(54) Title: LIGHT THERAPY PLATFORM SYSTEM

(Continued on next page)

(57) Abstract: Phototherapy systems comprising a therapeutic lamp platform for radiant lamps such as LEDs disposed in an assembly comprising a first wall to which the lamps are affixed thereto and a second wall, closer to the patient, spaced from the first wall wherein the lamps are recessed relative thereto. The second wall comprises a reflective surface facing towards a patient and a plurality of light apertures substantially aligned with the LEDs on the first wall for communicating lamp radiation from the lamps to a user. The lamps and associated circuitry are disposed between the first and second wall so that the reflective surface is relatively smooth and seamless towards the patient. The walls have a malleable rigidity for flexible adjustability relative to the user. The device is mounted to the user with a frame comprising an eyeglass frame or goggles including lenses for shielding the user's eyes from lamp radiation.

LIGHT THERAPY PLATFORM SYSTEM

[0001] This application claims the priority benefit of U.S. application Serial No. 61/532,140, filed September 8, 2011, the disclosure of which is incorporated herein by reference.

FIELD

[0002] The present embodiments relate to devices and methods for delivering light-based skin therapy treatments for improving skin health, such as anti-aging enhancement or acne prevention, using light-emitting diode (LED) light therapy, although other types of light radiating sources can be used.

BACKGROUND

[0003] Certain light spectrums emitted by LEDs (blue or red) are known to be therapeutic for skin treatment against maladies such as acne, or are beneficial to inhibit skin aging. However, there is a need to provide users/patients with a convenient at-home light therapy delivery device such as a wearable mask, veil or hood that is adjustable or flexible to conform to different sizes and shapes, and that is simple to use without user discomfort. Currently available at-home, consumer usable products on the market are fixed to one-size and/or usually have to be hand-held; which generally have not proven satisfactory for providing the best or desired light dispersion. The alternative is customers visiting a doctor’s office to receive treatments.

[0004] Prior known light therapy devices, particularly masks, have suffered from problems relating to the exposure of the LEDs and the associated circuitry to power the LEDs to contact by users. More particularly, in an effort to maximize light communication to a patient, the LEDs have been disposed in a manner which allow them to be physically engaged (e.g., touched) by a patient, or even contact a treatment surface, which processes are debilitating to the LEDs as a result of the accumulation of dirt and oil. In addition, any such engagement can be dangerous to patients who are exposed to the sharp or hot edges of the LEDs and the associated circuitry. The
exposure of detailed circuitry presents an intimidating and unpleasant experience when the therapy requires several minutes of time for completion and the mask is disposed relatively close to the face, often causing an uncomfortable, claustrophobic sensation over time to the patient.

[0005] A hands-free therapeutic experience is always better than having to hold the device in a particular position for extended periods of time during the therapy. Numerous assemblies have been conceived for mounting masks and helmet-like devices to varieties of straps, bands, wraps and cords, which can result in a pressing of the support and mounting assembly closely against the hair or scalp of a patient. There is always a need to minimize the extent of such attachment assemblies so that on the one hand the subject device is securely attached on the patient, but also that the attaching structure has minimal consequence to the patient's comfort during the therapy itself. Being relatively light in weight, and easily and minimally supported during therapeutic use are important to consumer acceptance.

[0006] As users come in a variety of shapes and sizes, devices should be size or area adjustable so that the therapy can be efficiently applied and/or selectively intensified to desired treatment areas.

[0007] Lastly, particularly in therapeutic devices treating facial areas, eye protection is needed to avoid light damage or irritation to a patient's eyes. Prior known devices have typically used separable patches which must rest on the eye area to block the therapeutic light from communication to the eye system itself. There is a need for a better way that is readily adaptable to communicate therapeutic light to areas near the eyes, particularly with regard to anti-aging treatments, and still protect the patient.

[0008] It is desired to provide alternative means of using the benefits of the light therapy in a manner to maximize therapeutic efficiencies in exposure while maintaining ease and convenience of use. For this reason, a variety of light weight, flexible and adjustable embodiments are disclosed within this disclosure incorporating a variety of energy varying applications responsive to user conditions or needs.

SUMMARY
[0009] The present embodiments comprise phototherapy systems and devices comprising a therapeutic lamp platform for radiant lamps such as LEDs are disposed in an assembly comprising a first wall to which the lamps are affixed thereto and a second wall, closer to the patient, spaced from the first wall wherein the lamps are recessed relative thereto. The second wall comprises a reflective surface facing towards a patient and a plurality of light apertures substantially aligned with the LEDs on the first wall for communicating lamp radiation from the lamps to a user. The lamps and associated circuitry are disposed between the first and second wall so that the reflective surface is relatively smooth and seamless towards the patient. The number of lamps are minimized, as is the circuitry therefor, and other assembly materials are purposefully selected for a relatively light weight assembly resulting in enhanced user comfort during therapy sessions. The walls have a malleable rigidity for flexible adjustability relative to the user. More particularly, the walls have a concave configuration relative to the face of the user which is adjustable relative to a rest position to be expandable relative to a size of the head of the user for a close fitting and secure engagement to the user during use. The device is mounted to the user with a frame comprising an eyeglass frame or goggles including lenses for shielding the user's eyes from lamp radiation. The adjustability of the embodiments is further enhanced by the walls being pivotable relative to the support frame and where the frames may include telescopic temple arms for selective adjustability relative to the head size of the user. The device is thus supported on the patient as a wearable hands-free mask or the like. A power source communicates energy to the lamps and comprises a remote battery pack and may also include a control processor for counting the number of uses by the device for the user and for indicating a need for device replacement after a predetermined number of uses.

[0010] The present embodiments comprise an adjustable/flexible platform for providing a light-based therapy that is adaptable to the user's receptive surfaces, whether based on size or condition, wherein the light therapy can be applied without limitation of the kind of light and without limitation of the ultimate purpose of the therapy, i.e., beauty, health, and/or wound healing. Such sources can vary in the form of the radiant energy delivery. Pulsed light (IPL), focused light (lasers) and other methods of manipulating light energy are encompassed within the present embodiments. Other
methods of light emission may comprise continuous, pulsed, focused, diffuse, multi wavelength, single wavelength, visible and/or non-visible light wavelengths.

[0011] A present embodiment describes forms such as a shaped/fitted mask, goggles, eye mask, shroud or hood, and facial mask (collectively referred to as "mask") with LED light emitted from LED bulbs or LED strips that are capable of being adjusted b accommodate the variances in face size or areas intended for therapeutic attention. Control systems are included to vary light intensity, frequency or direction.

[0012] The platform can be secured to the head by multiple means: eyeglass frames, straps, drawstring, harness, velcro, turn dial or snap and buttons. As the mask is secured it can be adjusted upward, for chin to forehead coverage. It can also be adjusted outward, for side-to-side coverage. In addition, once the platform has been bent/slid to cover the face area, the distance of the platform from the skin can be adjusted for achieving a desired light intensity relative to a user's skin surface. Thus, the light therapy can be maximized in up to three physical dimensions.

[0013] The subject adjustability may be implemented through "smart" processing and sensor systems for enhanced flexibility/adjustability in the form of adjustable energy output, adjustable wavelengths, priority zones, timers, and the like. The sensors of the sensor systems will enable the subject embodiments to have the ability to evaluate the skin of the face and body of a patient with sensors for color, wrinkles, age spots, acne, lesion density, and the like, and plan a smart treatment, utilizing more or less energy on the priority zones. The subject embodiments can be smart from the standpoint of skin type, age, overall severity of problems and have the ability to customize the treatment accordingly.

[0014] In yet another embodiment, the lamps are embedded in a flexible sheet of formable material and are integrally molded as strips within a material sheet.

[0015] In addition, control systems can measure or count device usage and communicate historical usage, and indicate a time for replacement.

[0016] The present disclosure thus describes a fully flexible and adjustable LED device which provides improved usability and light dispersion.

DETAILED DESCRIPTION

[0031] The subject embodiments relate to a phototherapy system including methods
and devices, preferably comprising a wearable hands-free device with a remote battery pack for powering therapeutic lamps in the device. The subject devices display numerous benefits including a light platform wherein the platform and the lamps therein are properly positionable relative to a user during use with no human touch. That is, structural componentry of the device not only supports the lamp platform on the user, but functions as a guide for the appropriate disposition of the lamps relative to the treatment areas of the user. The structural assembly of the device precludes sharp or hot surfaces from being engageable by a user as the lamps are recessed relative to an inner reflective surface closest to and facing the patient treatment surface. Circuit componentry to communicate power to the lamps is also encased within the wall structure. Therapeutic light, shining through wall apertures, is communicated to the user while the lamps and the circuitry are effectively encased within the spaced wall structure. A smooth seamless surface is thus presented to the user that is properly spaced for the desired therapeutic treatments, yet provides improved ventilation so that an aesthetic and appealing device surface is presented to the user that minimizes user discomfort. Other benefits relate to the adjustability of the device in the form of a flexible mask which forms upon user receipt to match a treatment surface, e.g., a head size, of the user. Smart componentry not only measures device usage, but may also calculate lamp degradations so that a time for proper replacement can be communicated to a user. The overall assembly is purposefully constructed of relatively light weight and minimized componentry for ease of user use and comfort.

[0032] More particularly, and with reference to Figs. 1-4, subject embodiments preferably comprise a lamp platform A and a remote battery pack B. The platform A is comprised of a wall structure 10 encasing the plurality of therapeutic lamps such as red and blue LEDs 12 and circuitry 14 for communicating power to the lamps via cable 80 and connector 83 from the battery pack B. Other radiant energy forms could also include fluorescents, lasers or infrareds. The wall structure 10 is mounted on a support frame 20 connected via snap-out pivotal connections 22 which allows the wall structure to adjust position via a slight pivot relative to the frame 20. The frame 20 also includes protective lenses 24 and a nose bridge 26. The temple arms 28 may be fixed or telescopic and hinge relative to the frame 20 so that the platform A can be mounted on
a user in a hands-free support manner via resting on the nose with the nose bridge 26 and the ears with temple arms 28.

[0033] With reference b Figs. 3, 4, 6, 7 and 8 it can be seen that the wall structure 10 is comprised of an outer wall 50 and an inner wall 52. The outer wall is disposed furthest away from the treatment surface of the user, while the inner wall 52 is disposed closer thereto. The walls have a concave configuration in both horizontal and vertical directions and are constructed of a plastic material having a malleable rigidity so that the structure 10 can be bent and deflected slightly during use. The concavity comprises a multi-dimensional parabolic curvature for catching and reflecting the radiation back to the treatment areas. It is intended that the concavity is slightly smaller than the head of the user so that the mask has to be bent out when applied thereby providing a close but comfortable tightness on the user which will keep the assembly A in a desired position during use. The concavity also positions the therapeutic lamps or LEDs 12 in desired positions relative to the user. The spacing 54 between walls 50 and 52 receives the lamps 12 and circuitry 14 so that the lamps and circuitry are interposed between the walls for enhanced safety and convenience purposes. It can be seen that the spacing is diminished from the middle of the device towards the end portions 58, 60; however, the entire end perimeter of the assembly 10 is sealed as the walls come together. Such a mating seal is typically effected through a sonic weld arrangement. Alternatively, local sealing points (not shown) can be employed to assemble the walls together with spaced intermediate seals. Thus, the inner and outer masks have different radii of concavity but present an integral structure as far as the user is concerned. The outer wall 50 primarily functions as a support for the lamps 12 and circuitry 14. With reference to Fig. 4 it can be seen that the lamps are disposed on the wall 50 in a predetermined manner for radiating treatment areas most susceptible for the phototherapeutic treatment. A minimum number of lamps 12 are intended but still enough to provide effective therapy. Alternatively, the lamps could be fixed to the inner wall 52. Regardless of which wall supports the lamps, the lamps need to be properly aligned with apertures 70 to desired treatment areas.

[0034] Rather than placing a plurality of LEDs randomly, the subject LEDs are specifically minimized in number and disposed relative to the treatment areas and wall
parabolic reflectivity to effect the desired therapy. More particularly, it can be seen that
the individual lamps 12, and associated inner wall apertures 70, are disposed to treat the most common areas benefiting from the therapy. The present embodiments illustrate a placement pattern useful for skin acne treatment. Other placement patterns are certainly intended to fall within the scope of the disclosed embodiments. Here three LED strips are seen and would typically comprise two blue strips on the top and bottom of a middle red strip, as these frequencies are most useful for acne treatment. The subject invention may include only blue, only red, or any other mixed combination of LED or other radiant energy form pattern. The illustrated pattern would thus have intensified therapeutic effect on the jaw line, chin, cheek and forehead, but not the eyelids. Light sources can include LEDs, fluorescents, lasers or infrareds as an example. Such sources can vary in the form of the radiant energy delivery. Pulsed light (IPL), focused light (lasers) and other methods of manipulating light energy are encompassed within the present embodiments. Other methods of light emission may comprise continuous, pulsed, focused, diffuse, multi wavelength, single wavelength, visible and/or non-visible light wavelengths.

[0035] The inner wall 52 is comprised of a smooth seamless reflective surface facing the treatment area and includes a plurality of apertures 70 matingly aligned relative to the lamps so that the lamps can radiate the therapeutic light through the apertures 70. Accordingly, the LEDs 12 are recessed relative to the inner wall 52 to preclude contact with the treatment surface and to make it very difficult for the lamps themselves to be in any way contacted by the user. Such an assembly results in a controlled communication of radiating therapy in a manner to impart a predetermined cone of therapeutic light on to a treatment area. The apertures are disposed relative to desired treatment areas and wall parabolic configuration for even light distributions across the treatment area. A combination of such a controlled cone of light, predetermined disposition of the lamps themselves on the platform, an inner reflective surface on the inner wall 52, and a controlled positioning of the assembly relative to the treatment area via a platform position relative to contact areas of the nose and the ears, presents an assembly which presents a highly predictable distributive pattern of the light (predetermined cones of light per light source), thereby minimizing the number of lamps
12 that need to be included for effective treatment.

[0036] With reference to Figs. 2, 3 and 4, one embodiment comprises a support frame essentially comprising eyeglass frames as the associated support structure for the platform 10. Interchangeable lenses 24 can be used to adjust the level of protection afforded by the lenses or their relative shape. Although not shown therein, telescopic temple arms 28 may telescope for better sizing relative to the head size of the user. Formable ear latches can also be included as part of the temple arms. Alternatively, the arms could include a head strap. The pivotable joints 22 allow the wall structure to pivot relative to the frames so that a user may adjust light intensity relative to a treatment area by moving the layers closer or farther away. As noted above, the platform 10 is flexible with a concave parabolic bias, but still has a malleable rigidity. When the frame 10 is received on the user, it is disposed to expand the platform parabolic bias to form a match to the size of the user. Eyeglass frame reference contact points of the user may comprise the nasion area, the nose bridge and the ears of the user. Alternatively, the support frame can comprise a goggle and head strap configuration relying on the nasion area.

[0037] Battery pack B (Fig. 5) holds the supply batteries 81 and processing controller 82 that is in electrical communication with the lamps through wire 80. The wiring between connectors 83 and LED strips 12 is not shown to avoid drawing clutter but is contained between walls 50, 52. The battery pack will include an on-off switch 84 and a user interface 86. The processing controller 82 may include a variety of control systems indicating device usage to the user. Such a system would be a counter. The user interface may comprise a display for a variety of useful information from the controller control systems to the user, such as a count of the number of times of usage and communication that the device has been used enough times such that the LEDs themselves have degraded and a replacement is recommended for the therapy.

[0038] "Try-me packaging", Figs. 11 and 12, presents a demonstrative use opportunity to a potential user while still packaged. The subject embodiments further include a packaging assembly 210 containing the device wherein a switch S1 (not shown) for operating the lamp assembly has a multi-position effect functionality including an on-mode, an off-mode and a try-me mode. The try-me mode is accessible
while the lamp assembly is contained in packaging for displaying lamp operation to a user. The packaging includes a clear or translucent cover 212 over the device A. A try-me time-out circuit is included for limiting the try-me display time of lamp operation, such as, for example two seconds. Lamp on-time as measured by the counter is segregable from the try-me mode so that try-me usage will not affect dosage count of the device for actual therapy. It is assumed try-me usage time will be negligible relative to a dosage use time.

[0039] The subject devices include multiple benefits to the user in a wearable hands-free device with a remote battery pack. The device is properly positionable in a relatively automatic way with minimal human touch by exploiting user reference contact points, and is particularly hand-free during use. No sharp or hot surfaces are engageable by the user. A smooth seamless surface faces the user and is properly spaced from the treatment area to provide enhanced ventilation and minimal discomfort during treatment.

[0040] With particular reference to Fig. 13, a flowchart illustrating an operational embodiment of a device control is illustrated. The device visioned as operational by Fig. 10 includes two switches, S1, S2, at least one of which are required to be closed to communicate energy from an energy source to the therapeutic lamps. S2 is a safety switch which is open when the device is in sales packaging so that only the "try-me" mode is enabled when S2 is open. After removal from the packaging, S2 can be closed and the device can be operated in a normal mode. Accordingly, after start 100, and in a situation when S2 is opened 102, such as when the device is still within the packaging, the system will remain in a stand-by mode wherein the GUI interface (such as an LCD) is off 104. If S2 remains closed 106 but S1 is pressed 108 (e.g. Fig. 12), then the device can enter the "try-me" mode 110 wherein the LEDs will light up for two seconds, then turn off 112. Such a "try-me" mode operational demonstration to a user while the device is in a packaging communicates to the user actual operation and can assist in a decision to purchase, or have a better understanding of how the device operates. If the device is removed from the packaging, and S2 is closed, the device will enter normal mode 114 wherein the GUI will include an LCD displaying the number of cycles left according to a counter value. Note that counter value 134 is not affected by any try-me
sampling operation.

[0041] In one embodiment, the unit will count down from 55 to 1, as 55 uses is deemed to be enough to diminish enough LED efficiency from the peak operational mode of LEDs when they are used as the therapeutic radiant lamps. Accordingly, upon a user picking up the device, they will immediately know how many cycles are left for acceptable and recommended operation of the device from 55 more uses all the way down to 0.

If the display shows a count greater than 0, and the user is interested in a therapy session, the user will turn the unit on by pressing S1 120 wherein the LEDs will ramp up to radiant operation 122 in approximately 1.5 seconds and then will radiate continuously 124 until either the user desires to turn off the unit by again pressing S1 126 so that the LEDs can ramp down 128 or until a therapy session has timed out 130 such as for remaining radiant for approximately ten minutes. After completing an appropriate run time of a therapy session, the LEDs will ramp down 132 and the GUI display to the user will subtract 1 from the counter value 134.

[0042] With reference to Figs. 9 and 10, an alternative embodiment is shown wherein a controller B is eliminated and the energy source and processing control are all integrally assembled in the device 90. In this case, the platform 20 and walls 50, 52 remain substantially the same as per the Fig. 1 device. However, the energy source such as batteries 92 are disposed as part of the eyeglass temple arms wherein wires provide energy from the batteries 92 to the LEDs through the hinge points of the frame 20 and into the spacing 54 for ultimate connection to the LEDs themselves. The controller 94 including LCD display 96 is also housed behind the reflective wall 52 relative to the user, which wall 52 can include a relatively small cutout (not shown) for the screen 96.

[0043] The embodiment of Figs. 9 and 10 is thus even more compact than the embodiment of Fig. 1, and more hands-free therefrom, as it eliminates the need to somehow manage the controller B during operation.

[0044] FIGURE 11 shows yet another alternative embodiment wherein the outer wall 50' and the inner wall 52" are not spaced by being configured with different curvatures. Rather, the walls 50', 52" have the same curvature, but the inner wall 52 has an off step 300 depending from the wall perimeter to form a flange raised from the surface of the
wall 52 towards the outer wall 50 towards the outer wall 50°b effectively form a spacer between the two. In one embodiment, the flange 300 is about 8 millimeters wide, continues around the entire perimeter of the wall 52° and is about .5 millimeters thick for effecting the desired spacing between the inner and outer walls. In this embodiment the flange 300 is part of the inner wall 52°, and as in the foregoing embodiment, both walls are vacuumed formed plastic, either PET or PVC. The assembly of Fig. 11 can be sonic welded, glued, or adhered with double-sided adhesive. Alternatively, a plurality of intermediate sealing points (not shown) could be used instead of a continuous seal. In this embodiment it can be seen that there is an alternative number of LEDs 12' opposite the forehead portion of the assembly relative to the user so that the number of apertures 70' and LEDs 12" are reduced from the foregoing embodiment from eighteen to fifteen. Either number are viable implementations of the desired therapy, although the other componentry of the assembly Fig. 11 is substantially the same as that shown in the foregoing Figs.

Another alternative embodiment from the device shown in Figs. 1, etc. includes disposition of a transparent flexible polymer sheet (not shown) incorporating working LED lights between outer wall 50 and inner wall 52. Such a configuration would comprise the polymer film being coated with a transparent thin layer of carbon nanotubes in a specific configuration to act as the wire pathways to connect LED lights. The polymer would protect the LEDs from user contact. Such protective polymers are available under the Lumisys brand.

Yet another alternative embodiment includes such a transparent flexible polymer sheet wherein a reflective film is applied on top of the flexible polymer sheet including cutouts opposite the LEDs for allowing the radiant light to communicate through a reflective area in a manner as shown in the relationship of Fig. 4 between the LEDs' 12 inner wall 52 through aperture 70. This arrangement may also include a flexible outer wall 50 on the other side of the flexible polymer sheet to provide malleable rigidity to the film, reflective coating assembly.

Yet another alternative embodiment includes a plurality of sensors (not shown), such as temperature or radiant energy sensors, disposed relative to inner wall 52 to monitor radiant energy exposure of a user during therapy. If such exposure is
deemed inappropriate for any reason, sensing thereof is recognized by controller B and the therapy can be halted.

[0048] It will be appreciated that variants of the above-disclosed and other features and functions, or alternatives thereof, may be combined into many other different systems or applications. Various presently unforeseen or unanticipated alternatives, modifications, variations or improvements therein may be subsequently made by those skilled in the art which are also intended to be encompassed by the following claims.

WHAT IS CLAIMED IS:
1. A phototherapy system device comprising;
   a plurality of therapeutic lamps;
   a first wall; and,
   a second wall spaced from the first wall and including a reflective surface and a
   plurality of light apertures substantially aligned with the lamps for communicating lamp
   radiation to a user wherein the lamps are interposed between the first and second walls.

2. The system of claim 1 wherein the lamps are affixed to the first wall.

3. The system of claim 1 wherein the lamps are affixed to the second wall.

4. The device of claim 1 wherein the walls have a malleable rigidity for flexible
   adjustability relative to the user.

5. The device of claim 4 wherein the device comprises a head mounted mask for
   facial phototherapy.

6. The device of claim 5 wherein the mask has a concave parabolic configuration
   relative to a face of a user.

7. The device of claim 6 wherein the mask has a parabolic configuration in a
   plurality of directions.

8. The device of claim 1 wherein the device comprises a wearable device.

9. The device of claim 8 wherein the device comprises a facial mask.

10. The device of claim 9 further including an eyeglass frame supporting the first and
    second walls.

11. The device of claim 10 wherein the frame includes lenses for shielding a user's
eyes from lamp radiation.

12. The device of claim 10 wherein the first and second walls are adjustable relative to the frame.

13. The device of claim 12 wherein the first and second walls are mounted to the frame at a pivotable joint.

14. The device of claim 10 wherein the frames include telescopic supports for selective adjustability relative to a size of the user.

15. The device of claim 1 including a usage processor and indicator for communicating device usage to the user.

16. The device of claim 15 wherein the indicator comprises a counter for counting a number of uses of the device by the user for indicating a need for device replacement after a predetermined number of uses.

17. The device of claim 16 wherein the usage processor determines a time of lamp radiating.

18. The device of claim 1 wherein the lamps comprise LEDs preselected for one of anti-aging and acne treatment therapy.

19. The device of claim 1 including a power source in the device.

20. The device of claim 19 wherein the power source is disposed in a remote battery pack.

21. The device of claim 1 wherein the light apertures are localized relative to the plurality of lamps and sized so that the second wall covers lamp circuitry.
22. The device of claim 1 wherein the reflective surface is seamless and continuous.

23. The device of claim 1 wherein the spacing between the first and second walls varies from end-to-end.

24. The device of claim 1 wherein the second wall is spaced from the first wall by a perimeter flange.

25. The device of claim 24 wherein the lamps comprise a plurality of LED strips.

26. The device of claim 25 wherein a number of LEDs in the LED strips range from fifteen to eighteen.

27. A phototherapy device comprising:
   a therapeutic lamp platform; and
   an eye protection frame for shielding eyes of a device user from lamp radiation wherein the lamp platform is adjustable relative to the frame via a pivotable connection.

28. The device of claim 27 wherein the eye protection frame comprises an eyeglass frame.

29. The device of claim 27 wherein the eye protection frame comprises goggles.

30. A phototherapy device comprising:
   a therapeutic lamp platform; and,
   a support frame for receipt on a user wherein the frame comprises an eyeglass frame associated with the platform.

31. The device of claim 30 wherein the frame includes interchangeable lenses.

32. The device of claim 30 wherein the frame is adjustable relative to the user.
33. The device of claim 32 wherein the frame includes telescopic temple arms.

34. The device of claim 32 wherein the frame includes a formable ear latch.

35. The device of claim 32 wherein the frame includes a head strap.

36. The device of claim 30 wherein the platform is adjustable relative to the frame.

37. The device of claim 36 wherein the platform is mounted to the frame at a pivotable joint.

38. The device of claim 30 wherein the platform is flexible with a concave parabolic bias.

39. The device of claim 38 wherein the platform is constructed to have a malleable rigidity.

40. The device of claim 38 wherein the frame, upon receipt on the user, is disposed to expand the platform parabolic bias to a form to match a size of the user.

41. The device of claim 30 wherein the frame has user reference contact points at a nasion area and ears of the user.

42. The device of claim 30 wherein the frame has user reference contact points at a nose and ears of the user.

43. A light therapy system including:

   a wearable device for radiating therapeutic light onto a user comprising a substantially seamless reflective surface having an arcuate configuration for reflecting the light from a treatment area of the user, and wherein a plurality of sources of the light
are recessed relative to the reflective surface.

44. The system of claim 43 wherein the reflective surface includes a plurality of light apertures disposed for communicating the light through the reflective surface.

45. The system of claim 44 wherein the apertures are disposed relative to the treatment area and parabolic configuration for even distribution across the treatment area.

46. The system of claim 45 wherein the apertures are sized and disposed to impart a predetermined cone of the light per light source onto the treatment area.

47. A phototherapy system comprising:
   a flexible wall supporting a plurality of therapeutic lamps and having a concave arcuate bias of a lesser radial degree than a treatment surface of a user; and,
   a support frame for the wall and for receipt on the user wherein upon the receipt the wall is flexed to a greater radial degree for a spaced mating relationship to the treatment surface.

48. The system of claim 47 wherein the frame comprises an eyeglass frame.

49. The system of claim 48 wherein the eyeglass frame is adjustable to a head size of the user, and wherein the eyeglass frame adjustability is communicated to the wall for wall flexing to the mating relationship.

50. The system of claim 49 including a pivot joint connecting the eyeglass frame to the wall.

51. A phototherapy device comprising:
   a lamp support layer having a plurality of therapeutic lamps and associated circuitry; and,
a reflective layer covering the lamp support layer including a plurality of apertures substantially aligned with the lamps for communicating therapeutic light to a treatment surface of a user, wherein the lamp support layer and the reflective layer have a flexibility for a selective mating relationship relative to a size of the treatment surface.

52. The device of claim 51 further including a support frame for supporting the lamp support layer and reflective layer upon receipt on a user.

53. The system of claim 51 wherein the frame comprises an eyeglass frame.

54. The system of claim 52 wherein the eyeglass frame is adjustable to a head size of the user, and wherein the eyeglass frame adjustability is communicated to the layer for layer flexing to the mating relationship.

55. The system of claim 53 including a pivot joint connecting the eyeglass frame to the layer.

56. A method of radiating therapeutic light onto a user, comprising;
   disposing a light source a distance away from a treatment area of the user;
   interposing an arcuate reflective surface between the user and the light source and spaced from the treatment area wherein the reflective surface includes a light aperture for directing the light as a predetermined cone onto the treatment area; and,
   communicating the light through the aperture wherein light reflected off of the treatment area is captured by the reflective surface and redirected back to the treatment area for maximizing light absorption of the treatment area.

57. The method of claim 56 wherein the light source comprises a plurality of therapeutic lamps disposed in a predetermined pattern and the light aperture comprises a plurality of through-holes in the reflective surface, substantially aligned with the lamps, and the communicating comprises coordinating a plurality of predetermined cones with the reflective surface to provide an even distribution of light onto the treatment area.
58. The method of claim 57 wherein the reflective surface comprises a facial mask and the disposing the light source includes positioning the lamps at the through-holes at selected locations for radiating treatment areas comprising acne-prone areas.

59. The method of claim 58 wherein the coordinating of the cones and the reflective surface includes minimizing radiating facial areas other than the treatment area.

60. The method of claim 56 wherein the disposing includes relative adjustment of the light source and reflective surface relative to a size of the treatment area.

61. The method of claim 56 further including associating a light blocking lens with the reflective surface, positioned for protecting user eye exposure to the light.

62. A light therapy device and packaging system including:
   a therapeutic lamp assembly for communicating light therapy to a user; and,
   a packaging containing the lamp assembly wherein a switch for operating the lamp assembly has a multi-position functionality, including an on mode, an off position and a try me position, the try me position being accessible while the lamp assembly is contained in the packaging for displaying lamp operation to a user.

63. The system of claim 62 further including a try me timeout circuit for limiting a try me display time of lamp operation.

64. The system of claim 63 further including a counter for measuring lamp assembly usage time, wherein lamp on time display from the try me position is segregated from lamp to time from the on position.

65. The system of claim 64 further including a dosage counter for counting user therapeutic uses of the device, and wherein try-me position lamp time is excluded from the counted uses.
66. A phototherapy system including a plurality of lamps for radiating therapeutic light onto a user, comprising:
   a counter for determining lamp on time and communicating a signal representative of loss of lamp efficacy and recommended system replacement.

67. The system of claim 66 further including a try-me operating mode and wherein any try-me mode operation from the counter determined lamp on time.

68. A phototherapy device comprising:
   a therapeutic lamp platform; and
   a support frame for the platform configured for receipt on a user, wherein the support frame includes an energy source.

69. The device of claim 68 wherein the energy source includes a battery pack.

70. The device of claim 69 wherein the support frame includes an eyeglass frame having temple arms, and the battery pack comprises a part of the temple arms.

71. The device of claim 68 wherein the lamp platform comprises a spaced wall structure and wherein a controller for communicating energy from the energy source to a plurality of lamps in the platform is disposed in a spacing of the wall structure.

72. The device of claim 71 wherein the controller includes a user interface for displaying selective device statuses to a user.
INTERNATIONAL SEARCH REPORT

International application No.
PCT/US12/253838

A. CLASSIFICATION OF SUBJECT MATTER

IPC(8) - A61N 5/06 (2013.01)
USPC - 607/88

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC(8): A61N 5/06 (2013.01)
USPC: 607/88, 607/89, 607/90

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

Search Terms Used: reflect*, (aperture’ or open’ or hole’T), flex’5, ((laser or light) adj5 therap’y5), (protect’3 nearI0 eye’y1), count’3 nearI0 (number near5 (uses or used)) nearI0 replac’5

Further documents are listed in the continuation of Box C.

* Special categories of cited documents:
  * “A” document defining the general state of the art which is not considered to be of particular relevance
  * “E” earlier application or patent but published on or after the international filing date
  * “L” document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
  * “O” document referring to an oral disclosure, use, exhibition or other means
  * “P” document published prior to the international filing date but later than the priority date claimed
  * “T” later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
  * “X” document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
  * “Y” document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
  * “&” document member of the same patent family

Date of the actual completion of the international search

### INTERNATIONAL SEARCH REPORT

**Box No. II**  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. [ ] Claims Nos.:
   Because they relate to subject matter not required to be searched by this Authority, namely:

2. [ ] Claims Nos.:
   Because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. [ ] Claims Nos.:
   Because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box No. III**  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

See Extra Sheet.

1. [ ] As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. [x] No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

   1-26

**Remark on Protest**

[ ] The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.

[ ] The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.

[ ] No protest accompanied the payment of additional search fees.
This application contains the following inventions or groups of inventions which are not so linked as to form a single general inventive concept under PCT Rule 13.1. In order for all inventions to be examined, the appropriate additional examination fees must be paid.

Group I: Claims 1-26 are directed toward a phototherapy system device comprising a plurality of therapeutic lamps, a first wall, and a second wall spaced from the first wall and including a reflective surface and a plurality of light apertures substantially aligned with the lamps for communicating lamp radiation to a user wherein the lamps are interposed between the first and second walls.

Group II: Claims 27-29 are directed toward a phototherapy device comprising a therapeutic lamp platform and an eye protection frame for shielding eyes of a device user from lamp radiation wherein the lamp platform is adjustable relative to the frame via a pivotable connection.

Group III: Claims 30-42 are directed toward a phototherapy device comprising a therapeutic lamp platform, and a support frame for receipt on a user wherein the frame comprises an eyeglass frame associated with the platform.

Group IV: Claims 43-46 are directed toward a light therapy system including a wearable device for radiating therapeutic light onto a user comprising a substantially seamless reflective surface having an arcuate configuration for reflecting the light from a treatment area of the user, and wherein a plurality of sources of the light are recessed relative to the reflective surface.

Group V: Claims 47-50 are directed toward a phototherapy system comprising a flexible wall supporting a plurality of therapeutic lamps and having a concave arcuate bias of a lesser radial degree than a treatment surface of a user; and a support frame for the wall and for receipt on the user wherein the wall is flexed to a greater radial degree for a spaced mating relationship to the treatment surface.

Group VI: Claims 51-55 are directed toward a phototherapy device comprising a lamp support layer having a plurality of therapeutic lamps and associated circuitry and a reflective layer covering the lamp support layer including a plurality of apertures substantially aligned with the lamps for communicating therapeutic light to a treatment surface of a user, wherein the lamp support layer and the reflective layer have a flexibility for a selective mating relationship relative to a size of the treatment surface.

Group VII: Claims 56-61 are directed toward a method of radiating therapeutic light onto a user, comprising disposing a light source a distance away from a treatment area of the user, interposing an arcuate reflective surface between the user and the light source and spaced from the treatment area wherein the reflective surface includes a light aperture for directing the light as a predetermined cone onto the treatment area, and communicating the light through the aperture wherein light reflected off of the treatment area is captured by the reflective surface and redirected back to the treatment area for maximizing light absorption of the treatment area.

Group VIII: Claims 62-65 are directed toward a light therapy device and packaging system including a therapeutic lamp assembly for communicating light therapy to a user, and a packaging containing the lamp assembly wherein a switch for operating the lamp assembly has a multi-position functionality, including an on mode, an off position and a try me position, the try me position being accessible while the lamp assembly is contained in the packaging for displaying lamp operation to a user.

Group IX: Claims 66-67 are directed toward a phototherapy system including a plurality of lamps for radiating therapeutic light onto a user, comprising a counter for determining lamp on time and communicating a signal representative of loss of lamp efficacy and recommended system replacement.

Group X: Claims 68-72 are directed toward a phototherapy device comprising a therapeutic lamp platform, and a support frame for the platform configured for receipt on a user, wherein the support frame includes an energy source.

The common features of Groups II, III, and X are a phototherapy device having a therapeutic lamp platform with a support frame. The common features of Groups I, VI, VII, and VIII are a phototherapy system having therapeutic lamps, reflective surface, and light apertures. These common features are disclosed by WO 2010/076707 A1 to Clegg et al. (hereinafter Clegg). Clegg discloses a phototherapy device/system (sleep mask providing light therapy, abstract) having a therapeutic lamp platform (first light module 16 and second light module 18, figure 3, paragraph [0033]) and a support frame (rigid or flexible frame, paragraph [0032]), therapeutic lamps (light emitting diodes, figure 5, paragraph [0038]), reflective surface (reflective surface, paragraph [0035]), and light apertures (apertures 50, figure 7, paragraph [0050]).

Since the common technical feature is previously disclosed by the Clegg reference, these common features are not special and so Groups I-III, VI, VII, VIII, and X lack unity.

Groups IV, V, and IX do not share any common technical features.

Therefore, since Groups IV, V, and IX do not share a common special technical feature and the shared technical features of Groups I-III, VI, VII, VIII, and X are previously disclosed by the Clegg reference, Groups I-X lack unity.
