(54) Title: PHENETHANOLAMINE DERIVATIVES FOR TREATMENT OF RESPIRATORY DISEASES

(57) Abstract: The present invention relates to novel compounds of formula (I), to a process for their manufacture, to pharmaceutical compositions containing them, and to their use in therapy, in particular their use in the prophylaxis and treatment of respiratory diseases.
PHENETHANOLAMINE DERIVATIVES FOR TREATMENT OF RESPIRATORY DISEASES

The present invention is concerned with phenethanolamine derivatives, processes for their preparation, compositions containing them and their use in medicine, particularly in the prophylaxis and treatment of respiratory diseases.

Certain phenethanolamine compounds are known in the art as having selective stimulant action at \( \beta_2 \)-adrenoreceptors and therefore having utility in the treatment of bronchial asthma and related disorders. Thus GB 2 140 800 describes phenethanolamine compounds including 4-hydroxy-\( \alpha \)-[[[6-(4-phenylbutoxy)hexyl]amino][methyl]-1,3-benzenedimethanol 1-hydroxy-2-naphthalenecarboxylate (salmeterol xinafoate) which is now used clinically in the treatment of such medical conditions.

Although salmeterol and the other commercially available \( \beta_2 \)-adrenoreceptor agonists are effective bronchodilators, the maximum duration of action is 12 hours, hence twice daily dosing is often required. There is therefore a clinical need for compounds having potent and selective stimulant action at \( \beta_2 \)-adrenoreceptors and having an advantageous profile of action.

According to the present invention, there is provided a compound of formula (I)

and salts and solvates thereof.
The compounds of formulae (I) and (Ia) include an asymmetric centre, namely the carbon atom of the

\[
\text{-CH-} \\
\text{\hspace{0.5cm} OH}
\]

group. The present invention includes both (S) and (R) enantiomers either in substantially pure form or admixed in any proportions.

Similarly, where R^4 and R^5 are different groups or where R^6 and R^7 are different groups, the carbon atom to which they are attached is an asymmetric centre and the present invention includes both (S) and (R) isomers at these centres either in substantially pure form or admixed in any proportions.

Thus the compounds of formulae (I) and (Ia) include all enantiomers and diastereoisomers as well as mixtures thereof in any proportions.

Salts and solvates of compounds of formulae (I) and (Ia) which are suitable for use in medicine are those wherein the counterion or associated solvent is pharmaceutically acceptable. However, salts and solvates having non-pharmaceutically acceptable counterions or associated solvents are within the scope of the present invention, for example, for use as intermediates in the preparation of other compounds of formulae (I) and (Ia) and their pharmaceutically acceptable salts, solvates, and physiologically functional derivatives.

By the term "physiologically functional derivative" is meant a chemical derivative of a compound of formula (I) or (Ia) having the same physiological function as the free compound of formula (I) or (Ia), for example, by being convertible in the body thereto. According to the present invention, examples of physiologically functional derivatives include esters.

Pharmaceutically acceptable esters of the compounds of formula (I) and (Ia) may have a hydroxyl group converted to a C_{1-6}alkyl, aryl, aryl C_{1-6} alkyl, or amino acid ester.

Suitable salts according to the invention include those formed with both organic and inorganic acids or bases. Pharmaceutically acceptable acid addition salts include those
formed from hydrochloric, hydrobromic, sulphuric, citric, tartaric, phosphoric, lactic,
pyruvic, acetic, trifluoroacetic, triphenylacetic, phenylacetic, substituted phenyl acetic
eg. methoxyphenyl acetic, sulphamic, sulphanilic, succinic, oxalic, fumaric, maleic,
malic, glutamic, aspartic, oxaloacetic, methanesulphonic, ethanesulphonic, arylsulphonic
(for example p-toluenesulphonic, benzenesulphonic, naphthalenesulphonic or
naphthalenedisulphonic), salicylic, glutaric, gluconic, tricarballylic, mandelic, cinnamic,
substituted cinnamic (for example, methyl, methoxy, halo or phenyl substituted
 cinnamic, including 4-methyl and 4-methoxycinnamic acid and α-phenyl cinnamic acid),
 ascorbic, oleic, naphthoic, hydroxynaphthoic (for example 1- or 3-hydroxy-2-naphthoic),
naphthaleneacrylic (for example naphthalene-2-acrylic), benzoic, 4-methoxybenzoic, 2-
or 4-hydroxybenzoic, 4-chlorobenoic, 4-phenylbenzoic, bezeneacrylic (for example 1,4-
benzenediacrylic) and isethionic acids. Pharmaceutically acceptable base salts include
ammonium salts, alkali metal salts such as those of sodium and potassium, alkaline
earth metal salts such as those of calcium and magnesium and salts with organic bases
such as dicyclohexyl amine and N-methyl-D-glucamine.

Advantageously, preferred compounds of the invention such as 4-\{(1R)-2-\{(6-\{(2,6-
dichlorobenzyl)oxy\}ethoxy\}hexyl\}amino\}-1-hydroxyethyl\}-2-(hydroxymethyl)phenol
are provided in the form of a crystalline salt, for example selected from those
exemplified in the experimental section below. Said crystalline salts have favourable
physical properties such as low hygroscopicity and/or improved stability.

As mentioned above, the compounds of formulae (I) and (Ia) are selective β₂-
adrenoreceptor agonists as demonstrated using functional or reporter gene readout
from cell lines transfected with human beta-adrenoreceptors as described below.
Compounds according to the present invention also have the potential to combine long
duration of effect with rapid onset of action. Furthermore, certain compounds have
shown an improved therapeutic index in animal models relative to existing long-acting
β₂-agonist bronchodilators. In addition, compounds of the invention demonstrate
pharmacokinetic properties that will reduce systemic exposure relative to existing long-
acting beta2 agonist bronchodilators. As such, compounds of the invention may be
suitable for once-daily administration.
Therefore, compounds of formulae (I) and (Ia) and their pharmaceutically acceptable salts, solvates, and physiologically functional derivatives have use in the prophylaxis and treatment of clinical conditions for which a selective \( \beta_2 \)-adrenoreceptor agonist is indicated. Such conditions include diseases associated with reversible airways obstruction such as asthma, chronic obstructive pulmonary diseases (COPD) (e.g. chronic and wheezy bronchitis, emphysema), respiratory tract infection and upper respiratory tract disease (e.g. rhinitis, including seasonal and allergic rhinitis).

Other conditions which may be treated include premature labour, depression, congestive heart failure, skin diseases (e.g. inflammatory, allergic, psoriatic, and proliferative skin diseases), conditions where lowering peptic acidity is desirable (e.g. peptic and gastric ulceration) and muscle wasting disease.

Accordingly, the present invention provides a method for the prophylaxis or treatment of a clinical condition in a mammal, such as a human, for which a selective \( \beta_2 \)-adrenoreceptor agonist is indicated, which comprises administration of a therapeutically effective amount of a compound of formula (I) or (Ia), or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof. In particular, the present invention provides such a method for the prophylaxis or treatment of a disease associated with reversible airways obstruction such as asthma, chronic obstructive pulmonary disease (COPD), respiratory tract infection or upper respiratory tract disease. In a further aspect the present invention provides such a method for the prophylaxis or treatment of a clinical condition selected from premature labour, depression, congestive heart failure, skin diseases (e.g. inflammatory, allergic, psoriatic, and proliferative skin diseases), conditions where lowering peptic acidity is desirable (e.g. peptic and gastric ulceration) or muscle wasting disease.

In the alternative, there is also provided a compound of formula (I) or (Ia) or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof for use in medical therapy, particularly, for use in the prophylaxis or treatment of a clinical condition in a mammal, such as a human, for which a selective \( \beta_2 \)-adrenoreceptor agonist is indicated. In particular, there is provided a compound of formula (I) or (Ia) or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof for the prophylaxis or treatment of a disease associated with reversible airways obstruction such as asthma, chronic obstructive pulmonary
disease (COPD), respiratory tract infection or upper respiratory tract disease. In a further aspect, there is provided a compound of formula (I) or (la) or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof for the prophylaxis or treatment of a clinical condition selected from premature labour, depression, congestive heart failure, skin diseases (e.g. inflammatory, allergic, psoriatic, and proliferative skin diseases), conditions where lowering peptic acidity is desirable (e.g. peptic and gastric ulceration) or muscle wasting disease.

The present invention also provides the use of a compound of formula (I) or (la), or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof in the manufacture of a medicament for the prophylaxis or treatment of a clinical condition for which a selective \( \beta_2 \)-adrenoreceptor agonist is indicated, for example a disease associated with reversible airways obstruction such as asthma, chronic obstructive pulmonary disease (COPD), respiratory tract infection or upper respiratory tract disease. In a further aspect, there is provided a compound of formula (I) or (la), or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof in the manufacture of a medicament for the prophylaxis or treatment of a clinical condition selected from premature labour, depression, congestive heart failure, skin diseases (e.g. inflammatory, allergic, psoriatic, and proliferative skin diseases), conditions where lowering peptic acidity is desirable (e.g. peptic and gastric ulceration) and muscle wasting disease.

The amount of a compound of formula (I) or (la), or a pharmaceutically acceptable salt, solvate or physiologically functional derivative thereof which is required to achieve a therapeutic effect will, of course, vary with the particular compound, the route of administration, the subject under treatment, and the particular disorder or disease being treated. The compounds of the invention may be administered by inhalation at a dose of from 0.0005mg to 10 mg, preferably 0.005mg to 0.5mg. The dose range for adult humans is generally from 0.0005 mg to 100mg per day and preferably 0.01 mg to 1mg per day.

While it is possible for the compound of formula (I) or (la), or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof to be administered alone, it is preferable to present it as a pharmaceutical formulation.
Accordingly, the present invention further provides a pharmaceutical formulation comprising a compound of formula (I) or (Ia) or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof, and a pharmaceutically acceptable carrier or excipient, and optionally one or more other therapeutic ingredients.

The compounds and pharmaceutical formulations according to the invention may be used in combination with or include one or more other therapeutic agents, for example anti-inflammatory agents, anticholinergic agents (particularly an M₁, M₂, M₁/M₂ or M₃ receptor antagonist), other β₂-adrenoreceptor agonists, antiinfective agents (e.g. antibiotics, antivirals), or antihistamines. The invention thus provides, in a further aspect, a combination comprising a compound of formula (I) or a pharmaceutically acceptable salt, solvate or physiologically functional derivative thereof together with one or more other therapeutically active agents, for example, an anti-inflammatory agent (for example a corticosteroid or an NSAID), an anticholinergic agent, another β₂-adrenoreceptor agonist, an antiinfective agent (e.g. an antibiotic or an antiviral), or an antihistamine. Preferred are combinations comprising a compound of formula (I) or a pharmaceutically acceptable salt, solvate or physiologically functional derivative thereof together with a corticosteroid, and/or an anticholinergic, and/or a PDE-4 inhibitor. Preferred combinations are those comprising one or two other therapeutic agents.

It will be clear to a person skilled in the art that, where appropriate, the other therapeutic ingredient(s) may be used in the form of salts, (e.g. as alkali metal or amine salts or as acid addition salts), or prodrugs, or as esters (e.g. lower alkyl esters), or as solvates (e.g. hydrates) to optimise the activity and/or stability and/or physical characteristics (e.g. solubility) of the therapeutic ingredient. It will be clear also that where appropriate, the therapeutic ingredients may be used in optically pure form.

Suitable anti-inflammatory agents include corticosteroids and NSAIDs. Suitable corticosteroids which may be used in combination with the compounds of the invention are those oral and inhaled corticosteroids and their pro-drugs which have anti-inflammatory activity. Examples include methyl prednisolone, prednisolone, dexamethasone, fluticasone propionate, 6α,9α-difluoro-17α-[(2-furanylcarbonyl)oxy]-11β-hydroxy-16α-methyl-3-oxo-androsta-1,4-diene-17β-carbothioic acid S-fluoromethyl

Of particular interest is use of the compound of formula (I) in combination with a phosphodiesterase 4 (PDE4) inhibitor or a mixed PDE3/PDE4 inhibitor. The PDE4-specific inhibitor useful in this aspect of the invention may be any compound that is known to inhibit the PDE4 enzyme or which is discovered to act as a PDE4 inhibitor, and which are only PDE4 inhibitors, not compounds which inhibit other members of the PDE family as well as PDE4. Generally it is preferred to use a PDE4 inhibitor which has an IC₅₀ ratio of about 0.1 or greater as regards the IC₅₀ for the PDE4 catalytic form which binds rolipram with a high affinity divided by the IC₅₀ for the form which binds rolipram with a low affinity. For the purposes of this disclosure, the cAMP catalytic site
which binds R and S rolipram with a low affinity is denominated the "low affinity" binding site (LPDE 4) and the other form of this catalytic site which binds rolipram with a high affinity is denominated the "high affinity" binding site (HPDE 4). This term "HPDE4" should not be confused with the term "hPDE4" which is used to denote human PDE4.

Initial experiments were conducted to establish and validate a [3H]-rolipram binding assay. Details of this work are given in the Binding Assays described in detail below.

The preferred PDE4 inhibitors for use in this invention will be those compounds which have a salutary therapeutic ratio, i.e., compounds which preferentially inhibit cAMP catalytic activity where the enzyme is in the form that binds rolipram with a low affinity, thereby reducing the side effects which apparently are linked to inhibiting the form which binds rolipram with a high affinity. Another way to state this is that the preferred compounds will have an IC$_{50}$ ratio of about 0.1 or greater as regards the IC$_{50}$ for the PDE4 catalytic form which binds rolipram with a high affinity divided by the IC$_{50}$ for the form which binds rolipram with a low affinity.

A further refinement of this standard is that of one wherein the PDE4 inhibitor has an IC$_{50}$ ratio of about 0.1 or greater; said ratio is the ratio of the IC$_{50}$ value for competing with the binding of 1 nM of [3H]R-rolipram to a form of PDE4 which binds rolipram with a high affinity over the IC$_{50}$ value for inhibiting the PDE4 catalytic activity of a form which binds rolipram with a low affinity using 1 µM[3H]-cAMP as the substrate.

Examples of useful PDE4 inhibitors are:
(R)-(+)1-(4-bromobenzyl)-4-[(3-cyclopentoxy)-4-methoxyphenyl]-2-pyrrolidone;
(R)-(+)1-(4-bromobenzyl)-4-[(3-cyclopentoxy)-4-methoxyphenyl]-2-pyrrolidone;
3-(cyclopentoxy-4-methoxyphenyl)-1-(4-N'-(N2-cyano-S-methyl-isothiourea)benzyl)-2-pyrrolidone;
cis 4-cyano-4-(3-cyclopentyloxy-4-methoxyphenyl)cyclohexan-1-carboxylic acid;
cis-[4-cyano-4-(3-cyclopropylmethoxy-4-difluoromethoxyphenyl)cyclohexan-1-ol];
(R)-(+)ethyl [4-(3-cyclopentyloxy-4-methoxyphenyl)pyrrolidine-2-yldene]acetate; and
(S)-(−)ethyl [4-(3-cyclopentyloxy-4-methoxyphenyl)pyrrolidine-2-yldene]acetate.
Most preferred are those PDE4 inhibitors which have an IC$_{50}$ ratio of greater than 0.5, and particularly those compounds having a ratio of greater than 1.0. Preferred compounds are cis-4-cyano-4-(3-cyclopropylxoxy-4-methoxyphenyl)cyclohexan-1-carboxylic acid, 2-carbamethoxy-4-cyano-4-(3-cyclopropylmethoxy-4-difluoromethoxyphenyl)cyclohexan-1-one and cis-[4-cyano-4-(3-cyclopropylmethoxy-4-difluoromethoxyphenyl)cyclohexan-1-ol]; these are examples of compounds which bind preferentially to the low affinity binding site and which have an IC$_{50}$ ratio of 0.1 or greater.

Phosphodiesterase and Rolipram Binding Assays

Assay method 1A

Isolated human monocyte PDE4 and hrPDE (human recombinant PDE4) was determined to exist primarily in the low affinity form. Hence, the activity of test compounds against the low affinity form of PDE4 can be assessed using standard assays for PDE4 catalytic activity employing 1 µM [3H]cAMP as a substrate (Torphy et al., J. of Biol. Chem., Vol. 267, No. 3 pp1798-1804, 1992).

Rat brain high speed supernatants were used as a source of protein and both enantiomers of [3H]-rolipram were prepared to a specific activity of 25.6 Ci/mmol. Standard assay conditions were modified from the published procedure to be identical to the PDE assay conditions, except for the last of the cAMP: 50 mM Tris HCl (pH 7.5), 5 mM MgCl₂, 50 µM 5'-AMP and 1 nM of [3H]-rolipram (Torphy et al., J. of Biol. Chem., Vol. 267, No. 3 pp1798-1804, 1992). The assay was run for 1 hour at 30° C. The reaction was terminated and bound ligand was separated from free ligand using a Brandel cell harvester. Competition for the high affinity binding site was assessed under conditions that were identical to those used for measuring low affinity PDE activity, expect that [3H]-cAMP was not present.

Assay method 1B

Measurement of Phosphodiesterase Activity

PDE activity was assayed using a [3H]cAMP SPA or [3H]cGMP SPA enzyme assay as described by the supplier (Amersham Life Sciences). The reactions were conducted in 96-well plates at room temperature, in 0.1 ml of reaction buffer containing (final concentrations): 50 mM Tris-HCl, pH 7.5, 8.3 mM MgCl₂, 1.7 mM EGTA, [3H]cAMP or [3H]cGMP (approximately 2000 dpm/pmol), enzyme and various concentrations of the inhibitors. The assay was allowed to proceed for 1 hr and was terminated by adding 50 µl of SPA yttrium silicate beads in the presence of zinc sulfate. The plates were shaken and allowed to stand at room temperature for 20 min. Radiolabeled product formation was assessed by scintillation spectrometry.

[3H]Rolipram binding assay
The $^{3}$H]R-rolipram binding assay was performed by modification of the method of Schneider and co-workers, see Nicholson, et al., Trends Pharmacol. Sci., Vol. 12, pp.19-27 (1991) and McHale et al., Mol. Pharmacol., Vol. 39, 109-113 (1991). R-Rolipram binds to the catalytic site of PDE4 see Torphy et al., Mol. Pharmacol., Vol. 39, pp. 376-384 (1991). Consequently, competition for $^{3}$H]R-rolipram binding provides an independent confirmation of the PDE4 inhibitor potencies of unlabeled competitors. The assay was performed at 30°C for 1 hr in 0.5 μl buffer containing (final concentrations): 50 mM Tris-HCl, pH 7.5, 5 mM MgCl₂, 0.05% bovine serum albumin, 2 nM $^{3}$H]R-rolipram (5.7 x 104 dpm/pmol) and various concentrations of non-radiolabeled inhibitors. The reaction was stopped by the addition of 2.5 ml of ice-cold reaction buffer (without $^{3}$H]R-rolipram) and rapid vacuum filtration (Brandel Cell Harvester) through Whatman GF/B filters that had been soaked in 0.3% polyethyleneimine. The filters were washed with an additional 7.5 ml of cold buffer, dried, and counted via liquid scintillation spectrometry.

Suitable anticholinergic agents are those compounds that act as antagonists at the muscarinic receptor, in particular those compounds which are antagonists of the M₁ and M₂ receptors. Exemplary compounds include the alkaloids of the belladonna plants as illustrated by thelikes of atropine, scopolamine, homatropine, hyoscyamine; these compounds are normally administered as a salt, being tertiary amines. These drugs, particularly the salt forms, are readily available from a number of commercial sources or can be made or prepared from literature data via, to wit:

Suitable antihistamines (also referred to as H₁-receptor antagonists) include any one or more of the numerous antagonists known which inhibit H₁-receptors, and are safe for human use. All are reversible, competitive inhibitors of the interaction of histamine with H₁-receptors. The majority of these inhibitors, mostly first generation antagonists, have a core structure, which can be represented by the following formula:

\[
\begin{array}{c}
\text{Ar}_1 \\
\text{Ar}_2 \\
X \longrightarrow C \longrightarrow C \longrightarrow N
\end{array}
\]

This generalized structure represents three types of antihistamines generally available: ethanolamines, ethylenediamines, and alkylamines. In addition, other first generation antihistamines include those which can be characterized as based on piperazine and phenothiazines. Second generation antagonists, which are non-sedating, have a similar structure-activity relationship in that they retain the core ethylene group (the alkylamines) or mimic the tertiary amine group with piperazine or piperidine. Exemplary antagonists are as follows:

Ethanolamines: carboxinonamine maleate, clemastine fumarate, diphenhydramine hydrochloride, and dimenhydrinate.

Ethylenediamines: pyrilamine amlrate, tripelennamine HCl, and tripelennamine citrate.

Alkylamines: chlopheniramine and its salts such as the maleate salt, and acrivastine.
Piperazines: hydroxyzine HCl, hydroxyzine pamoate, cyclizine HCl, cyclizine lactate, meclizine HCl, and cetirizine HCl.
Piperidines: Astemizole, levocabastine HCl, loratadine or its descarboethoxy analogue, and terfenadine and fexofenadine hydrochloride or another pharmaceutically acceptable salt.

Azelastine hydrochloride is yet another H₁ receptor antagonist which may be used in combination with a PDE4 inhibitor.
Examples of preferred anti-histamines include methapyrilene and loratadine.

The invention thus provides, in a further aspect, a combination comprising a compound of formula (I) a pharmaceutically acceptable salt, solvate or physiologically functional derivative thereof together with an anticholinergic and a PDE-4 inhibitor.
The combinations referred to above may conveniently be presented for use in the form of a pharmaceutical formulation and thus pharmaceutical formulations comprising a combination as defined above together with a physiologically acceptable diluent or carrier represent a further aspect of the invention.

The individual compounds of such combinations may be administered either sequentially or simultaneously in separate or combined pharmaceutical formulations. Appropriate doses of known therapeutic agents will be readily appreciated by those skilled in the art.

Hereinafter, the term "active ingredient" means a compound of formula (I) or (Ia), or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof.

The formulations include those suitable for oral, parenteral (including subcutaneous, intradermal, intramuscular, intravenous and intraarticular), inhalation (including fine particle dusts or mists which may be generated by means of various types of metered dose pressurised aerosols, nebulisers or insufflators), rectal and topical (including dermal, buccal, sublingual and intraocular) administration, although the most suitable route may depend upon, for example, the condition and disorder of the recipient. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both and then, if necessary, shaping the product into the desired formulation.

Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus, electuary or paste.
A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, lubricating, surface active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient therein.

Formulations for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilised) condition requiring only the addition of the sterile liquid carrier, for example saline or water-for-injection, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described.

Dry powder compositions for topical delivery to the lung by inhalation may, for example, be presented in capsules and cartridges of for example gelatine, or blisters of for example laminated aluminium foil, for use in an inhaler or insufflator. Formulations generally contain a powder mix for inhalation of the compound of the invention and a suitable powder base (carrier substance) such as lactose or starch. Use of lactose is preferred. Each capsule or cartridge may generally contain between 20μg-10mg of the compound of formula (I) optionally in combination with another therapeutically active ingredient. Alternatively, the compound of the invention may be presented without excipients. Packaging of the formulation may be suitable for unit dose or multi-dose delivery. In the case of multi-dose delivery, the formulation can be pre-metered (eg as in Diskus, see GB 2242134 or Diskhaler, see GB 2178965, 2129691 and 2169265) or metered in use (eg as in Turbuhaler, see EP 69715). An example of a unit-dose device is Rotahaler (see GB 2064336). The Diskus inhalation device comprises an elongate
strip formed from a base sheet having a plurality of recesses spaced along its length
and a lid sheet hermetically but peelably sealed thereto to define a plurality of
containers, each container having therein an inhalable formulation containing a
compound of formula (I) preferably combined with lactose. Preferably, the strip is
sufficiently flexible to be wound into a roll. The lid sheet and base sheet will preferably
have leading end portions which are not sealed to one another and at least one of the
said leading end portions is constructed to be attached to a winding means. Also,
preferably the hermetic seal between the base and lid sheets extends over their whole
width. The lid sheet may preferably be peeled from the base sheet in a longitudinal
direction from a first end of the said base sheet.

Spray compositions for topical delivery to the lung by inhalation may for example be
formulated as aqueous solutions or suspensions or as aerosols delivered from
pressurised packs, such as a metered dose inhaler, with the use of a suitable liquefied
propellant. Aerosol compositions suitable for inhalation can be either a suspension or a
solution and generally contain the compound of formula (I) optionally in combination
with another therapeutically active ingredient and a suitable propellant such as a
fluorocarbon or hydrogen-containing chlorofluorocarbon or mixtures thereof, particularly
hydrofluoroalkanes, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetra-
fluoroethane, especially 1,1,1,2-tetrafluoroethane, 1,1,1,2,3,3,3-heptafluoro-n-propane
or a mixture thereof. Carbon dioxide or other suitable gas may also be used as
propellant. The aerosol composition may be excipient free or may optionally contain
additional formulation excipients well known in the art such as surfactants eg oleic acid
or lecithin and cosolvents eg ethanol. Pressurised formulations will generally be
retained in a canister (eg an aluminium canister) closed with a valve (eg a metering
valve) and fitted into an actuator provided with a mouthpiece.

Medicaments for administration by inhalation desirably have a controlled particle size.
The optimum particle size for inhalation into the bronchial system is usually 1-10μm,
preferably 2-5μm. Particles having a size above 20μm are generally too large when
inhaled to reach the small airways. To achieve these particle sizes the particles of the
active ingredient as produced may be size reduced by conventional means eg by
micronisation. The desired fraction may be separated out by air classification or sieving.
Preferably, the particles will be crystalline. When an excipient such as lactose is employed, generally, the particle size of the excipient will be much greater than the inhaled medicament within the present invention. When the excipient is lactose it will typically be present as milled lactose, wherein not more than 85% of lactose particles will have a MMD of 60-90μm and not less than 15% will have a MMD of less than 15μm.

Intranasal sprays may be formulated with aqueous or non-aqueous vehicles with the addition of agents such as thickening agents, buffer salts or acid or alkali to adjust the pH, isotonicity adjusting agents or anti-oxidants.

Solutions for inhalation by nebulisation may be formulated with an aqueous vehicle with the addition of agents such as acid or alkali, buffer salts, isotonicity adjusting agents or antimicrobials. They may be sterilised by filtration or heating in an autoclave, or presented as a non-sterile product.

Formulations for rectal administration may be presented as a suppository with the usual carriers such as cocoa butter or polyethylene glycol.

Formulations for topical administration in the mouth, for example buccally or sublingually, include lozenges comprising the active ingredient in a flavoured basis such as sucrose and acacia or tragacanth, and pastilles comprising the active ingredient in a basis such as gelatin and glycerin or sucrose an acacia.

Preferred unit dosage formulations are those containing an effective dose, as hereinbefore recited, or an appropriate fraction thereof, of the active ingredient.

It should be understood that in addition to the ingredients particularly mentioned above, the formulations of this invention may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents.

According to a further aspect of the invention, there is provided a process for preparing a compound of formula (I) or (Ia) or a salt, solvate, or physiologically functional
derivative thereof which comprises a process as described below followed where necessary or desired by one or more of the following steps in any order:

(i) optional removal of any protecting groups;
(ii) optional separation of an enantiomer or diastereoisomer from a mixture of enantiomers or diastereoisomers;
(iii) optional conversion of the product to a corresponding salt, solvate, or physiologically functional derivative thereof.
(iv) optional conversion of a group $R^{1a}$, $R^{2a}$ and/or $R^{3a}$ to a group $R^1$, $R^2$ and/or $R^3$ respectively.

In one general process (A), a compound of formula (I) or (Ia) may be obtained by deprotection of a protected intermediate, for example of formula (II):

$$
\begin{array}{c}
\text{R}^{13}\text{OCH}_2 \\
\text{R}^{14}\text{O} \\
\text{CHCH}_2\text{NR}^{15}\text{CR}^{4}\text{R}^{5}\text{(CH}_2\text{)}_m\text{O--(CH}_2\text{)}_n\text{OCR}^{6}\text{R}^{7} \\
\text{Or}^{3a} \\
\text{R}^{2a} \\
\text{R}^{1a} \\
\text{R}^{3a} \\
\text{R}^{15} \\
\text{(II)}
\end{array}
$$

or a salt or solvate thereof, wherein $R^4$, $R^5$, $R^6$, $R^7$, $m$, and $n$ are as defined for the compound of formula (I) or (Ia), and $R^{1a}$, $R^{2a}$, and $R^{3a}$ are each independently either the same as $R^1$, $R^2$, and $R^3$ respectively as defined for the compound of formulae (I) or (Ia) or a precursor for said group $R^1$, $R^2$, or $R^3$, and $R^{13}$, $R^{14}$, and $R^{15}$ are each independently either hydrogen or a protecting group provided that at least one of $R^{13}$, $R^{14}$, and $R^{15}$ is a protecting group, and $R^{15}$ is hydrogen or a protecting group.

Suitable protecting groups may be any conventional protecting group such as those described in "Protective Groups in Organic Synthesis" by Theodora W Greene and Peter G M Wuts, 3rd edition (John Wiley & Sons, 1999). Examples of suitable hydroxyl protecting groups represented by $R^{13}$ and $R^{14}$ are esters such as acetate ester, aralkyl groups such as benzyl, diphenylmethyl, or triphenylmethyl, and tetrahydropyranyl. Examples of suitable amino protecting groups represented by $R^{15}$ include benzyl, α-
methylbenzyl, diphenylmethyl, triphenylmethyl, benzyloxy carbonyl, tert-butoxycarbonyl, and acyl groups such as trichloroacetyl or trifluoroacetyl.

As will be appreciated by the person skilled in the art, use of such protecting groups may include orthogonal protection of groups in the compounds of formula (II) to facilitate the selective removal of one group in the presence of another, thus enabling selective functionalisation of a single amino or hydroxyl function. For example, the \(-\text{CH(OH)}\) group may be orthogonally protected as \(\text{CHOR}^{19}\) using, for example, a trialkylsilyl group such as triethylsilyl. A person skilled in the art will also appreciate other orthogonal protection strategies, available by conventional means as described in Theodora W Greene (see above).

The deprotection to yield a compound of formula (I) or (Ia) may be effected using conventional techniques. It will be apparent to persons skilled in the art that the deprotection method employed should not effect cleavage of the \(-\text{OCR}^6\text{R}^7\) moiety.

When \(\text{R}^{13}\) and/or \(\text{R}^{14}\) is tetrahydropyranyl this may be cleaved by hydrolysis under acidic conditions, for example using aqueous acetic acid. Acyl groups represented by \(\text{R}^{15}\) may be removed by hydrolysis, for example with a base such as sodium hydroxide, or a group such as trichloroethoxycarbonyl may be removed by reduction with, for example, zinc and acetic acid. Other deprotection methods may be found in Theodora W Greene (see above). In a particular embodiment of the above process, \(\text{R}^{13}\) and \(\text{R}^{14}\) may together represent a protecting group as in the compound of formula (III):

\[
\begin{align*}
\text{R}^{16} & \quad \text{OCH}_2 \\
\text{R}^{17} & \quad \text{O} \\
\text{CHCH}_2 \text{NHCR}^4 \text{R}^5 (\text{CH}_2)_m \text{O} \quad (\text{CH}_2)_n \text{OCR}^6 \text{R}^7 \\
\text{R}^{3a} & \quad \text{R}^{1a}
\end{align*}
\]

or a salt or solvate thereof, wherein \(\text{R}^4, \text{R}^5, \text{R}^6, \text{R}^7, m, \) and \(n\) are as defined for the compound of formula (I) or (Ia), and \(\text{R}^{1a}, \text{R}^{2a}, \) and \(\text{R}^{3a}\) are each independently either the same as \(\text{R}^1, \text{R}^2, \) and \(\text{R}^3\) respectively as defined for the compound of formulae (I) or (Ia) or a precursor for said group \(\text{R}^1, \text{R}^2, \) or \(\text{R}^3\).
R^{16} and R^{17} are independently selected from hydrogen, C_{1-6}alkyl, or aryl. In a preferred aspect, both R^{16} and R^{17} are methyl.

A suitable precursor group R^{1a}, R^{2a}, and/or R^{3a} in the compounds of formulae (II) and (III) would be a group which is convertible to the desired group R^{1}, R^{2}, and/or R^{3}, before, after or simultaneously with the removal of the protecting groups R^{13}, R^{14}, and/or R^{15}. For example, R^{1a}, R^{2a}, and/or R^{3a} may suitably be a protected version of a group R^{1}, R^{2}, and R^{3} respectively, such that removal of the protecting group gives the desired group R^{1}, R^{2}, or R^{3}. Preferred protecting groups in R^{1a}, R^{2a}, and/or R^{3a} are those which may be removed under the conditions used for the removal of the protecting groups R^{13}, R^{14}, and/or R^{15}.

The compound of formula (III) may be converted to a compound of formula (I) or (Ia) by hydrolysis with dilute aqueous acid, for example acetic acid or hydrochloric acid in a suitable solvent or by transketalisation in an alcohol, for example ethanol, in the presence of a catalyst such as an acid (for example, toluenesulphonic acid) or a salt (such as pyridinium tosylate) at normal or elevated temperature.

Compounds of formulae (II) and (III) wherein R^{15} is hydrogen may be prepared from the corresponding compound of formula (IV):

![Diagram](image_url)

or a salt or solvate thereof, wherein R^{4}, R^{5}, R^{6}, R^{7}, R^{13}, R^{14}, m, and n are as defined for the compound of formula (II) or (III) and R^{1a}, R^{2a}, and R^{3a} are each independently either the same as R^{1}, R^{2}, and R^{3} respectively as defined for the compound of formula (II) or (III) or a precursor for said group R^{1}, R^{2}, or R^{3}.

A suitable precursor group R^{1a}, R^{2a}, and/or R^{3a} in the compound of formula (IV) would be a group which is convertible to the desired group R^{1}, R^{2}, and/or R^{3}. Suitably, such
conversions are carried out using conventional methods which are known in the art. For example, where R¹ is to be \(-NR^6SO_2R^6\), a suitable precursor group R¹a in the compound of formula (IV) would have the amine \(-NHR^6\) in place of the substituent R¹, such that the desired substituent R¹ may be formed by reaction with the appropriate sulphonyl chloride (i.e. R⁶SO₂Cl) before deprotection to form the compound of formula (I).

As a second example, where R¹ is to be \(-NR^6C(O)NHR^6\), a suitable precursor group R¹a in the compound of formula (IV) would have the amine \(-NHR^6\) in place of the substituent R¹, such that the desired substituent R¹ may be formed by reaction with the appropriate isocyanate (i.e. R⁶NCO) before deprotection to form the compound of formula (I).

Alternatively, where R¹ is to be \(-NHC(O)NHR^6\), a suitable precursor group R¹a in the compound of formula (IV) has \(-NO_2\) in place of the substituent R¹ which may be reduced to form the corresponding primary amine before reaction with the isocyanate R⁶NCO as described above to form the desired urea substituent R¹. The reduction of the \(-NO_2\) group may be effected by any suitable method such as hydrogenation in the presence of a catalyst, for example, palladium/charcoal or platinum oxide, or by reaction with aluminium amalgam in tetrahydrofuran, or with zinc in ammonium chloride solution.

As a further example, where R¹ is to be \(-NR^6C(O)R^6\), a suitable precursor group R¹a in the compound of formula (IV) would have the amine \(-NHR^6\) in place of the substituent R¹, such that the desired substituent R¹ may be formed by reaction with the appropriate acyl chloride (i.e. R⁶C(O)Cl) before deprotection to form the compound of formula (I).

As a further example, where R¹ is to be \(-NR^6C(O)OR^6\), a suitable precursor group R¹a in the compound of formula (IV) would have the amine \(-NHR^6\) in place of the substituent R¹, such that the desired substituent R¹ may be formed by reaction with the appropriate chloroformate (i.e. R⁶OC(O)Cl) before deprotection to form the compound of formula (I).

Alternatively, where R¹ is to be an optionally substituted aryl group, a suitable precursor group R¹a in the compound of formula (IV) would have a halo substituent, for example iodo, in place of the substituent R¹, such that the desired substituent R¹ may be formed by reaction with bis(pinacolato)diboron followed by reaction with the appropriate optionally substituted haloaryl group, before deprotection to form the compound of formula (I). Alternatively, where R¹ is to be an optionally substituted aryl group, a suitable precursor group R¹a in the compound of formula (IV) would have a halo
substituent, for example iodo, in place of the substituent $R^1$, such that the desired substituent $R^1$ may be formed by reaction with the appropriate optionally substituted aryloboronic acid, for example an optionally substituted phenylboronic acid, before deprotection to form the compound of formula (I).

Alternatively, $R^{1a}$, $R^{2a}$, and/or $R^{3a}$ may suitably be a protected version of a group $R^1$, $R^2$, and $R^3$ respectively, such that removal of the protecting group gives the desired group $R^1$, $R^2$, or $R^3$. Preferred protecting groups in $R^{1a}$, $R^{2a}$, and/or $R^{3a}$ are those which may be removed under the conditions used for the removal of the protecting groups $R^{13}$ and $R^{14}$, or the conditions used for the conversion of the compound of formula (IV) to the compound of formulae (II) or (III). For example, an $\text{-NH-}$ group in the desired group $R^1$, $R^2$, or $R^3$ may be protected by a 2-(trimethylsilyl)ethoxymethyl group or a tert-butoxycarbonyl group.

The conversion of a compound of formula (IV) to a compound of formula (II) or (III) may be effected by treatment with a base, for example a non-aqueous base, such as potassium trimethylsilanolate, or an aqueous base such as aqueous sodium hydroxide, in a suitable solvent such as tetrahydrofuran.

Compounds of formula (IV) may be prepared according to a first method (a) by coupling the corresponding compound of formula (V):

\[
\text{R}^{13}\text{OCH}_2\text{R}^{14}\text{O} \quad \text{(V)}
\]

or a salt or solvate thereof, wherein $R^{13}$ and $R^{14}$ are as defined for the compound of formula (IV) with a compound of formula (VI):

\[
\text{L}^1\text{CR}^a\text{R}^5(\text{CH}_2)_m\text{O}-(\text{CH}_2)_n\text{O}-\text{CR}^a\text{R}^7\quad \text{(VI)}
\]
wherein R\textsuperscript{10}, R\textsuperscript{2a}, R\textsuperscript{3a}, R\textsuperscript{4}, R\textsuperscript{6}, R\textsuperscript{7}, m, and n are as defined for the compound of formula (IV) and L\textsuperscript{1} is a leaving group, for example a halo group (typically bromo or iodo) or a sulphonate such as an alkyl sulphonate (typically, methanesulphonate), an arylsulphonate (typically, toluenesulphonate), or a haloalkyl sulphonate (typically, trifluoromethanesulphonate).

The coupling of a compound of formula (V) with a compound of formula (VI) may be effected in the presence of a base, such as a metal hydride, for example sodium hydride, anathoride such as potassium t-butoxide or an inorganic base such as caesium carbonate, in an aprotic solvent, for example dimethylformamide.

Compounds of formula (V) may be prepared by ring closure of a compound of formula (VII):

\[
\begin{align*}
&\text{R}^{13}\text{OCH}_2 & \text{R}^{14}\text{O} & \text{NHC(O)}\text{OR}^{18} \\
&\text{(VII)}
\end{align*}
\]

wherein R\textsuperscript{13} and R\textsuperscript{14} are as defined for the compound of formula (V) and R\textsuperscript{18} is C\textsubscript{1-6}alkyl, for example tert-butyl, or aryl, for example phenyl. The ring closure may be effected by treatment with a base, such as a metal hydride, for example sodium hydride, in the presence of an aprotic solvent, for example, dimethylformamide.

Compounds of formula (VII) may be prepared from the corresponding ketone of formula (VIII):

\[
\begin{align*}

&\text{(VIII)}
\end{align*}
\]

wherein R\textsuperscript{13}, R\textsuperscript{14} and R\textsuperscript{18} are as defined for the compound of formula (VII), by reduction by any suitable method, for example by treatment with borane, in the presence of a
chiral catalyst, such as CBS-oxazaborolidine, in a suitable solvent such as tetrahydrofuran.

The compound of formula (VIII) may be prepared from the corresponding halide of formula (IX):

wherein R\textsuperscript{13} and R\textsuperscript{14} are as defined for the compound of formula (VIII) and Y is a halo group, suitably bromo.

The conversion of a compound of formula (IX) to a compound of formula (VIII) may be effected by reaction with the protected amine HN(COOR\textsuperscript{18})\textsubscript{2} wherein R\textsuperscript{18} is as defined for the compound of formula (VIII) in the presence of an inorganic base such as caesium carbonate, followed by selective removal of one of the COOR\textsuperscript{18} groups, for example by treatment with an acid such as trifluoroacetic acid.

Compounds of formula (IX) may be prepared from the corresponding compound having free hydroxymethyl and hydroxy substituents by forming the protected groups R\textsuperscript{13}OCH\textsubscript{2} and R\textsuperscript{14}O- wherein R\textsuperscript{13} and R\textsuperscript{14} are as defined for the compound of formula (IX). Such methods are described in DE 3513885 (Glaxo).

(XI)

wherein $R^4$, $R^5$, and $m$ are as defined for the compound of formula (VI), and $L^2$ is a leaving group such as halo (typically bromo).

The coupling of compounds (X) and (XI) may be effected in the presence of a base, such as a metal hydride, for example sodium hydride, or an inorganic base such as caesium carbonate, in an aprotic solvent, for example dimethylformamide. Alternatively, the coupling of compounds (X) and (XI) may be effected under phase transfer conditions, suitably in excess aqueous alkali such as 50% aqueous sodium hydroxide, optionally in the presence of a phase transfer catalyst such as a tetrabutylammonium salt, for example tetrabutylammonium bromide.

Compounds of formula (XI) are commercially available or may be prepared by methods well known to the person skilled in the art.

Compounds of formula (X) may be prepared by coupling the corresponding compound of formula (XII):

dihydroxy compound may be effected by methods analogous to those described for the coupling of compounds (X) and (XI).

This coupling may be effected by methods analogous to those described for the coupling of compounds (X) and (XI).

Compounds of formula (XIII) may be prepared by coupling the corresponding compound of formula (V) as defined above wherein R^{13} and R^{14} are as defined for the desired compound of formula (XIII) with the corresponding compound of formula (XIV):

![Chemical Structure](image)

or a protected derivative thereof, wherein R^4, R^5, m and n are as defined for the desired compound of formula (XIII) and L^4 is a leaving group such as halo (typically bromo). Alternatively, compounds of formula (XIII) may be prepared by coupling the corresponding compound of formula (XV):

![Diagram](image)

wherein \( R^{13}, R^{14}, R^4, R^5 \), and \( m \) are as defined for the desired compound of formula (XIII) and \( L^2 \) is a leaving group such as halo (typically bromo), followed by coupling the compound of formula (XV) with the dihydroxy compound of formula HO\((CH_2)_n\)OH, wherein \( n \) is as defined for the desired compound of formula (XIII), by methods analogous to those described for the coupling of compounds of formula (X) and (XI).

The compound of formula (XVI) may be prepared by converting the hydroxyl group in a compound of formula (XIII) into a leaving group \( L^{4} \) such as a methansulphonate group using methods known in the art, for example by reaction with methanesulphonyl chloride in the presence of a suitable base, for example \( \text{NEt}(\text{Pr})_{2} \), in a suitable solvent such as dichloromethane.

The compounds of formula (XVII) are commercially available or may be prepared using methods known in the art.

During the synthesis of the compound of formula (XIII), appropriate protecting chemistry may be used, for example, the compounds of formula (XIV) and the dihydroxy

Suitable protecting strategies will be appreciated by the person skilled in the art and may also be found in Theodora W. Greene (see above). Thus, for example, a primary hydroxyl group may be protected with a trialkysilyl group such as tert-butyldimethylsilyl or with a benzyl group.

In a further process (d) compounds of formula (IV) as defined above may be prepared by coupling a compound of formula (XVIII):

\[

The reaction of compounds (XVIII) and (X) may be effected in a similar manner to the coupling of compounds (XI) and (X).

Compounds of formula (XVIII) may be prepared by reacting a compound of formula (V) with a compound of formula (XI) in a similar manner to the reaction of compounds (V) and (XIV).

In a further general process (B) a compound of formula (I) and (Ia) may be obtained by alkylation of an amine of formula (XIX):

In a yet further general process (C), a compound of formula (I) or (Ia) may be prepared by reacting an amine of formula (XIX) as defined hereinabove, with a compound of formula (XX):

![Diagram](image)

wherein $R^4$, $R^6$, $R^7$, $R^{1a}$, $R^{2a}$, $R^{3a}$, $m$ and $n$ are as hereinbefore defined; under conditions suitable to effect reductive amination, for example in the presence of a reducing agent such as borohydride, typically tetramethylammonium (triacetoxy) borohydride.

A compound of formula (XX) may be prepared by methods known in the art, for example from a compound of formula (VI) as defined hereinabove via Kornblum oxidation.

It will be appreciated that in any of the general processes (A), (B) or (C) as well as the processes for (a) to (d) for preparing compounds (IV) described above, the precise
order of the synthetic steps by which the various groups and moieties are introduced into the molecule may be varied. It will be within the skill of the practitioner in the art to ensure that groups or moieties introduced at one stage of the process will not be affected by subsequent transformations and reactions, and to select the order of synthetic steps accordingly. It will also be appreciated that in general processes (B) and (C) appropriate protecting groups may be employed if necessary and/or desired and removed at any suitable stage of the synthesis, eg. in the last stage, as described in general process (A).

The enantiomeric compounds of the invention may be obtained (i) by separation of the components of the corresponding racemic mixture, for example, by means of a chiral chromatography column, enzymic resolution methods, or preparing and separating suitable diastereoisomers, or (ii) by direct synthesis from the appropriate chiral intermediates by the methods described herein.

Optional conversion of a compound of formula (I) or (Ia) to a corresponding salt may conveniently be effected by reaction with the appropriate acid or base. Optional conversion of a compound of formula (I) or (Ia) to a corresponding solvate or physiologically functional derivative may be effected by methods known to those skilled in the art.

BIOLOGICAL ACTIVITY

The potencies of the aforementioned compounds were determined using frog melanophores transfected with the human beta 2 adrenoreceptor. The cells were incubated with melatonin to induce pigment aggregation. Pigment dispersal was induced by compounds acting on the human beta 2 adrenoreceptor. The beta 2 agonist activity of test compounds was assessed by their ability to induce a change in light transmittance across a melanophore monolayer (a consequence of pigment dispersal). At the human beta 2 adrenoreceptor, compounds of examples 1 and 4 to 82 had IC$_{50}$ values below 1 µM.

Potency at human beta1 and beta3 adrenoceptors was determined in functional studies using Chinese hamster ovary cells transfected with either the human beta1 adrenoceptor or the human beta3 adrenoceptor. Agonist activity was assessed by measuring changes in intracellular cyclic AMP. For particularly preferred compounds of the invention, selectivity for beta2 adrenoceptors over beta1 adrenoceptors was typically 10 fold or greater. Selectivity for beta2 adrenoceptors over beta3 adrenoceptors was typically 5 fold or greater.

The onset of action and duration of action in vitro was assessed on isolated superfused airway preparations (human or guinea pig). Tissues were contracted either electrically or by spasmogen. Agonist was perfused over the tissue until maximum relaxation was achieved, and onset of action determined. Perfusion of the agonist was then ceased and duration determined by the time taken for the contractile response to re-establish.

For particularly preferred compounds of the invention, onset was typically less than 30min. Duration was typically >3h.

Particularly preferred compounds of the invention are potent and long-acting inhibitors of histamine-induced bronchospasm in conscious guinea pigs. They also demonstrate an improved therapeutic index in conscious guinea pigs (bronchoprotective effects vs blood pressure lowering effects) relative to established long-acting beta2 agonist bronchodilators.
The particularly preferred compounds of the invention show low oral bioavailability in rat and dog. In human hepatocyte cultures they are metabolised to products that are significantly less potent at the beta2 adrenoceptor than the parent compound.

Form PCT/ISA/210 (second sheet) (July 1992)
INTERNATIONAL SEARCH REPORT

Box I  Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☑ Claims Nos.:
   because they relate to subject matter not required to be searched by this Authority, namely:
   Although claim 11 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

2. ☑ Claims Nos.:
   because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
   see FURTHER INFORMATION sheet PCT/ISA/210

3. ☐ Claims Nos.:
   because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II  Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☑ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest  ☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.
Continuation of Box I.2

The present claims do not meet the requirements of Article 6 PCT in that the matter for which protection is sought is not clearly defined. The functional term "physiologically functional derivative" does not enable the skilled person to determine which technical features are necessary to perform the stated function. It is thus unclear which specific compounds fall within the scope of said claim. A lack of clarity within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Consequently, the search does not include "physiologically functional derivatives" of the compounds of formula I.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
