sub>2</sub>CO<sub>3</sub>, NaHCO<sub>3</sub>, and the like, in a variety of solvents, including but not limited to water, alcohols,

-19-

biphasic THF/water, and the like. Illustratively, the pH of the reaction conditions for removing such base sensitive protecting groups is greater than about 9. The reaction is illustratively performed at ambient temperature.

Another illustrative chemical synthesis of fluorescein conjugates of pteric acid, and derivatives thereof, is shown in Scheme 3.

Scheme 3

(a) FITC (**7**); (b) fluorescein-NH<sub>2</sub> (**15**); (c) deprotection of amine group; (d) amide coupling reagent; (e) selective deprotection of carboxylic acid group; (f) 1. amide coupling reagent; 2. optional deprotection of any of R<sup>1</sup> to R<sup>6</sup>.

where R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, and R<sup>4</sup> are each independently hydrogen, alkyl, acyl, or a suitably selected nitrogen protecting group; R<sup>5</sup> is hydrogen, alkyl, or a suitably selected carboxyl protecting group; R<sup>9</sup> is hydrogen, alkyl, or a suitably selected carboxyl protecting group; m is an integer from 0-4; n is an integer from 1-4; and R<sup>6</sup>, R<sup>7</sup>, and R<sup>8</sup> are each independently hydrogen or a suitably selected nitrogen protecting group.

Protected alkylene diamine **16** may be prepared by either (i) reacting alkylene diamine **5** with FITC (**7**); (ii) reacting protected alkylene diamine **10** with FITC (**7**); or (iii) reacting protected aminoalkyl isothiocyanate **14** with

-20-

fluoresceinamine (**15**). The amine is deprotected to give **17**. Pteric acid derivative **1** is coupled with triply protected amino acid **18** to give folic acid derivative **19**. The protecting groups  $R^5$  and  $R^9$  are selected so that each may be chemically removed independent of the other. Protecting group  $R^9$  is removed to give carboxylic acid **20**,  
5 which is coupled to amine **17** to give conjugate **8**.

The reaction of isothiocyanates with amines, as illustrated in Scheme 3 for the reaction of compounds **5**, **10**, **14** with compounds **7** and **15**, as appropriate, may be performed in a variety of solvents, including but not limited to EtOH, MeOH, THF,  $CH_2Cl_2$ , DMF,  $CHCl_3$ , and the like. The reactions may be performed at a  
10 variety of temperatures, such as temperatures in the range from about 0 °C to about 100 °C, and illustratively at reflux for the solvent sued in the reaction.

Similarly to the deprotecting reactions described herein, deprotecting step (c) may be performed in any conventional manner. In one illustrative embodiment, protecting group  $R^7$  is a *tert*-Boc group, which is chemically sensitive to  
15 acid. Illustrative deprotecting agents for deprotecting such acid sensitive protecting groups include but are not limited to TFA, HCl, HBr, AcOH,  $HCO_2H$ , and the like. The deprotecting reaction may be performed in a variety of solvents, including but not limited to water,  $CH_2Cl_2$ , EtOAc, AcOH, and the like. It is appreciated that cation scavengers may also be included in the reaction conditions to improve the rate and/or  
20 overall yield of the deprotecting reactions, including with the use of AcOH as a solvent. The deprotecting reactions described herein may be performed at a variety of temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature.

The coupling steps (d) and (f) in Scheme 3 may be performed in  
25 similarly to that described herein, with conventional coupling agents, and reaction conditions. A variety of solvents, including but not limited to THF, ether, DMF, DMSO, chloroform,  $CH_2Cl_2$ , NMP, and the like, and may be performed at a variety of temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature.

30 Similarly to the deprotecting reactions described herein, deprotecting step (e) may be performed in any conventional manner. In one illustrative embodiment, protecting group  $R^9$  is a *tert*-Bu ester, which is chemically sensitive to acid. Illustrative deprotecting agents for deprotecting such acid sensitive protecting

-21-

groups include but are not limited to TFA, HCl, HBr, AcOH, HCO<sub>2</sub>H, and the like. The deprotecting reaction may be performed in a variety of solvents, including but not limited to water, CH<sub>2</sub>Cl<sub>2</sub>, EtOAc, AcOH, and the like. It is appreciated that cation scavengers may also be included in the reaction conditions to improve the rate and/or overall yield of the deprotecting reactions, including with the use of AcOH as a solvent. The deprotecting reactions described herein may be performed at a variety of temperatures, such as temperatures in the range from about 0 °C to about 50 °C, and illustratively at ambient temperature.

Optional deprotecting step (f) may be included in the synthesis described in Scheme 3 to remove any remaining protecting groups on the compounds 8. For example, when R<sup>4</sup> is an amide protecting group and R<sup>5</sup> is a carboxylic acid protecting group, such groups may be removed to prepare the free amino acid derivative illustrated by compound 8. In one illustrative embodiment, coupling step (f) in Scheme 3 gives a protected form of compound 8, where R<sup>1</sup>, R<sup>2</sup>, and R<sup>3</sup> are hydrogen, R<sup>4</sup> is trifluoroacetyl, and R<sup>5</sup> is methyl. Protecting groups R<sup>4</sup> and R<sup>5</sup> may be contemporaneously removed by contacting the protected compound 8 with a base, including but not limited to NH<sub>4</sub>OH, including 0.5 M NH<sub>4</sub>OH, LiOH, NaOH, KOH, K<sub>2</sub>CO<sub>3</sub>, and the like, in a variety of solvents, including but not limited to water, alcohols, biphasic THF/water, and the like. Illustratively, the pH of the reaction conditions for removing such base sensitive protecting groups is greater than about 9. The reaction is illustratively performed at ambient temperature.

Alternatively, illustrative chemical synthesis of fluorescein conjugates of pteronic acid, and derivatives thereof, is shown in Scheme 3a.

-22-

Scheme 3a

(a) amide coupling reagent; (b) selective deprotection of amino acid amine group;  
(c) amide coupling reagent.

- 5 Amine 17 is coupled with protected amino acid analog 9 to give amide 21, as shown  
Amide 21 is deprotected to give amine 22, which is coupled with protected pterioic  
acid analog 1 to give vitamin-fluorescein conjugate 8.

It is appreciated that the syntheses shown in Schemes 1, 2, and 3, and variations thereof, may also be used to prepare fluorescein conjugates of pterioic acid  
10 analogs, and derivatives of pterioic acid analogs, as described herein. Pterioic acid analogs, and derivatives of pterioic acid analogs, include but are not limited to folinic acid, pteropolyglutamic acid, tetrahydropterins, dihydrofolates, tetrahydrofolates, aminopterin, amethopterin, N<sup>10</sup>-methylfolate, 2-deaminohydroxyfolate, 3',5'-dichloro-4-amino-4-deoxy-N<sup>10</sup>-methylpteroylglutamic acid, and the like, as well as deaza and  
15 dideaza analogs of these compounds, such as 1-deazamethopterin, 3-deazamethopterin, and other deaza and dideaza analogs, such as 1-deaza, 3-deaza, 5-deaza, 8-deaza, and 10-deaza analogs, and 1,5-dideaza, 5,10-dideaza, 8,10-dideaza, and 5,8-dideaza analogs. For example, other analogs of folate that include one or more amino acids in addition to or in place of glutamate may be prepared according to  
20 the processes and procedures described herein. Illustratively, in Schemes 1, 2, and 3, protected forms of tyrosine, cysteine, cysteic acid, phenylalanine, lysine, and many other natural and non-natural amino acids may be substituted for the protected glutamate compounds specifically described in those Schemes. Thus, folic acid

-23-

analogues that differ from folate by being pteroyl amides of amino acids other than glutamate are contemplated herein. Further, it is to be understood that such amides may also be prepared from pteronic acid analogues and derivatives using the syntheses and processes described herein.

5 It is also appreciated that side products, contaminants, impurities, and/or other components may form during the preparation of the pteronic acid, folic acid, the analogues and derivatives of pteronic acid and folic acid, and conjugates of any of these compounds. These side products, contaminants, impurities, and/or other components may be removed by the purification methods described herein. In one  
10 embodiment, the other component is folic acid. In another embodiment, the other component is a bisfluorescein derivative, such as the bisfluorescein derivative. One illustrative bisfluorescein derivative is a compound of formula **II**

Another illustrative bisfluorescein derivative is a compound of formula

15 **III**

wherein  $n$  is an integer from 1-4.

It is also appreciated that side products, contaminants, or impurities may be avoided by selecting a suitable synthetic route, or modifying a synthetic route.  
20 In one illustrative aspect, the compound of formula **II** may be substantially or completely avoided by the careful elimination of water from the various synthetic methods and processes described herein. In another illustrative aspect, the compound of formula **II** may be avoided by using the FITC reagent in exactly one or slightly less than one molar equivalent.

-24-

In another illustrative aspect, the compound of formula **III** may be substantially or completely avoided by using the alkylene diamine reagent **5**, in exactly one or slightly less than one molar equivalent, as shown in Scheme 1. In another illustrative aspect, the compound of formula **III** may be avoided by purifying the reaction products following the introduction of the alkylene diamine reagent **5** to substantially remove any remaining alkylene diamine reagent **5** prior to the addition of FITC, such as purifying the intermediate amine **6** shown in Scheme 1 to substantially or completely remove the alkylene diamine reagent **5**.

In another illustrative aspect, the compound of formula **III** may be avoided by using a synthetic equivalent of the alkylene diamine, such as the monoprotected alkylene diamine **10**, as shown in Scheme 2. In another illustrative aspect, the compound of formula **III** may be avoided by preparing the FITC intermediate **16**, as shown in Scheme 3, prior to conjugation with the pteronic acid, folic acid, or analog or derivative of pteronic acid or folic acid. In this latter aspect, it is appreciated that the compound of formula **III** may be avoided by using the alkylene diamine reagent, illustratively compound **5**, in exactly at least a slight excess, or illustratively a substantial excess above one molar equivalent. It is also appreciated in this latter aspect, that the product compound **16**, or subsequent products, such as **17**, **21**, or **22**, when they are prepared from alkylene diamine reagent **5** may be purified to substantially or completely remove the compound of formula **III**.

Illustratively, a conjugate of pteronic acid, or a derivative thereof, can be synthesized by any of the methods described herein in combination with purification by any of the methods described herein employing an ion-exchange chromatographic support, such as those described herein.

In another embodiment, methods for purifying conjugates comprising pteronic acid or derivatives thereof, and fluorescein or derivatives thereof. In one aspect, the methods include the steps of (a) contacting a solution that includes the conjugate with a first reversed phase chromatographic support; (b) eluting a first fraction that includes a phosphate complex of the conjugate with a mobile phase, where the mobile phase includes water at a predetermined pH; (c) contacting the first fraction with a second reversed phase chromatographic support; and (d) eluting a second fraction that includes the conjugate with a mobile phase comprising water, where the second fraction is substantially free or completely free of phosphate.

-25-

Eluting step (b) may be performed with an aqueous mobile phase prepared from water and one or more phosphate salts. The predetermined pH may be in the range from about 6 to about 8; in the range from about 7 to about 8; or in the range from about 7.1 to about 7.5, or illustratively at a pH of about 7.4. It is appreciated that eluting  
5 step (d) includes a mobile phase that is advantageously substantially or completely free of phosphate salts.

In one aspect, the reversed-phase chromatographic support is a modified silica support including, but not limited to, a C8 silica, a C18, silica, and modified C8 and/or C18 silicas, including capped or deactivated silicas, and the like,  
10 and combinations thereof.

It is appreciated that the chromatography column or columns described for use in the methods described herein may be regenerated using conventional techniques and then reused for the purification or separation of additional mixtures of pterioic acid, or analogs or derivatives thereof. Regeneration includes washing the  
15 chromatographic solid support with a solvent having a higher elutropic index or elutropic power than the mobile phase used for the separation. For example, a purification may include a reversed phase solid support and a mobile phase comprising water, such as pure water or an inorganic salt solution in water. The mobile phase may also include an organic solvent, such as acetonitrile (ACN),  
20 methanol, tetrahydrofuran (THF), and the like. In such an illustrative chromatographic separation, the mobile phase may be a fixed or variable mixture of water and acetonitrile, such as 90:10 water/acetonitrile, a linear gradient of 99:1 to 90:10 water/acetonitrile, and the like. Subsequently, the column may be illustratively regenerated by washing with a mobile phase having a higher elutropic index that  
25 includes a higher percentage of the organic solvent relative to the percentage of water, such as 60:40 or 50:50 water/acetonitrile. These illustrative embodiments are not limiting and any suitable mobile phase mixture for chromatographic separation and any suitable method for column regeneration may be used.

In another illustrative embodiment, methods are described herein for  
30 purifying conjugates comprising pterioic acid or analogs or derivatives thereof, and fluorescein or derivatives thereof may be purified by complexation with a polyvalent cation, such as an alkaline earth metal cation. Illustrative cations include but are not limited to magnesium, calcium, beryllium, strontium, barium, and the like.

-26-

Conventional methods are used to prepare salts such as sodium and/or potassium salts of the conjugates. Cation exchange is illustratively accomplished by mixing the sodium or potassium salt form with a polyvalent cation salt solution in a polar solvent, such as water. The polyvalent cation salt solution is prepared from conventional salts  
5 such as magnesium chloride, calcium chloride, and the like. The resulting complex is precipitated or crystallized from the polar solvent. It is appreciated that co-solvents may also be added to the polar solvent to facilitate precipitation of the polyvalent cation salts of the conjugates.

Polyvalent cation salts of the conjugates may be converted back to  
10 neutral forms or other salts forms, such as sodium and potassium salts by ion exchange chromatography on a suitable conventional resin.

In another illustrative embodiment, a method is provided for the therapeutic treatment of a host harboring a pathogenic cell population, such as cancer cells or pathogenic organisms. Illustratively, the method employs an isolated ligand-  
15 fluorescein conjugate capable of high affinity binding to cancer cells or other pathogenic agents. The method results in enhancement of the immune response-mediated elimination of pathogenic cell populations by rendering the pathogenic cells antigenic resulting in their recognition and elimination by the host immune system. In this method, the ligand-fluorescein conjugate is synthesized as described herein to  
20 avoid the formation of at least one bisfluorescein derivative and/or may be purified as described above to remove at least one bisfluorescein derivative.

In accordance with the methods and compositions described herein, the term "isolated ligand-fluorescein conjugate" refers to a ligand-fluorescein conjugate that has been purified or manipulated to remove at least one bisfluorescein derivative,  
25 or to a ligand-fluorescein conjugate that has been synthesized to avoid the formation of at least one bisfluorescein derivative, or to both.

In another illustrative embodiment, the method can utilize combination therapy by employing the isolated ligand-fluorescein conjugate, and an additional therapeutic factor capable of stimulating an endogenous immune response, a cell  
30 killing agent, a chemotherapeutic agent, a tumor penetration enhancer, a cytotoxic immune cell, or an antimicrobial agent to enhance immune response-mediated elimination of the pathogenic cell populations.

-27-

Illustratively, the method is utilized to enhance an endogenous immune response-mediated elimination of a population of pathogenic cells in a host animal harboring the population of pathogenic cells. The method is applicable to populations of pathogenic cells that cause a variety of pathologies such as cancer and infectious diseases. Thus, the population of pathogenic cells can be a cancer cell population that is tumorigenic, including benign tumors and malignant tumors, or it can be non-tumorigenic. The cancer cell population can arise spontaneously or by such processes as mutations present in the germline of the host animal or somatic mutations, or it can be chemically-, virally-, or radiation-induced. The method can be utilized to treat such cancers as carcinomas, sarcomas, lymphomas, Hodgekin's disease, melanomas, mesotheliomas, Burkitt's lymphoma, nasopharyngeal carcinomas, leukemias, and myelomas. The cancer cell population can include, but is not limited to, oral, thyroid, endocrine, skin, gastric, esophageal, laryngeal, pancreatic, colon, bladder, bone, ovarian, cervical, uterine, breast, testicular, prostate, rectal, kidney, liver, and lung cancers.

Illustratively, the population of pathogenic cells can also be an exogenous pathogen or a cell population harboring an exogenous pathogen, e.g., a virus. The method is applicable to such exogenous pathogens as bacteria, fungi, viruses, mycoplasma, and parasites. Infectious agents that can be treated with the method are any art-recognized infectious organisms that cause pathogenesis in an animal, including such organisms as bacteria that are gram-negative or gram-positive cocci or bacilli, DNA and RNA viruses, including, but not limited to, DNA viruses such as papilloma viruses, parvoviruses, adenoviruses, herpesviruses and vaccinia viruses, and RNA viruses, such as arenaviruses, coronaviruses, rhinoviruses, respiratory syncytial viruses, influenza viruses, picornaviruses, paramyxoviruses, reoviruses, retroviruses, and rhabdoviruses. Folate receptors have previously been identified on bacterial cells (Kumar et al., J. Biol. Chem.. 262, 7171-79 (1987)).

Of interest are bacteria that are resistant to antibiotics such as antibiotic-resistant *Streptococcus* species and *Staphylococcus* species, or bacteria that are susceptible to antibiotics, but cause recurrent infections treated with antibiotics so that resistant organisms eventually develop. Such organisms can be treated with the isolated ligand-fluorescein conjugates in combination with lower doses of antibiotics than would normally be administered to a patient to avoid the development of these

-28-

antibiotic-resistant bacterial strains. The method is also applicable to any fungi, mycoplasma species, parasites, or other infectious organisms that cause disease in animals. Examples of fungi that can be treated with the method of the present invention include fungi that grow as molds or are yeastlike, including, for example, 5 fungi that cause diseases such as ringworm, histoplasmosis, blastomycosis, aspergillosis, cryptococcosis, sporotrichosis, coccidioidomycosis, paracoccidioidomycosis, and candidiasis.

The method can also be utilized to treat parasitic infections including, but not limited to, infections caused by somatic tapeworms, blood flukes, tissue 10 roundworms, ameba, and *Plasmodium*, *Trypanosoma*, *Leishmania*, and *Toxoplasma* species. Parasites of interest are those that express folate receptors and bind folate or pteronic acid, or derivatives of folate or pteronic acid.

Penicillins and cephalosporins known for their antibiotic activity and specific binding to bacterial cell wall precursors can also be used as ligands for 15 preparing the isolated ligand-fluorescein conjugates for use in accordance with this method. The isolated ligand-fluorescein conjugates can be directed to a cell population harboring endogenous pathogens wherein pathogen-specific antigens are preferentially expressed on the surface of cells harboring the pathogens, and act as receptors for the ligand with the ligand specifically binding to the antigen.

20 Illustratively, the method can be used for both human clinical medicine and veterinary applications. Thus, the host animals harboring the population of pathogenic organisms and treated with the isolated ligand-fluorescein conjugates can be humans or, in the case of veterinary applications, can be a laboratory, agricultural, domestic, or wild animals. The method can be applied to host animals including, but 25 not limited to, humans, laboratory animals such rodents (e.g., mice, rats, hamsters, etc.), rabbits, monkeys, chimpanzees, domestic animals such as dogs, cats, and rabbits, agricultural animals such as cows, horses, pigs, sheep, goats, and wild animals in captivity such as bears, pandas, lions, tigers, leopards, elephants, zebras, giraffes, gorillas, dolphins, and whales.

30 Illustratively, the isolated ligand-fluorescein conjugate is administered to the host animal parenterally, e.g., intradermally, subcutaneously, intramuscularly, intraperitoneally, or intravenously. In another embodiment, the conjugate can be administered to the host animal by other medically useful processes, and any effective

-29-

dose and suitable therapeutic dosage form, including prolonged release dosage forms, can be used. The method can be used in combination with surgical removal of a tumor, radiation therapy, chemotherapy, or biological therapies such as other immunotherapies including, but not limited to, monoclonal antibody therapy, treatment with immunomodulatory agents, adoptive transfer of immune effector cells, treatment with hematopoietic growth factors, cytokines and vaccination.

Illustratively, suitable ligands include folic acid, analogs and derivatives of folic acid, and other folate receptor-binding molecules, including pteronic acid, and derivatives thereof, and other vitamins. Folate and pteronic acid derivatives include folate receptor-binding pteridines such as tetrahydropterins, dihydrofolates, tetrahydrofolates, and their deaza and dideaza analogs. The terms “deaza” and “dideaza” analogs refers to the art recognized analogs having a carbon atom substituted for one or two nitrogen atoms in the naturally occurring folic acid structure. For example, the deaza analogs include the 1-deaza, 3-deaza, 5-deaza, 8-deaza, and 10-deaza analogs. The dideaza analogs include, for example, 1,5 dideaza, 5,10-dideaza, 8,10-dideaza, and 5,8-dideaza analogs. The foregoing derivatives bind to folate-receptors. Other derivatives useful in the method described herein are the folate receptor-binding analogs aminopterin, amethopterin (methotrexate), N<sup>10</sup>-methylfolate, 2-deamino-hydroxyfolate, deaza analogs such as 1-deazamethopterin or 3-deazamethopterin, and 3',5'-dichloro-4-amino-4-deoxy-N<sup>10</sup>-methylpteroylglutamic acid (dichloromethotrexate).

Other suitable vitamins that can be used as ligands include niacin, pantothenic acid, riboflavin, thiamine, biotin, vitamin B<sub>12</sub>, and the lipid soluble vitamins A, D, E and K. (See U.S. Patent Nos. 5,108,921, 5,416,016, 5,635,382, and 5,688,488 incorporated herein by reference.) These vitamins, and their receptor-binding analogs and derivatives, constitute the ligand that can be coupled with fluorescein according to the procedures described herein.

Other suitable ligands include peptide ligands identified from library screens, tumor-specific peptides, tumor-specific aptamers, tumor-specific carbohydrates, tumor-specific monoclonal or polyclonal antibodies, Fab or scFv (i.e., a single chain variable region) fragments of antibodies such as, for example, an Fab fragment of an antibody directed to EphA2 or other proteins specifically expressed or uniquely accessible on metastatic cancer cells, small organic molecules derived from

-30-

combinatorial libraries, growth factors, such as EGF, FGF, insulin, and insulin-like growth factors, and homologous polypeptides, somatostatin and its analogs, transferrin, lipoprotein complexes, bile salts, selectins, steroid hormones, Arg-Gly-Asp containing peptides, retinoids, various Galectins,  $\gamma$ -opioid receptor ligands, cholecystokinin A receptor ligands, ligands specific for angiotensin AT1 or AT2 receptors, peroxisome proliferator-activated receptor  $\gamma$  ligands,  $\beta$ -lactam antibiotics, small organic molecules including antimicrobial drugs, and other molecules that bind specifically to a receptor preferentially expressed on the surface of tumor cells or on an infectious organism, or fragments of any of these molecules.

Of interest in the case of ligands that bind to infectious organisms, are any molecules, such as antibiotics or other drugs, that are known in the art to preferentially bind to the microorganism. The method also applies to ligands which are molecules, such as antimicrobial drugs, designed to fit into the binding pocket of a particular receptor, based on the crystal structure of the receptor, or other cell surface protein, and wherein such receptors are preferentially expressed on the surface of tumors, bacteria, viruses, mycoplasma, fungi, parasites, or other pathogens. It is also contemplated that ligands binding to any tumor antigens or other molecules preferentially expressed on the surface of tumor cells can be utilized. The ligands should be capable of specifically eliminating a population of pathogenic cells in the host animal due to preferential expression of a receptor for the ligand, accessible for ligand binding, on the pathogenic cells. The use of combinations of isolated ligand-fluorescein conjugates to maximize elimination of the pathogenic cells is also contemplated.

Illustratively, the method described herein employs fluorescein, or derivatives thereof, as the immunogen. Fluorescein, and derivatives thereof, should be capable of eliciting antibody production in the host animal or should be capable of binding to passively administered antibodies. In one illustrative embodiment, the host animal can develop a novel immunity through immunization against the unnatural antigen (i.e., fluorescein). Active immunization involves multiple injections of the unnatural antigen scheduled outside of a normal vaccination regimen to induce the novel immunity. Thus, the isolated ligand-fluorescein conjugates can be used to direct a previously acquired humoral or cellular immunity to a population of

-31-

pathogenic cells in the host animal for elimination of the foreign cells or pathogenic organisms.

In embodiments where the host animal develops a novel immunity through immunization against the unnatural antigen (i.e., fluorescein), the host animal can be preimmunized, to establish the novel immunity, with fluorescein linked to a carrier that renders fluorescein, a hapten, immunogenic. Any adjuvants known to the skilled artisan, such as Freund's adjuvant, saponin adjuvants, Alum™ (Pierce Chemical Co.), and the like, can also be administered with the carrier-fluorescein conjugate to enhance the novel immunity to fluorescein. Illustratively, carriers that can be used include keyhole limpet hemocyanin (KLH), haliotis tuberculata hemocyanin (HtH), inactivated diphtheria toxin, inactivated tetanus toxoid, purified protein derivative (PPD) of *Mycobacterium tuberculosis*, bovine serum albumin (BSA), ovalbumin (OVA), g-globulins, thyroglobulin, peptide antigens, and synthetic carriers, such as poly-L-lysine, dendrimer, and liposomes.

The carrier (e.g., KLH or BSA) can be conjugated to fluorescein by using any art-recognized method of forming a complex. This can include covalent, ionic, or hydrogen bonding of the carrier to the fluorescein, either directly or indirectly via a linking group such as a divalent linker. The fluorescein-carrier conjugates are illustratively formed by covalent bonding through the formation of amide, ester or imino bonds between acid, aldehyde, hydroxy, amino, or hydrazo groups on the respective components of the conjugates. In embodiments where a linker is used, the linker can comprise about 1 to about 30 carbon atoms or about 2 to about 20 carbon atoms. Lower molecular weight linkers (i.e., those having an approximate molecular weight of about 20 to about 500) can be employed. Also, the linker can comprise an indirect means for associating the carrier with the fluorescein, such as by connection through intermediary linkers, spacer arms, or bridging molecules.

The carrier-fluorescein conjugates can be purified to remove at least one bisfluorescein contaminant by any method known to the skilled artisan. Illustratively, an ultrafiltration step can be used to remove bisfluorescein contaminants or impurities from the carrier-fluorescein conjugates. A pharmaceutical composition comprising these carriers-fluorescein conjugates purified from bisfluorescein contaminants is contemplated.

-32-

In another illustrative embodiment, antibodies directed against fluorescein can be administered to the host animal to establish a passive immunity. The antibodies can be natural antibodies collected from serum or monoclonal antibodies that may or may not be genetically engineered antibodies, including humanized antibodies. The utilization of a particular amount of an antibody reagent to develop a passive immunity, and the use of an isolated ligand-fluorescein conjugate wherein the passively administered antibodies are directed to fluorescein, provides the advantage of a standard set of reagents to be used in cases where a patient's induced antibody titer is not therapeutically useful. The passively administered antibodies can be "co-administered" with the isolated ligand-fluorescein conjugate and co-administration is defined as administration of antibodies at a time prior to, at the same time as, or at a time following administration of the isolated ligand-fluorescein conjugate.

The isolated ligand-fluorescein conjugates enhance an endogenous immune response-mediated elimination of a population of pathogenic cells. The endogenous immune response can include a humoral response, a cell-mediated immune response, and any other immune response endogenous to the host animal, including complement-mediated cell lysis, antibody-dependent cell-mediated cytotoxicity (ADCC), antibody opsonization leading to phagocytosis, clustering of receptors upon antibody binding resulting in signaling of apoptosis, antiproliferation, or differentiation, and direct immune cell recognition of the delivered hapten. It is also contemplated that the endogenous immune response will employ the secretion of cytokines that regulate such processes as the multiplication and migration of immune cells. The endogenous immune response can include the participation of such immune cell types as B cells, T cells, including helper and cytotoxic T cells, macrophages, natural killer cells, neutrophils, LAK cells and the like.

It is contemplated that the induced antibodies, or passively administered antibodies will be redirected to the tumor cells or infectious organisms by preferential binding of the isolated ligand-fluorescein conjugates to these invading cells or organisms and that the pathogenic cells will be killed by complement-mediated lysis, ADCC, antibody-dependent phagocytosis, or antibody clustering of receptors. The cytotoxic process can also involve other types of immune responses, such as cell-mediated immunity, as well as secondary responses that arise when the

-33-

attracted antigen-presenting cells phagocytose the unwanted cells and present natural tumor antigens or antigens of foreign pathogens to the immune system for elimination of the cells or organisms bearing the antigens.

At least one additional composition comprising a therapeutic factor can be administered to the host in combination with the above-detailed methodology, to enhance the endogenous immune response-mediated elimination of the population of pathogenic cells, or more than one additional therapeutic factor can be administered. The therapeutic factor can be selected from a compound capable of stimulating an endogenous immune response, a chemotherapeutic agent, an antimicrobial agent, or other therapeutic factor capable of complementing the efficacy of the administered isolated ligand-fluorescein conjugate. The method described herein can be performed by administering to the host, in addition to the above-described conjugates, compounds or compositions capable of stimulating an endogenous immune response including, but not limited to, cytokines or immune cell growth factors such as interleukins 1-18, stem cell factor, basic FGF, EGF, G-CSF, GM-CSF, FLK-2 ligand, HILDA, MIP-1 $\alpha$ , TGF- $\alpha$ , TGF- $\beta$ , M-CSF, IFN- $\alpha$ , IFN- $\beta$ , IFN- $\gamma$ , soluble CD23, LIF, and combinations thereof.

In one illustrative embodiment, therapeutically effective combinations of these cytokines can be used. Therapeutically effective combinations of these cytokines can also be used. In one embodiment, for example, therapeutically effective amounts of IL-2, for example, in amounts ranging from about 0.1 MIU/m<sup>2</sup>/dose/day to about 60 MIU/m<sup>2</sup>/dose/day in a multiple dose daily regimen, and IFN- $\alpha$ , for example, in amounts ranging from about 0.1 MIU/m<sup>2</sup>/dose/day to about 10 MIU/m<sup>2</sup>/dose/day in a multiple dose daily regimen, can be used (MIU = million international units; m<sup>2</sup> = approximate body surface area of an average human). In another embodiment IL-12 and IFN- $\alpha$  are used in therapeutically effective amounts, and in yet another embodiment IL-15 and IFN- $\alpha$  are used in therapeutically effective amounts. In another embodiment, IL-2, IFN- $\alpha$  or IFN- $\gamma$ , and GM-CSF are used in combination. The therapeutic factor(s) used, such as IL-2, IL-12, IL-15, IFN- $\alpha$ , IFN- $\gamma$ , and GM-CSF, including combinations thereof, can activate natural killer cells and/or T cells. Alternatively, the therapeutic factor or combinations thereof, including an interleukin in combination with an interferon and GM-CSF, can activate other immune effector cells such as macrophages, B cells, neutrophils, NK cells, NKT

-34-

cells, T cells, LAK cells, or the like. The use of any other effective combination of cytokines including combinations of other interleukins and interferons and colony stimulating factors is also contemplated.

Chemotherapeutic agents, which are cytotoxic themselves and can  
5 work to enhance tumor permeability, suitable for use in the method include  
adrenocorticoids, alkylating agents, antiandrogens, antiestrogens, androgens,  
estrogens, antimetabolites such as cytosine arabinoside, purine analogs, pyrimidine  
analogues, and methotrexate, busulfan, carboplatin, chlorambucil, cisplatin and other  
platinum compounds, tamoxiphen, taxol, cyclophosphamide, plant alkaloids,  
10 prednisone, hydroxyurea, teniposide, antibiotics such as mitomycin C and bleomycin,  
nitrogen mustards, nitrosureas, vincristine, vinblastine, inflammatory and  
proinflammatory agents, and any other art-recognized chemotherapeutic agent. Other  
therapeutic agents that can be administered adjuvant to the administration of the  
conjugates described herein, include penicillins, cephalosporins, vancomycin,  
15 erythromycin, clindamycin, rifampin, chloramphenicol, aminoglycosides, gentamicin,  
amphotericin B, acyclovir, trifluridine, ganciclovir, zidovudine, amantadine, ribavirin,  
and any other art-recognized antimicrobial compound.

In one illustrative embodiment, the elimination of the population of  
pathogenic cells comprises a reduction or elimination of tumor mass or of pathogenic  
20 organisms resulting in a therapeutic response. In the case of a tumor, the elimination  
can be an elimination of cells of the primary tumor or of cells that have metastasized  
or are in the process of dissociating from the primary tumor. A prophylactic  
treatment to prevent return of a tumor after its removal by any therapeutic approach  
including surgical removal of the tumor, radiation therapy, chemotherapy, or  
25 biological therapy is also contemplated. The prophylactic treatment can be an initial  
treatment with the isolated ligand-fluorescein conjugate, such as treatment in a  
multiple dose daily regimen, and/or can be an additional treatment or series of  
treatments after an interval of days or months following the initial treatments(s).

In another illustrative embodiment, pharmaceutical compositions are  
30 provided comprising an amount of an isolated ligand-fluorescein conjugate effective  
to "label" a population of pathogenic cells in a host animal for specific elimination by  
an endogenous immune response or by co-administered antibodies. In another  
embodiment, the composition further comprises an amount of an additional factor,

-35-

effective to enhance the elimination of the pathogenic cells, selected from the group consisting of a cell killing agent, a tumor penetration enhancer, a chemotherapeutic agent, an antimicrobial agent, a cytotoxic immune cell, and a compound capable of stimulating an endogenous immune response. The pharmaceutical composition  
5 contains therapeutically effective amounts of the isolated ligand-fluorescein conjugate and the therapeutic factor and the factor can comprise a cytokine such as IL-2, IL-12, or IL-15, or combinations of cytokines, including IL-2, IL-12, or IL-15 and interferons such as IFN- $\alpha$  or IFN- $\gamma$  and combinations of interferons, interleukins, and colony stimulating factors, such as GM-CSF.

10 The unitary daily dosage of the isolated ligand-fluorescein conjugate can vary significantly depending on the host condition, the disease state being treated, its route of administration and tissue distribution, and the possibility of co-usage of other therapeutic treatments such as radiation therapy. The effective amount to be administered to a patient is based on body surface area, patient weight, and physician  
15 assessment of patient condition. An effective dose can range from about 1 ng/kg to about 1 mg/kg, from about 1  $\mu$ g/kg to about 500  $\mu$ g/kg, or from about 1  $\mu$ g/kg to about 100  $\mu$ g/kg.

Any effective regimen for administering the isolated ligand-fluorescein conjugate and the therapeutic factor to redirect induced antibodies to the tumor cells  
20 or infectious organisms or to induce a humoral response to the fluorescein can be used. For example, the isolated ligand-fluorescein conjugate and therapeutic factor can be administered as single doses, or they can be divided and administered as a multiple-dose daily regimen. Further, a staggered regimen, for example, one to three days per week can be used as an alternative to daily treatment, and such intermittent  
25 or staggered daily regimen is considered to be equivalent to every day treatment. In one embodiment, the host is treated with multiple injections of the isolated ligand-fluorescein conjugate and the therapeutic factor to eliminate the population of pathogenic cells. In another embodiment, the host is injected multiple times (preferably about 2 up to about 50 times) with the isolated ligand-fluorescein  
30 conjugate, for example, at 12-72 hour intervals or at 48-72 hour intervals. Additional injections of the isolated ligand-fluorescein conjugate can be administered to the patient at an interval of days or months after the initial injections(s) and the additional

-36-

injections can prevent recurrence of disease. Alternatively, the initial injection(s) of the isolated ligand-fluorescein conjugate may prevent recurrence of disease.

Illustratively, the therapeutic factor can be administered to the host animal prior to, after, or at the same time as the isolated ligand-fluorescein conjugate and the therapeutic factor can be administered as part of the same composition  
5 containing the conjugate or as part of a different composition than the isolated ligand-fluorescein conjugate. Any such therapeutic composition containing the therapeutic factor at a therapeutically effective dose can be used in the present method. Additionally, more than one type of isolated ligand-fluorescein conjugate can be used.  
10 For example, a pterioic acid-fluorescein conjugate and a riboflavin-fluorescein conjugate can be used in combination. In the case of chemotherapeutic and antimicrobial agents, the therapeutic factor can be administered at a suboptimal dose along with the isolated ligand-fluorescein conjugate in a combination therapy to avoid development of resistance to the chemotherapeutic or antimicrobial agent by the host  
15 animal.

Illustratively, the isolated ligand-fluorescein conjugate and the therapeutic factor can be injected parenterally and such injections can be intraperitoneal injections, subcutaneous injections, intramuscular injections, intravenous injections or intrathecal injections. The isolated ligand-fluorescein  
20 conjugate and the therapeutic factor can also be delivered using a slow pump. Examples of parenteral dosage forms include aqueous solutions of the active agent, in an isotonic saline, 5% glucose or other well-known pharmaceutically acceptable liquid carriers such as liquid alcohols, glycols, esters, and amides. The parenteral dosage form can be in the form of a reconstitutable lyophilizate comprising the dose  
25 of isolated ligand-fluorescein conjugate and therapeutic factor. In one aspect of the present embodiment, any of a number of prolonged release dosage forms known in the art can be administered such as, for example, the biodegradable carbohydrate matrices described in U.S. Patent Nos. 4,713,249; 5,266,333; and 5,417,982, the disclosures of which are incorporated herein by reference.

30 In another illustrative embodiment, pharmaceutical compositions are provided comprising an amount of an isolated carrier-fluorescein conjugate effective to establish a novel immunity to the fluorescein moiety in the conjugate when the host animal is preimmunized with the carrier-fluorescein conjugate. The carrier-

-37-

fluorescein conjugate can be used in any of the dosages or dosage forms described above and can be administered according to any of the regimens described above.

## EXAMPLES

Unless otherwise noted, all reactions were performed at ambient temperature; all evaporations were performed under reduced pressure or in vacuo; and Example compounds were analyzed by  $^1\text{H}$  NMR,  $^{13}\text{C}$  NMR, elemental analysis, analytical HPLC, UV absorption, and/or fluorescence, as appropriate.

EXAMPLE 1. Synthesis of compound **8a** from a pteroylglutamate.

Scheme 4

10

Step (a). A solution of N<sup>10</sup>-protected pteric acid **1a** (119 g, 0.25 mol) and the  $\alpha$ -*tert*-butyl,  $\gamma$ -methyl diester of glutamate (**2a**, 76 g, 0.30 mol) in DMF (4 L) was treated with PyBop (171 g, 0.325 mol) and DIPEA (109 mL, 0.60 mol). After 18 h, the mixture was evaporated giving diester **3a** as a precipitate from 1:1 ACN/methyl *tert*-butyl ether (MTBE).

Step (b). The *tert*-butyl protecting group of diester **3a** was chemoselectively removed with 1:1 TFA/anhydrous DCM in the presence of poly(4-vinylpyridine) to give the  $\alpha$ -acid,  $\gamma$ -methyl ester analog **4a** as a precipitate from 1:1 petroleum ether/MTBE.

20

-38-

Step (c). A mixture of the  $\alpha$ -acid,  $\gamma$ -methyl ester analog **4a** and ethylene diamine (**5a**) was stirred for 2 h to form EDA-folate analog **6a**. The N<sup>10</sup>-trifluoroacetamide protecting group was simultaneously removed during the reaction. Compound **6a** may be optionally purified to remove remaining ethylene diamine (**5a**) by column chromatography using a DEAE-cellulose solid support, such as DE52 (Whatman Cat. No. 4057-200).

Step (d). EDA-folate analog **6a** was condensed with fluorescein isothiocyanate (FITC, **7**) in the presence of DIPEA and 1,1,3,3-tetramethylguanidine (TMG) in DMSO, giving **8a** (218 g), which was collected as a precipitate from 1:1 ACN/MTBE. Folate-FITC **8a** was purified by reverse phase column chromatography (Biotage C18 cartridge, 100 mM sodium phosphate buffer/acetonitrile as mobile phase). Fractions containing **8a** were detected by UV absorption (280 nm) and pooled. Volatile solvents were evaporated, and the residue was desalted by reverse phase column chromatography (Biotage C18 cartridge, water/acetonitrile as mobile phase). Volatile solvents were evaporated, and the residue was lyophilized to give 47 g (22% overall) of **8a**. HPLC (Nova-Pak C18 column, 10 mM ammonium acetate/acetonitrile as mobile phase) indicated that the material was greater than 98% pure, and bisfluorescein derivative **IIIa** (n=1) was not detectable by UV or fluorescence.

-39-

EXAMPLE 2. Synthesis of **8a** from a glutamylethylenediamine.

Scheme 5

Step (a). A mixture of protected glutamic acid **9a** and protected ethylenediamine **10a** in THF was treated with PyBOP and diisopropylethylamine (DIPEA). Amide **11a** was isolated by extracting the reaction mixture with EtOAc. The combined organic phase was evaporated to give amide **11a**.

Step (b). Amide **11a** was treated with diazabicycloundecane (DBU) in methylene chloride at ambient temperature to remove the Fmoc protecting group. The mixture was evaporated to give amine **12a**, which may be optionally purified. Alternatively as indicated below, steps (b)-(d) may be performed in a single operation without purification in a one-pot process.

Step (c). The residue from step (b), or optionally the purified form containing amine **12a**, was dissolved in DMF and coupled with *N*<sup>10</sup>-trifluoroacetylpteroic acid (**1a**) using PyBOP and DIPEA. The reaction mixture was evaporated to give folate analog **13a**, which may be optionally purified. Alternatively as indicated below, steps (c)-(d) may be performed in a single operation without purification in a one-pot process.

Step (d). The residue from step (c), or optionally the purified form containing folate analog **13a**, was dissolved in methylene chloride and treated with trifluoroacetic acid (TFA) and poly(4-vinylpyridine) as a cation scavenger to simultaneously remove the Boc and *tert*-butyl protecting groups. Double

-40-

precipitation (butyl t-butyl ether, then 1:1 methyl t-butyl ether/CH<sub>3</sub>CN) gave amine **6b** as a light yellow solid.

Step (e). Condensation of amine **6b** with fluorescein isothiocyanate (**7**) gave the corresponding *N*<sup>10</sup>-trifluoroacetamide protected analog of **8a**, which was collected as a precipitate. The precipitate was dissolved in water and the pH was raised to about 10 or greater resulting in hydrolysis of the *N*<sup>10</sup>-trifluoroacetyl-protecting group, giving **8a**.

Folate-FITC **8a** was purified by reverse phase HPLC (XTerra column, 90:10 10 mM sodium phosphate buffer/acetonitrile as mobile phase). Fractions containing **8a** were detected by UV absorption (280 nm) and pooled. Volatile solvents were evaporated. The residue was desalted by reverse phase HPLC (XTerra column, 50:50 water/acetonitrile as mobile phase). Volatile solvents were evaporated, and the residue was lyophilized to give of **8a** as an orange solid.

EXAMPLE 3. Synthesis of **8a** from a ethylenediamineisothiocyanate.

Scheme 6

Step (a). A mixture of Boc-protected aminoethylisothiocyanate (**14a**, 1.5 mmol) and fluoresceinamine (**15**, Isomer-I, 0.3 mmol) in EtOH was heated at reflux for 24 h. The EtOH solvent was evaporated, the residue was dissolved in water, resulting in a pH of about 10. The aqueous layer was washed with EtOAc, and

-41-

the pH of the aqueous layer was adjusted to 4.0 by addition of acid, resulting in Boc-protected amine **16a** as a precipitate, which was freeze dried (70% yield).

Step (b). Boc-protected amine **16a** was suspended in dry  $\text{CH}_2\text{Cl}_2$ , poly-(4-vinylpyridine) was added, then trifluoroacetic acid was slowly added. The resulting clear yellow solution was stirred for 3 h. The reaction mixture was filtered and precipitated with 1:1 methyl t-butyl ether (MTBE)/ $\text{CH}_2\text{Cl}_2$ . The precipitate was washed with MTBE and dried under high vacuum giving amine **17a** in quantitative yield.

Step (c). PyBop (1.01 mmol) and glutamic acid(O-t-Bu)OMe (1.01 mmol) were sequentially added to a suspension of  $\text{N}^{10}$ -TFA-pterioic acid (0.84 mmol) in DMF. The resulting clear solution was treated with diisopropylethyl amine (DIPEA, 2.02 mmol) and stirred for 3 h. The DMF was removed under reduced pressure and impure **19a** was precipitated with 1:1  $\text{CH}_3\text{CN}$ /MTBE. The precipitate was washed with 1:1  $\text{CH}_3\text{CN}$ /MTBE and dried under high vacuum giving **19a** in quantitative yield.

Step (d). Compound **19a** was suspended in dry  $\text{CH}_2\text{Cl}_2$  and poly-(4-vinylpyridine) and trifluoroacetic acid were added sequentially. The resulting clear yellow solution was stirred for 2h, filtered, and impure **20a** was precipitated with 1:1 MTBE/ $\text{CH}_2\text{Cl}_2$ . The precipitate was washed with MTBE and dried under high vacuum giving **20a** (66% yield).

Step (e). PyBop (0.052 mmol) and DIPEA (0.20 mmol) were added simultaneously to a solution of folic acid analog **20a** (0.05 mmol) and EDA-fluorescein **17a** (0.05 mmol) in dry DMF. The resulting solution was stirred for 2h, and impure **23a** was precipitated with MTBE. The precipitate was washed with MTBE and dried under high vacuum giving **23a** in quantitative yield.

Step (f). Compound **23a** (0.05 mmol) was treated with an ice-cold solution of 0.5 M  $\text{Na}_2\text{CO}_3$  (pH=10.6). The resulting bright orange solution was stirred for 4 h, followed by adjusting the reaction mixture pH to about 7.6-7.8 by addition of 1 M HCl. Purification by preparative HPLC column (eluent: 5.0 mM sodium phosphate/ACN) gave pure fractions containing compound **8a**. ACN was removed under reduced pressure the concentrate was freeze dried to obtain **8a** as an orange powder (60% yield).

-42-

EXAMPLE 4. Pretreatment of DEAE cellulose anion exchange solid support.

Prior to loading the DEAE cellulose anion exchange solid support (for example DE32) onto a column, the solid support was slurried into 15 volumes of a 0.5 M HCl solution. After about 0.5 hours, the supernatant was decanted away, and the solid support was washed with water until the wash had a pH of about 4. The solid support was slurried into 15 volumes of a 0.5 M NaOH solution. After about 0.5 hours, the supernatant was decanted away, and the solid support was washed with water until the wash had a pH of about 8.

10 EXAMPLE 5. Purification of pterioic acid from folic acid with DE32.

Dry microgranular DE32 anion exchange resin (DEAE cellulose, Whatman Cat. No. 6055-010) was pretreated as described in Example 4. A slurry of the pretreated resin in deionized water was degassed for at least 1 hour under vacuum, uniformly packed into a glass column (25 X 900 mm), and the column was checked to minimize trapped bubbles. The column was equilibrated with the mobile phase (1.0 M NaCl/0.01 M NaOH, pH 11.5). A mixture containing pterioic acid and folic acid (1.0 g) was partially dissolved in 1.0 M NaCl (1 mL) at about pH 6. The mixture completely dissolved after adjusting the pH to 11.5. The resulting solution was loaded onto the column and eluted with the mobile phase (1.0 M NaCl/0.01 M NaOH). Referring to FIG. 1A, elution was monitored by UV absorption (280 nm). It was determined that folic acid eluted in fractions 13-31, and pterioic acid eluted in fractions 35-81. Referring to FIG. 1B, each of fractions 35-75 contained pterioic acid (greater than 99% pure) as determined by reversed phase HPLC on a Nova-Pak C18, 3.9 X 150 mm column running a 99:1 to 1:1 A/B gradient at 1 mL/min where A is a 0 1% TFA-H<sub>2</sub>O solution and B is a 0.1% TFA-CH<sub>3</sub>CN solution, with detection at 280 nm. Fractions 35-75 were combined, and the pH of the combined fraction was adjusted to about 2 by adding 1.0 M HCl. The resulting precipitate slurry was centrifuged, and the supernatant was decanted. The residue was resuspended in water, centrifuged, and the supernatant decanted (3 times). The residue was lyophilized to give 0.40 g of pterioic acid.

30 EXAMPLE 6. Purification of pterioic acid from folic acid with DE52.

Pre-swollen microgranular DE52 anion exchange resin (DEAE cellulose, Whatman Cat. No. 4057-200, 6 kg) was mixed with deionized water (12 L).

-43-

The resulting slurry was degassed for at least 1 hour under vacuum, uniformly packed into a glass column (100 X 1200 mm), and the column was checked to minimize trapped bubbles. The column was equilibrated with the mobile phase (1.0 M NaCl, 0.01 M NaOH, pH 11.5). A sample of crude pterioic acid (40 g) containing about 25% folic acid was dissolved in water (500 mL), and the pH was adjusted to 11.5 by adding a NaOH solution. The solution was filtered, loaded onto the column, and eluted with the mobile phase. Each fraction was monitored by reversed phase HPLC. The fractions containing pterioic acid in greater than about 95% purity were combined, and the pterioic acid was precipitated from the combined fractions by adjusting the pH to about 3 by adding a 1.0 M HCl solution. The precipitate was lyophilized to give pterioic acid (20 g, > 98% purity as determined by analytical reverse phase HPLC).

The column was regenerated by eluting 2 bed volumes of the mobile phase. Columns that were stored for about a week or longer were treated with a preservative, such as a 0.2% benzalkonium chloride solution.

EXAMPLE 7. Purification of a folate-fluorescein conjugate from fluorescein.

Pre-swollen microgranular DE52 anion resin (DEAE cellulose, Whatman Cat. No. 4057-200, 1.8 kg) was pretreated as described in Example 6. A slurry of the pretreated resin in deionized water (4 L) was degassed for at least 1 hour under vacuum, uniformly packed into a glass column (75 X 600 mm), and the column was checked to minimize trapped bubbles. The column was equilibrated with the mobile phase (1.0 M NaCl, NaOH to pH 9.0). A sample of crude folate-fluorescein conjugate (47.9 g) containing about 10% fluorescein and other impurities was dissolved in water (600 mL), and the pH was adjusted to 9.0 by adding a 1.0 M NaOH solution. The solution was filtered, loaded onto the column, and eluted with the mobile phase. Each fraction was monitored by reversed phase HPLC. The fractions containing folate-fluorescein conjugate in greater than about 95% purity were combined, and the folate-fluorescein conjugate was precipitated from the combined fractions by adjusting the pH to about 3 by adding a 1.0 M HCl solution. The precipitates was lyophilized to give **8a** (41.8 g).

EXAMPLE 8. Purification of **8a** by HPLC.

A sample of impure **8a** (4 g) was prepared as described in Example 1 and purified by preparative HPLC using an XTERRA RP18, 30 x 300 mm 10  $\mu$ m

-44-

column (Waters) running a 100:0 to 91:9 A/B gradient over 30 min at 35 ml/min (where A was a 100 mM sodium phosphate (pH 7.4) solution and B was ACN). Compound **8a** eluted and was collected in fractions, while the bisfluorescein-derivative did not elute under these conditions and was not detected. Each eluted fraction was monitored by analytical reverse phase HPLC with both a UV detector and a fluorescence detector. Fractions that were greater than 98% purity by UV, did not contain any EDA-bisfluorescein or bisfluorescein impurities by UV or by fluorescence (threshold of less than 0.1%) were combined. The ACN was evaporated at a temperature less than about 35 °C. The column was regenerated by eluting 1:1 A/B for two or more bed volumes.

The resulting solution of **8a** containing phosphate salts was purified by reverse phase HPLC on a column equilibrated with 100% water for injection (WFI) by eluting with WFI for 30 min to wash out the phosphate salts, followed by a 100:0 to 91:9 WFI/ACN gradient over 30 min at 35 mL/min to elute **8a**. Each fraction was also monitored by analytical reverse phase HPLC with both a UV detector and a fluorescence detector. Fractions with greater than 98% purity by UV and less than 0.05% EDA-bisfluorescein or bisfluorescein impurities by fluorescence were pooled and lyophilized to obtain **8a** as a powder.

EXAMPLE 9. Effect of isolated folate-fluorescein conjugates on growth of solid tumors.

Six to eight-week old (~20-22 grams) female Balb/c mice (8 mice/group) were immunized subcutaneously at multiple sites with fluorescein-labeled keyhole limpet hemocyanin (KLH) using a commercial saponin adjuvant (GPI-0100; Galenica). After assuring that anti-fluorescein antibody titers were high in all mice (as evidenced by the results of ELISA assays of serum samples of the mice), each animal was injected subcutaneously in the shoulder with  $1 \times 10^6$  M109 cells (a syngeneic lung cancer cell line that expresses high levels of the folate receptor; day 0) following prior immunization with KLH-fluorescein. The immunizations with folate-fluorescein after tumor cell implantation consisted of 500, 2000, or 5000 nmol/kg of folate-fluorescein, conjugated via a gamma carboxyl-linked ethylene diamine bridge, given in 19 intraperitoneal doses at 24 hour intervals (days 1-19). Control animals were injected with phosphate buffered saline (PBS). A series of 5 daily injections (five times a week) for three weeks of 20,000 IU/day of

-45-

recombinant human IL-2 were administered to all mice in order to stimulate the immune system. A series of 3 injections for three weeks of 25,000 U/day of recombinant human IFN- $\alpha$  were also administered to all mice. The efficacy of this immunotherapy was then evaluated by monitoring tumor volume (mm<sup>3</sup>) using a caliper. The tumor growth curves depicted in FIG. 2 show that the growth of solid tumors was significantly inhibited when animals were treated with folate-fluorescein in combination with IL-2 and IFN- $\alpha$ .

EXAMPLE 10. Purification of EDA-folate (**6a**) with DE52.

Pre-swollen microgranular DE52 anion exchange resin (DEAE cellulose, SIGMA) was mixed with deionized water (12 L). The slurry was degassed for at least 1 h under vacuum, uniformly packed into a glass column (100 X 1200 mm), and the column was checked to minimize trapped bubbles. The column was equilibrated with a NaOH solution at pH 10.5. A sample of EDA-folate **6a** contaminated with ethylene diamine **5a** was partially dissolved in water at neutral pH, and completely dissolved after adjusting the solution to pH 10.5 by adding a NaOH solution. After loading the pH adjusted solution, the column was first eluted with 3 bed volumes of NaOH solution at pH 10.5, and then eluted with 2 bed volumes of 1.0 M NaCl/NaOH solution (pH 10.5). The yellow colored fractions obtained while eluting with 1.0 M NaCl/NaOH (pH 10.5) solution were collected and combined. EDA-folate **6a** was precipitated from the pooled fractions by adjusting the pH to about 7 by adding an HCl solution. After freeze drying, a small portion of **6a** was coupled with fluorescein and analyzed by HPLC with a fluorescence detector. EDA-bisfluorescein compounds of formulae **II** and **III** were not detected.

EXAMPLE 11. Purification of compound 8a as a calcium or magnesium salt.

Treatment of 8a as a sodium salt (84% purity) with 10-50 mol equivalents of magnesium chloride or calcium chloride in water resulted in precipitation. After heating the mixture to 90 - 100 °C, the precipitate dissolved to give a yellow solution, which was filtered, and slowly cooled to room temperature. The resulting yellow solids were filtered, washed with water, and freeze dried to give 8a in 93-97% purity. The calcium or magnesium salt may be converted to the sodium salt by ion exchange.

-46-

## CLAIMS:

1. A method for purifying pteronic acid, a derivative of pteronic acid, an analog of pteronic acid, or a combination thereof, the method comprising the  
5 steps of:
  - (a) contacting a solution comprising pteronic acid, the derivative of pteronic acid, an analog of pteronic acid, or the combination thereof with an ion exchange chromatographic support;
  - (b) eluting a first fraction comprising pteronic acid, the derivative of  
10 pteronic acid, or the analog of pteronic acid, with a mobile phase having a pH of about 10 or greater;
  - (c) lowering the pH of the first fraction to about 3 or less; and
  - (d) precipitating pteronic acid, the derivative of pteronic acid, or the analog of pteronic acid.
- 15 2. The method of claim 1 wherein the contacting step includes contacting the solution with an ion exchange chromatographic support comprising a saccharide-based ion exchange resin.
3. The method of claim 1 wherein the contacting step includes contacting the solution with an ion exchange chromatographic support comprising a  
20 saccharide-based ion exchange resin selected from the group consisting of cellulose, amylose, agarose, sepharose, sephadex, and combinations thereof.
4. The method of claim 1 wherein the contacting step includes contacting the solution with an ion exchange chromatographic support comprising a saccharide-based ion exchange resin comprising cellulose, amylose, or a combination  
25 thereof.
5. The method of claim 1 wherein the contacting step includes contacting the solution with an ion exchange chromatographic support comprising a saccharide-based anion exchange resin.
6. The method of claim 1 wherein the contacting step includes  
30 contacting the solution with an ion exchange chromatographic support comprising a saccharide-based anion exchange resin comprising cellulose, amylose, or a combination thereof.

-47-

7. The method of claim 1 wherein the contacting step includes contacting the solution with an ion exchange chromatographic support comprising a saccharide-based anion exchange resin selected from the group consisting of sephadex DEAE, sephadex QA, PEI cellulose, QA cellulose, DEAE cellulose, and combinations thereof.

8. The method of claim 1 wherein the contacting step includes contacting a solution further comprising folic acid, a derivative of folic acid, or a combination thereof.

9. The method of claim 8 further comprising the step of (e) eluting a second fraction comprising folic acid or the derivative of folic acid, where the first fraction and the second fraction are substantially separated.

10. The method of claim 8 or 9 wherein the contacting step includes contacting the solution with an ion exchange chromatographic support comprising a saccharide-based anion exchange resin selected from the group consisting of sephadex DEAE, sephadex QA, PEI cellulose, QA cellulose, DEAE cellulose, and combinations thereof.

11. The method of any one of claims 1 to 9 wherein the eluting step includes eluting a first fraction comprising pteronic acid, the derivative of pteronic acid, or the analog of pteronic acid, with a mobile phase having a pH of about 11 or greater.

12. The method of any one of claims 1 to 9 wherein the eluting step includes eluting a first fraction comprising pteronic acid, the derivative of pteronic acid, or the analog of pteronic acid, with a mobile phase having a pH in the range from about 11 to about 13.

13. The method of any one of claims 1 to 9 wherein the eluting step includes eluting with a mobile phase substantially free of ammonia or salts thereof.

14. The method of any one of claims 1 to 9 wherein the precipitating step includes precipitating pteronic acid, the derivative of pteronic acid, or the analog of pteronic acid, as a precipitate having a purity of about 95% by weight or greater.

15. The method of any one of claims 1 to 9 wherein the precipitating step includes precipitating pteronic acid, the derivative of pteronic acid, or the analog of pteronic acid, as a precipitate having a purity of about 98% by weight or greater.

-48-

16. The method of any one of claims 1 to 9 wherein the precipitating step includes precipitating pterioic acid, the derivative of pterioic acid, or the analog of pterioic acid, as a precipitate having a purity of about 99% by weight or greater.

5 17. The method of any one of claims 1 to 9 wherein the precipitating step includes precipitating pterioic acid, the derivative of pterioic acid, or the analog of pterioic acid, as a precipitate that is substantially free of folic acid.

18. The method of any one of claims 1 to 9 wherein the contacting step includes contacting a solution comprising pterioic acid with the ion exchange chromatographic support.

19. The method of any one of claims 1 to 9 wherein the contacting step includes contacting a pterioic acid derivative of the formula

with the ion exchange chromatographic support.

15 20. The method of any one of claims 1 to 9 wherein the contacting step includes contacting a pterioic acid derivative of the formula

with the ion exchange chromatographic support.

21. A method for purifying pterioic acid, a derivative of pterioic acid, an analog of pterioic acid, or a combination thereof, the method comprising the steps of:

(a) contacting a solution comprising pterioic acid, the derivative of pterioic acid, the analog of pterioic acid, or the combination thereof, with an anion exchange chromatographic support; and

-49-

(b) eluting a first fraction comprising pterioic acid, the derivative of pterioic acid, or the analog of pterioic acid.

22. The method of claim 21 wherein the contacting step includes contacting pterioic acid, the derivative of pterioic acid, or the analog of pterioic acid with an anion exchange chromatographic support selected from the group consisting of sephadex DEAE, sephadex QA, PEI cellulose, QA cellulose, DEAE cellulose, and combinations thereof.

23. A method for purifying a conjugate comprising pterioic acid, a derivative thereof, or an analog of pterioic acid, and fluorescein or a derivative of fluorescein, the method comprising the steps of:

- (a) contacting a solution comprising the conjugate with a first reversed phase chromatographic support;
- (b) eluting a first fraction comprising a phosphate complex of the conjugate with a mobile phase, said mobile phase comprising a phosphate salt and having a pH in the range from about 6 to about 8;
- (c) contacting a solution of the phosphate complex of the conjugate with a second reversed phase chromatographic support; and
- (d) eluting a second fraction comprising the conjugate with a mobile phase comprising water, where the second fraction is substantially free of phosphate.

24. The method of claim 23 wherein the conjugate is a compound of the formula

25. The method of claim 23 or 24 wherein eluting step (b) includes using a mobile phase having a pH of about 7.4.

26. The method of claim 23 or 24 wherein contacting step (a) includes contacting the conjugate with a first reversed phase chromatographic support comprising a C18 silica support.

-50-

27. The method of claim 23 or 24 wherein eluting step (b) and eluting step (d) each includes eluting with a mobile phase further comprising an independently selected organic solvent selected from the group consisting of acetonitrile, methanol, tetrahydrofuran, and combinations thereof.

5 28. The method of claim 23 or 24 wherein eluting step (b) and eluting step (d) each includes eluting with a mobile phase further comprising acetonitrile.

29. The method of claim 28 wherein eluting step (b) includes eluting with the mobile phase comprising the phosphate salt and acetonitrile along a  
10 gradient, where the relative percentage of acetonitrile is increased and the relative percentage of phosphate salt is decreased over a predetermined period of time.

30. The method of claim 28 wherein eluting step (d) includes eluting with the mobile phase comprising water and acetonitrile along a gradient, where the relative percentage of acetonitrile is increased and the relative percentage  
15 of water is decreased over a predetermined period of time.

31. A process for preparing a compound of the formula

the process comprising the step of:

reacting a compound of the formula

20

with a compound of the formula

-51-

wherein  $R^1$  and  $R^2$  are each independently selected from the group consisting of hydrogen and a nitrogen protecting group, or  $R^1$  and  $R^2$  are taken together to form a nitrogen protecting group;  $R^3$  and  $R^4$  are each independently selected from the group consisting of hydrogen and a nitrogen protecting group;  $R^5$  is hydrogen or a  
 5 carboxylic acid protecting group;  $n$  is an integer selected from the group consisting of 0, 1, 2, 3, and 4;  $m$  is an integer selected from the group consisting of 1, 2, 3, and 4; and  $R^6$  and  $R^7$  are each independently selected from the group consisting of hydrogen and a nitrogen protecting group, or  $R^6$  and  $R^7$  are taken together to form a nitrogen protecting group.

10 32. The process of claim 31 wherein at least one of  $R^6$  and  $R^7$  is a nitrogen protecting group.

33. The process of claim 31 or 32 wherein  $R^4$  is a nitrogen protecting group.

34. A process for preparing a compound of the formula

15

the process comprising the steps of:

(a) reacting a compound of the formula

with a compound of the formula

20

wherein  $R^1$  and  $R^2$  are each independently selected from the group consisting of hydrogen and a nitrogen protecting group, or  $R^1$  and  $R^2$  are taken together to form a nitrogen protecting group;  $R^3$  and  $R^4$  are each independently selected from the group

-52-

consisting of hydrogen and a nitrogen protecting group;  $R^5$  is hydrogen or a carboxylic acid protecting group;  $n$  is an integer selected from the group consisting of 0, 1, 2, 3, and 4;  $m$  is an integer selected from the group consisting of 1, 2, 3, and 4;  $R^6$  and  $R^7$  are each independently selected from the group consisting of hydrogen and a nitrogen protecting group, or  $R^6$  and  $R^7$  are taken together to form a nitrogen protecting group; and  $R^9$  is an alkyl group.

35. The process of claim 34 wherein  $R^5$  is hydrogen, and  $R^9$  is methyl.

36. The process of claim 34 wherein at least one of  $R^6$  and  $R^7$  is a nitrogen protecting group.

37. A process for preparing a compound of the formula

the process comprising the steps of:

(a) reacting a compound of the formula

with a compound of the formula

wherein  $R^1$  and  $R^2$  are each independently selected from the group consisting of hydrogen and a nitrogen protecting group, or  $R^1$  and  $R^2$  are taken together to form a nitrogen protecting group;  $R^3$  and  $R^4$  are each independently selected from the group

-53-

consisting of hydrogen and a nitrogen protecting group;  $R^5$  is hydrogen or a carboxylic acid protecting group;  $n$  is an integer selected from the group consisting of 0, 1, 2, 3, and 4; and  $m$  is an integer selected from the group consisting of 1, 2, 3, and 4.

- 5                    38.    The process of claim 37 wherein  $R^5$  is alkyl.  
                       39.    A compound of the formula

and pharmaceutically acceptable salts, hydrates, and solvates thereof, where the compound is isolated in a form having a purity of at least about 95 mole percent or at  
 10    least about 95% by weight.

40.    The compound of claim 39 wherein the purity is at least about 98 mole percent or at least about 98% by weight.  
                       41.    The compound of claim 39 wherein the purity is at least about 99 mole percent or at least about 99% by weight.  
 15                    42.    The compound of claim 39 further isolated in a form having no more than about 0.1 mole percent or no more than about 0.1% by weight of one or more bisfluorescein components.  
                       43.    The compound of claim 39 further isolated in a form having no more than about 0.05 mole percent or no more than about 0.05% by weight of one or  
 20    more bisfluorescein components.  
                       44.    The compound of any one of claims 39 to 43 further isolated in a form being substantially free of one or more bisfluorescein components.  
                       45.    The compound of any one of claims 39 to 43 further isolated in a form being substantially free of a component of the formula

-54-

46. The compound of any one of claims 39 to 43 further isolated in a form being substantially free of a component of the formula

5 47. A composition comprising a compound of the formula

and pharmaceutically acceptable salts, hydrates, and solvates thereof, where the compound corresponds to at least about 95 mole percent of the composition or at least about 95% of the composition by weight.

10 48. The composition of claim 47 wherein the compound corresponds to at least about 98 mole percent of the composition or at least about 98% of the composition by weight .

49. The composition of claim 47 wherein the compound corresponds to at least about 99 mole percent of the composition or at least about 99%  
15 of the composition by weight.

50. The composition of claim 47 wherein the composition is substantially free of folic acid.

51. The composition of any of claims 47 to 50 wherein the compound is prepared by a method including the step of contacting a solution  
20 comprising the compound with DEAE cellulose.

-55-

52. A composition comprising a compound of the formula

and pharmaceutically acceptable salts, hydrates, and solvates thereof, where the compound corresponds to at least about 90 mole percent of the composition, or at least about 95% of the composition by weight.

53. The composition of claim 52 wherein the compound corresponds to at least about 95 mole percent of the composition, or at least about 98% of the composition by weight.

54. The composition of claim 52 wherein the compound corresponds to at least about 99 mole percent of the composition, or at least about 99% of the composition by weight.

55. The composition of claim 52 wherein the composition includes no more than about 0.1% by weight of one or more bisfluorescein components.

56. The composition of claim 52 wherein the composition includes no more than about 0.05% by weight of one or more bisfluorescein components.

57. The composition of claim 52 wherein the composition is substantially free of one or more bisfluorescein components.

58. The composition of any one of claims 52 to 56 wherein the composition is substantially free of a component of the formula

20

59. The composition of any one of claims 52 to 56 wherein the composition is substantially free of a component of the formula

-56-

60. A composition comprising a compound of the formula

wherein the composition includes no more than about 0.1% by weight of one or more  
5 bisfluorescein components.

61. The composition of claim 60 wherein the composition includes  
no more than about 0.05% by weight of one or more bisfluorescein components.

62. The composition of claim 60 or 61 being substantially free of  
one or more bisfluorescein components.

10 63. The composition of claim 60 or 61 being substantially free of a  
component of the formula

64. The composition of claim 60 or 61 being substantially free of a  
component of the formula

-57-

65. A method for enhancing an endogenous immune response-mediated elimination of a population of pathogenic cells in a mammal, the method comprising the step of administering to the mammal an effective amount of a composition comprising a ligand-fluorescein conjugate, and no more than about 0.1% by weight of one or more bisfluorescein components.

66. The method of claim 65 wherein the administering step includes administering a composition comprising a ligand-fluorescein conjugate, and no more than about 0.05% by weight of one or more bisfluorescein components.

67. The method of claim 65 wherein the administering step includes administering a composition comprising a ligand-fluorescein conjugate, and being substantially free of one or more bisfluorescein components.

68. The method of claim 65 or 66 wherein the administering step includes administering a composition comprising a ligand-fluorescein conjugate, and being substantially free of a compound of the formula

69. The method of claim 65 or 66 wherein the administering step includes administering a composition comprising a ligand-fluorescein conjugate, and being substantially free of a compound of the formula

70. A method for enhancing an endogenous immune response-mediated elimination of a population of pathogenic cells in a host animal, the method comprising the step of administering to the host animal an effective amount of a compound according to any one of claims 43 to 50.

-58-

71. A method for enhancing an endogenous immune response-mediated elimination of a population of pathogenic cells in a host animal, the method comprising the step of administering to the host animal an effective amount of a composition according to any one of claims 56 to 68.

5 72. A method of enhancing an endogenous immune response-mediated elimination of a population of pathogenic cells in a host animal, the method comprising the step of administering to the host animal an effective amount of a ligand-fluorescein conjugate, where the conjugate is prepared according to any one of claims 1 to 9 or 39 to 43.

10 73. A pharmaceutical composition comprising an effective amount of a compound according to any one of claims 39 to 43, and a pharmaceutically acceptable carrier, diluent, or excipient therefor.

74. A pharmaceutical composition comprising an effective amount of a composition according to any one of claims 47 to 50 or 52 to 57, and a  
15 pharmaceutically acceptable carrier, diluent, or excipient therefor.
