UNITED STATES PATENT OFFICE.

JOSEPH BROKAW MATTSON, OF MINNEAPOLIS, MINNESOTA.

PAPER LINER FOR CAKE DECORATORS.

Application filed March 7, 1925. Serial No. 13,723.

To all whom it may concern:

Be it known that I, JOSEPH BROKAW MATTSON, a citizen of United States, residing at Minneapolis, in the county of Hennepin and State of Minnesota, have invented certain new and useful Improvements in Paper Liners for Cake Decorators; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same.

My invention relates to cake decorators and has for its object to provide a removable liner therefor. Cake decorators now commonly used consist of cloth bags having removable nozzles for holding a decorating paste or other plastic substance to be forced through the nozzles onto cakes, desserts or other dishes, by squeezing the bags. When different colored pastes are used for such decorating it is necessary to wash the bag each time a different color is used or to use a plurality of decorating bags for holding the different colors.

By the use of my invention, the paste is placed in a removable liner and does not come in direct contact with the bag, and when the decorating is completed the liner can be removed and thrown away, thus avoiding the necessity of washing the bag each time a different colored paste is used.

To the above end, the invention consists of the novel devices and combinations of devices hereinafter described and defined in the claims.

In the accompanying drawings, which illustrate the invention, like characters indicate like parts throughout the several views.

Referring to the drawings:

Fig. 1 is a side elevation of a cake decorator having one of the removable liners inserted therein;

Fig. 2 is a view of the cake decorator and liner in central longitudinal section;

Fig. 3 is a side elevation of the liner removed from the bag;

Fig. 4 is a plan view of the blank from which the liner is formed; and

Fig. 5 is a side elevation of the nozzle removed from the liner and bag.

The cake decorator includes a conical cloth bag 6 having a truncated end to afford a nozzle opening 7 in which is removably

mounted a metal nozzle 8 inserted through said opening from the inside of the bag.

My invention provides a removable conical liner 9, preferably of paper, adapted to be inserted into the bag 6 and having a truncated end to afford a nozzle opening 10 which is coincident with the nozzle opening 7. This liner 9 has the same taper as the bag 6 and is inserted into the bag 6 before the nozzle 8 is inserted therein. After the liner 9 is inserted into the bag 6 the nozzle 8 is inserted through the coincident openings 7 and 10 and projects therethrough, as shown in Figs. 1 and 2.

It is important to note that the taper of the nozzle 8 is greater than that of either the bag 6 or liner 9 so that its rim engages the liner with a greater pressure to form a tight joint between the nozzle 8 and liner 9, as shown in Fig. 2. The bag 6 and liner 9 have the same taper so that said liner is reinforced by the bag to prevent the same from bursting at the time the mouth of the bag is held closed and squeezed to force the paste or other substance held in the liner 9.

Preferably, the liners 9 are supplied to the trade with a gummed edge 11 and folded on lines 12. When a liner is to be used it is only necessary to dampen the gummed edge 11 and press the other longitudinal edge thereon to connect the respective edges of the liner 9 and plait the same. When the decorating is completed the liner 9 may be removed from the bag 6 and thrown away or when two or more colors are used, a different liner can be used for each color and said liners interchangeably used while decorating a cake or the like.

The term "cake" is herein used in a broad sense to cover desserts and the like.

As is obvious, the device herein described and claimed may be used very generally for applying pastry substances. Among other materials that are often applied in ornamental or artistic designs may be mentioned mashed potatoes, cheese, modeling clay, plaster of Paris, etc.

What I claim is:

1. A cake decorator comprising a bag, a removable liner for the bag, said bag and liner having co-incident nozzle openings, and a nozzle mounted in said openings.

2. A cake decorator comprising a cloth bag, a removable paper liner for said bag, said bag and liner having co-incident nozzle

openings, and a nozzle removably mounted in said openings.

3. A cake decorator comprising a conical cloth bag, a removable conical paper liner for said bag, said bag and liner being truncated to afford co-incident nozzle openings, and a removable nozzle mounted in said openings.

4. The structure defined in claim 3 in which the nozzle is of conical formation.

5. The structure defined in claim 3 in which the nozzle is of conical formation and has a greater taper than said bag and liner so that its rim tightly presses against the liner to form a tight joint between the nozzle and liner and to press the liner against the bag to reinforce the same.

In testimony whereof I affix my signature.

JOSEPH BROKAW MATTSON.
