TECHNICAL FIELD

The present application relates to compounds that are calcium channel blockers, compositions comprising such compounds, and methods of treating conditions and disorders using such compounds and compositions.

BACKGROUND

Voltage-gated calcium channels (VGCC) play an integral role in the regulation of membrane ion conductance, neurotransmitter release, and cellular excitability. VGCC are composed of the pore-forming α subunit and auxiliary α2δ and β subunits that modulate channel expression and functional properties (Dolphin, A. C. British Journal of Pharmacology 2006, 147 (Suppl. 1), S56-S62). These channels can be classified into low-voltage activated (LVA; T-type or Ca3.3) and high-voltage activated (HVA; L-type or Ca1.2,3.x and N-, P/Q- and R-types or Ca2.2.x) channels. N-, P/Q and R channels typically activate at more positive membrane potentials (~ -30 mV) and are involved in "presynaptic" neurotransmission (McGivern J. G. Drug Discovery Today 2006, 11, 245-253). T-type channels are activated at relatively negative membrane potentials (~ -60 mV) and are primarily involved in "postsynaptic" excitability (Shin, H.-S.; et al. Curr. Opin. in Pharmacology 2008, 8, 33-41).

N-type channel α subunits are encoded by a single gene (αB or Ca2.2) in contrast to pharmacologically defined L- and T-type currents that are encoded by multiple α subunit genes. A diversity of N-type channels arises due to extensive alternative splicing of the α subunit gene that generates variants with different expression patterns and
GPCR-modulated biophysical properties (Gray, A. C.; et al. Cell Calcium, 2007, 42(4-5), 409-417). The primary sequence for Ca,2.2 is highly conserved across species (rat and human share 91% identity at the amino acid level).

[0006] Following nerve injury there is increased expression of Ca,2.2 (Westenbroek, R. E.; et al. J. Neurosci. 1998, 18(16), 6319-6330. Cizkova, D.; et al. Exp. Brain Res. 2002, 147, 456-463. Yokoyama, K.; et al. Anesthesiology 2003, 99(6), 1364-1370) and α2δ1 subunits (Luo, Z. D.; et al. J. Neurosci. 2001, 21(6), 1868-1875. Newton, R. A.; et al. Mol. Brain Res. 2001, 95(1-2), 1-8) in addition to increases in the superficial layers of the dorsal horn of the spinal cord supporting a role for N-type channels in neuropathic pain. Recently a nociceptor-specific Ca,2.2 splice variant has been identified in the dorsal root ganglion (Bell, T. J.; et al. Neuron 2004, 41(1), 127-138). These channels have distinct electrophysiological properties and current densities (Castiglioni, A. J.; et al. J. Physiol. 2006, 576(Pt 1), 119-134) compared to wildtype Ca,2.2 channels. While G-protein coupled receptor inhibition of wildtype N-type channels is typically mediated by Gβγ and is voltage-dependent, the nociceptor specific splice variant is inhibited by GPCR activation (e.g. opioids) in a voltage-independent fashion (Raingo, J.; et al. Nat. Neurosci. 2007, 10(3), 285-292). This mechanism substantially increases the sensitivity of Ca,2.2 channels to opiates and gamma-aminobutyric acid (GABA) suggesting that cell-specific alternative splicing of mRNA for Ca,2.2 channels serves as a molecular switch that controls the
sensitivity of N-type channels to neurotransmitters and drugs that modulate nociception. Collectively these data provide further support for the role of Ca_{2.2} channels in pain states.

[0009] L, P/Q and N-type channels are blocked by channel specific antagonists i.e., dihydropyridines, ω-agatoxin IVA and ω-conotoxin MVIIA/ ziconotide, respectively. Agatoxin IVa has been shown to block excitatory (Luebke, J. I.; et al. Neuron 1993, 11(5),

[0010] T-Type or LVA calcium channels are composed of a single pore forming α subunit of which there are three subtypes: Cav3.1, Cav3.2 and Cav3.3 (Perez-Reyes, E.; et al. J. Pharmacol. Exp. Ther. 2009, 328(2), 621-7). These channels are activated at relatively hyperpolarized cell membrane potentials and contribute to membrane depolarization following action potential generation. As a result, T-type calcium channel activation triggers secondary bursts of neuronal action potentials with increased action potential duration. Evidence supporting a role of T-type calcium channels in neuropathic pain comes from studies that have shown a concurrent increase in the expression of Cav3.2 channels after-depolarization potentials in medium diameter Aδ high threshold mechanoreceptor dorsal root ganglia (DRG) neurons in diabetic neuropathy (Jagodic,
M.M.; et al. J Neurosci 2007, 27, 3305-3316) and in small diameter neurons from the chronic constriction injury (CCI) neuropathic pain model (Jagodic, M.M.; et al. J Neurophysiol 2008, 99, 3151-3156). Additional support comes from gene knockdown studies whereby intrathecal Cav3.2 antisense administration produces a significant knockdown (-80-90%) of T-type calcium currents in small and medium diameter DRG neurons, and produces robust anti-allodynic and antihyperalgesic effects in the CCI rat model of neuropathic pain (Bourinet, E.; et al. Embo J 2005, 24, 315-324). Moreover, Cav3.2 knockout mice show decreased pain responses compared to wild-type mice in acute mechanical, thermal, and chemical pain models (Choi, S.; et al. Genes Brain Behav 2007, 6, 425-431).

Recently, T-type calcium channel blockers have been proposed to have potential in treating schizophrenia and substance dependence. The T-type calcium channels are located in brain regions that have relevance to schizophrenia and substance dependence (Talley, E.M.; et al. J Neurosci 1999, 19, 1895-1911). More importantly, it has been demonstrated that selective T-type calcium channel blockers, such as TTA-A2, have antipsychotic-like effects in preclinical animal models of psychosis (Uslaner, J.M.; et al. Neuropharmacology 2012, 62, 1413-1421) and were able to decrease nicotine seeking behavior in rats trained to self-administer nicotine (Uslaner, J.M.; et al. Biol Psychiatry 2010, 68, 712-718).

In addition to a role in nociception, T-type calcium channels have also been implicated to play roles in sleep disorders and absence epilepsy (Shin, H.-S.; et al. Curr Opin Pharmacol, 2008, 8, 33-41). Based on expression in the thalamus, T-type calcium channels may play a role in arousal from sleep (Benington, J.H.; et al. Prog Neurobiol 2003, 69, 71-101; Nordskog, B.K.; et al. Neuroscience 2006, 141, 1365-1373). Expression in the adrenal, pituitary and pineal glands suggests that these channels modulate hormone secretion. Notably, Cav3.2 knockout mice appear normal and healthy, although smaller than wild-type mice (Chen, C.-C; et al. Science 2003, 302, 1416-1418; Choi, S.; et al. Genes Brain Behav 2007, 6, 425-431).

Pain is the most common symptom of disease and the most frequent complaint with which patients present to physicians. Inadequate pain management across the spectrum of pain etiologies remains a major public health problem. Going forward, the
development of novel therapeutics with new mechanisms of action for the treatment of pain including calcium channel blockade will have a significant impact on the ongoing struggle to balance efficacy and safety for those patients most in need. The compounds of the present invention are novel calcium channel blockers that have utility in treating pain, amongst other conditions.

The bicyclic heteroaryl consists of a monocyclic heteroaryl fused to a phenyl, or a monocyclic heteroaryl fused to a monocyclic cycloalkenyl, or a monocyclic heteroaryl fused to a monocyclic heteroaryl, or a monocyclic heteroaryl fused to a monocyclic heterocycle. Representative examples of bicyclic heteroaryl groups include, but are not limited to, benzofuranyl, benzothenyl, benzoazoxyl, 2,1,3-benzothiadiazolyl, benzimidazolyl, benzoxadiazolyl, 6,7-dihydro-1,3-benzothiazolyl, furo[3,2-c]pyrrolyl, imidazo[1,2-a]pyridinyl, indazolyl, indolyl, isoindolyl, isouinolinyl, naphthyridinyl, pyridoimidazolyl, pyrrolopyridinyl, quinolinyl, thiazolo[5,4-d]pyridin-2-yl, thiazolo[5,4-d]pyrimidin-2-yl, and 5,6,7,8-tetrahydroquinolin-5-yl. The monocyclic and bicyclic heteroaryl groups of the present invention can be substituted or unsubstituted and are connected to the parent molecular moiety through any carbon atom or any nitrogen atom contained within the ring systems.

[0059] The term "heteroarylalkyl," as used herein, means a heteroaryl group appended to the parent molecular moiety through an alkyl group, as defined herein.

[0060] The term "heteroatom" as used herein, means a nitrogen, oxygen, or sulfur atom.

[0061] The term "hydroxyl" or "hydroxy" as used herein, means an -OH group.

[0062] The term "hydroxyalkyl" as used herein, means at least one hydroxy group, as defined herein, is appended to the parent molecular moiety through an alkylene group, as defined herein. Representative examples of hydroxyalkyl include, but are not limited to, hydroxymethyl, 2-hydroxyethyl, 3-hydroxypropyl, 2,3-dihydroxypentyl, and 2-ethyl-4-hydroxyheptyl.

[0063] The term "nitro" as used herein, means a -NO₂ group.
The term "nitrogen protecting group" as used herein means those groups intended to protect a nitrogen atom against undesirable reactions during synthetic procedures. Nitrogen protecting groups comprise carbamates, amides, N-benzyl derivatives, and imine derivatives. Preferred nitrogen protecting groups are acetyl, benzoyl, benzyl, benzyloxy carbonyl (Cbz), formyl, phenyl sulfonyl, pivaloyl, tert-butoxy carbonyl (Boc), tert-butylacetyl, trifluoroacetyl, and triphenylmethyl (trityl). Nitrogen-protecting groups are appended onto primary or secondary amino groups by reacting the compound that contains the amine group with base, such as triethylamine, and a reagent selected from an alkyl halide, an alkyl triflate, a dialkyl anhydride, for example as represented by an alkyl anhydride (alkyl-OC=0)$_2$, a dialkyl anhydride, for example as represented by (aryl-OC=0)$_2$, an acyl halide, an alkyl chloroformate, or an alkyl sulfonyl halide, an aryl sulfonyl halide, or halo-CON(alkyl)$_2$, for example acetyl chloride, benzoyl chloride, benzyl bromide, benzyloxy carbonyl chloride, formyl fluoride, phenyl sulfonyl chloride, pivaloyl chloride, (tert-butyl-0-C=0)$_2$, trifluoroacetic anhydride, and triphenylmethyl chloride.

The term "oxo" as used herein, means a =0 group.

When cycloalkyl, heterocycle, heteroaryl, aryl, and the like are "substituted", it means there are one or more substituents other than hydrogen on the respective ring. "Unsubstituted" rings have no substituents other than hydrogen.

In some instances, the number of carbon atoms in a hydrocarbon substituent (e.g., alkyl, alkenyl, alkynyl, cycloalkyl or cycloalkenyl) is indicated by the prefix "C$_x$-C$_y$-", wherein x is the minimum and y is the maximum number of carbon atoms in the substituent. Thus, for example, "C$_5$-C$_6$-alkyl" refers to an alkyl substituent containing from 1 to 6 carbon atoms. Illustrating further, C$_5$-C$_6$-cycloalkyl means a saturated hydrocarbon ring containing from 3 to 6 carbon ring atoms.

Compounds of the present application can exist as stereoisomers wherein, asymmetric or chiral centers are present. These stereoisomers are "R" or "5" depending on the configuration of substituents around the chiral carbon atom. The terms "R" and "5" used herein are configurations as defined in IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, Pure Appl. Chem., 1976, 45: 13-30. The stereoisomers of Formula (I) wherein R² is hydrogen include those depicted below as Formula (1-1), (1-2), (1-3), and (1-4):

In one embodiment, the invention is directed to compounds of Formula (I) having the configuration of Formula (1-2):
In another embodiment, the invention is directed to compounds of Formula (I) wherein Z' and Z'' are CH₂, R² is hydrogen, and the compounds have the configuration of Formula (I-2A):

\[

\text{N}

\]

(1-2A).

On occasion, the relative stereochemistry of an enantiomeric pair is known, however, the absolute configuration is not known. In that circumstance, the relative stereochemistry descriptor terms "R*" and "S*" are used. The terms "R*" and "S*" used herein are defined in Eliel, E. L.; Wilen, S. H. Stereochemistry of Organic Compounds; John Wiley & Sons, Inc.: New York, 1994; pp 119-120 and 1206. In a particular enantiomeric pair, the relative descriptors are reversed to indicate that this pair of enantiomers is of unknown absolute stereochemistry.

The present application contemplates various stereoisomers and mixtures thereof and these are specifically included within the scope of this application. Stereoisomers include enantiomers and diastereomers, and mixtures of enantiomers or diastereomers. Individual stereoisomers of compounds of the present application can be prepared synthetically from commercially available starting materials which contain asymmetric or chiral centers or by preparation of racemic mixtures followed by resolution which is well known to those of ordinary skill in the art. These methods of resolution are exemplified by (1) attachment of a mixture of enantiomers to a chiral auxiliary, separation of the resulting mixture of diastereomers by recrystallization or chromatography and liberation of the optically pure product from the auxiliary or (2) direct separation of the mixture of optical enantiomers on chiral chromatographic columns.

Geometric isomers can exist in the present compounds. The invention contemplates the various geometric isomers and mixtures thereof resulting from the disposition of substituents around a carbon-carbon double bond, a carbon-nitrogen double bond, a cycloalkyl group, or a heterocycle group. Substituents around a carbon-carbon double bond or a carbon-nitrogen bond are designated as being of Z or E configuration and substituents around a cycloalkyl or a heterocycle are designated as being of cis or trans configuration.
Within the present invention it is to be understood that compounds disclosed herein can exhibit the phenomenon of tautomerism.

Thus, the formulae drawings within this specification can represent only one of the possible tautomeric or stereoisomeric forms. It is to be understood that the invention encompasses any tautomeric or stereoisomeric form, and mixtures thereof, and is not to be limited merely to any one tautomeric or stereoisomeric form utilized within the naming of the compounds or formulae drawings.

The present invention also includes isotopically-labeled compounds, which are identical to those recited in Formula (I), but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes suitable for inclusion in the compounds of the invention are hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine, and chlorine, such as, but not limited to $^2$H, $^3$H, $^{13}$C, $^{14}$C, $^{15}$N, $^{16}$O, $^{17}$O, $^{18}$O, $^{31}$P, $^{32}$P, $^{33}$S, $^{34}$S, $^{35}$F, and $^{36}$Cl, respectively. Substitution with heavier isotopes such as deuterium, i.e., $^2$H, can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Compounds incorporating positron-emitting isotopes are useful in medical imaging and positron-emitting tomography (PET) studies for determining the distribution of receptors. Suitable positron-emitting isotopes that can be incorporated in compounds of Formula (I) are $^{11}$C, $^{13}$N, $^{15}$O, and $^{18}$F. Isotopically-labeled compounds of Formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples using appropriate isotopically-labeled reagent in place of non-isotopically-labeled reagent.

(i)  *In Vitro* Assessment of Calcium Channel Activity Using FLIPR

[0701] IMR32 cells endogenously expressing human Ca,2.2 were assayed for Ca\(^{2+}\) influx using a no-wash calcium indicator dye (Calcium 4 dye: Molecular Probes) and FLIPR technology (Lubin, ML; et al. Assay and Drug Development Technologies, 2006, 4(6), 689-694). The IMR32 cells were maintained in MEM media containing 10% (v/v) FBS, 1% (v/v) antibiotic/antimitotic, 1% (v/v) sodium pyruvate and 1% (v/v) MEM NEAA. Following dissociation in 0.05% (v/v) trypsin/EDTA, cells were seeded into black 1x96-well plates (Corning Cellbind) at a density of 1-1.2x10^5 cells/well and incubated in the maintenance media above for 48 hours at 37°C. Immediately prior to performing the assay the media was removed and cells were loaded for 1.5 hours with 1xCalcium 4 dye prepared in HBSS (137 mMNaCl, 5.4 mM KC1, 0.25 mM Na_2HP0_4, 0.44 mM KH_2PO_4, 1.3 mM CaCl_2, 1 mM MgSO_4, 4.2 mM NaHC0_3) containing HEPES pH 7.4 at room temperature. After dye loading and a subsequent 60 minute pre-incubation with compounds (full log dilutions from 10 µM to 0.1 nM) in the presence of 1.3 mM CaCl_2 and 2 µM nifedipine to block endogenous L-type channels, the external Ca\(^{2+}\) concentration was increased to 5 mM CaCl_2 and the cells concomitantly depolarized with 80 mM KC1 to assay channel activity. To determine the IC\textsubscript{50} values, the percent inhibition of the compound at each concentration was determined relative to the activity in the absence of inhibitor, and data was fitted using non-linear regression sigmoidal dose response curve analysis with GraphPad Prism®. Unless otherwise indicated (*), the reported values are average values from at least two runs (*i.e.*, n ≥ 2).

(ii) In Vivo Assessment of Analgesic Effect Against Neuropathic Pain

(Bennett Model)

Animals were prepared for testing, by use of a surgical procedure that induces neuropathic pain in one paw. IACUC guidelines for rodent survival surgery were followed. All surgical procedures were conducted on a clean, uncluttered surgical station. The area was wiped with a 70% ethanol solution before and after use. All instruments were sterilized by either autoclave or chemical sterilant (such as 2% glutaraldehyde >10 hours). Surgeons wore sterile gloves (for the initial procedure), clean lab coat or scrubs, hairnet or cap, and a half-mask respirator (when not working under a hood). Surgeons thoroughly washed their hands prior to donning sterile gloves. Gloves were disinfected in-between animals by cleansing with povidone iodine, chlorhexidine or 70% alcohol for at least 30 seconds. If multiple surgeries were performed, the instruments were cleaned and sterilized between procedures with hot glass beads (> 10 seconds). To prevent thermal or chemical burns, the instruments were cooled by rinsing in sterile saline before use.

Male, Sprague Dawley® rats, 175-200 g were used for surgeries. To minimize post-operative dehydration/maintain blood volume during the surgery, warmed sterile saline or Lactate Ringers solution at 10-15 mL/kg was administered subcutaneously immediately before or after surgery. This facilitated better renal function and presumably anesthesia product excretion post surgery. For all surgical procedures, anesthesia was induced with 4-5% isoflurane. Anesthesia was maintained during surgery with 1-3% isoflurane. Following induction, the surgical site was carefully shaved and the exposed

area was aseptically prepared with povidone-iodine scrub solution and 70% ethanol 2-3 times.

[0704] Chronic constriction injury (CCI), a model of neuropathic pain, was produced by following the method of Bennett and Xie (Bennett, G, et al. Pain, 1988, 33, 87-107). After site sterilization and anesthetic procedures outline above were completed, a 1.5 cm incision was made at the mid-thigh level to expose the biceps femoris and gluteous superficialis (right side), which were then separated by blunt dissection. The common sciatic nerve was exposed, isolated, and loosely ligated by four 5-0 chromic gut ligatures with < 1 mm spacing between each. The surgical site was closed in layers - muscle was closed with 6.0 absorbable sutures, and the skin closed with wound clips. Animals were allowed to recover on a warming plate and were returned to their home cages when fully ambulatory. Animals were not be used for testing until at least 10 days following surgery.

[0705] To measure mechanical sensitivity, tactile alldynia was measured using calibrated von Frey filaments (Stoelting, Wood Dale, IL) as described by Chaplan et al. (Chaplan S., et al. J of Neuroscience Methods 1994, 53, 55-63). Filament strengths used were: 0.4, 0.6, 1.0, 2, 4, 6, 8, and 15 g. Rats were placed into inverted individual plastic containers (20x12.5x20 cm) on top of a suspended wire mesh grid, and acclimated to the test chambers for at least 20 minutes. Filaments were applied perpendicular to the mid-plantar paw surface with enough force to cause slight buckling and held in place for 6-8 seconds. Positive responses included an abrupt withdrawal of the paw from the stimulus or flinching behavior immediately following removal of the stimulus. The maximum force applied was 15 g. The 50% paw withdrawal threshold (PWT) was calculated in grams (g) using the up-down method of Dixon (Dixon W. Ann Rev Pharmacol Toxicol 1980, 20, 441-462). Only rats exhibiting increased mechanical sensitivity were used (threshold responses below 5 g). All compounds were orally administered in at a dose of 10 mg/kg in 10% dimethyl sulfoxide/polyethylene glycol at a volume of 2.0 mL/kg, and mechanical alldynia was determined 60 minutes following compound administration. Data were reported as log g values and the percentage of maximum possible effect (%MPE) was calculated using log g values with the formula:

[0706] \[ \%MPE = \frac{\log(\text{observed PWT in grams}) - \log(\text{mean PWT vehicle})}{(\log(15) - \log(\text{mean PWT vehicle}))} \times 100 \]
All statistical procedures were run on log g values.

The ability of the compounds of the present invention to reduce nociceptive pain can be evaluated using conventional in vivo nociceptive pain models known in the art. Such models include, for example, those described in Pain (1996) 64:493-501; and Pain (2001) 93:69-76.

The ability of the compounds of the present invention to reduce inflammatory pain can be evaluated using conventional in vivo nociceptive pain models known in the art. Such models include, for example, those described in Pain (1999) 80:67-82.

D. Methods of Using the Compounds

One embodiment of the present invention provides a method of treating pain in a subject in need thereof. The method comprises administering to the subject, including a mammal, such as a human, a therapeutically suitable amount of a compound of Formula (I), or a pharmaceutically acceptable salt thereof. Conditions related to pain include, for example, acute pain, chronic pain, neuropathic pain, nociceptive pain, alldynia, inflammatory pain, inflammatory hyperalgesia, post herpetic neuralgia, post-operative pain, post-stroke pain, neuropathies, neuralgia, diabetic neuropathy, HIV-related neuropathy, nerve injury, rheumatoid arthritic pain, osteoarthritic pain, burns, back pain, eye pain, visceral pain, cancer pain, dental pain, headache, migraine, carpal tunnel syndrome, fibromyalgia, neuritis, sciatica, pelvic hypersensitivity, pelvic pain, menstrual pain. In one
embodiment, the condition related to pain is selected from the group consisting of acute pain, chronic pain, neuropathic pain, inflammatory pain, visceral pain, cancer pain, osteoarthritis pain, allodynia, fibromyalgia, sciatica, back pain, and headache pain including migraine, or combinations thereof. Preferably, the method comprises administering to the mammal a therapeutically effective amount of any of the compounds as described herein, or a pharmaceutically acceptable salt thereof.

[0711] Pain generally can be classified as acute or chronic. Acute pain begins suddenly and is short-lived (usually twelve weeks or less). It is usually associated with a specific cause such as a specific injury and is often sharp and severe. It is the kind of pain that can occur after specific injuries resulting from surgery, dental work, a strain or a sprain. Acute pain does not generally result in any persistent psychological response. In contrast, chronic pain is long-term pain, typically persisting for more than three months and leading to significant psychological and emotional problems. Common examples of chronic pain include neuropathic pain (e.g. painful diabetic neuropathy, postherpetic neuralgia), carpal tunnel syndrome, back pain, headache, cancer pain, arthritic pain and chronic post-surgical pain. In one embodiment, the condition related to pain is chronic pain. In another embodiment, the condition related to pain is acute pain.

[0712] Pain also can be divided into a number of different subtypes according to differing pathophysiology, including neuropathic, nociceptive, and inflammatory pain.

[0713] Some types of pain have multiple etiologies and can be classified in more than one area, e.g., back pain and cancer pain have both nociceptive and neuropathic components. In one embodiment, the condition related to pain is selected from the subtypes of neuropathic pain, nociceptive pain, and inflammatory pain.

[0713] In another embodiment, the condition related to pain is neuropathic pain. Neuropathic pain generally is defined as pain initiated or caused by a primary lesion or dysfunction in the nervous system and can result, for example, from trauma or disease. The term neuropathic pain encompasses many conditions with diverse etiologies including peripheral neuropathy, diabetic neuropathy, post-herpetic neuralgia, trigeminal neuralgia, back pain, cancer neuropathy, HIV-neuropathy, phantom limb pain, carpal tunnel syndrome, central post-stroke pain, and pain associated with chronic alcoholism,
hypothyroidism, uremia, multiple sclerosis, spinal cord injury, Parkinson's disease, epilepsy and vitamin deficiency.

[0714] In another embodiment, the condition related to pain is nociceptive pain. Nociceptive pain is induced by tissue injury or by intense stimuli with the potential to cause injury. When a substantial injury occurs to body tissue through trauma or disease, the characteristics of nociceptor activation are altered and there is sensitization in the periphery leading to a heightened sensation of pain in the subject. Moderate to severe acute nociceptive pain is a prominent feature of pain from central nervous system trauma, strains/sprains, burns, myocardial infarction and acute pancreatitis, post-operative pain (pain following any type of surgical procedure), post-traumatic pain, renal colic, cancer pain and back pain. Cancer pain can be chronic pain such as tumor related pain (e.g., bone pain, headache, facial pain or visceral pain) or pain associated with cancer therapy (e.g., post-chemotherapy syndrome, chronic postsurgical pain syndrome or post radiation syndrome). Cancer pain can also occur in response to chemotherapy, immunotherapy, hormonal therapy or radiotherapy. Back pain can be due to herniated or ruptured intervertebral discs or abnormalities of the lumber facet joints, sacroiliac joints, paraspinal muscles or the posterior longitudinal ligament.

[0715] In another embodiment, the condition related to pain is inflammatory pain. A common type of inflammatory pain is arthritic pain arising from rheumatoid disease (such as ankylosing spondylitis) or symptomatic osteoarthritis or degenerative joint disease. Another type of inflammatory pain is visceral pain. Visceral pain is pain associated with the viscera, which encompass the organs of the abdominal cavity including the sex organs, spleen and part of the digestive system. Pain associated with the viscera can be divided into digestive visceral pain and non-digestive visceral pain. Commonly encountered gastrointestinal disorders that cause pain include functional bowel disorder and inflammatory bowel disease. These gastrointestinal disorders include a wide range of disease states that are currently only moderately controlled, including, with respect to functional bowel disorder, gastro-esophageal reflux, dyspepsia, irritable bowel syndrome, and functional abdominal pain syndrome, and, in respect of inflammatory bowel disease, Crohn's disease, ileitis and ulcerative colitis, all of which regularly produce visceral pain.
Other types of visceral pain include the pain associated with dysmenorrhea, cystitis and pancreatitis and pelvic pain.

[0716] In another embodiment, the condition related to pain results from a musculoskeletal condition such as myalgia, fibromyalgia, spondylitis, sero-negative (non-rheumatoid) arthropathies, non-articular rheumatism, dystrophinopathy, glycogenolysis, polymyositis and pyomyositis; heart and vascular pain, including pain caused by angina, myocardial infarction, mitral stenosis, pericarditis, Raynaud's phenomenon, scleredema and skeletal muscle ischemia; head pain, such as migraine (including migraine with aura and migraine without aura), cluster headache, tension-type headache mixed headache and headache associated with vascular disorders; and orofacial pain, including dental pain, otic pain, burning mouth syndrome and temporomandibular myofascial pain.

agent selected from the group consisting of acetaminophen, opioid analgesics, NSAIDs, and combinations thereof.

This method comprises administering to the mammal (including human) a therapeutically effective amount of a compound of the invention or a pharmaceutically acceptable salt thereof.

[0719] Calcium channel blockers have been associated with a slightly greater decreased risk of stroke compared to other types of antihypertensive agents (Angeli, F.; et al. American Journal of Hypertension 2004, 17(9), 817-822). The enhanced effect did not correlate with differences in systolic blood pressure and the mechanism of action remains unknown. However, calcium channel blockers have been associated with blockade of central neuronal calcium influx and subsequent ischemic injury in two rodent models (Barone, F. C.; et al. Stroke 1995, 26, 1683-1690). In another model of global ischemia, a calcium channel blocker offered neuroprotection although not permanently (Colbourne, F.; et al. Stroke 1999, 30(3), 662-668). Additionally, diminished progression of carotid atherosclerosis has been observed with calcium channel blocker use (Zanchetti, A.; et al. Circulation 2002, 106, r47-r52).

[0720] An increase in intracellular calcium concentration has been correlated with seizure activity (Heinemann, U.; et al. Exp. Brain Res. 1977, 27, 237-243). Several studies have indicated that calcium channel blockers produce anticonvulsant activity
[0721] Calcium channel blockers have been evaluated in the treatment of bipolar disorders and manic depression for decades. There are suggestions that the calcium channel subtype has influence on efficacy of these disorders (Gitlin, M. Molecular Psychiatry 2006, 11, 227-240. Levy, N. A.; Janicak, P. G. Bipolar Disorders 2000, 2, 108-119).

[0722] Calcium channel blockers have also been associated with the treatment of anxiety and depression (Saade, S.; et al. Pharmacology, Biochemistry and Behavior 2003, 74, 269-278).

[0723] Antischizophrenic drugs have been found to be calcium channel antagonists (Gould, R. J.; et al. Proc. Natl. Acad. Sci. USA 1983, 80, 5122-5125). Other calcium channel blockers have been suggested for the treatment of schizophrenia (Tort, A. B. L.; et al. Psychopharmacology 2005, 177, 344-348). T-type calcium channels have been located in brain regions with relevance to schizophrenia and substance dependence (Talley, E. M.; et al. JNeurosci 1999, 19, 1895-1911).

[0725] Disorders of the lower urinary tract including overactive bladder, prostatis, prostadynia, interstitial cystitis, and benign prostatic hyperplasia can be treated with calcium channel blockers (Fraser, M. O.; et al. US20050148587, 2005).

[0726] Ethanol withdrawal syndrome is decreased with calcium channel blockers (Little, H. J.; et al. Life Sciences 1986, 39, 2059-2065).

[0727] Dependence on nicotine has been decreased upon treatment with T-type calcium channel blockers (Uslaner, JM; et al. Biological Psychiatry 2010, 68(8), 712-718).

[0728] Several cardiac disorders are treated with calcium channel blockers. Atherosclerosis can be reduced by a decrease in free radical-mediated damage as a result of...

[0730] Calcium channels have been suggested as a target for the treatment of diabetes (Bhattacharjee, A.; et al. Endocrinology 1997, 138(9), 3735-3740).

[0731] Ion channels including calcium channels play an important role in sperm physiology and fertilization (Darszon, A.; et al. Physiological Reviews 1999, 79(2), 481-510).

[0733] Increased calcium levels in neurones has been implicated in Alzheimer's disease. Two suggested mechanisms of increased calcium influx are that β-amyloid can form calcium permeable channels (Bhatia, R.; et al. FASEB J. 2000, 14(9), 1233-1243) or a G-protein-coupled receptor can be activated by β-amyloid (Lorton, D. Mech. Ageing Dev. 1997, 94(1-3), 199-211).

[0735] Sleep disorders and absence epilepsy have been associated with calcium channels (Shin, H.-S.; et al. Curr Opin Pharmacol, 2008, 8, 33-41).

[0736] Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention can be varied so as to obtain an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular patient, compositions
and mode of administration. The selected dosage level can depend upon the activity of the particular compound, the route of administration, the severity of the condition being treated and the condition and prior medical history of the patient being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

[0737] Compounds of the invention can also be administered as a pharmaceutical composition comprising the compounds of interest in combination with one or more pharmaceutically acceptable carriers. The phrase "therapeutically effective amount" of the compound of the invention means a sufficient amount of the compound to treat disorders, at a reasonable benefit/risk ratio applicable to any medical treatment. It can be understood, however, that the total daily usage of the compounds and compositions of the invention can be decided by the attending physician within the scope of sound medical judgment. The specific therapeutically effective dose level for any particular patient can depend upon a variety of factors including the disorder being treated and the severity of the disorder; activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed; and like factors well-known in the medical arts. For example, it is well within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

[0738] The total daily dose of the compounds of this invention administered to a human or other animal range from about 0.01 mg/kg body weight to about 100 mg/kg body weight. More preferable doses can be in the range of from about 0.01 mg/kg body weight to about 30 mg/kg body weight. If desired, the effective daily dose can be divided into multiple doses for purposes of administration. Consequently, single dose compositions can contain such amounts or submultiples thereof to make up the daily dose.

[0739] The present invention also is directed, in part, to a use of one or more compounds and/or salts of the invention, and, optionally one or more additional therapeutic
agents to prepare a medicament. In some embodiments, the medicament is for co-administration with one or more additional therapeutic agents. In some embodiments, the medicament is for treating pain. In some embodiments, the medicament is for treating neuropathic pain. In some embodiments, the medicament is for treating nociceptive pain.

In some embodiments, the medicament is for treating inflammatory pain.

This invention also is directed, in part, to one or more compounds and/or salts of the invention, and, optionally one or more additional therapeutic agents, for use as a medicament. In some embodiments, the medicament is for treating pain. In another embodiment, the medicament is for treating neuropathic pain. In another embodiment, the medicament is for treating nociceptive pain. In another embodiment, the medicament is for treating inflammatory pain.

E. Pharmaceutical Compositions

The present invention further provides pharmaceutical compositions that comprise compounds of the present invention or a pharmaceutically acceptable salt or solvate thereof. The pharmaceutical compositions comprise compounds of the present invention that can be formulated together with one or more non-toxic pharmaceutically acceptable carriers.

Another aspect of the present invention is a pharmaceutical composition comprising compounds of the invention, or a pharmaceutically acceptable salt thereof, and one or more pharmaceutically acceptable carriers, alone or in combination with one or more nonsteroidal anti-inflammatory drugs (NSAID), opioid analgesics, barbiturates, benzodiazepines, histamine antagonists, sedatives, skeletal muscle relaxants, transient receptor potential ion channel antagonists, a-adrenergics, tricyclic antidepressants, anticonvulsants, tachykinin antagonists, muscarinic antagonists, cyclooxygenase-2 selective inhibitors, neuroleptics, vanilloid receptor agonists, vanilloid receptor antagonists, β-adrenergics, local anesthetics, corticosteroids, 5-HT receptor antagonists, 5-HT receptor antagonists, 5-HT2A receptor antagonists, cholinergic analgesics, αδ ligands such as gabapentin or pregabalin, cannabinoid receptor ligands, metabotropic glutamate subtype 1 receptor antagonists, serotonin reuptake inhibitors, norepinephrine reuptake inhibitors, dual serotonin-noradrenaline reuptake inhibitors, Rho kinase inhibitors, inducible nitric oxide
synthase inhibitors, acetylcholinesterase inhibitors, prostaglandin E₂ subtype 4 antagonists, leukotriene B₄ antagonists, 5-lipoxygenase inhibitors, sodium channel blockers, 5-HT₃ antagonists, N-methyl-D-aspartic acid receptor antagonists, and phosphodiesterase V inhibitors.

[0743] The pharmaceutical compositions of this invention can be administered to humans and other mammals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments or drops), buccally or as an oral or nasal spray. The term "parenterally" as used herein, refers to modes of administration which include intravenous, intramuscular, intraperitoneal, intrasternal, subcutaneous and intraarticular injection and infusion.

[0744] The term "pharmaceutically acceptable carrier" as used herein, means a non-toxic, inert solid, semi-solid or liquid filler, diluent, encapsulating material or formulation auxiliary of any type. Some examples of materials which can serve as pharmaceutically acceptable carriers are sugars such as, but not limited to, lactose, glucose and sucrose; starches such as, but not limited to, corn starch and potato starch; cellulose and its derivatives such as, but not limited to, sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients such as, but not limited to, cocoa butter and suppository waxes; oils such as, but not limited to, peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; glycols; such a propylene glycol; esters such as, but not limited to, ethyl oleate and ethyl laurate; agar; buffering agents such as, but not limited to, magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as, but not limited to, sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator.

[0745] Pharmaceutical compositions of this invention for parenteral injection comprise pharmaceutically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions as well as sterile powders for reconstitution into sterile injectable solutions or dispersions just prior to use. Examples of suitable aqueous and nonaqueous
carriers, diluents, solvents or vehicles include water, ethanol, polyols (such as glycerol, propylene glycol, polyethylene glycol and the like), vegetable oils (such as olive oil), injectable organic esters (such as ethyl oleate) and suitable mixtures thereof. Proper fluidity can be maintained, for example, by the use of coating materials such as lecithin, by the maintenance of the required particle size in the case of dispersions and by the use of surfactants.

[0746] These compositions can also contain adjuvants such as preservatives, wetting agents, emulsifying agents and dispersing agents. Prevention of the action of microorganisms can be ensured by the inclusion of various antibacterial and antifungal agents, for example, paraben, chlorobutanol, phenol sorbic acid and the like. It can also be desirable to include isotonic agents such as sugars, sodium chloride and the like. Prolonged absorption of the injectable pharmaceutical form can be brought about by the inclusion of agents which delay absorption such as aluminum monostearate and gelatin.

[0747] In some cases, in order to prolong the effect of the drug, it is desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This can be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, can depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

[0748] Injectable depot forms are made by forming microencapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

[0749] The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter or by incorporating sterilizing agents in the form of
sterile solid compositions which can be dissolved or dispersed in sterile water or other 
sterile injectable medium just prior to use.

[0750] Solid dosage forms for oral administration include capsules, tablets, pills, 
powders and granules. In such solid dosage forms, the active compound can be mixed with 
5 at least one inert, pharmaceutically acceptable excipient or carrier, such as sodium citrate or 
dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, 
glucose, mannitol and silicic acid; b) binders such as carboxymethylcellulose, alginates, 
gelatin, polyvinylpyrrolidone, sucrose and acacia; c) humectants such as glycerol; d) 
disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic 
10 acid, certain silicates and sodium carbonate; e) solution retarding agents such as paraffin; f) 
absorption accelerators such as quaternary ammonium compounds; g) wetting agents such 
as cetyl alcohol and glycerol monostearate; h) absorbents such as kaolin and bentonite clay 
and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene 
glycols, sodium lauryl sulfate and mixtures thereof. In the case of capsules, tablets and 
pills, the dosage form can also comprise buffering agents.

[0751] Solid compositions of a similar type can also be employed as fillers in soft 
and hard-filled gelatin capsules using such carriers as lactose or milk sugar as well as high 
molecular weight polyethylene glycols and the like.

[0752] The solid dosage forms of tablets, dragees, capsules, pills and granules can be 
20 prepared with coatings and shells such as enteric coatings and other coatings well-known in 
the pharmaceutical formulating art. They can optionally contain opacifying agents and can 
also be of a composition such that they release the active ingredient(s) only, or 
preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. 
Examples of embedding compositions which can be used include polymeric substances and 
waxes.

[0753] The active compounds can also be in micro-encapsulated form, if appropriate, 
25 with one or more of the above-mentioned carriers.

[0754] Liquid dosage forms for oral administration include pharmaceutically 
acceptable emulsions, solutions, suspensions, syrups and elixirs. In addition to the active 
30 compounds, the liquid dosage forms can contain inert diluents commonly used in the art
such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethyl formamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan and mixtures thereof.

Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring and perfuming agents.

Suspensions, in addition to the active compounds, can contain suspending agents as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metaphosphate, bentonite, agar-agar, tragacanth and mixtures thereof.

Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating carriers or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at room temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

Compounds of the present invention can also be administered in the form of liposomes. As is known in the art, liposomes are generally derived from phospholipids or other lipid substances. Liposomes are formed by mono- or multi-lamellar hydrated liquid crystals which are dispersed in an aqueous medium. Any non-toxic, physiologically acceptable and metabolizable lipid capable of forming liposomes can be used. The present compositions in liposome form can contain, in addition to a compound of the present invention, stabilizers, preservatives, excipients and the like. The preferred lipids are natural and synthetic phospholipids and phosphatidyl cholines (lecithins) used separately or together.

[0760] Dosage forms for topical administration of a compound of this invention include powders, sprays, ointments and inhalants. The active compound can be mixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives, buffers or propellants which can be required. Ophthalmic formulations, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

[0761] The compounds of the present invention can be used in the form of pharmaceutically acceptable salts derived from inorganic or organic acids. The phrase "pharmaceutically acceptable salt" means those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like and are commensurate with a reasonable benefit/risk ratio.

[0762] Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge et al. describe pharmaceutically acceptable salts in detail in (J. Pharmaceutical Sciences, 1977, 66: 1 et seq). The salts can be prepared in situ during the final isolation and purification of the compounds of the invention or separately by reacting a free base function with a suitable organic acid. Representative acid addition salts include, but are not limited to acetate, adipate, alginate, citrate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, glycerophosphate, hemisulfate, heptanoate, hexanoate, fumarate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethansulfonate (isothionate), lactate, malate, maleate, methanesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, palmitoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, tartrate, thiocyanate, phosphate, glutamate, bicarbonate, p-toluene sulfonate and undecanoate. Also, the basic nitrogen-containing groups can be quaternized with such agents as lower alkyl halides such as, but not limited to, methyl, ethyl, propyl, and butyl chlorides, bromides and iodides; dialkyl sulfates like dimethyl, diethyl, dibutyl and diamyl sulfates; long chain halides such as, but not limited to, decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides; arylalkyl halides like benzyl and phenethyl bromides and others. Water or oil-soluble or dispersible products are thereby obtained. Examples of acids which can be employed to form pharmaceutically acceptable acid addition salts include such inorganic acids as hydrochloric acid,
hydrobromic acid, sulfuric acid, and phosphoric acid and such organic acids as acetic acid, fumaric acid, maleic acid, 4-methylbenzenesulfonic acid, succinic acid and citric acid.

[0763] Basic addition salts can be prepared in situ during the final isolation and purification of compounds of this invention by reacting a carboxylic acid-containing moiety with a suitable base such as, but not limited to, the hydroxide, carbonate or bicarbonate of a pharmaceutically acceptable metal cation or with ammonia or an organic primary, secondary or tertiary amine. Pharmaceutically acceptable salts include, but are not limited to, cations based on alkali metals or alkaline earth metals such as, but not limited to, lithium, sodium, potassium, calcium, magnesium and aluminum salts and the like and nontoxic quaternary ammonia and amine cations including ammonium, tetramethylammonium, tetraethylammonium, methylammonium, dimethylammonium, trimethylammonium, triethylammonium, diethylammonium, ethylammonium and the like. Other representative organic amines useful for the formation of base addition salts include ethylenediamine, ethanolamine, diethanolamine, piperidine, piperazine and the like.

[0764] The compounds of the invention can exist in unsolvated as well as solvated forms, including hydrated forms, such as hemi-hydrates. In general, the solvated forms, with pharmaceutically acceptable solvents such as water and ethanol among others are equivalent to the unsolvated forms for the purposes of the invention.

[0765] The present invention also is directed, in part, to a kit comprising one or more compounds and/or salts of the invention. The kit can optionally contain one or more additional therapeutic agents and/or instructions for, for example, using the kit.

F. General Synthesis

[0766] This invention is intended to encompass compounds of the invention when prepared by synthetic processes or by metabolic processes. Preparation of the compounds by metabolic processes includes those occurring in the human or animal body (in vivo) or processes occurring in vitro.

[0767] This invention is directed, in part, to the synthetic processes for preparing compounds of Formula I as shown in Schemes 1 through 14 and the Examples below. This invention also is directed, in part, to novel intermediates that can be used to prepare the
compounds of Formula I (and their salts) as shown in Schemes 1 through 14 and the Examples below.

[0768] The compounds of the invention can be prepared by a variety of processes well known for the preparation of compounds of this class. For example, the compounds of the invention wherein the groups $\text{Ar}^1$, $G^1$, $G^2$, $Z'$, $Z''$, $R^a$ and $R^b$, have the meanings as set forth in the Summary of the Invention section unless otherwise noted, can be synthesized as shown in Schemes 1-14.

[0769] Abbreviations which have been used in the descriptions of the Schemes and the Examples that follow are: APCI for atmospheric pressure chemical ionization; DMSO for dimethyl sulfoxide; ESI for electrospray ionization; LCMS for liquid chromatography-mass spectrometry; HPLC for high performance liquid chromatography; Ph for phenyl; and psi for pounds per square inch.

Scheme 1

![Diagram of Scheme 1](image)

[0770] Compounds of Formula (1-4), wherein $Z'$, $Z''$, $G^1$ and $G^2$ are as defined in the Summary of the Invention, can be prepared as illustrated in Scheme 1. Compounds of Formula (1-1), wherein the primary amine can be located at either the position of $R^1$ or $R^2$ in compounds of Formula (I) shown the Summary of the Invention and PG is a nitrogen protecting group, can be reacted with an acid chloride, $G^1\text{-C(O)-Cl}$, in the presence of a base such as but not limited to sodium carbonate in a suitable solvent at ambient or elevated temperature to afford compounds of Formula (1-2). The protecting group can be removed from compounds of Formula (1-2) under suitable conditions known to one skilled
in the art to deliver compounds of Formula (1-3). For example, if the protecting group is a benzyl group, it can be removed by catalytic hydrogenation in the presence of a palladium or palladium hydroxide catalyst. Alternatively, if the protecting group is tert-butoxycarbonyl, exposure to acids such as hydrochloric acid or trifluoroacetic acid will remove the protecting group. Compounds of Formula (1-3) can be reacted with sulfonyl chlorides, G²-S(0)₂-Cl, in the presence of a base in a suitable solvent at or near room temperature to give compounds of Formula (1-4) which are representative of compounds of Formula (I).

Scheme 2

As shown in Scheme 2, compounds of Formula (1-1) can be transformed to compounds of Formula (2-4) which are representative of compounds of Formula (I). Compounds of Formula (1-1) can be reacted with compounds of Formula (2-1) in the presence of a base such as but not limited to sodium carbonate in a solvent such as heated dimethyl sulfoxide to give compounds of Formula (2-2). In compounds of Formula (2-1), Hal¹ is fluorine, chlorine, bromine or iodine. Also in compounds of Formula (2-1) one or none of Z¹, Z², Z³ and Z⁴ can be nitrogen and the others of Z¹, Z², Z³ and Z⁴ are CR', wherein R' is either hydrogen or the substituents described for Ar¹ in the Summary of the Invention. Compounds of Formula (2-3) can be deprotected to give compounds of Formula (2-3) and subsequently sulfonylated to give compounds of Formula (2-4) as described in Scheme 1.
As shown in Scheme 3, compounds of Formula (3-1) can be reacted with compounds of Formula (2-1) in the presence of a base in an optionally heated solvent to give compounds of Formula (3-2). The protecting group can be removed from compounds of Formula (3-2) under suitable conditions known to one skilled in the art to deliver compounds of Formula (3-3). Compounds of Formula (3-3) can be reacted with sulfonyl chlorides, $G^2$-$S(0)$-Cl, in the presence of a base in a suitable solvent at or near room temperature to give compounds of Formula (3-4) which are representative of compounds of Formula (I).
Scheme 4 depicts the alternative transformation of compounds of Formula (3-1) to compounds of Formula (3-4) as well as the sequence to deliver compounds of Formula (4-3). [0786] Optimum reaction conditions and reaction times for each individual step can
vary depending on the particular reactants employed and substituents present in the
reactants used. Unless otherwise specified, solvents, temperatures and other reaction
conditions can be readily selected by one of ordinary skill in the art. Specific procedures
are provided in the Examples section. Reactions can be worked up in the conventional
manner, e.g. by eliminating the solvent from the residue and further purified according to
methodologies generally known in the art such as, but not limited to, crystallization,
distillation, extraction, trituration and chromatography. Unless otherwise described, the
starting materials and reagents are either commercially available or can be prepared by one
skilled in the art from commercially available materials using methods described in the
chemical literature.

[0787] Routine experimentations, including appropriate manipulation of the reaction
conditions, reagents and sequence of the synthetic route, protection of any chemical
functionality that can not be compatible with the reaction conditions, and deprotection at a
suitable point in the reaction sequence of the method are included in the scope of the
invention. Suitable protecting groups and the methods for protecting and deprotecting
different substituents using such suitable protecting groups are well known to those skilled
in the art; examples of which can be found in T. Greene and R Wuts, Protective Groups in
Organic Synthesis (3rd ed.), John Wiley & Sons, NY (1999), which is incorporated herein
by reference in its entirety. Synthesis of the compounds of the invention can be
accomplished by methods analogous to those described in the synthetic schemes described
hereinabove and in specific examples.

[0788] Starting materials, if not commercially available, can be prepared by
procedures selected from standard organic chemical techniques, techniques that are
analogous to the synthesis of known, structurally similar compounds, or techniques that are
analogous to the above described schemes or the procedures described in the synthetic examples section.

[0789] When an optically active form of a compound of the invention is required, it can be obtained by carrying out one of the procedures described herein using an optically active starting material (prepared, for example, by asymmetric induction of a suitable reaction step), or by resolution of a mixture of the stereoisomers of the compound or intermediates using a standard procedure (such as chromatographic separation, recrystallization or enzymatic resolution).

[0790] Similarly, when a pure geometric isomer of a compound of the invention is required, it can be obtained by carrying out one of the above procedures using a pure geometric isomer as a starting material, or by resolution of a mixture of the geometric isomers of the compound or intermediates using a standard procedure such as chromatographic separation.

[0791] It can be appreciated that the synthetic schemes and specific examples as illustrated in the Examples section are illustrative and are not to be read as limiting the scope of the invention as it is defined in the appended claims. All alternatives, modifications, and equivalents of the synthetic methods and specific examples are included within the scope of the claims.
