## ABSTRACT

An orthogonal complex spreading method for a multichannel and an apparatus thereof are disclosed. The method includes the steps of complex-summing $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}$ which is obtained by multiplying an orthogonal Hadamard sequence $\mathrm{W}_{M, n 1}$ by a first data $\mathrm{X}_{n 1}$ of a n-th block and $\alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}$ which is obtained by multiplying an orthogonal Hadamard sequence $\mathrm{W}_{1, n 2}$ by a second data $\mathrm{X}_{n 2}$ of a n -th block; com-plex-multiplying $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}$ which is summed in the complex type and $\mathrm{W}_{M, n 3}+\mathrm{jPW}_{M, n 4}$ of the complex type using a complex multiplier and outputting as an in-phase information and quadrature phase information; and summing only in-phase information outputted from a plurality of blocks and only quadrature phase information outputted therefrom and spreading the same using a spreading code.

## ORTHOGONAL COMPLEX SPREADING METHOD FOR MULTICHANNEL AND APPARATUS THEREOF

#### Abstract

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates the additions made by reissue.

NOTE: More than one reissue application has been filed for the reissue of U.S. Pat. No. 6,449,306. The reissue applications are U.S. patent application Ser. No. 10/932,227, filed on Sep. 2, 2004 and issued as U.S. Pat. No. RE40,385; U.S. patent application Ser. No. 11/648,915, filed on Jan. 3, 2007, which is a continuation reissue application of U.S. patent application Ser. No. 10/932,227 filed Sep. 2, 2004 now U.S. Pat. No. Re. 40,385; and U.S. patent application Ser. No. 13/177,498 (the present application), filed on Jul. 6, 2011, which is a continuation reissue application of U.S. patent application Ser. No. 11/648,915 filed Jan. 3, 2007.

This application is a continuation of application Ser. No. 09/162,764, filed Sep. 30, 1998 now U.S. Pat. No. 6,222,873.

## BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to an orthogonal complex spreading method for a multichannel and an apparatus thereof, and in particular, to an improved orthogonal complex spreading method for a multichannel and an apparatus thereof which are capable of decreasing a peak power-to-average power ratio by introducing an orthogonal complex spreading structure and spreading the same using a spreading code, implementing a structure capable of spreading complex output signals using a spreading code by adapting a permutated orthogonal complex spreading structure for a complex-type multichannel input signal with respect to the summed values, and decreasing a phase dependency of an interference based on a multipath component (when there is one chip difference) of a self signal, which is a problem that is not overcome by a permutated complex spreading modulation method, by a combination of an orthogonal Hadamard sequence.
2. Description of the Conventional Art

Generally, in the mobile communication system, it is known that a linear distortion and non-linear distortion affect power amplifier. The statistical characteristic of a peak power-to-average power ratio has a predetermined interrelationship for a non-linear distortion.

The third non-linear distortion which is one of the factors affecting the power amplifier causes an inter-modulation product problem in an adjacent frequency channel. The above-described inter-modulation product problem is generated due to a high peak amplitude for thereby increasing an adjacent channel power ( ACP ), so that there is a predetermined limit for selecting an amplifier. In particular, the CDMA (Code Division Multiple Access) system requires a very strict condition with respect to a linearity of a power amplifier. Therefore, the above-described condition is a very important factor.

In accordance with IS-97 and IS-98, the FCC stipulates a condition on the adjacent channel power (ACP). In order to satisfy the above-described condition, a bias of a RF power amplifier should be limited.

According to the current IMT-2000 system standard recommendation, a plurality of CDMA channels are recom-
mended. In the case that a plurality of channels are provided, the peak power-to-average power ratio is considered as an important factor for thereby increasing efficiency of the modulation method.

The IMT-2000 which is known as the third generation mobile communication system has a great attention from people as the next generation communication system following the digital cellular system, personal communication system, etc. The IMT- 2000 will be commercially available as one of the next generation wireless communication system which has a high capacity and better performance for thereby introducing various services and international loaming services, etc.

Many countries propose various IMT-2000 systems which IC require high data transmission rates adapted for an internet service or an electronic commercial activity. This is directly related to the power efficiency of a RF amplifier.

The CDMA based IMT-2000 system modulation method introduced by many countries is classified into a pilot channel method and a pilot symbol method. Of which, the former is directed to the ETRI 1.0 version introduced in Korea and is directed to CDMA ONE introduced in North America, and the latter is directed to the NTT-DOCOMO and ARIB introduced in Japan and is directed to the FMA2 proposal in a reverse direction introduced in Europe.

Since the pilot symbol method has a single channel effect based on the power efficiency, it is superior compared to the pilot channel method which is a multichannel method. However since the accuracy of the channel estimation is determined by the power control, the above description does not have its logical ground.

FIG. 1 illustrates a conventional complex spreading method based on a CDMA ONE method. As shown therein, the signals from a fundamental channel, a supplemental channel, and a control channel are multiplied by a Walsh code by each multiplier of a multiplication unit 20 through a signal mapping unit $\mathbf{1 0}$. The signals which are multiplied by a pilot signal and the Walsh signal and then spread are multiplied by channel gains A0, A1, A2 and A3 by a channel gain multiplication unit 30.

In a summing unit 40, the pilot signal multiplied by the channel gain A0 and the fundamental channel signal multiplied by the channel gain A1 are summed by a first adder for thereby obtaining an identical phase information, and the supplemental channel signal multiplied by the channel gain A2 and the control channel signal multiplied by the channel gain A3 are summed by a second adder for thereby obtaining an orthogonal phase information.

The thusly obtained in-phase information and quadraturephase information are multiplied by a PN1 code and PN2 code by a spreading unit 50, and the identical phase information multiplied by the PN2 code is subtracted from the identical phase information multiplied by the PN1 code and is outputted as an I channel signal, and the quadrature-phase information multiplied by the PN1 code and the in-phase information multiplied by the PN2 code are summed and are outputted through a delay unit as a $Q$ channel signal.

The CDMA ONE is implemented using a complex spreading method. The pilot channel and the fundamental channel spread to a Walsh code $\mathbf{1}$ are summed for thereby forming an in-phase information, and the supplemental channel spread to the Walsh code 2 and the control channel spread to a Walsh code $\mathbf{3}$ are summed for thereby forming an quadrature-phase information. In addition, the in-phase information and quadrature-phase information are complex-spread by PN codes.

FIG. 2A is a view illustrating a conventional CDMA ONE method, and FIG. 2B is a view illustrating a maximum eyeopening point after the actual shaping filter of FIG. 2 A .

As shown therein, in the CDMA ONE, the left and right information, namely, the in-phase information (I channel) and the upper and lower information, namely, the quadraturephase information (Q channel) pass through the actual pulse shaping filter for thereby causing a peak power, and in the ETRI version 1.0 shown in FIGS. 3A and 3B, a peak power may occur in the transverse direction for thereby causing deterioration.

In view of the crest factor and the statistical distribution of the power amplitude, in the CDMA ONE, the peak power is generated in vertical direction, so that the irregularity problem of the spreading code and an inter-interference problem occur.

## SUMMARY OF THE INVENTION

Accordingly, it is an object of the present invention to provide an orthogonal complex spreading method for a multichannel and an apparatus thereof overcome the aforementioned problems encountered in the conventional art.

The CDMA system requires a strict condition for a linearity of a power amplifier, so that the peak power-to-average power ratio is important. In particular, the characteristic of the IMT-2000 system is determined based on the efficiency of the modulation method since multiple channels are provided, and the peak power-to-average power ratio is adapted as an important factor.

It is another object of the present invention to provide an orthogonal complex spreading method for a multichannel and an apparatus thereof which have an excellent power efficiency compared to the CDMA-ONE introduced in U.S.A. and the W-CDMA introduced in Japan and Europe and is capable of resolving a power unbalance problem of an inphase channel and a quadrature-phase channel as well as the complex spreading method.

It is still another object of the present invention to provide an orthogonal complex spreading method for a multichannel and an apparatus thereof which is capable of stably maintaining a low peak power-to-average power ratio.

It is still another object of the present invention to provide an orthogonal complex spreading method for a multichannel and an apparatus thereof in which a spreading operation is implemented by multiplying a predetermined channel data among data of a multichannel by an orthogonal Hadamard sequence and a gain and, multiplying a data of another channel by an orthogonal Hadamard sequence and a gain, summing the information of two channels in complex type, multiplying the summed information of the complex type by the orthogonal Hadamard sequence of the orthogonal type, obtaining a complex type, summing a plurality of channel information of the complex type in the above-described manner and multiplying the information of the complex type of the multichannel by a spreading code sequence.

It is still another object of the present invention to provide an orthogonal complex spreading method for a multichannel and an apparatus thereof which is capable of decreasing the probability that the power becomes a zero state by preventing the FIR filter input state from exceeding $\pm 90^{\circ}$ in an earlier sample state, increasing the power efficiency, decreasing the consumption of a bias power for a back-off of the power amplifier and saving the power of a battery.

It is still another object of the present invention to provide an orthogonal complex spreading method for a multichannel and an apparatus thereof which is capable of implementing a

POCQPSK (Permutated Orthogonal Complex QPSK) which is another modulation method and has a power efficiency similar with the OCQPSK (Orthogonal Complex QPSK).
In order to achieve the above objects, there is provided an orthogonal complex spreading method for a multichannel which includes the steps of complex-summing $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}$ which is obtained by multiplying an orthogonal Hadamard sequence $\mathrm{W}_{M, n 1}$ by a first data $\mathrm{X}_{n 1}$ of a $n$-th block and $\alpha_{n 2}$ $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$ which is obtained by multiplying an orthogonal Hadamard sequence $\mathrm{W}_{M, n 2}$ by a second data $\mathrm{X}_{n 2}$ of a n -th block; complex-multiplying $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}$ which is summed in the complex type and $\mathrm{W}_{M, n 3}+\mathrm{jW}_{M, n 4}$ of the complex type using a complex multiplier and outputting as an in-phase information and quadrature-phase information; and summing only in-phase information outputted from a plurality of blocks and only quadrature-phase information outputted therefrom and spreading the same using a spreading code.

In order to achieve the above objects, there is provided an orthogonal complex spreading apparatus according to a first embodiment of the present invention which includes a plurality of complex multiplication blocks for distributing the data of the multichannel and complex-multiplying $\alpha_{n 1}$ $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}$ in which $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}$ which is obtained by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, n 1}$ with the first data $\mathrm{X}_{n 1}$ of the n -th block and the gain $\alpha_{n 1}$ and $\alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}$ which is obtained by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, n 2}$ with the second data $\mathrm{X}_{n 2}$ of the n-th block and the gain $\alpha_{n 2}$ and $\mathrm{W}_{M, n 3}+\mathrm{W}_{M, n 4}$ using the complex multiplier; a summing unit for summing only the in-phase information outputted from each block of the plurality of the complex multiplication blocks and summing only the quadrature-phase information; and a spreading unit for multiplying the in-phase information and the quadraturephase information summed by the summing unit with the spreading code and outputting an I channel and a Q channel.

In order to achieve the above objects, there is provided an orthogonal complex spreading apparatus according to a second embodiment of the present invention which includes first and second Hadamard sequence multipliers for allocating the multichannel to a predetermined number of channels, splitting the same into two groups and outputting $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}$ which is obtained by multiplying the data $\mathrm{X}_{n 1}$ of each channel by the gain $\alpha_{n 1}$ and the orthogonal Hadamard sequence $\mathrm{W}_{M, n 1}$;
a first adder for outputting

$$
\sum_{n=1}^{K}\left(\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}\right)
$$

which is obtained by summing the output signals from the first Hadamard sequence multiplier;
a second adder for outputting

$$
\sum_{n=1}^{K}\left(\alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

which is obtained by summing the output signals from the second Hadamard sequence multiplier, a complex
multiplier for receiving the output signal from the first adder and the output signal from the second adder in the complex form of

$$
\sum_{n=1}^{K}\left(\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

and complex-multiplying $\mathrm{W}_{M, l}+\mathrm{jPW}_{M, Q}$ which $\mathrm{n}=1$ consist of the orthogonal Hadamard code $\mathrm{W}_{M,}$, and the permutated orthogonal Hadamard code $\mathrm{PW}_{M, Q}$ that $\mathrm{W}_{M, Q}$ and a predetermined sequence P are complexmultiplied; a spreading unit for multiplying the output signal from the complex multiplier by the spreading code; a filter for filtering the output signal from the spreading unit; and a modulator for multiplying and modulating the modulation carrier wave, summing the in-phase signal and the quadrature-phase signal and outputting a modulation signal of the real number.
Additional advantages, objects and other features of the invention will be set forth in part in the description which follows and in part will become apparent to those having ordinary skill in the art upon examination of the following or may be learned from practice of the invention. The objects and advantages of the invention may be realized and attained as particularly pointed out in the appended claims.

## BRIEF DESCRIPTION OF THE DRAWINGS

The present invention will become more fully understood from the detailed description given hereinbelow and the accompanying drawings which are given by way of illustration only, and thus are not limitative of the present invention, and wherein;

FIG. 1 is a block diagram illustrating a conventional multichannel complex spreading method of a CDMA (Code Division Multiple Access) ONE method;

FIG. 2A is a view illustrating a constellation plot of a conventional CDMA ONE method;

FIG. 2B is a view illustrating a maximum open point after the actual shaping filter of FIG. 2A;

FIG. 3A is a view illustrating a constellation plot of a conventional ETRI version 1.0 method;

FIG. 3B is a view illustrating a maximum open point after the actual pulse shaping filter of FIG. 3A;

FIG. 4 is a block diagram illustrating a multichannel orthogonal complex spreading apparatus according to the present invention;

FIG. 5 A is a circuit diagram illustrating the complex multiplexor of FIG. 4;

FIG. 5 B is a circuit diagram illustrating the summing unit and spreading unit of FIG. 4;

FIG. 5C is a circuit diagram illustrating another embodiment of the spreading unit of FIG. 4;

FIG. 5D is a circuit diagram illustrating of the filter and modulator of FIG. 4;

FIG. 6A is a view illustrating a constellation plot of an OCQPSK according to the present invention;

FIG. 6B is a view illustrating a maximum open point after the actual pulse shaping filter of FIG. 6A;

FIG. 7 is a view illustrating a power peak occurrence statistical distribution characteristic with respect to an average power between the conventional art and the present invention;

FIG. 8 is a view illustrating an orthogonal Hadamard sequence according to the present invention;

FIG. 9 is a circuit diagram illustrating a multichannel permutated orthogonal complex spreading apparatus according to the present invention;

FIG. 10 is a circuit diagram illustrating the complex multiplier according to the present invention;

FIG. 11 is a circuit diagram illustrating a multichannel permutated orthogonal complex spreading apparatus for a voice service according to the present invention;
FIG. 12 is a circuit diagram illustrating a multichannel permutated orthogonal complex spreading apparatus having a high quality voice service and a low transmission rate according to the present invention;

FIG. 13A is a circuit diagram illustrating a multichannel permutated orthogonal complex spreading apparatus for a QPSK having a high transmission rate according to the present invention;

FIG. 13B is a circuit diagram illustrating a multichannel permutated orthogonal complex spreading apparatus for a data having a high transmission rate according to the present invention;

FIG. 14A is a circuit diagram illustrating a multichannel permutated orthogonal complex spreading apparatus for a multimedia service having a QPSK data according to the present invention;
FIG. 14B is a circuit diagram illustrating a multichannel permutated orthogonal complex spreading apparatus for a multimedia service according to the present invention;

FIG. 15A is a phase trajectory view of an OCQPSK according to the present invention;
FIG. 15B is a phase trajectory view of a POCQPSK according to the present invention; and

FIG. 15C is a phase trajectory view of a complex spreading method according to the present invention.

## DETAILED DESCRIPTION OF THE INVENTION

The complex summing unit and complex multiplier according to the present invention will be explained with reference to the accompanying drawings. In the present invention, two complexes ( $\mathrm{a}+\mathrm{jb}$ ) and ( $\mathrm{c}+\mathrm{jd}$ ) are used, where a, $\mathrm{b}, \mathrm{c}$ and d represent predetermined real numbers.

A complex summing unit outputs $(a+c)+j(b+d)$, and a complex multiplier outputs $((\mathrm{axc})-(\mathrm{b} \times \mathrm{d}))+\mathrm{j}((\mathrm{b} \times \mathrm{c})+(\mathrm{a} \times \mathrm{d}))$. Here, a spreading code sequence is defined as SC , an information data is defined as $X_{n 1}$, and $X_{n 2}$, a gain constant is defined as $\alpha_{n 1}$ and $\alpha_{n 2}$, and an orthogonal Hadamard sequence is defined as $\mathrm{W}_{M, n 1}, \mathrm{~W}_{M, n 2}, \mathrm{~W}_{M, n 3}, \mathrm{~W}_{M, n 4}, \mathrm{~W}_{M, 1}, \mathrm{~W}_{M, Q}$, where M represents a $M \times M$ Hadamard matrix, and $n 1, n 2, n 3$ and $n 4$ represents index of a predetermined vector of the Hadamard matrix. For example, n3 represents a Hadamard vector which is a third vector value written into the $n$-th block like the $n$-th block 100n of FIG. 4. The Hadamard M represents a Hadamard matrix. For example, if the matrix W has values of 1 and -1 , in the $W_{T} \times W$, the main diagonal terms are $M$, and the remaining products are zero. Here, T represents a transpose.

The data $\mathrm{X}_{n 1}, \mathrm{X}_{n 2}, \mathrm{~W}_{M, n 1}, \mathrm{~W}_{M, n 2}, \mathrm{~W}_{M, n 3}, \mathrm{~W}_{M, n 4}, \mathrm{~W}_{M, 1}$, and $\mathrm{W}_{M, Q}$, and SC are combined data consisting of +1 or -1 , and any and $\alpha_{n 2}$ represent real number.

FIG. 4 is a block diagram illustrating a multichannel orthogonal complex spreading apparatus according to the present invention.

As shown therein, there is provided a plurality of complex multipliers $\mathbf{1 0 0}$ through 100 n in which a data of a predetermined channel is multiplied by a gain and orthogonal Hadamard sequence, and a data of another channel is multiplied by the orthogonal Hadamard sequence for thereby complexsumming two channel data, the orthogonal Hadamard
sequence of the complex type is multiplied by the complexsummed data, and the data of other two channels are complexmultiplied in the same manner described above. A summing unit 200 sums and outputs the output signals from the complex multipliers 100 through $\mathbf{1 0 0}$. A spreading unit $\mathbf{3 0 0}$ multiplies the output signal from the summing unit 200 with a predetermined spreading code $S C$ for thereby spreading the signal. A pulse shaping filter 400 filters the data spread by the spreading unit 300. A modulation wave multiplier $\mathbf{5 0 0}$ multiplies the output signal from the filter $\mathbf{4 0 0}$ with a modulation carrier wave and outputs the modulated data through an antenna.

As shown in FIG. 4, the first complex multiplier $\mathbf{1 0 0}$ com-plex-sums $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}$ which is obtained by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, 11}$ with the data $\mathrm{X}_{11}$ of one channel and the gain $\alpha_{11}$ and $\alpha_{12} W_{M, 12} \mathrm{X}_{12}$ which is obtained by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, 12}$ with the data $\mathrm{X}_{12}$ of another channel and the gain $\alpha_{12}$, and complex-multiplies $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}+\mathrm{j} \alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12}$ and the complex-type orthogonal sequence $\mathrm{W}_{M, 13} \mathrm{X}_{11}+\mathrm{j} \mathrm{W}_{M, 14}$ using the complex multiplier 111.

In addition, the $n$-th complex multiplier 100 n complexsums $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}$ which is obtained by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, n 1}$ with the data $\mathrm{X}_{n 1}$ of another channel and the gain $\alpha_{n 1}$ and $\alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}$ which is obtained by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, n 2}$ with the data $\mathrm{X}_{n 2}$ of another channel and the gain $\alpha_{n 2}$, and complex-multiplies $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}$ and the complex-type orthogonal sequence $\mathrm{W}_{M, n 3} \mathrm{X}_{11}+\mathrm{j}_{M, n 4}$ using the complex multiplier 100n.

The complex multiplication data outputted from the n-number of the complex multipliers are summed by the summing unit $\mathbf{2 0 0}$, and the spreading code SC is multiplied and spread it by the spreading unit $\mathbf{3 0 0}$. The thusly spread data are filtered by the pulse shaping filter $\mathbf{6 0 0}$, and the modulation carried $\mathrm{e}^{j 2 \pi f c c}$ is multiplied by the multiplier 700, and then the function $\operatorname{Re}\{*\}$ is processed, and the real data $s(t)$ is outputted through the antenna. Here, $\operatorname{Re}\left\{{ }^{*}\right\}$ represents that a predetermined complex is processed to a real value through the $\operatorname{Re}\left\{{ }^{*}\right\}$ function.

The above-described function will be explained as follows:

$$
\left(\sum_{n=1}^{K}\left(\left(\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right) \otimes\left(\mathrm{W}_{M, n 3}+(\mathrm{jW})_{M, n 4}\right)\right)\right) \otimes \mathrm{SC}
$$

where K represents a predetermined integer greater than or equal to $1, \mathrm{n}$ represents an integer greater than or equal to 1 and less than K and is identical with each channel number of the multichannel.

Each of the complex multipliers $\mathbf{1 1 0}$ through 100n is identically configured so that two different channel data are com-plex-multiplied.

As shown in FIG. 5A, one complex multiplier includes a first multiplier $\mathbf{1 0 1}$ for multiplying the data $\mathrm{X}_{11}$ by the orthogonal Hadamard sequence $\mathrm{W}_{M, 11}$ a second multiplier for multiplying the input signal from the first multiplier by the gain $\alpha_{11}$, a third multiplier 103 for multiplying the data $X_{12}$ of the other channel by another orthogonal Hadamard sequence $\mathrm{W}_{M, 12}$, a fourth multiplier 104 for multiplying the output signal from the third multiplier 103 by the gain $\alpha_{12}$, fifth and sixth multipliers $\mathbf{1 0 5}$ and $\mathbf{1 0 6}$ for multiplying the as output signals $\alpha_{11} W_{M, 11} X_{11}$ from the second multiplier 102 and the output signals $\alpha_{11} W_{M, 12} \mathrm{X}_{12}$ from the fourth multiplier 102 by the orthogonal Hadamard sequence $\mathrm{W}_{M, 13}$, respectively,
seventh and eighth multipliers $\mathbf{1 0 7}$ and $\mathbf{1 0 8}$ for multiplying the output signal $\alpha_{11} W_{M, 11} \mathrm{X}_{11}$ from the second multiplier 102 and the output signal $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12}$ from the fourth multiplier 102 by the orthogonal Hadamard sequence $W_{M, 14}$, sequentially, a first adder 109 for summing the output signal ( +ac ) from the fifth multiplier 105 and the output signal (-bd) from the eighth multiplier 108 and outputting in-phase information ( $\mathrm{ac}-\mathrm{bd}$ ), and a second adder 110 for summing the output signal (bc) from the sixth multiplier 106 and the output signal (ad) from the seventh multiplier 107 and outputting the quadrature-phase information (bc+ad).

Therefore, the first and-second multipliers 101 and 102 multiply the data $X_{11}$ by the orthogonal Hadamard sequence $\mathrm{W}_{M, 11}$ and the gain $\alpha_{11}$ for thereby obtaining $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}$ ( $=\mathrm{a}$ ). In addition, the third and fourth multipliers 103 and 104 multiply the orthogonal Hadamard sequence $\mathrm{W}_{M, 12}$ and the gain $\alpha_{12}$ for thereby obtaining $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12}(=\mathrm{b})$. The fifth and sixth multipliers 105 and 106 multiply $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}(=\mathrm{a})$ and $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12}(=\mathrm{b})$ by the orthogonal Hadamard sequence $\mathrm{W}_{M, 13}(=\mathrm{c})$, respectively, for thereby obtaining $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11} \mathrm{~W}_{M, 13}(=\mathrm{ac})$ and $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12} \mathrm{~W}_{M, 13}(=\mathrm{bc})$, and the fifth and sixth multipliers 105 and 106 multiply $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}(=\mathrm{a})$ and $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12}(=\mathrm{b})$ by the orthogonal Hadamard sequence $\mathrm{W}_{M, 14}(=\mathrm{d})$ for thereby obtaining $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11} \mathrm{~W}_{M, 14}(=\mathrm{ad})$ and $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12} \mathrm{~W}_{M, 14}(=b d)$. In addition, the first adder 109 computes $\left(\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}\right.$ $\left.\mathrm{W}_{M, 13}\right)-\left(\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12} \mathrm{~W}_{M, 14}\right) \quad(=\mathrm{ac}-\mathrm{bd}), \quad$ namely, $\quad \alpha_{12}$ $\mathrm{W}_{M, 12} \mathrm{X}_{12} \mathrm{~W}_{M, 14}$ is subtracted from $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11} \mathrm{~W}_{M, 13}$. In addition, the second adder 110 computes $\left(\alpha_{11} W_{M, 11} X_{11}\right.$ $\left.\mathrm{W}_{M, 14}\right)+\left(\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12} \mathrm{~W}_{M, 13}\right) \quad(\mathrm{ad}+\mathrm{bc})$, namely, $\alpha_{11}$ $\mathrm{W}_{M, 11} \mathrm{X}_{11} \mathrm{~W}_{M, 14}(=\mathrm{ad})$ is added with $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12} \mathrm{~W}_{M, 13}$ ( $=\mathrm{bc}$ ).

FIG. 4 illustrates the first complex multiplier 100 which is configured identically with the $n$-th complex multiplier 100n. Assuming that $\alpha_{11} W_{M, 11} X_{11}$ is "a", $\alpha_{12} W_{M, 12} X_{12}$ is " $b$ ", the orthogonal Hadamard sequence $\mathrm{W}_{M, 13}$ is " c ", and the orthogonal Hadamard sequence $\mathrm{W}_{M, 14}$ is "d", the expression " $(a+j b)(c+j d)=a c-b d+j(b c+a d)$ " is obtained. Therefore, the signal outputted from the first complex multiplier 100 becomes the in-phase information "ac-bd" and the quadra-ture-phase information "bc+ad".

In addition, FIG. 5B is a circuit diagram illustrating the summing unit and spreading unit of FIG. 4, and FIG. 5C is a circuit diagram illustrating another embodiment of the spreading unit of FIG. 4.
As shown therein, the summing unit 200 includes a first summing unit $\mathbf{2 1 0}$ for summing the in-phase information $\mathrm{A}_{1}(=(\mathrm{ac}-\mathrm{bd}), \ldots$, An outputted from a plurality of complex multipliers, and a second summing unit 220 for summing the quadrature-phase information $B_{1}(=b c+a d)$ outputted from the complex multipliers.

The spreading unit $\mathbf{3 0 0}$ includes first and second multipliers $\mathbf{3 0 1}$ and $\mathbf{3 0 2}$ for multiplying the output signals from the first adder 210 and the second adder $\mathbf{2 2 0}$ of the summing unit 200 by the spreading sequence SC , respectively. Namely, the signals are spread to the in-phase signal (I channel signal) and the quadrature-phase signal ( Q channel signal) using one spreading code SC.

In addition, as shown in FIG. 5 C , the spreading unit $\mathbf{3 0 0}$ includes first and second multipliers $\mathbf{3 1 0}$ and $\mathbf{3 2 0}$ for multiplying the output signals from the first and second adders 210 and $\mathbf{2 2 0}$ of the summing unit 200 by the spreading sequence SC1, third and fourth multipliers 330 and $\mathbf{3 4 0}$ for multiplying the output signals from the first and second adders 210 and 220 by a spreading sequence SC 2 , respectively, a first adder 350 for summing the output signal $(+)$ from the first multiplier 310 and the output signal (-) from the third multiplier 330 and outputting an I channel signal, and a second summing unit

360 for summing the output signal ( + ) from the second multiplier $\mathbf{3 2 0}$ and the output signal (+) from the fourth multiplier 340 and outputting a Q channel signal.

Namely, in the summing unit 200, the in-phase information and the quadrature-phase information of the n-number of the complex multipliers are summed by the first and second summing units 210 and $\mathbf{2 2 0}$. In the spreading unit 300, the inphase information summing value ( g ) and the quadrature phase information summing value ( h ) from the summing unit 200 are multiplied by the first spreading code SC1 (1) by the first and second multipliers $\mathbf{3 1 0}$ and $\mathbf{3 2 0}$ for thereby obtaining gl and hl , and the in-phase information summing value ( g ) and the quadrature phase information summing value (h) from the summing unit 200 are multiplied by the second spreading code SC2(m) by the third and fourth multipliers 330 and 340 for thereby obtaining gm and hm , and the first adder 350 computes $\mathrm{gl}-\mathrm{hm}$ in which hm is subtracted from gl , and the second adder $\mathbf{3 6 0}$ computes $\mathrm{hl}+\mathrm{gm}$ in which hl is added by gm.

As shown in FIG. 5D, the filter 400 includes first and second pulse shaping filters $\mathbf{4 1 0}$ and $\mathbf{4 2 0}$ for filtering the I channel signal which is the in-phase information shown in FIGS. 5B and 5C and the channel signal which is the quadrature phase information signal. The modulation unit $\mathbf{5 0 0}$ includes first and second multipliers $\mathbf{5 1 0}$ and $\mathbf{5 2 0}$ for multiplying the output signals from the first and second pulse shaping filters $\mathbf{4 1 0}$ and $\mathbf{4 2 0}$ by $\cos \left(2 \pi f_{c} t\right)$ and $\sin \left(2 \pi f_{c} t\right)$, and an adder $\mathbf{5 3 0}$ for summing the output signals from the multipliers 510 and 520 and outputting a modulation data $S(t)$.

Here, the orthogonal Hadamard sequences may be used as 30 a Walsh code or other orthogonal code.

For example, from now on, the case that the orthogonal Hadamard sequence is used for the $8 \times 8$ Hadamard matrix shown in FIG. 8 will be explained.

FIG. 8 illustrates an example of the Hadamard (or Walsh) code. Namely, the case that the sequence vector of a k-th column or row is set to $\mathrm{W}_{k-1}$ based on the $8 \times 8$ Hadamard matrix is shown therein. In this case, if $k$ is $1, W_{k-1}$ represents $\mathrm{W}_{0}$ of the column or row, and if k is $5, \mathrm{~W}_{k-1}$ represents $\mathrm{W}_{4}$ of the column or row.

Therefore, in order to enhance the efficiency of the present invention, the orthogonal Hadamard sequence which multiplies each channel data is determined as follows.

In the $\mathrm{M} \times \mathrm{M}$ Hadamard matrix, the sequence vector of the k -th column or row is set to $\mathrm{W}_{k-1}$, and $\mathrm{W}_{M, n 1}=\mathrm{W}_{0}$, $\mathrm{W}_{M, n 2}=\mathrm{W}_{2 P}$ (where p represents a predetermined number of $(\mathrm{M} / 2)-1)$, and $\mathrm{W}_{M, n 3}=\mathrm{W}_{2 n-2}, \mathrm{~W}_{M, n 4}=\mathrm{W}_{2 n-1}$ (where n represents the number of $n$-th blocks), and $\alpha_{n 1} \mathrm{~W}_{0} \mathrm{X}_{n 1}+$ $\mathrm{j} \alpha_{n 2} \mathrm{~W}_{2 p} \mathrm{X}_{n 2}$ and $\mathrm{W}_{2 n-2}+\mathrm{j} \mathrm{W}_{2 n-1}$. The case that only first complex multiplier is used in the embodiment of FIG. 4, namely, the data of two channels are complex-multiplied will be explained. In the $\mathrm{M} \times \mathrm{M}(\mathrm{M}=8)$ Hadamard matrix, if the k -th column or row sequence vector is set to $\mathrm{W}_{k-1}$, it is possible to determine $\mathrm{W}_{M, 11}=\mathrm{W}_{0}, \mathrm{~W}_{M, 12}=\mathrm{W}_{2}$, or $\mathrm{W}_{M, 12}=\mathrm{W}_{4}$, and $\mathrm{W}_{M, 13}=\mathrm{W}_{0}, \mathrm{~W}_{M, 14}=\mathrm{W}_{1}$. In addition, it is possible to complexmultiply $\alpha_{11} \mathrm{~W}_{0} \mathrm{X}_{11}+\mathrm{j} \alpha_{12} \mathrm{~W}_{2} \mathrm{X}_{12}$ or $\alpha_{11} \mathrm{~W}_{0} \mathrm{X}_{11}+\mathrm{j} \alpha_{12} \mathrm{~W}_{4} \mathrm{X}_{12}$ and $W_{0}+j W_{1}$.

In the case that two complex multipliers shown in FIG. 4 are used, the second complex multiplier determines $\mathrm{W}_{M, 21}=\mathrm{W}_{0}, \mathrm{~W}_{M, 22}=\mathrm{W}_{4}$, and $\mathrm{W}_{M, 23}=\mathrm{W}_{2}$, and $\mathrm{W}_{M, 24}=\mathrm{W}_{3}$, so that it is possible to complex-multiply $\alpha_{21} \mathrm{~W}_{0} \mathrm{X}_{21}+$ $j \alpha_{22} W_{4} \mathrm{X}_{22}$ and $\mathrm{W}_{2}+\mathrm{j} \mathrm{W}_{3}$.

In addition, as shown in FIG. 5, when the spreading is implemented by using the spreading code SC , one spreading code may be used, and as shown in FIG. 5C, two spreading codes SC1 and SC2 may be used for thereby implementing the spreading operation.

In order to achieve the objects of the present invention, the orthogonal Hadamard sequence directed to multiplying each channel data may be determined as follows.
The combined orthogonal Hadamard sequence may be used instead of the orthogonal Hadamard sequence for removing a predetermined phase dependency based on the interference generated in the multiple path type of self-signal and the interference generated by other users.

For example, in the case of two channels, when the sequence vector of the $k$-th column or row is set to $\mathrm{W}_{k-1}$ in the $\mathrm{M} \times \mathrm{M}(\mathrm{M}=8)$ Hadamard matrix, and the sequence vector of the $m$-th column or row is set to $\mathrm{W}_{m}$, the first $\mathrm{M} / 2$ or the last $\mathrm{M} / 2$ is obtained based on the vector $\mathrm{W}_{k-1}$ and the last $\mathrm{M} / 2$ or the first $\mathrm{M} / 2$ is obtained based on $\mathrm{W}_{m-1}$, so that the combined orthogonal Hadamard vector is set to $\mathrm{W}_{k-1 / m-1}$, and $\mathrm{W}_{M, 11}=\mathrm{W}_{0}, \mathrm{~W}_{M, 12}=\mathrm{W}_{4 / 1}, \mathrm{~W}_{M / I}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q=W 1 / 4}$ are determined, so that it is possible to complex-multiply $\alpha_{11} W_{0} X_{11}+$ $\mathrm{j}_{12} \mathrm{~W}_{4 / / 1} \mathrm{X}_{11}$ and $\mathrm{W}_{0}+\mathrm{jPW}_{1 / 4}$.

In the case of three channels, the sequence vector of the k -th column or row is set to $\mathrm{W}_{k-1}$ based on the $\mathrm{M} \times \mathrm{M}(\mathrm{M}=8)$ Hadamard matrix, and the sequence vector of the m -th column or row is set to $\mathrm{W}_{M}$, so that the first $\mathrm{M} / 2$ or the last $\mathrm{M} / 2$ is obtained from the vector $\mathrm{W}_{k-1}$, and the last $\mathrm{M} / 2$ or the first $\mathrm{M} / 2$ is obtained from $\mathrm{W}_{m-1}$, and the combined orthogonal Hadamard vector is set to $\mathrm{W}_{k-1 / m-1}$, and the summed value of $\alpha_{11} \mathrm{~W}_{0} \mathrm{X}_{11}+\mathrm{j} \alpha_{12} \mathrm{~W}_{4 / 1} \mathrm{X}_{12}$ and $\alpha_{21} \mathrm{~W}_{2} \mathrm{X}_{21}$ and $\mathrm{W}_{0}+\mathrm{jPW} \mathrm{W}_{1 / / 4}$ are complex multiplied based on $\mathrm{W}_{M, 11}=\mathrm{W}_{0}, \mathrm{~W}_{M, 12}=\mathrm{W}_{4 / 1 / 1}$, $\mathrm{W}_{M, 21}=\mathrm{W}_{1}$, and $\mathrm{W}_{M, I}=\mathrm{W}_{0}, \mathrm{~W}_{\boldsymbol{M}, Q}=\mathrm{W}_{1 / / 4}$.
In addition, in the case of two channels, when the sequence vector of the k -th column or row of the $\mathrm{M} \times \mathrm{M}(\mathrm{M}=8)$ Hadamard vector matrix is set to $\mathrm{W}_{k-1}$, and the sequence vector of the m -th column or row is set to $\mathrm{W}_{m}$, the first $\mathrm{M} / 2$ or the last $\mathrm{M} / 2$ is obtained from the vector $\mathrm{W}_{k-1}$, and the last $\mathrm{M} / 2$ or the first $\mathrm{M} / 2$ is obtained from $\mathrm{W}_{m-1}$, so that the combined orthogonal Hadamard vector is set to $\mathrm{W}_{-1 / / m-1}$, and the summed value of $\alpha_{11} W_{0} X_{11}+j \alpha_{12} W_{2 / / 1} \mathrm{X}_{12}$ and $\mathrm{W}_{0}+\mathrm{jPW} W_{1 / 2}$ are complex-multiplied based on $\mathrm{W}_{M, 11}=\mathrm{W}_{0}, \mathrm{~W}_{M, 12}=\mathrm{W}_{2 / / 1}$, and $\mathrm{W}_{M, I}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1 / / 2}$.

In addition, in the case of three channels, when the sequence vector of the $k$-th column or row of the $\mathrm{M} \times \mathrm{M}(\mathrm{M}=8)$ Hadamard vector matrix is set to $\mathrm{W}_{k-1}$, and the sequence vector of the m -th column or row is set to $\mathrm{W}_{m}$, the first $\mathrm{M} / 2$ or the last $\mathrm{M} / 2$ is obtained from the vector $\mathrm{W}_{k-1}$, and the last $\mathrm{M} / 2$ or the first $\mathrm{M} / 2$ is obtained from $\mathrm{W}_{m-1}$, so that the combined orthogonal Hadamard vector is set to $\mathrm{W}_{k-1 / m-1}$, and the summed value of $\alpha_{11} \mathrm{~W}_{0} \mathrm{X}_{11}+\mathrm{j} \alpha_{12} \mathrm{~W}_{2 / 1} \mathrm{X}_{12}$ and $\alpha_{21} \mathrm{~W}_{4} \mathrm{X}_{21}$ and $\mathrm{W}_{0}+\mathrm{jPW}_{1 / 2}$ are complex-multiplied based on $\mathrm{W}_{M, 11}=\mathrm{W}_{0}, \quad \mathrm{~W}_{M, 12}=\mathrm{W}_{2 / 11}, \quad \mathrm{~W}_{M, 21}=\mathrm{W}_{4}, \quad$ and $\quad \mathrm{W}_{M, 1=\boldsymbol{L}}$, $\mathrm{W}_{M, Q}=\mathrm{W}_{1 / 2}$.
Here, so far the cases of two channels and three channels were explained. The cases of two channels and three channels may be selectively used in accordance with the difference of the impulse response characteristic difference of the pulse shaping bandpass filter.
FIG. 6A is a view illustrating a constellation plot of the OCQPSK according to the present invention, FIG. 6B is a view illustrating a maximum eye-opening point after the actual pulse shaping filter of FIG. 6A, and FIG. 7 is a view illustrating a power peak occurrence statistical distribution characteristic with respect to an average power between the OCQPSK according to the present invention and the conventional CDMA ONE and version ETRI 1.0. As shown therein, the embodiment of FIG. 6A is similar with that of FIG. 2A. However, there is a difference in the point of the maximum eye-opening point after the actual pulse shaping filter. Namely, in FIG. 6B, the range of the upper and lower information ( Q channel) and the left and right information (I
channel) are fully satisfied. This causes the difference of the statistical distribution of the peak power-to-average power.

FIG. 7 illustrates the peak power-to-average power ratio obtained based on the result of the actual simulation between the present invention and the conventional art.

In order to provide the identical conditions, the power level of the control or signal channel is controlled to be the same as the power level of the communication channel (Fundamental channel, supplemental channel or the In-phase channel and the Quadrature channel), and the power level of the pilot channel is controlled to be lower than the power level of the communication channel by 4 dB . In the above-described state, the statistical distributions of the peak power-to-average power are compared.

In the case of OCQPSK according to the present invention, the comparison is implemented using the first complex multiplier $\mathbf{1 0 0}$ and the n -th complex multiplier $\mathbf{1 0 0} \mathrm{n}$ shown in FIG. 4. The first block 100 is implemented based on $\mathrm{W}_{M, 11}=\mathrm{W}_{0}, \mathrm{~W}_{M, 12}=\mathrm{W}_{4}, \mathrm{~W}_{M, 13}=\mathrm{W}_{0}$, and $\mathrm{W}_{M, 14}=\mathrm{W}_{1}$, and the n -th block 100 n is implemented based on $\mathrm{W}_{M, n 1}=\mathrm{W}_{\mathrm{O}}$, $\mathrm{W}_{M, n 2}=\mathrm{W}_{4}, \mathrm{~W}_{M, n 3}=\mathrm{W}_{2}$, and $\mathrm{W}_{M, n 4}=\mathrm{W}_{3}$. In addition, the SCI is used as the SC 1 for the spreading code. In this case, the SC2 is not used.

In the case of OCQPSK, the probability that the instantaneous power exceeds the average power value $(0 \mathrm{~dB})$ by 4 dB is $0.03 \%$, and in the case of CDMA ONE, the same is $0.9 \%$, and in the case of the ETRI version 1.0 , the same is $4 \%$. Therefore, in the present invention, the system using the CDMA technique has very excellent characteristic in the peak to average power ratio sense, and the method according to the present invention is a new modulation method which eliminates the cross talk problem.

FIG. 9 illustrates a permutated orthogonal complex spreading modulation (POCQPSK) according to the present invention.

As shown therein, one or a plurality of channels are combined and complex-multiplied by the permutated orthogonal Hadamard code and then are spread by the spreading code.

As shown therein, there are provided first and second Hadamard sequence multipliers $\mathbf{6 0 0}$ and $\mathbf{7 0 0}$ for allocating the multichannel to a predetermined number of channels, splitting the same into two groups and outputting $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}$ which is obtained by multiplying the data $\mathrm{X}_{n 1}$ of each channel by the gain $\alpha_{n 1}$ and the orthogonal Hadamard sequence $\mathrm{W}_{M, n 1}$, a first adder 810 for outputting

$$
\sum_{n=1}^{K}\left(\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}\right)
$$

which is obtained by summing the output signals from the first Hadamard sequence multiplier 600, a second adder $\mathbf{8 2 0}$ for outputting

$$
\sum_{n=1}^{K}\left(\alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

which is obtained by summing the output signals from the second Hadamard sequence multiplier 700, a complex multiplier 900 for receiving the output signal from the first adder 810 and the output signal from the second adder 820 in the complex form of

$$
\sum_{n=1}^{K}\left(\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

and complex-multiplying $\mathrm{W}_{M, I}+\mathrm{PWW}_{M, Q}$ which consist of the orthogonal Hadamard code $\mathrm{W}_{M, I}$, and the permutated orthogonal Hadamard code $\mathrm{PW}_{M, Q}$ that $\mathrm{W}_{M, Q}$ and a predetermined sequence $P$ are complex-multiplied, a spreading unit 300 for multiplying the output signal from the complex multiplier 900 by the spreading code, a filter $\mathbf{4 0 0}$ for filtering the output signal from the spreading unit 300, and a modulator 500 for multiplying and modulating the modulation carrier wave, summing the in-phase signal and the quadrature phase signal and outputting a modulation signal of the real number.

Here, the construction of the spreading unit 300, the filter 400 and the modulator $\mathbf{5 0 0}$ is the same as the embodiment of FIG. 4 except for the following construction. Namely, comparing to the embodiment of FIG. 4, in the construction of FIG. 9, the multiplication of the complex type orthogonal Hadamard sequence performed by the complex multipliers 100 through 100 n are separated and connected in the rear portion of the summing unit, and the channel-wise multiplication by the complex type orthogonal Harmard sequence is not implemented. Namely, the two group summed signal is multiplied by the complex type orthogonal Hadamard sequence.

The first orthogonal Hadamard sequence multiplier 600 outputs

$$
\sum_{n=1}^{K}\left(\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}\right)
$$

which is summed by the first adder $\mathbf{8 1 0}$ by summing $\alpha_{11} \mathrm{~W}_{M}$, ${ }_{11} \mathrm{X}_{11}$ which is obtained by the first adder $\mathbf{8 1 0}$ by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, 11}$ by the first data $\mathrm{X}_{11}$ of the first block and the gain $\alpha_{11}$, respectively, $\alpha_{21}$ $\mathrm{W}_{M, 21} \mathrm{X}_{21}$ which is obtained by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, 21}$ by the second data $\mathrm{X}_{21}$ of the first block and the gain $\alpha_{21}$, respectively, and $\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}$ which is obtained by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, n 1}$ by the $n$-th data $\mathrm{X}_{n 1}$ of the first block and the gain $\alpha_{n 1}$.

The second orthogonal Hadamard sequence multiplier 700 outputs

$$
\sum_{n=1}^{K}\left(\alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

which is summed by the second adder 820 by summing $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12}$ which is obtained by multiplying the orthogonal Hadamard sequence $W_{M, 12}$ by the first data $\mathrm{X}_{12}$ of the second block and the gain $\alpha_{12}$, respectively, $\alpha_{22} \mathrm{~W}_{M, 22} \mathrm{X}_{22}$ which is obtained by multiplying the orthogonal Hadamard sequence $W_{M, 22}$ by the second data $\mathrm{X}_{22}$ of the second block and the gain $\alpha_{22}$, respectively, and $\alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}$ which is obtained by multiplying the orthogonal Hadamard sequence $\mathrm{W}_{M, n 2}$ by the n -th data $\mathrm{X}_{n 2}$ of the second block and the gain $\alpha_{n 2}$.Here, the block represents one group split into 1 group. The signal outputted from the first adder $\mathbf{8 1 0}$ forms an in-phase data, and the signal outputted from the second adder $\mathbf{8 2 0}$ forms an quadrature phase data and outputs

$$
\sum_{n=1}^{K}\left(\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

In addition, the complex multiplier $\mathbf{9 0 0}$ multiplies the complex output signals from the first and second adders $\mathbf{8 1 0}$ and 820 by a complex type signal that is comprised of an orthogonal Harmard code $\mathrm{W}_{M, I}$ and $\mathrm{PW}_{M, Q}$ which results from the multiplication of the orthogonal Hardmard code $\mathrm{W}_{M, Q}$ by the sequence P and outputs an in-phase signal and a quadrature phase signal. Namely, the complex output signals from the first and second adders $\mathbf{8 1 0}$ and $\mathbf{8 2 0}$ are complex-multiplied by the complex type signals of $\mathrm{W}_{M, I}+\mathrm{PPW}_{M, Q}$ by the complex multiplier.

The spreading unit $\mathbf{3 0 0}$ multiplies the output signal from the complex multiplier 900 by the spreading code SCI and spreads the same. The thusly spread signals are filtered by the pulse shaping filters 410 and $\mathbf{4 2 0}$. The modulation carrier waves of $\cos \left(2 \pi f_{c} t\right)$ and $\sin \left(2 \pi f_{c} t\right)$ are summed by the modulation multipliers 510 and $\mathbf{5 2 0}$ and then modulated for thereby outputting $\mathrm{s}(\mathrm{t})$.

Namely, the following equation is obtained.

$$
\left(\sum_{n=1}^{K}\left(\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)\right) \otimes\left(\mathrm{W}_{M, I}+(\mathrm{jPW})_{M, Q}\right) \otimes \mathrm{SCI} .
$$

where K represents an integer greater than or equal to 1.
FIG. 10 illustrates an embodiment that two channel data are complex-multiplied. A channel data $\mathrm{X}_{11}$ is allocated to the first orthogonal Hadamard sequence multiplier 600 and another channel data $X_{12}$ is allocated to the second orthogonal Hadamard sequence multiplier 700.

Here, the orthogonal Hadamard sequence multiplier includes a first multiplier $\mathbf{6 1 0}$ for multiplying the first data $\mathrm{X}_{11}$ by the gain $\alpha_{11}$, a second multiplier $\mathbf{6 1 1}$ for multiplying the output signal from the first multiplier $\mathbf{6 1 0}$ by the orthogonal Hadamard sequence $\mathrm{W}_{M, 11}$, a third multiplier 710 for multiplying the second data $\mathrm{X}_{12}$ by the gain $\alpha_{12}$, and a fourth multiplier 711 for multiplying the output signal from the third multiplier 710 by the orthogonal Hadamard sequence $\mathrm{W}_{M, 12}$. At this time, since one channel is allocated to one group, the summing unit is not used.

The complex multiplier 900 includes fifth and sixth multipliers 901 and 902 for multiplying the output signal $\alpha_{11}$ $\mathrm{W}_{M, 11} \mathrm{X}_{11}$ from the second multiplier 611 and the output signal $\alpha_{12} W_{M, 12} \mathrm{X}_{12}$ from the fourth multiplier 711 by the orthogonal Hadamard sequence seventh and eighth multipliers 903 and 904 for multiplying the output signal $\alpha_{11}$ $\mathrm{W}_{M, 11} \mathrm{X}_{11}$ from the second multiplier 611 and the output signal $\alpha_{12} W_{M, 12} \mathrm{X}_{12}$ from the fourth multiplier 711 by the permutated orthogonal Hadamard sequence $\mathrm{PW}_{M, O}$, a first adder 905 for summing the output signal ( +ac ) from the fifth multiplier 901 and the output signal (-bd) from the seventh multiplier 903 and outputting an in-phase information (acbd), and a second adder 906 for summing the output signal (bc) from the sixth multiplier 902 and the output signal (ad) from the eighth multiplier 904 and outputting an quadrature phase information (bc+ad).

Therefore, the first and second multipliers 610 and 611 multiply the data $\mathrm{X}_{11}$ by the orthogonal Hadamard sequence $\mathrm{W}_{M, 11}$ and the gain $\alpha_{11}$ for thereby obtaining $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}$ ( $=$ a). In addition, the third and fourth multipliers 710 and 711 multiply the data $\mathrm{X}_{12}$ by the orthogonal Hadamard sequence
$\mathrm{W}_{M, 12}$ and the gain $\alpha_{12}$ for thereby obtaining $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12}$ $(=\mathrm{b})$. The fifth and sixth multipliers 901 and 902 multiply $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}(=\mathrm{a})$ and $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12}(=\mathrm{b})$ by the orthogonal Hadamard sequence $\mathrm{W}_{M, I}(=\mathrm{c})$ for thereby obtaining $\alpha_{11}$ $\mathrm{W}_{M, 11} \mathrm{X}_{11} \mathrm{~W}_{M, I}(=\mathrm{ac})$ and $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12} \mathrm{~W}_{M, I}(=\mathrm{bc})$.

The seventh and eighth multipliers 903 and 904 multiply $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}(=\mathrm{a})$ and $\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12}(=\mathrm{b})$ by the permutated orthogonal Hadamard sequence $\mathrm{PW}_{M, Q}$ for thereby obtaining $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11} \mathrm{PW}_{M, Q}(=\mathrm{ad})$ and $\alpha_{12} \mathrm{~W}_{M,, 12} \mathrm{X}_{12} \mathrm{PW}_{M, Q}(=\mathrm{bd})$.
In addition, the first adder 905 obtains ( $\alpha_{11} W_{M, 11} X_{11}$ $\left.\mathrm{W}_{M, J}\right)-\left(\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12} \mathrm{PW}_{M, Q}\right) \quad(=\mathrm{ac}-\mathrm{bd})$, namely, $\alpha_{12} \mathrm{~W}_{M .12} \mathrm{X}_{12 P W M, O}(\mathrm{bd})$ is subtracted from $\alpha_{11}$ $\mathrm{W}_{M, 11} \mathrm{X}_{11} \mathrm{~W}_{M, I}(=\mathrm{ac})$, and the second adder 906 obtains $\left(\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11} \mathrm{PW}_{M, Q}\right)+\left(\alpha_{12} \mathrm{~W}_{M, 12} \mathrm{X}_{12} \mathrm{~W}_{M, I}\right) \quad(\mathrm{ad}+\mathrm{bc})$, namely, $\left(\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11} \mathrm{PW}_{M, Q}\right)(=\mathrm{ad})$ is summed by ( $\alpha_{12}$ $\left.\mathrm{W}_{M, 12} \mathrm{X}_{12} \mathrm{~W}_{M, I}\right)(\mathrm{bc})$.

FIG. 10 illustrates the complex multiplier 900 shown in FIG. 9. Assuming that $\alpha_{11} \mathrm{~W}_{M, 11} \mathrm{X}_{11}$ is "a", $\alpha_{12} \mathrm{~W}_{M 12} \mathrm{X}_{12}$ is " b ", the orthogonal Hadamard sequence $\mathrm{W}_{M, I}$ is " c ", and the permutated orthogonal Hadamard sequence $\mathrm{PW}_{M, Q}$ is " d ", since $(a+j b)(c+j d)=a c-b d+j c(b c+a d)$, the signal from the complex multiplier 900 becomes the in-phase information $\mathrm{ac}-\mathrm{bd}$ and the quadrature phase information $\mathrm{bc}+\mathrm{ad}$.

The in-phase data and the quadrature phase data are spread by the spreading unit $\mathbf{3 0 0}$ based on the spreading code (for example, PN code). In addition, the I channel signal which is the in-phase information and the Q channel signal which is the quadrature phase information signal are filtered by the first and second pulse shaping filters 410 and $\mathbf{4 2 0}$. The first and second multipliers $\mathbf{5 1 0}$ and $\mathbf{5 2 0}$ multiply the output signals from the first and second pulse shaping filters 410 and 420 by $\cos \left(2 \pi f_{c} t\right)$ and $\sin \left(2 \pi f_{c} t\right)$. The output signals from the multipliers $\mathbf{5 1 0}$ and $\mathbf{5 2 0}$ are summed and modulated by the adder 530 which outputs $S(t)$.
In the embodiment as shown in FIG. 9, identically to the embodiment as shown in FIG. 4, for the orthogonal Hadamard sequence, the Walsh code or other orthogonal code may be used. In addition, in the orthogonal Hadamard sequence of each channel, the sequence vector of the k -th column or row is set to $\mathrm{W}_{k-1}$ in the $\mathrm{M} \times \mathrm{M}$ Hadamard matrix. Therefore, $\alpha_{n 1} \mathrm{~W}_{\mathrm{o}} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{2 p} \mathrm{X}_{n 2}$ and $\mathrm{W}_{\mathrm{o}}+\mathrm{jPW} \mathrm{W}_{1}$ are com-plex-multiplied based on $\mathrm{W}_{M, n 1}=\mathrm{W}_{0}, \mathrm{~W}_{M, n 2}=\mathrm{W}_{2 p}$ (where p represents a predetermined number in a range from 0 to (M/2)-1.

The orthogonal Hadamard sequence is allocated to each channel based on the above-described operation, and if there remain other channels which are not allocated the orthogonal Hadamard sequence by the above-described operation, and if there remain other channel which are not allocated the orthogonal Hadamard sequence by the above-described is operation, then any row or column vector from the Hamard matrix can be selected.
FIG. 11 illustrates an embodiment of the POCQPSK for the voice service. In this case, two channels, namely, the pilot channel and the data of traffic channels are multiplied by the gain and orthogonal Hadamard sequence, and two channel signals are inputted into the complex multiplier 900 in the complex type, and the orthogonal Hadamard sequence of the complex type is multiplied by the complex multiplier 900 .

FIG. 12 illustrates the construction of a data service having a good quality voice service and low transmission rate. In this case, the pilot channel and signaling channel are allocated to the first orthogonal Hadamard sequence multiplier 700, and the traffic channel is allocated to the second orthogonal Hadamard sequence multiplier 700.

FIG. 13A illustrates the construction for a data service of a high transmission rate. As shown therein, the data transmitted at a rate of R bps has the QPSK data type and are transmitted at $R / 2$ bps through the serial to parallel converter. As shown in

FIG. 13B, the system may be constituted so that the input data (traffic 1 and traffic 2) have the identical gains ( $\alpha_{31}=\alpha_{12}$ ). Here, when the data having high transmission rate are separated into two channels, the gain allocated to each channel should be determined to the identical gain for thereby eliminating the phase dependency.

FIGS. 14A and 14B illustrate the construction of the multichannel service. In this case, the data (traffic) having a high transmission rate is converted into the QPSK data for R/2 bps through the serial to parallel converter and then is distributed to the first orthogonal Hadamard sequence multiplier 600 and the second Hadamard sequence multiplier 700, and three channels are allocated to the first orthogonal Hadamard sequence multiplier 600 and two channels are allocated to the second orthogonal Hadamard sequence multiplier 700.

As shown in FIG. 14B, the serial to parallel converter is not used, and when the data (traffic) is separated into two channel data (Traffic 1) and (traffic 2) and then is inputted, the gain adapted to each channel adapts the identical gains ( $\alpha 31=\alpha 12$ ).

FIG. 15A is a phase trajectory view of an OCQPSK according to the present invention, FIG. 15B is a phase trajectory view of a POCQPSK according to the present invention, and FIG. 15C is a phase trajectory view of a complex spreading method according to PN complex spreading method of the present invention.

As shown therein, when comparing the embodiments of FIGS. 15A, 15B and 15C, the shapes of the trajectories and the zero points are different. In a view of the power efficiency there is also a difference. Therefore the statistical distribution of the peak power-to-average power ratio is different.

FIG. 7 illustrates a characteristic illustrating a statistical distribution of a peak power-to-average power ratio of the CDMA ONE method compared to the OCQPSK method and the POSQPSK.

In order to provide the identical condition, the power level of the signal channel is controlled to be the same as the power level of the communication channel, and the power level of the pilot channel is controlled to be lower than the power level of the communication channel by 4 dB , and then the statistical distribution of the peak power-to-average power ratio is compared.

In the case of the POCQPSK according to the present invention, in the first block 600 of FIG. $9, W_{M, 11}=W_{0}$, and $\mathrm{W}_{M, 21}=\mathrm{W}_{2}$ are implemented, and in the second block 700, $\mathrm{W}_{M, 12}=\mathrm{W}_{4}$, and $\mathrm{W}_{M, l}=\mathrm{W}_{0}$ and $\mathrm{W}_{M, Q}=\mathrm{W}_{1}$ are implemented. For the value of P , the spreading code is used so that consecutive two sequences have the identical value.

For example, the probability that the instantaneous power exceeds the average power value ( 0 dB ) by 4 dB is $0.1 \%$ based on POCQPSK, and the complex spreading method is $2 \%$. Therefore, in view of the power efficiency, the method adapting the CDMA technique according to the present invention is a new modulation method having excellent characteristic.

As described above, in the OCQPSK according to the present invention, the first data and the second data are multiplied by the gain and orthogonal code, and the resultant values are complex-summed, and the complex summed value is complex-multiplied by the complex type orthogonal code. The method that the information of the multichannel of the identical structure is summed and then spread is used. Therefore, this method statistically reduces the peak power-toaverage power ratio to the desired range.

In addition, in the POCQPSK according to the present invention, the data of the first block and the data of the second block are multiplied by the gain and the orthogonal code, respectively, and the permutated orthogonal spreading code
of the complex type is complex-multiplied and then spread. Therefore, this method statistically reduces the peak power-to-average power ratio to the desired range, and it is possible to decrease the phase dependency based in the multichannel interference and the multiuser interference using the combined orthogonal Hadamard sequence.

Although the preferred embodiments of the present invention have been disclosed for illustrative purposes, those skilled in the art will appreciate that various modifications, tat additions and substitutions are possible, without departing from the scope and spirit of the invention as recited in the accompanying claims.

What is claimed is:
[1. An orthogonal complex spreading method for multiple channels, comprising the steps of:
complex-summing $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}$, which is obtained by multiplying an orthogonal code sequence $\mathrm{W}_{M, n 1}$ by first data group $\mathrm{X}_{n 1}$ of a n -th block, and $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$, which is obtained by multiplying an orthogonal code sequence $\mathrm{W}_{M, n 2}$ by second data group $\mathrm{X}_{n 2}$ of a n -th block, M and n being positive integers;
complex-multiplying the complex summed form of $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j}_{M, n 2} \mathrm{X}_{n 2}$, by a complex form of $\mathrm{W}_{M, n 3}+$ $\mathrm{jW}_{M, n 4}$ and outputting $\left(\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{jW}_{M, n 2} \mathrm{X}_{n 2}\right) \times$ $\left.\left(\mathrm{W}_{M, n 3}+\mathrm{j}^{M, n 4}\right)\right)$ as an output signal; and
summing in-phase and quadrature phase parts of the output signal outputted from a plurality of blocks as

$$
\left(\sum_{n=1}^{K}\left(\left(\mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+(\mathrm{jW})_{M, n 2} \mathrm{X}_{n 2}\right) \times\left(\mathrm{W}_{M, n 3}+(\mathrm{jW})_{M, n 4}\right)\right)\right)
$$

K is a predetermined integer greater than or equal to 1 to generate I channel and Q channel signal.]
[2. The method of claim $\mathbf{1}$ wherein a spreading code spreads the summed in-phase and quadrature-phase signals outputted from the summing step.]
[3. The method of claim 1 wherein said orthogonal code sequence includes a Hadamard code sequence.]
[4. The method of claim 1 wherein said orthogonal code sequence includes a Walsh code.]
[5. The method of claim 2 wherein said spreading code is one spreading code.]
[6. The method of claim 5 wherein said spreading code sequence includes a PN code.]
[7. The method of claim 5 wherein said spreading code includes a first spreading code for the in-phase signal and a second spreading code for the quadrature-phase signal.]
[8. The method of claim 7 wherein the first and second spreading codes are PN codes.]
[9. The method of claim 3 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}, \mathrm{~W}_{M, 12}=\mathrm{W}_{2}$, and $\mathrm{W}_{M, 13}=\mathrm{W}_{0}, \mathrm{~W}_{M, 14}=\mathrm{W}_{1}$, when $\mathrm{M}=4$.]
[10. The method of claim 9 wherein $\mathrm{M}=8$ and $\mathrm{W}_{M, 12}=\mathrm{W}_{4}$.]
[11. The method of claim 3 wherein $\mathrm{W}_{M, n 1}=\mathrm{W}_{\mathrm{o}}$, $\mathrm{W}_{M, n 2}=\mathrm{W}_{2 p}$, where p represents a predetermined number in a range from 0 to ( $\mathrm{M} / 2$ ) -1 , and $\mathrm{W}_{M, n 3}=\mathrm{W}_{2 n-2}, \mathrm{~W}_{M, n 4}=\mathrm{W}_{2 n-1}$.]
[12. The method of claim 3 wherein $\mathrm{W}_{M, 21}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 22}=\mathrm{W}_{4}, \mathrm{~W}_{M, 23}=\mathrm{W}_{2}, \mathrm{~W}_{M, 24}=\mathrm{W}_{3}$ when $\mathrm{M}=8$ in case of two channels.]
[13. The method of claim 12 wherein $W_{M, 12}=W_{6}$, and $\mathrm{W}_{M, 22}=\mathrm{W}_{6}$.]
[14. An orthogonal complex spreading apparatus, comprising:
a plurality of complex multiplication blocks, each for com-plex-multiplexing a complex signal $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}+$ $\mathrm{jW}_{M, n 2} \mathrm{X}_{n 2}$ by $\mathrm{W}_{M, n 3}+\mathrm{j} \mathrm{W}_{M, n 4}$ wherein $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}$ is obtained by multiplying an orthogonal code sequence $\mathrm{W}_{M, n 1}$ by first data group $\mathrm{X}_{n 1}$ of n -th block and $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$ is obtained by multiplying orthogonal sequence $\mathrm{W}_{M, n 2}$ by second data group $\mathrm{X}_{n 2}$ of the n -th block, wherein M and n are positive integers and $\mathrm{W}_{M, n 1}$, $\mathrm{W}_{\boldsymbol{M}, n 2}, \mathrm{~W}_{M, n 3}$ and $\mathrm{W}_{\boldsymbol{M}, n 4}$ are predetermined orthogonal sequences; and
a summing unit for summing in-phase and quadrature phase parts of an output signal from each block of the plurality of the complex multiplication blocks as

$$
\left(\sum_{n=1}^{K}\left(\left(\alpha_{n 1} \mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+\mathrm{j} \alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right) \times\left(\mathrm{W}_{M, n 3}+(\mathrm{j} \mathrm{~W})_{M, n 4}\right)\right),\right.
$$

K is a predetermined integer greater than or equal to 1.]
[15. The apparatus of claim 14 further comprising a spreading unit for multiplying the summed in-phase and quadrature phase signals inputted from the summing unit by spreading code.]
[16. The apparatus of claim $\mathbf{1 5}$ wherein said spreading unit multiplies the in-phase and quadrature phase part by different spreading codes.]
[17. The apparatus of claim 14 wherein each said complex multiplication block includes:
a first multiplier for multiplying the first data group $\mathrm{X}_{n 1}$ by the orthogonal code sequence $\mathrm{W}_{M, n 1}$;
a second multiplier for multiplying the second data group $\mathrm{X}_{n 2}$ by the orthogonal code sequence $\mathrm{W}_{M, n 2}$;
third and fourth multipliers for multiplying the output signal $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}$ from the first multiplier and the output signal $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$ from the second multiplier by orthogonal code sequence $\mathrm{W}_{M, n 3}$;
fifth and sixth multipliers for multiplying the output signal $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}$ from the first multiplier and the output signal $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$ from the second multiplier by orthogonal code sequence $\mathrm{W}_{M, n 4}$;
a first adder for subtracting output signal from the sixth multiplier from output signal (ac) from the third multiplier and outputting an in-phase information; and
a second adder for summing output signal from the fourth multiplier and output signal from the fifth multiplier and outputting quadrature phase information.]
[18. The apparatus of claim 17 wherein said orthogonal code sequence includes a Hadamard code sequence.]
[19. The apparatus of claim 17 wherein said orthogonal code sequence includes a Walsh code.]
[20. A permuted orthogonal complex spreading method for multiple channels allocating at least two input channels to first and second groups, comprising the steps of:
multiplying a predetermined orthogonal code sequence $\mathrm{W}_{M, n 1}$ by first data group $\mathrm{X}_{n 1}$;
multiplying orthogonal code sequence $\mathrm{W}_{M, n 2}$ by second data group $\mathrm{X}_{n 2}$;
summing output signals $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}$ and $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$ in the complex form of

$$
\begin{equation*}
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+(\mathrm{jW})_{M, n 2} \mathrm{X}_{n 2}\right) ; \tag{65}
\end{equation*}
$$

and
complex-multiplying the received output signal

$$
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+(\mathrm{jW})_{M, n 2} \mathrm{X}_{n 2}\right) \text { by }\left(\mathrm{W}_{M, l}+(\mathrm{jPW})_{M, Q}\right)
$$

wherein P is a predetermined sequence, and $\mathrm{W}_{M, I}$ and $\mathrm{W}_{M, Q}$ are orthogonal code sequences.]
[21. The method of claim 20 wherein the spreading code is a PN code.]
[22. The method of claim 20 wherein $P$ represents said predetermined sequence or predetermined spreading code or predetermined integer configured so that two consecutive sequences have identical values.]
[23. The method of claim 20 wherein said orthogonal code sequence includes a Hadamard code sequence.]
[24. The method of claim 20 wherein said orthogonal code sequence includes a Walsh code.]
[25. The method of claim 23 wherein $\mathrm{W}_{M, I}=\mathrm{W}_{0}$, $\mathrm{W}_{M, Q}=\mathrm{W}_{2 q+1}$ (where q represents a predetermined number in a range from 0 to ( $\mathrm{M} / 2$ )-1)] ]
[26. The method of claim $\mathbf{2 3}$ further comprising the steps of:
multiplying the first data group $X_{n 1}$ by gain $\alpha_{n 1}$; and multiplying the second data group $\mathrm{X}_{n 2}$ by gain $\alpha_{n 2}$.]
[27. The method of claim 23 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$,
[28. The method of claim 27 wherein $\mathrm{M}=8$ and $\mathrm{W}_{M, 12}=\mathrm{W}_{4}$.]
[29. The method of claim 23 wherein $\mathrm{W}_{M, n 1}=\mathrm{W}_{0}$, $\mathrm{W}_{M, n 2}=\mathrm{W}_{2 q+1}$, wherein $q$ represents a predetermined number 35 in a range from 0 to $(\mathrm{M} / 2)-1$ and $\mathrm{W}_{M, l}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1}$.]
[30. The method of claim 20 wherein each group has at least two channels and the receiving step includes the steps of:
summing output signals $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}$ from a first sequence multiplier; and
summing output signals $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$ from a second sequence multiplier.]
[31. A permuted orthogonal complex spreading apparatus for multiple channels, allocating at least two input channels to first and second groups, comprising:
a first multiplier block having at least one channel contained in a first group of channels, each for outputting $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}$ which is obtained by multiplying first data group $\mathrm{X}_{n 1}$ by orthogonal code sequence $\mathrm{W}_{M, n 1}, \mathrm{M}$ and n are positive integers;
a second multiplier block having a number of channels having at least one channel contained in a second group of channels, each for outputting $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$ which is obtained by multiplying a first data group $\mathrm{X}_{n 2}$ by orthogonal code sequence $\mathrm{W}_{M, n 2}$;
a complex multiplier for receiving the output signals from the first and the second multiplier blocks in a complex form of

$$
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+(\mathrm{jW})_{M, n 2} \mathrm{X}_{n 2}\right)
$$

and complex-multiplying received output signal by $\mathrm{W}_{M, I}+\mathrm{jPW}_{M, Q}$, wherein $\mathrm{W}_{M, I}$ and $\mathrm{W}_{M, Q}$ are predetermined orthogonal code sequence permuted and P is a predetermined sequence.]
[32. The apparatus of claim 31 wherein said orthogonal code sequence includes a Hadamard code sequence.]
[33. The apparatus of claim 31 wherein said orthogonal code sequence includes a Walsh code.]
[34. The apparatus of claim 32 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{4}, \mathrm{~W}_{M, 21}=\mathrm{W}_{2}$, and $\mathrm{W}_{M, I}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1}$, when $\mathrm{M}=8$ in case of three input channels.]
[35. The apparatus of claim 32 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{2}$, and $\mathrm{W}_{M, I}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1}$ in case of three input channels.]
[36. The apparatus of claim 32 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{4}, \quad \mathrm{~W}_{M, 23}=\mathrm{W}_{2}, \quad \mathrm{~W}_{M, 31}=\mathrm{W}_{6}, \quad$ and $\quad \mathrm{W}_{M, I}=\mathrm{W}_{0}$, $\mathrm{W}_{M, Q}=\mathrm{W}_{1}$ in case of four input channels.]
[37. The apparatus of claim 32 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$ $\mathrm{W}_{M, 12}=\mathrm{W}_{4}, \quad \mathrm{~W}_{M, 31}=\mathrm{W}_{2}, \quad \mathrm{~W}_{M, I}=\mathrm{W}_{0}, \quad \mathrm{~W}_{M, Q}=\mathrm{W}_{1} \quad$ and $\mathrm{W}_{M, 21}=\mathrm{W}_{6}$ in case of four input channels.]
[38. The apparatus of claim 32 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{4}, \quad \mathrm{~W}_{M, 21}=\mathrm{W}_{2}, \quad \mathrm{~W}_{M, 31}=\mathrm{W}_{0}, \quad \mathrm{~W}_{M, 22}=\mathrm{W}_{1}, \quad$ and $\mathrm{W}_{M, I} \mathrm{~W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1}$ in case of five input channels.]
[39. The apparatus of claim 32 wherein $\mathrm{W}_{M, n 1}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{4}, \quad \mathrm{~W}_{M, 21}=\mathrm{W}_{2}, \quad \mathrm{~W}_{M, 31}=\mathrm{W}_{6}, \quad \mathrm{~W}_{M, 22}=\mathrm{W}_{3}$, and $\mathrm{W}_{M, I}=\mathrm{W}_{\mathrm{O}}, \mathrm{W}_{M, Q}=\mathrm{W}_{1}$ in case of five channels.]
[40. The apparatus of claim 31 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{4}, \quad \mathrm{~W}_{M, 31} \mathrm{~W}_{2}, \quad \mathrm{~W}_{M, 22}=\mathrm{W}_{6}, \quad$ and $\quad \mathrm{W}_{M, 1}=\mathrm{W}_{0}$, $\mathrm{W}_{M, Q}=\mathrm{W}_{1}$ and $\mathrm{W}_{M, 21}=\mathrm{W}_{8}$ in case of five input channels.]
[41. The apparatus of claim 36 wherein $\mathrm{W}_{0} \mathrm{X}_{11}+\mathrm{j} \mathrm{W}_{4} \mathrm{X}_{12}$, $W_{2} \mathrm{X}_{21}$ and $\mathrm{W}_{6} \mathrm{X}_{31}$ are replaced by $\alpha_{11} \mathrm{~W}_{0} \mathrm{X}_{11}+\mathrm{j} \alpha_{12} \mathrm{~W}_{4} \mathrm{X}_{12}$, $\alpha_{21} \mathrm{~W}_{2} \mathrm{X}_{21}$ and $\alpha_{31} \mathrm{~W}_{6} \mathrm{X}_{31}$, and a gain $\alpha_{n 1}$ and a gain $\alpha_{n 2}$ are the identical gain in order to remove the phase dependency by an interference occurring in a multipath of a self signal and an interference occurring by other users.]
[42. The apparatus of claim 31 wherein $\mathrm{W}_{M, n 1}=\mathrm{W}_{0}$, $\mathrm{W}_{M, n 2}=\mathrm{W}_{2}$, and $\left.\mathrm{W}_{M, I}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1}.\right]$
[43. The apparatus of claim 31 wherein the first multiplier block comprises at least a third multiplier for multiplying the first data group $\mathrm{X}_{n 1}$ by gain $\alpha_{n 1}$, and the second multiplier block comprises at least a fourth multiplier the second data group $X_{n 2}$ by gain $\alpha_{n 2}$.]
[44. The apparatus of claim 31 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{4 / 1}$, and $\mathrm{W}_{M,, 2}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1 / 4}$, when $\mathrm{M}=8$ in case of two input channels.]
[45. The apparatus of claim 32 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{4 / 1}, \mathrm{~W}_{M, 21}=\mathrm{W}_{2}$, and $\mathrm{W}_{M, I}=\mathrm{W}_{\mathrm{O}}, \mathrm{W}_{M, Q}=\mathrm{W}_{1 / 4}$, when $\mathrm{M}=8$ in case of three input channels.]
[46. The method of claim 32 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{2 / 1}$, and $\mathrm{W}_{M, I}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1 / 2}$, when $\mathrm{M}=8$ in case of two input channels.]
[47. The apparatus of claim 32 wherein $\mathrm{W}_{M, 11}=\mathrm{W}_{0}$, $\mathrm{W}_{M, 12}=\mathrm{W}_{2 / 1}, \mathrm{~W}_{M, 21}=\mathrm{W}_{4}$, and $\mathrm{W}_{M, I}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1 / 2}$, when $\mathrm{M}=8$ in case of three input channels.]
[48. The apparatus of claim 31 wherein each group has at least the two input channels, further comprising: a first adder for outputting

$$
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}\right)
$$

by summing output signals from the first multiplier block; and
a second adder for outputting

$$
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

by summing output signals from the second multiplier block.]
[49. The apparatus of claim 31 further comprising: a spreading unit for multiplying the signal

$$
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+j \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

received by the complex multiplier by a spreading code.]
[50. The apparatus of claim 49 wherein the spreading unit respectively multiplies the in-phase and quadrature-phase parts by different spreading codes.]
[51. The apparatus of claim 31 wherein $\mathrm{W}_{M, n 1}, \mathrm{~W}_{M, n 2}$, $\mathrm{W}_{M, I}$, and $\mathrm{W}_{M, Q}$ are orthogonal Hadamard sequences.]
[52. The apparatus of claim 31 wherein the complex multiplier includes:
fifth and sixth multipliers for multiplying said output signal from the first multiplier block and said output signal from the second sequence multiplier by orthogonal sequence $\mathrm{W}_{M I}$;
seventh and eighth multipliers for multiplying said output signal from the first multiplier block and output signal $\alpha_{n 2} \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}$ from the second multiplier block by orthogonal sequence $\mathrm{W}_{M, Q}$;
a third adder for subtracting output signal from the eighth multiplier from output signal from the fifth multiplier to output an in-phase information; and
a second adder for summing output signal from the sixth multiplier and output signal from the seventh multiplier to output quadrature-phase information.]
[53. A permuted orthogonal complex spreading apparatus for multiple channels, allocating at least two input channels into first and second groups, comprising:
first and second multiplier blocks for respectively multiplying first and second data group $X_{n 1}$, and $X_{n 2}$ with a set of predetermined orthogonal sequences $\mathrm{W}_{M, n}$, and $\mathrm{W}_{M, n 2}$ to output $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}$ and $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$;
a complex multiplier for receiving the output signals $\mathrm{W}_{M, n 1} \mathrm{X}_{n 1}$ and $\mathrm{W}_{M, n 2} \mathrm{X}_{n 2}$ from the first and the second multiplier blocks in the complex form of

$$
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+j \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

and multiplying a received signal

$$
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}+j \mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

by a predetermined sequence $\left(\mathrm{W}_{M, Y}+\mathrm{j} \mathrm{PW}_{M, Q}\right) \times \mathrm{SC}$, wherein $\mathrm{W}_{M, T}, \mathrm{~W}_{M, Q}$ are predetermined orthogonal sequences, P is a predetermined sequence and SC is a spreading sequence.]
[54. The apparatus of claim $\mathbf{5 3}$ wherein each group has at least two input channels, further comprising:
a first adder for outputting

$$
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 1} \mathrm{X}_{n 1}\right)
$$

by summing output signals from the first sequence multiplier; and
a second adder for outputting

$$
\sum_{n=1}^{K}\left(\mathrm{~W}_{M, n 2} \mathrm{X}_{n 2}\right)
$$

by summing output signals from the second sequence multiplier.]
[55. The apparatus of claim 53 wherein the first sequence multiplier comprises at least one first gain multiplier for multiplying the data $\mathrm{X}_{n 1}$, of each channel of the first group by gain $\alpha_{n 1}$, and the second sequence multiplier comprises at least one second gain multiplier for multiplying the data $\mathrm{X}_{n 2}$ of each channel of the second group by gain $\alpha_{n 2}$.]
[56. The apparatus of claim 53 wherein $\mathrm{W}_{M, n 1}=\mathrm{W}_{0}$, $\mathrm{W}_{M, n 2} \mathrm{~W}_{2 p}$, and $\mathrm{W}_{M, I}=\mathrm{W}_{0}, \mathrm{~W}_{M, Q}=\mathrm{W}_{1}$, where p represents a predetermined integer in a range from 0 to ( $\mathrm{M} / 2$ )-1.]
[57. The apparatus of claim 53 wherein $\mathrm{W}_{M, n 1}, \mathrm{~W}_{M, n 2}$, $\mathrm{W}_{M, I}$, and $\mathrm{W}_{M, Q}$ are orthogonal Hadamard sequences.]
58. A mobile communications device, comprising:
a first signal generator configured to generate a first signal, a, based on at least a first input, a first code, and a first gain;
a second signal generator configured to generate a second signal, $b$, based on at least a second input, a second code, and a second gain;
a first sequence receiving unit configured to receive a first sequence of elements, the elements in the first sequence of elements nonrandomly alternating between a first value and a second value, the first value being different from the second value;
a second sequence receiving unit configured to receive a second sequence of elements, $e$, wherein some of the elements in the second sequence of elements have the first value and the other elements in the second sequence of elements have the second value;
a first output unit configured to nonrandomly output e ea$e \cdot b \cdot d$, wherein dis a third signal based on at least the first sequence of elements; and
a second output unit configured to nonrandomly output $e \cdot b+e \cdot a \cdot d$.
59. The mobile communication device of claim 58, wherein the first sequence of elements is $W_{1}$.
60. The mobile communication device of claim 59, wherein the first signal is generated based on at least a fourth signal generated by multiplying the first input, the first code, and the first gain, and the second signal is generated based on at least a fifth signal generated by multiplying the second input, the second code, and the second gain.
61. The mobile communication device of claim 59, wherein the first code consists of elements, one or more of the elements of the first code having the first value and the remaining elements of the first code having the second value, wherein for the (2M-1) th element of the first code, the value of the ( $2 M-$

1) th element of the first code is the same as the value of the ( $2 M$ )th element of the first code, where $M$ is a series of sequential positive integers beginning at 1 .
62. The mobile communication device of claim 61, wherein 5 the second code consists of elements, one or more of the elements of the second code having the first value and the remaining elements of the second code having the second value, wherein for the $(2 K-1)$ th element of the second code, the value of the $(2 K-1)$ th element of the second code is the same as the value of the $(2 K)$ th element of the second code, where $K$ is a series of sequential positive integers beginning at 1.
63. The mobile communication device of claim 59, wherein the first signal consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
64. The mobile communication device of claim 63, wherein the second signal consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
65. The mobile communication device of claim 58 , wherein the second sequence of elements is a first $P N$ code.
66. The mobile communication device of claim 65, wherein the first sequence of elements is $W_{I}$.
67. The mobile communication device of claim 65 , wherein the third signal is further based on a third sequence of elements.
68. The mobile communication device of claim 58, wherein the third signal is further based on a third sequence of elements.
69. The mobile communication device of claim 68 or claim 67 , wherein the third sequence of elements is generated based on a second PN code.
70. The mobile communication device of claim 68 or claim 67, wherein the third sequence of elements is generated based on a spreading sequence.
71. The mobile communication device of claim 68 or claim 67 , wherein one or more of the elements in the third sequence of elements have the first value and the remaining elements in 0 the third sequence of elements have the second value, wherein for the ( $2 N-1$ ) the element in the third sequence of elements, the value of the $(2 \mathrm{~N}-1)$ th element is the same as the value of the $(2 N)$ th element in the third sequence of elements, where $N$ is a series of sequential positive integers beginning at 1 .
72. The mobile communication device of claim 68 or claim 67, wherein the third signal is a multiplication of the first sequence of elements and the third sequence of elements.
73. The mobile communication device of claim 68 or claim 67, wherein the third sequence of elements consists of a sequence of groups, wherein each of the groups consists of either two elements both having the first value or two elements both having the second value.
74. The mobile communication device of claim 58, wherein the first signal is generated based on at least a fourth signal 5 generated by multiplying the first input, the first code, and the first gain, and the second signal is generated based on at least a fifth signal generated by multiplying the second input, the second code, and the second gain.
75. The mobile communication device of claim 68 or claim 67, wherein the third signal is a multiplication of the first sequence of elements and the third sequence of elements and wherein the third sequence consists of a sequence of groups, wherein each of the groups consists of either two elements both having the first value or two elements both having the 65 second value.
76. The mobile communication device of claim 75, wherein the first signal is generated based on at least a fourth signal
generated by multiplying the first input, the first code, and the first gain, and the second signal is generated based on at least a fifth signal generated by multiplying the second input, the second code, and the second gain.
77. The mobile communication device of claim 76, wherein the first code consists of elements, one or more of the elements of the first code having the first value and the remaining elements of the first code having the second value, wherein for the (2M-1) th element of the first code, the value of the ( $2 M-$ 1)th element of the first code is the same as the value of the (2M)th element of the first code, where $M$ is a series of sequential positive integers beginning at 1 .
78. The mobile communication device of claim 77, wherein the second code consists of elements, one or more of the elements of the second code having the first value and the remaining elements of the second code having the second value, wherein for the $(2 K-1)$ th element of the second code, the value of the $(2 \mathrm{~K}-1)$ th element of the second code is the same as the value of the $(2 K)$ th element of the second code, where $K$ is a series of sequential positive integers beginning at 1 .
79. The mobile communication device of claim 76, wherein the first signal consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
80. The mobile communication device of claim 79, wherein the second signal consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
81. The mobile communication device of claim 75, wherein the first code consists of elements, one or more of the elements of the first code having the first value and the remaining elements of the first code having the second value, wherein for the $(2 M-1)$ th element of the first code, the value of the (2M1)th element of the first code is the same as the value of the (2M)th element of the first code, where $M$ is a series of sequential positive integers beginning at 1 .
82. The mobile communication device of claim 81, wherein the second code consists of elements, one or more of the elements of the second code having the first value and the remaining elements of the second code having the second value, wherein for the $(2 K-1)$ th element of the second code, the value of the $(2 \mathrm{~K}-1)$ th element of the second code is the same as the value of the $(2 K)$ th element of the second code, where $K$ is a series of sequential positive integers beginning at 1 .
83. The mobile communication device of claim 75, wherein the first signal consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
84. The mobile communication device of claim 83 , wherein the second signal consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
85. The mobile communication device of claim 58 or claim 65, wherein the first code and the second code include Walsh codes.
86. The mobile communication device of claim 58 or claim 65, wherein the first code and the second code are evennumbered Walsh codes.
87. The mobile communication device of claim 86, wherein the first signal is generated based on at least a fourth signal generated by multiplying the first input, the first code, and the first gain, and the second signal is generated based on at least a fifth signal generated by multiplying the second input, the second code, and the second gain.
88. The mobile communication device of claim 68, wherein the first signal is generated based on at least a fourth signal generated by multiplying the first input, the first code, and the first gain, and the second signal is generated based on at least a fifth signal generated by multiplying the second input, the second code, and the second gain.
89. The mobile communication device of claim 58, wherein the first code consists of elements, one or more of the elements of the first code having the first value and the remaining elements of the first code having the second value, wherein for each (2M-1)th element of the first code, the value of the (2M-1) th element of the first code is the same as the value of $a(2 M)$ th element of the first code, where $M$ is a series of sequential positive integers beginning at 1 .
90. The mobile communication device of claim 89 , wherein the second code consists of elements, one or more of the elements of the second code having the first value and the remaining elements of the second code having the second value, wherein for the $(2 K-1)$ th element of the second code, the value of the $(2 K-1)$ th element of the second code is the same as the value of the $(2 K)$ th element of the second code, where K is a series of sequential positive integers beginning at 1.
91. The mobile communication device of claim 58, wherein the first signal consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
92. The mobile communication device of claim 91, wherein the second signal consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
93. The mobile communication device of claim 58, wherein the second sequence of elements is a spreading sequence.
94. A mobile communications device, comprising:
a first output generator configured to generate a first output, a, based on at least one or more first inputs, one or more first codes, and one or more first gains;
a second output generator configured to generate a second output, $b$, based on at least one or more second inputs, one or more second codes, and one or more second gains;
a first sequence receiving unit configured to receive a first sequence of elements, $e$, wherein some of the elements in the first sequence have a first value and the other elements in the first sequence have a second value, the first value being different from the second value;
a second sequence receiving unit configured to receive a second sequence of elements, $W$;
a thirdsequence receiving unit configured to receive a third sequence of elements, $P$; and
an output unit configured to nonrandomly output $(a+j b)$. $(1+j P \cdot W) \cdot e$.
95. The mobile communication device of claim 94, wherein the second sequence of elements is $W_{1}$.
96. The mobile communication device of claim 95, wherein:
the first output is generated based on summing one or more first multiplications, each first multiplication generated by multiplying one of the one or more first inputs, one of the one or more first codes, and one of the one or more first gains; and
the second output is generated based on summing one or more second multiplications, each second multiplication generated by multiplying one of the one or more second inputs, one of the one or more second codes, and one of the one or more second gains.
97. The mobile communication device of claim 96, wherein:
each of the one or more first codes consists of elements;
for each of the one or more first codes, one or more of the elements in the respective first code have the first value and the remaining elements have the second value; and
for the $(2 M-1)$ th element of each of the one or more first codes, the value of the ( $2 M-1$ )th element is the same as the value of the $(2 M)$ th element, where $M$ is a series of sequential positive integers beginning at 1 .
98. The mobile communication device of claim 97, wherein:
each of the one or more second codes consists of elements;
for each of the one or more second codes, one or more of the elements in the respective second code have the first value and the remaining elements have the second value; and
for the $(2 K-1)$ th element of each of the one or more second codes, the value of the $(2 K-1)$ th element is the same as the value of the $(2 K)$ th element, where $K$ is a series of sequential positive integers beginning at 1 .
99. The mobile communication device of claim 96, wherein the first output consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
100. The mobile communication device of claim 99, wherein the second output consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
101. The mobile communication device of claim 95 , wherein:
each of the one or more first codes consists of elements;
for each of the one or more first codes, one or more of the elements in the respective first code have the first value and the remaining elements have the second value; and
for the (2M-1)th element of each of the one or more first codes, the value of the $(2 M-1)$ th element is the same as the value of the ( $2 M$ ) th element, where $M$ is a series of 40 sequential positive integers beginning at 1 .
102. The mobile communication device of claim 101, wherein:
each of the one or more second codes consists of elements;
for each of the one or more second codes, one or more of the elements in the respective second code have the first value and the remaining elements have the second value; and
for the $(2 K-1)$ th element of each of the one or more second codes, the value of the $(2 K-1)$ th element is the same as the value of the $(2 K)$ th element, where $K$ is a series of sequential positive integers beginning at 1 .
103. The mobile communication device of claim 95, wherein the first output consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
104. The mobile communication device of claim 103, wherein the second output consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
105. The mobile communication device of claim 94, wherein the one or more first codes and the one or more second codes are even-numbered Walsh codes.
106. The mobile communication device of claim 105, wherein:
the first output is generated based on summing one or more first multiplications, each first multiplication generated
by multiplying one of the one or more first inputs, one of the one or more first codes, and one of the one or more first gains; and
the second output is generated based on summing one or more second multiplications, each second multiplication generated by multiplying one of the one or more second inputs, one of the one or more second codes, and one of the one or more second gains.
107. The mobile communication device of claim 94, wherein the $(2 N-1)$ th element in the second sequence of elements has the first value and the $(2 N)$ th element in the second sequence of elements has the second value, wherein $N$ is a series of sequential positive integers beginning at 1 .
108. The mobile communication device of claim 107, wherein:
the first output is generated based on summing one or more first multiplications, each first multiplication generated by multiplying one of the one or more first inputs, one of the one or more first codes, and one of the one or more first gains; and
the second output is generated based on summing one or more second multiplications, each second multiplication generated by multiplying one of the one or more second inputs, one of the one or more second codes, and one of the one or more second gains.
109. The mobile communication device of claim 107, wherein:
each of the one or more first codes consists of elements;
for each of the one or more first codes, one or more of the elements in the respective first code have the first value and the remaining elements have the second value; and
for the (2M-1)th element of each of the one or more first codes, the value of the $(2 M-1)$ th element is the same as the value of the $(2 M)$ th element, where $M$ is a series of sequential positive integers beginning at 1 .
110. The mobile communication device of claim 109, wherein:
each of the one or more second codes consists of elements;
for each of the one or more second codes, one or more of the elements in the respective second code have the first value and the remaining elements have the second value; and
for the $(2 K-1)$ th element of each of the one or more second codes, the value of the $(2 K-1)$ th element is the same as the value of the $(2 K)$ th element, where $K$ is a series of sequential positive integers beginning at 1 .
111. The mobile communication device of claim 107, wherein the first output consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
112. The mobile communication device of claim 111, wherein the second output consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
113. The mobile communication device of claim 94, claim 95, claim 105, or claim 107, wherein the third sequence of elements consists of a sequence of groups, wherein each of the groups consists of either two elements both having the first value or two elements both having the second value.
114. The mobile communication device of claims 94, claim 95, claim 105, or claim 107, wherein P is generated based on a PN code.
115. The mobile communication device of claim 94, claim 95, claim 105, or claim 107, wherein e is a spreading 5 sequence.
116. The mobile communication device of claim 94, claim 95, claim 105, or claim 107, wherein e is a PN code.
117. The mobile communication device of claim 94, wherein:
the first output is generated based on summing one or more first multiplications, each first multiplication generated by multiplying one of the one or more first inputs, one of the one or more first codes, and one of the one or more first gains; and
the second output is generated based on summing one or more second multiplications, each second multiplication generated by multiplying one of the one or more second inputs, one of the one or more second codes, and one of the one or more second gains.
118. The mobile communication device of claim 117, wherein:
each of the one or more first codes consists of elements;
for each of the one or more first codes, one or more of the elements in the respective first code have the first value and the remaining elements have the second value; and
for the (2M-1)th element of each of the one or more first codes, the value of the $(2 M-1)$ th element is the same as the value of the $(2 M)$ th element, where $M$ is a series of sequential positive integers beginning at 1 .
119. The mobile communication device of claim 118, wherein:
each of the one or more second codes consists of elements;
for each of the one or more second codes, one or more of the elements in the respective second code have the first value and the remaining elements have the second value; and
for the $(2 K-1)$ th element of each of the one or more second codes, the value of the $(2 K-1)$ th element is the same as the value of the $(2 K)$ th element, where $K$ is a series of sequential positive integers beginning at 1 .
120. The mobile communication device of claim 117, wherein the first output consists of a sequence of pairs of
elements, wherein each pair of elements consists of two elements both having a same value.
121. The mobile communication device of claim 120, wherein the second output consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
122. The mobile communication device of claim 94, wherein:
each of the one or more first codes consists of elements;
for each of the one or more first codes, one or more of the elements in the respective first code have the first value and the remaining elements have the second value; and
for the $(2 M-1)$ th element of each of the one or more first codes, the value of the ( $2 M-1$ )th element is the same as the value of the (2M)th element, where $M$ is a series of sequential positive integers beginning at 1 .
123. The mobile communication device of claim 122, wherein:
each of the one or more second codes consists of elements;
for each of the one or more second codes, one or more of the elements in the respective second code have the first value and the remaining elements have the second value; and
for the $(2 K-1)$ th element of each of the one or more second codes, the value of the $(2 K-1)$ th element is the same as the value of the $(2 K)$ th element, where $K$ is a series of sequential positive integers beginning at 1 .
124. The mobile communication device of claim 94, wherein the first output consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
125. The mobile communication device of claim 124, wherein the second output consists of a sequence of pairs of elements, wherein each pair of elements consists of two elements both having a same value.
