## COMBINATION OF A CRTH2 ANTAGONIST AND A PROTON PUMP INHIBITOR FOR THE TREATMENT OF EOSINOPHILIC ESOPHAGITIS

### BACKGROUND OF THE INVENTION

#### Field of the Invention

The present invention provides a method for the treatment of eosinophilic esophagitis by administering compositions comprising one or more CRTH2 antagonist compounds and one or more proton pump inhibitors.

#### Related Art

Eosinophilic esophagitis (EoE) is characterised by signs and symptoms related to esophageal dysfunction (Liacouras *et al.*, *J. Allergy Clin. Immunol.* 128:3-20 (2011)). In adults these include dysphagia, chest pain, food impaction, and upper abdominal pain (Croese *et al.*, *Gastrointest. Endosc.* 58:516-522 (2003); Furuta and Straumann, *Aliment. Pharmacol. Ther.* 24:173-182 (2006)). Clinical manifestations in children vary by age. Infants often present with feeding difficulties and failure to thrive, whereas school-aged children are more likely to present with vomiting or pain (Liacouras *et al.*, 2011). Eosinophils are present histologically in biopsied esophageal tissue. EoE is considered to have an allergic etiology with 70% of EoE patients having current or past allergic disease or positive skin prick tests to food or other allergens (Blanchard and Rothenberg, *Gastrointest. Endosc. Clin. N. Am.* 18:133-43 (2008)). The signs and symptoms of EoE are generally resistant to proton pump inhibitor (PPI) therapy, although some patients do demonstrate a clinicopathological response to PPIs (Molina-Infante *et al.*, *Clin. Gastroenterol. Hepatol.* 9:110-117 (2011)) and this has been described as "PPI-responsive esophageal eosinophilia" which may be differentiated from eosinophilic esophagitis based on response to PPIs (Liacouras *et al.*, 2011).

Topical corticosteroids, used 'off-label' in EoE, are very effective at reducing the eosinophilic load of the esophagus, a process thought to be mediated by the promotion of eosinophil apoptosis. Double-blind placebo-controlled trials have demonstrated that both fluticasone and budesonide are effective as induction treatments for reducing eosinophilic load and symptoms in both children and adults with EoE (Schaefer *et al.*, *Clin. Gastroenterol. Hepatol.* 6:165-173 (2008); Konikoff *et al.*, *Gastroenterology* 131:1381-1391 (2006); Dohil *et al.*, *Gastroenterology* 139:418-429 (2010); Straumann *et al.*, *Gastroenterology* 139:1526-1537 (2010)).

Although PPIs are not of general benefit in patients with EoE, many patients remain on these drugs to control acid reflux which may be secondary to inflammatory damage of the distal (lower) esophagus.

### **BRIEF SUMMARY OF THE INVENTION**

One aspect of the invention is to provide a method of preventing, treating, or ameliorating eosinophilic esophagitis (EoE) in an individual, comprising administering to the individual a therapeutically effective amount of at least one CRTH2 antagonist or a pharmaceutically acceptable salt thereof and at least one proton pump inhibitor (PPI) or a pharmaceutically acceptable salt thereof.

Another aspect of the invention is a composition comprising at least one CRTH2 antagonist or a pharmaceutically acceptable salt thereof and at least one proton pump inhibitor or a pharmaceutically acceptable salt thereof.

### DETAILED DESCRIPTION OF THE INVENTION

The invention provides methods and compositions for preventing, treating, or ameliorating eosinophilic esophagitis (EoE) in an individual, comprising administering to the individual a therapeutically effective amount of at least one

CRTH2 antagonist and at least one proton pump inhibitor (PPI). The invention also provides compositions comprising a CRTH2 antagonist and/or a PPI for use in preventing, treating, or ameliorating EoE in an individual.

EoE is characterised by an allergic response with involvement of mast cells and Th2 cells, in addition to eosinophils. The number of IgE-bearing mast cells is elevated in EoE tissue and examination of the mast cell transcriptome in such tissue has demonstrated the presence of mast cell products such as carboxypeptidase A3 and tryptase (Abonia *et al.*, *J. Allergy Clin. Immunol.* 126:140-149 (2010)). The Th2 cell-derived cytokines interleukin 4, 5, and 13 are also elevated in EoE tissue (Blanchard *et al.*, *J. Allergy Clin. Immunol.* 127:208-217 (2011)). Factors produced by activated mast cells and Th2 cells exposed to antigens in esophageal tissue are likely to be important in promoting tissue eosinophilia and other aspects of disease pathology. Prostaglandin D2 (PGD2) is one such product that is produced in high concentrations by mast cells and Th2 cells in response to immunological activation (Pettipher, *Br. J. Pharmacol.* 153 Suppl. 1:S191-S199 (2008)) and causes activation of Th2 cells, eosinophils, and basophils through a high affinity interaction with the G protein coupled receptor CRTH2 (chemoattractant receptor-homologous molecule expressed on Th2 cells - also known as DP2) (Hirai *et al.*, *J. Exp. Med.* 193:255-261 (2001)). Mast cell-dependent activation of Th2 cells promoting enhanced migration and cytokine production is mediated by PGD2 acting on CRTH2 (Gyles *et al.*, *Immunology* 119:362-368 (2006); Xue *et al.*, *Clin. Exp. Immunol.* 156:126-133 (2009)). Paracrine activation of Th2 cells is also inhibited by CRTH2 antagonists (Vinall *et al.*, *Immunology* 121:577-584 (2007)). Studies in animal models indicate that genetic ablation of CRTH2 or administration of CRTH2 antagonists is effective in reducing eosinophil and lymphocyte accumulation and Th2 cytokine production in response to allergen in sensitised airways and skin (Pettipher, 2008).

Consequently, it is proposed that PGD2 produced by mast cells in response to food allergens or airborne allergens will contribute to eosinophil accumulation and disease pathology in EoE.

In a further embodiment, the anti-IL-3 antibody is a human or humanized monoclonal antibody. Anti-IL-3 antibodies are known and taught for example, by Lokker *et al.*, *J. Immunol.* 146:893-898 (1991) and Finkelman *et al.*, *J. Immunol.* 151:1235-1244 (1993).

In another embodiment, the pharmaceutical formulation comprises a CRTH2 antagonist and a PPI with montelukast.

In another embodiment, the present invention provides a maintenance therapy regimen for the treatment of eosinophilic esophagitis.

In one embodiment, the present invention provides a method for the maintenance therapy of eosinophilic esophagitis comprising:

(a) firstly administering to an individual in need of such treatment a therapeutically effect amount of a corticosteroid for a first predetermined period of time; and

(b) subsequently administering to the individual a therapeutically effective amount of at least one CRTH2 antagonist or a pharmaceutically acceptable salt thereof and at least one proton pump inhibitor or a pharmaceutically acceptable salt thereof for a second predetermined period of time.

The method of this invention comprises first administering to an individual in need thereof a therapeutically effective amount of a corticosteroid for a first predetermined period of time. In one embodiment, the corticosteroid is fluticasone. In another embodiment, the corticosteroid is budesonide. The corticosteroid may be administered as instructed according to the manufacturer of the particular corticosteroid used for this invention. In one embodiment, the corticosteroid is administered once a day. In another embodiment, the corticosteroid is administered twice a day. The duration for the first predetermined period can be determined by a person skilled in the art. In one embodiment of the invention, the first predetermined period of time is between 1 and 24 weeks, between 1 and 16 weeks, between 1 and 4 weeks, and between 1 and 3 weeks.

Doses of swallowed steroid to induce clinical remission are shown in Table 1. Remission is usually induced after treatment for 1-3 weeks. Oral viscous budesonide is the particular steroid. Straumann, A., *et al.*, *Clinical Gastroenterology and Hepatology* 9:400-409 (2011) disclosed a double-blind trial whether reduction to a dose of 0.25 mg budesonide twice-a-day is sufficient to maintain remission compared to placebo. Budesonide is more effective than placebo but is only partially effective in suppressing tissue eosinophilia. Consequently, there is an unmet medical need for new treatments to maintain patients in clinical remission.

**Table 1**

| Fluticasone (from MDI)                 | 88-440 µg twice daily | 440-880 µg twice daily |
| Budesonide (oral viscous formulations) | 0.5 mg twice daily    | 1 mg twice daily       |

The method of this invention also comprises subsequently administering to an individual in need thereof a therapeutically effective amount of at least one CRTH2 antagonist and at least one PPI for a second predetermined period of time. In one embodiment, the at least one CRTH2 antagonist is selected from the group consisting of (5-fluoro-2-methyl-3-quinolin-2-ylmethyl-indol-1-yl)-acetic acid or a pharmaceutically acceptable salt thereof, [5-fluoro-3-(4-methanesulfonyl-benzyl)-2-methyl-indol-1-yl]-acetic acid or a pharmaceutically acceptable salt thereof, (3-{[2-(benzenesulfonyl)pyridin-3-yl]methyl}-5-fluoro-2-methylindol-1-yl)-acetic acid or a pharmaceutically acceptable salt thereof, [5-fluoro-3-({2-[(4-fluorobenzene)sulfonyl]pyridin-3-yl}methyl)-2-methylindol-1-yl]-acetic acid or a pharmaceutically acceptable salt thereof, and 5-(acetylamino)-3-[(4-chlorophenyl)thio]-2-methyl-1H-indole-1-acetic acid. In one embodiment, the PPI is selected from the group consisting of omeprazole, esomeprazole, lansoprazole, dexlansoprazole, pantoprazole, and rabeprazole, or a pharmaceutically acceptable salt thereof. In one embodiment, the administration of the at least one CRTH2 antagonist and at least one PPI may start within a period of between 0 and 30 days after terminating administration of the corticosteroid.

The at least one CRTH2 antagonist and the at least one PPI may be administered at the same time or at different times. In one embodiment, the administration of the at least one CRTH2 antagonist and the at least one PPI starts immediately after terminating administration of the corticosteroid. The CRTH2 antagonist may be administered as instructed according to the manufacturer of the particular CRTH2 antagonist used for this invention. In one embodiment, the CRTH2 antagonist is administered once a day. The PPI may be administered as instructed according to the manufacturer of the particular PPI used for this invention. and between 1 and 3 weeks.

The method of this invention also comprises subsequently administering to an individual in need thereof a therapeutically effective amount of at least one CRTH2 antagonist and at least one PPI and further administering a corticosteroid for a second predetermined period of time. In one embodiment, the dosage of the corticosteroid in the first predetermined period of time is higher than the dosage of the corticosteroid in the second predetermined period of time.

Pharmaceutical formulations comprising PPI's are known and described in the aforementioned patents. PPI's are known to be unstable to acid. Thus, oral formulations comprising PPI's may comprise an enteric coating which remains intact in the stomach, and dissolves in the intestinal tract. In one embodiment, a pharmaceutical formulation is in the form of an enterically coated tablet or granule comprising (1) a core comprising the PPI, (2) a first layer coated on the core, and (3) a second layer coated on the first layer which is an enteric coating. The core may comprise the PPI and a suitable excipient such as mannitol or lactose, and a binder such as hydroxypropylcellulose or polyvinylpyrrolidone. The first or intermediate layer may comprise a substantially water-insoluble film-forming material such as ethylcellulose and polyvinyl acetate and, optionally, an alkaline material such as an alkaline earth metal oxide or salt, e.g. magnesium oxide, silicic anhydride, calcium silicate, magnesium hydroxide, magnesium carbonate, aluminum hydroxide, calcium stearate and magnesium stearate. The enteric coating may comprise hydroxymethylcellulose phthalate, cellulose acetate phthalate, methacrylic acid/methyl methacrylate copolymer, and polyvinyl acetate phthalate. In one embodiment, both the PPI and the CRTH2 antagonist are present in the core. In another embodiment, the PPI and the CRTH2 antagonist are not in the core, but admixed with the enterically coated tablets or granules. In another embodiment, the admixed enterically coated tablets or granules are in a capsule.

The CRTH2 antagonists and PPIs may also be administered in a pharmaceutical formulation which may be a formulation suitable for oral, rectal, nasal, bronchial

(inhaled), topical (including eye drops, buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular, intravenous and intradermal) administration and may be prepared by any methods well known in the art.

The formulation may be prepared by bringing into association the above defined active agents with a carrier. In general, the formulations are prepared by uniformly and intimately bringing into association the active agent with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product.

Formulations for oral administration in the present invention may be presented as: discrete units such as capsules, sachets, tablets, which may be chewable tablets, or lozenges, each containing a predetermined amount of the active agent; as a powder or granules; as fine particles for sprinkling over food; as a solution or a suspension of the active agent in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion; or as a bolus etc.

For compositions for oral administration (e.g. tablets and capsules), the term "acceptable carrier" includes vehicles such as common excipients e.g. binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, polyvinylpyrrolidone (Povidone), methylcellulose, ethylcellulose, sodium carboxymethylcellulose, hydroxypropylmethylcellulose, sucrose and starch; fillers and carriers, for example corn starch, gelatin, lactose, sucrose, microcrystalline cellulose, kaolin, mannitol, dicalcium phosphate, sodium chloride and alginic acid; and lubricants such as magnesium stearate, sodium stearate and other metallic stearates, glycerol stearate stearic acid, silicone fluid, talc waxes, oils and colloidal silica. Flavouring agents such as peppermint, oil of wintergreen, cherry flavouring and the like can also be used. It may be desirable to add a colouring agent to make the dosage form readily identifiable. Tablets may also be coated by methods well known in the art.

A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a

suitable machine the active agent in a free flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active agent.

Other formulations suitable for oral administration include lozenges comprising the active agent in a flavoured base, usually sucrose and acacia or tragacanth; pastilles comprising the active agent in an inert base such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active agent in a suitable liquid carrier.

In one embodiment, the CRTH2 antagonist and the PPI may be in the same form (e.g., both may be administered as tablets) while in another embodiment, the CRTH2 antagonist and the PPI may be administered in different forms (e.g., one may be administered as a tablet and the other may be administered as an oral suspension).

In one embodiment, the invention provides a kit comprising a carrier means having in close confinement at least one CRTH2 antagonist and at least one PPI. The kit contains instructions to facilitate the administration of the CRTH2 antagonist and the PPI. In one embodiment, the carrier means is a blister pack. In another embodiment, the kit comprises a blister pack designed to contain one or more CRTH2 tablets, one or more PPI tablets, and instructions for administration. Exemplary blister packs are known in the art.

## EXAMPLES

Having now generally described this invention, the same will be understood by reference to the following examples which are provided herein for purposes of illustration only and are not intended to be limiting unless otherwise specified.

### EXAMPLE 1

#### **8 Week Study in Patients with Active Eosinophilic Esophagitis**

##### **Study Design**

The study was a randomized, double-blind, placebo-controlled, single-center study of (5-fluoro-2-methyl-3-quinolin-2-ylmethyl-indo-1-yl)-acetic acid (OC000459) for 8 weeks in patients with active ( $\geq 20$  eos/hpf and symptoms), corticosteroid-dependent, and/or -resistant eosinophilic esophagitis (EoE). The study compared patients taking 100 mg of OC000459 twice daily with patients taking a placebo twice daily. The study consisted of 26 patients with 14 patients taking OC000459 and 12 patients taking the placebo. Pre- and post-treatment disease-activity was assessed clinically, endoscopically, histologically, and via biomarkers. The primary endpoint was the reduction of the esophageal eosinophil load.

##### **Study population**

The following selection criteria were used to identify subjects:

##### *Inclusion criteria:*

1. Males and females ages 18-75 years.
2. Previously diagnosed and symptomatic isolated eosinophilic esophagitis.
3. Relevant eosinophil tissue inflammation as demonstrated by a mean eosinophil load  $\geq 20$  eos/hpf in 8 biopsies at the baseline visit.
4. Able to swallow placebo medication successfully under supervision in the clinic.
5. Free of all medications for EoE (including topical steroids) for at least 2 weeks prior to baseline and free of systemic steroids for at least 90 days before screening. A proton-pump inhibitor is allowed if required for treatment of secondary acid reflux.

*Exclusion criteria:*

1. Other causes of esophagitis (GERD, peptic ulceration, and/or infection).
2. Other causes of esophageal or generalized eosinophilia (i.e., hypereosinophilic syndromes, parasitic infection, GERD).
3. The patient's EoE is dependent on the level of seasonal allergens and the patient's participation in the study will occur during the allergy season.
4. History of an abnormal gastric or duodenal eosinophilia (e.g., HES, Churg-Strauss vasculitis, EG, or a parasitic infection).
5. Receipt of a forbidden prescribed or over-the-counter medication within 4 weeks prior to the baseline visit and for the duration of the trial, including vitamins and herbal remedies.

**Results**

After an 8-week treatment of active EoE with OC000459, the total mean eosinophil number decreased from 114.7 to 74.2 eos/hpf, whereas under placebo, no reduction was observed (from 102.8 to 99.4 eos/hpf). However, the effect of drug was more pronounced in the proximal upper esophagus than in the distal esophagus. The difference in % change in eosinophil load compared to placebo is shown in Figure 1.

These data indicate that eosinophil infiltration in the upper esophagus may be mediated by CRTH2 but that eosinophil accumulation in the distal esophagus is CRTH2-resistant. A possible explanation for this is that acid reflux may be responsible for the eosinophilic inflammation in the distal esophagus which is consistent with reports that eosinophilia is reduced by PPIs in some patients with EoE (Molina-Infante *et al.*, 2011). These data highlight two components of eosinophil accumulation in EoE, an allergic mechanism mediated by CRTH2 and acid reflux-dependent process which is reduced by PPI therapy. It is therefore proposed that the combination of CRTH2 antagonists with PPIs will be effective in the treatment of EoE by blocking both the allergic and acid reflux pathways.

Three patients were treated with both OC000459 and esomeprazole, either 20 mg or 40 mg once a day. As shown in Figure 2, these patients demonstrated a profound reduction in eosinophilic load compared to those patients taking OC000459 alone.

### **Conclusions**

OC00459 reduces eosinophilic load in the proximal but not distal esophagus in patients with EoE. When combined with a PPI to reduce acid reflux there is a considerable reduction in total eosinophilic load. Consequently, the combination of a CRTH2 antagonist with a PPI is an effective method to control inflammation of the esophagus in EoE which may be more convenient and safer than the current use of topical corticosteroids.
