This invention provides compounds, compositions thereof, and methods of using said compounds and compositions in treating hypercholesterolemia in a mammal. Compounds of this invention have been shown to inhibit the biosynthesis of cholesterol and have potential for decreasing cholesterol formation in mammals. Compounds of the present invention have formula (1), wherein R is CH₃CH₂, CHOHCH₂CH₃, or CH₃CH=CH₂.

TITLE

15-OXASTEROLS AS HYPOCHOLESTEROLEMICS

Field of the Invention

This invention relates to novel 15-oxasterols, pharmaceutical compositions thereof, and methods of using said compositions in mammals to inhibit the biosynthesis of cholesterol.

BACKGROUND OF THE INVENTION

Ko and Trzaskos, International Patent Application (PCT) WO 91/13903, published on September 19, 1991, disclose a class of 15-oxasterol cholesterol biosynthesis inhibitors useful as cholesterol lowering agents. The application of Ko and Trzaskos discloses 15-oxa, thia and azasterols substituted at the 14-position of the sterol nucleus with alkyl, alkenyl or alkynyl, which can themselves be substituted with oxygen, sulfur, nitrogen and other functional groups.

The general disclosure of WO 91/13903 encompasses the compounds of this invention, however, the compounds of this invention are neither exemplified nor specifically claimed in WO 91/13903. Applicants have now discovered that the compounds of the present invention exhibit remarkable and unexpected potency as cholesterol biosynthesis inhibitors, and are unexpectedly superior to compounds disclosed in WO 91/13903.
DETAILED DESCRIPTION OF THE INVENTION

This invention provides 15-oxasterol compounds which exhibit remarkable and unexpected potency as cholesterol biosynthesis inhibitors. The compounds of this invention are 15-oxasterols of formula 1:

![Chemical Structure]

wherein:
R is CH₂CH₃, CHOHC₃H₂CH₃, and CH₂CH=CH₂.

This invention also provides pharmaceutical compositions comprising compounds of formula 1. Finally, this invention provides a method of treating hypercholesterolemia by orally administering a compound of formula 1.

As used herein, the term "therapeutically effective amount" means that amount of a drug or pharmaceutical agent that will elicit the biological or medical response of a tissue, system, animal or human subject that is being sought by a clinician or researcher.

Synthesis

The compounds of formula 1 are prepared using methods disclosed in Schemes 1 and 2. As shown in Scheme 1, the starting material, 4,4-dimethyl-5a-cholesta-8,14-dien-3β-ol (I) [Bloch and Gautschi, J. Chem. Soc., 223, (6), 1343 (1958)] was hydroxylated by a catalytic osmium tetroxide reaction in a mixture of dioxane and water using trimethylamine-N-oxide as an
oxidant in the presence of pyridine and diazabicyclo-[4,4,0]undec-7-ene (DBU) to give the triol (II). Next, the D-ring of the sterol was opened by treating the triol with either lead tetraacetate in benzene or sodium periodate in aqueous methanol to provide the corresponding enone-aldehyde (III). The aldehyde-carrying chain was shortened by converting the aldehyde to an enamine (IV) and reacting the enamine with ozone followed by dimethylsulfide in dichloromethane at -78 °C to give a new enone-aldehyde (V). After replacing the solvent with methanol the aldehyde was treated with sodium borohydride to provide the corresponding enone-alcohol (VI), which serves as the key intermediate for the 15-oxasterols of this invention.

Scheme 1

As shown in Scheme 2, compounds of formula 1 are then prepared by nucleophilic addition to the enone-
alcohol (VI) using either a Grignard reagent or an alkyl lithium reagent in an inert solvent such as diethyl ether, tetrahydrofuran or in a mixture of inert solvents; and treating the product with an acid in an alcoholic solvent such as methanol or ethanol. The primary hydroxyl group of the enone-alcohol (VI) can be masked with a suitable protecting group such as a silyl ether prior to the nucleophilic addition when necessary. Specifically, the compounds of Examples 2 and 3 are prepared by this method. Thus, reaction of (VI) with either ethyl magnesium bromide or ethyllithium provides the compound of the formula 1 wherein R is ethyl (Example 2); and reaction of (VI) with either allyl magnesium bromide or allyllithium provides a compound of formula 1 wherein R is allyl (Example 3).
As shown in Scheme 2, the R group of formula 1 can be further elaborated when R is CH=CH₂ (compound VII) to prepare additional examples of this invention. For example, the vinyl group of (VII) can be hydrogenated to afford the corresponding ethyl compound which is the compound of the formula 1 wherein R is ethyl (Example 2), or it can be treated with ozone to yield the corresponding aldehyde (VIII). The aldehyde can then be reacted with either ethyl magnesium bromide or ethyllithium to afford the compound of formula 1 wherein
R is CHO\textsubscript{2}CH\textsubscript{3} (Example 1). Alternatively, the compound of Example 1 compound can be prepared by reacting the aldehyde (VIII) with vinyl magnesium bromide or vinyl lithium to provide Compounds IX\textsubscript{a} and IX\textsubscript{b}, and then reducing the vinyl group by catalytic hydrogenation.

**EXAMPLES**

Syntheses of specific examples are shown below.

**Synthesis of Intermediate Compound VI**

Step 1: Preparation of 4,4-Dimethyl-5\(\alpha\)-cholest-8-ene-3\(\beta\),14\(\alpha\),15\(\alpha\)-triol (Compound II).

To a stirred solution of 4,4-dimethyl-5\(\alpha\)-cholesta-8,14-dien-3\(\beta\)-ol (Compound I, 254 g, 0.615 moles) in 1,4-dioxane (2500 ml) were added pyridine (245 ml), 1,8-diazabicyclo[4.4.0]undec-7-ene (DBU, 100 ml) an aqueous solution of trimethylamine N-oxide dihydrate (135 g, 1.21 moles in 500 ml of water) and a 20\% solution of osmium tetroxide in dichloromethane (64 ml, 0.05 moles), and the mixture was stirred at 80-90 °C for 16 hours. After cooling to room temperature was added 20\% solution of sodium bisulfite (1000 ml) and the mixture was stirred at room temperature for 2 hours. It was partitioned between ethyl acetate (2000 ml) and water (1000 ml) and the two layers were separated. The aqueous layer was extracted with ethyl acetate (3 x 1000 ml) and the combined extracts were washed with water and brine. The ethyl acetate solution was dried over magnesium sulfate and evaporated to give a solid residue. The crude product was dissolved in a minimum amount of ether and passed through a short column of silica gel (1000 g) with elution by ether to remove the colored impurities. The solvent was evaporated to
afford a white crystalline solid of the desired triol (Compound II) in about 80% yield.

M.P. 133-134 °C (decomposed), NMR [300 MHz, CDCl3-D2O (5%) ] δ 4.11 (dd, J=5 Hz, 9 Hz, 1H), 3.22 (dd, J=5 Hz, 11 Hz, 1H), 2.33 (m, 1H), 2.26 (brm, 1H), 2.09 (brm, 2H), 2.00-1.05 (m, 20H), 1.01 (d, J=3 Hz, 6H), 0.87 (s, 3H), 8.86 (d, J=8 Hz, 3H), 0.85 (s, 3H), 0.82 (s, 3H), 0.69 (s, 3H); IR (film) : 3422 (bs), 2950 (s), 1652 (s), 1465 (m), 1036 (m) cm⁻¹; EA for C₂₉H₅₀O₃ : Calcd. C 77.97%, H 11.2%; found C 78.05%, H 11.19%.

Step 2: Preparation of 4,4-Dimethyl-3β-hydroxy-15-oxo-5α-secocholestan-8-en-14-one (Compound III).

To a stirred solution of the triol (Compound II, 111.6 g, 0.25 moles) in dry benzene (3500 ml) in the dark was added lead tetracetate (113.1 g, 0.25 moles) in 7 roughly equal portions over a period of 1 hour and the mixture was continued to stir for an additional hour. The mixture was filtered through Celite and the filtercake was rinsed several times with benzene. Evaporation of the solvent provided a foamy solid of the enone-aldehyde (Compound III) in near quantitative yield.

NMR (300 mHz, CDCl3) δ 3.93 (t, J=8.1 Hz, 1H), 3.63 (t, J=8.1 Hz, 1H), 3.26 (dd, J=4.8 Hz, 11.4 Hz, 1H), 2.10-0.70 (m, 25H), 1.01 (s, 3H), 0.98 (s, 3H), 0.95 (d, J=6.3 Hz, 3H), 0.89 (s, 3H), 0.88 (d, J=6.6 Hz, 6H), 0.81 (s, 3H); IR (film) : 3336, 2932, 2870, 1467, 1458, 1383, 1377, 1266, 1040, 1028, 924, 737 cm⁻¹.

Step 3: Preparation of 4,4-Dimethyl-3β,16-dihydroxy-14,16-seco-D-nor-cholestan-8-en-14-one (Compound VI).

To a solution of the enone-aldehyde (Compound III, 111.2 g, 0.25 moles) in benzene (1500 ml) was added
piperidine (66.8 ml, 0.68 moles) and the mixture was refluxed under a Dean-Stark trap until the removal of water is completed (1-1.5 hours). The excess piperidine and the solvent were evaporated off under reduced pressure after cooling to give a foamy solid residue of the enamine (Compound IV).

The enamine was dissolved in dichloromethane (1750 ml) and the solution was cooled to -78 °C. Ozone was bubbled through the solution and reaction was followed by thin layer chromatography (TLC) using silica gel plate and a 7:93 mixture of acetone and toluene. Near the end point of the reaction was added few drops of Sudan Red 7B in dichloromethane and ozone was continued to bubble through until the color become light pink. After stirring for 5 minutes, was added dimethyl sulfide (60 ml) and the mixture was stirred at -78 °C for 30 minutes. The residue after evaporation of the solvent was dissolved in a minimum amount of ether and passed through a plug of silica gel with elution by a 1:9 mixture of ethyl acetate and hexane to remove polar impurities. Evaporation of the solvent afforded a foamy solid of the enone-aldehyde (Compound V, 98 g).

The enone-aldehyde (Compound V) was dissolved in methanol (995 ml) and the solution was cooled to -40 °C. Then was added sodium borohydride (5.16 g, 0.136 moles) in a single portion and the mixture was stirred for 1.5 hours while allowing the temperature to rise to -10 °C. The excess sodium borohydride was destroyed by dropwise addition of saturated aqueous ammonium chloride solution over a period of 15 minutes. The solution was then made basic with saturated solution of sodium bicarbonate and concentrated under reduced pressure. The residue was extracted with ethyl acetate (3 x 500 ml) and the combined extracts were washed with water and brine, dried over magnesium sulfate, and evaporated to give an oily residue of the enone-alcohol (Compound VI) in about 90% yield as a crude product.
NMR (300 MHz, CDCl₃) δ 3.72 (m, 1H), 3.56 (m, 1H), 3.28 (m, 1H), 2.60 (dd, J=6.0 Hz, 18.1 Hz, 1H), 2.37-0.8 (m, 23H), 1.07 (s, 6H), 1.06 (d, J=5.2 Hz, 3H), 1.02 (s, 3H), 0.86 (d, J=6.0 Hz, 6H), 0.84 (s, 3H); IR (film): 3426, 2951, 2869, 1651, 1625, 1462, 1374, 1094, 1029, 733 cm⁻¹.

Example 1

32-Ethyl-15-oxa-lanost-8-ene-3β,32-diol (Compound 1)

Step 1: Preparation of 4,4-Dimethyl-15-oxa-14-vinyl-5α-cholest-8-en-3β-ol (Compound VII).

To a stirred solution of the enone-alcohol (Compound VI, 140 g, 0.324 moles) in dry tetrahydrofuran (1670 ml) were added 2,6-lutidine (79.3 ml, 0.68 moles) and 4-dimethyl-aminopyridine (1.56 g), and the mixture was cooled to 0 °C. Then chlorotrimethylsilane (82.4 ml, 0.65 moles) was added dropwise over a period of 10 minutes and it was stirred at the same temperature for 1 hour. To the mixture was added dropwise 1M-vinyl magnesium bromide in tetrahydrofuran (1621 ml, 1.621 moles) and it was gently refluxed for 1 hour. After cooling to 0 °C, 2N-HCl was added dropwise with caution and the mixture was stirred for 30 minutes. Two layers were separated and the aqueous layer was extracted with ethyl acetate (2 x 500 ml). The combined organic extracts were washed with brine, dried over magnesium sulfate and evaporated to give an oily residue. The residue was then dissolved in methanol (1624 ml) and camphorsulfonic acid (31g) was added. The mixture was stirred at room temperature for 4.5 hours and was made basic with saturated sodium bicarbonate solution. It was extracted with ethyl acetate (4 x 500 ml) and the combined extracts were washed with brine, dried over magnesium sulfate and evaporated to give an oily residue. The crude product was purified by column
chromatography on silica gel with elution by a 5 : 95 mixture of ethyl acetate and hexane to provide 86 g of pure vinyl-oxyasterol (Compound VII).

NMR (300 MHz, CDCl₃) δ 5.73 (dd, J=10.8 Hz, 17.4 Hz, 1H), 5.12 (dd, J=1.8 Hz, 10.8 Hz, 1H), 5.00 (dd, J=1.8 Hz, 17.4 Hz, 1H), 3.88 (t, J=8.7 Hz, 1H), 3.55 (t, J=9 Hz, 1H), 3.26 (dd, J=4.8 Hz, 11.7 Hz, 1H), 2.07-0.80 (m, 23H), 1.01 (s, 6H), 0.95 (d, J=6 Hz, 3H), 0.86 (d, J=6.3 Hz, 6H), 0.81 (s, 3H), 0.78 (s, 3H); IR (film): 2933, 2868, 1512, 1467, 1375, 1095, 1040, 1033, 1029 cm⁻¹; HRMS for C₃₀H₅₀O₂ (M⁺): Calcd. 442.3811; found 442.3806.

A solution of the vinyl-oxyasterol (Compound VII, 1.96 g, 4.4 mmole) in methanol (80 ml) at -78 °C was bubbled with ozone until the solution turn to light blue. After stirring for 3 minutes the excess ozone was purged out and the mixture was treated with dimethylsulfide (1 ml). The temperature was raised to 0 °C and the solvent was evaporated off to give an oily residue. It was purified by a column chromatography with elution by a 1:9 mixture of ethyl acetate and hexane to give 1.15 g of pure aldehyde (Compound VIII).

NMR (300 MHz, CDCl₃) δ 9.59 (s, 1H), 4.03 (t, J=8.4 Hz, 1H), 3.70 (dd, J=8.1 Hz, 9.6 Hz, 1H), 3.26 (dd, J=4.5 Hz, 11.4 Hz, 1H), 2.20-0.90 (m, 24H), 1.04 (s, 3H), 1.01 (s, 3H), 0.95 (d, J=6.6 Hz, 3H), 0.92 (s, 3H), 0.86 (d, J=6.3 Hz, 6H), 0.81 (s, 3H); IR (film): 3446, 2946, 2933, 2870, 2691, 1731, 1468, 1383, 1378, 1365, 1064, 1042, 1027 cm⁻¹; HRMS for C₂₈H₄₇O₂ (M-CHO): Calcd. 415.3576; found 415.3600.

To a solution of the aldehyde (Compound VIII, 14.37 g, 0.032 moles) in dry tetrahydrofuran (650 ml) at -78 °C was added 1M vinyl magnesium bromide in tetrahydrofuran (97 ml, 0.097 moles) dropwise over a period of 1.75 hours and the mixture was stirred for 2.5 hours while raising the temperature to 4 °C gradually. Then the reaction was quenched with saturated ammonium chloride. After addition of 1N-HCl (100 ml) the product was extracted with ethyl acetate (3 x 300 ml) and the combined extracts were washed with saturated sodium bicarbonate and brine. It was dried over magnesium sulfate and evaporated to give an oily residue (13.3 g) of 1:2 mixture of two epimeric allylic alcohols (Compounds IXa and IXb). The two epimers were separated by a column chromatography on silica gel with elution by a 7:93 mixture of ethyl ether and toluene.

Fast epimer (Compound IXa)

NMR (300 MHz, CDC13) : δ 5.95 (m, 1H), 5.29 (dt, J=17.2 Hz, 1H), 5.12 (dt, J=11.1 Hz, 2.2 Hz, 1H), 4.51 (m, 1H), 3.86 (t, J=8.4 Hz, 1H), 3.56 (dd, J=9.6 Hz, 8.4 Hz, 1H), 3.26 (m, 1H), 2.50 (d, J=2.9 Hz, 1H), 2.35-0.8 (m, 23H), 1.03 (s, 3H), 1.02 (s, 3H), 1.01 (s, 3H), 0.93 (d, J=6.6 Hz, 3H), 0.86 (d, J=6.6Hz, 6H), 0.82 (s, 3H);
IR (film) : 3459, 3090, 2939, 2869, 1642, 1466, 1416, 1375, 1042 cm⁻¹;
MS (CI) : 473 (M+H), 471 (M-H), 455 (M+H-H2O).

Slow epimer (Compound IXb)

NMR (300 MHz, CDC13) : δ 5.70 (m, 1H), 5.27 (d, J=17.9 Hz, 1H), 5.12 (d, J=10.2 Hz, 1H), 4.32 (d, J=6.9 Hz, 1H), 3.87 (t, J=8.4 Hz, 1H), 3.51 (t, J=9.7 Hz, 1H), 3.25 (dd, J=6.4 Hz, 4.8Hz, 1H), 2.56 (m, 1H), 2.13 (m, 23H), 1.01 (s, 3H), 0.99 (s, 3H), 0.96 (s, 3H), 0.94 (d, J=6.6 Hz, 3H), 0.86 (d, J=6.6 Hz, 6H), 0.81 (s, 3H);
IR (film) : 3450, 3078, 2935, 2869, 1642, 1468, 1377, 1284, 1251, 1096, 1039 cm⁻¹.
MS (CI) : 473 (M+H), 471 (M-H), 455 (M+H-H2O).

A solution of the allylic alcohol (slow isomer, Compound IXb, 0.13 g) and 10% palladium on carbon (c.a. 50 mg) in ethyl acetate (10 ml) and acetic acid (0.5 ml) was stirred under hydrogen (1 atm.) at room temperature for 6 hours. After the stirring the mixture was filtered through Celite™ and the filtrate was evaporated to give an oily residue of the propyl alcohol (Compound 1). It was purified by a column chromatography on silica gel with elution by a 1:9 mixture of ethyl acetate and hexane.

NMR (300 MHz, CDCl₃) δ 3.85 (t, J=8.4 Hz, 1H), 3.77 (bd, J=10.3 Hz, 1H), 3.48 (t, J=8.8 Hz, 1H), 3.25 (qn, J=5.9 Hz 1H), 2.91 (s, 1H), 2.60 (dd, J=15.7 Hz, 6.2 Hz, 1H), 2.15-0.8 (m, 24H), 1.00 (d, J=5.1 Hz, 6H), 0.99 (t, J=6.9 Hz, 3H), 0.95 (d, J=6.6 Hz, 3H), 0.93 (s, 3H), 0.87 (s, 3H), 0.85 (s, 3H), 0.81 (s, 3H).

Example 2

32-Methyl-15-oxa-lanost-8-en-3β-ol (Compound 2)

A solution of the vinyl-oxasterol (Compound VII, 0.2 g) and 10% palladium on carbon (about 50 mg) in a 20:1 mixture of ethyl acetate and acetic acid (10 ml) was stirred under hydrogen (1 atm.) at room temperature for 16 hours. At the end of the stirring the mixture was filtered through Celite® and the filtrate was evaporated to give an oily residue of the ethyl-oxasterol (Compound 2). It was purified by a column chromatography on silica gel with elution by a 1:9 mixture of ethyl acetate and hexane.
NMR (300 MHz, CDCl₃): δ 3.76 (t, J=8.78 Hz, 1H), 3.42 (t, J=8.61 Hz, 1H), 3.27 (m, 1H), 2.11-0.8 (m, 25H), 1.01 (d, J=5.13 Hz, 6H), 0.95 (d, J=7.7 Hz, 3H), 0.94 (s, 3H), 0.87 (s, 3H), 0.85 (s, 3H), 0.82 (s, 3H), 0.74 (t, J=8.01 Hz, 3H).

Example 3

15-Oxa-32-vinyl-lanost-8-en-3β-ol (Compound 3)

To a stirred solution of the enone-alcohol (Compound VI, 2 g, 4.62 mmoles) in dry tetrahydrofuran (30 ml) were added 2,6-lutidine (1.13 ml, 9.7 mmoles) and 4-dimethyl-aminopyridine (22 mg), and the mixture was cooled to 0 °C. Then chlorotrimethylsilane (1.18 ml, 9.3 mmoles) was added dropwise over a period of 10 minutes and the mixture was stirred at the same temperature for 30 minutes. To the mixture was added dropwise 1.2M allyl magnesium bromide in tetrahydrofuran (19.3 ml, 23.1 mmoles) and it was stirred at room temperature for 3 hours. The reaction was quenched with 1N HCl (30 ml) and it was extracted with ethyl acetate (2 x 50 ml). The combined organic extracts were washed with brine, dried over magnesium sulfate and evaporated to give an oily residue. The residue was then dissolved in methanol (25 ml) and camphorsulfonic acid (0.45 g) was added. The mixture was stirred at room temperature for 4 hours and was made basic with saturated sodium bicarbonate solution. It was extracted with ethyl acetate (3 x 50 ml) and the combined extracts were washed with brine, dried over magnesium sulfate and evaporated to give an oily residue. The crude product was purified by column chromatography on silica gel with elution by a 5 : 95 mixture of ethyl acetate and hexane to provide the pure allyl-oxasterol (Compound 3).

NMR (300 MHz, CDCl₃) δ 5.57 (m, 1H), 5.01 (d, J=17.2 Hz, 1H), 4.94 (d, J=11.7 Hz, 1H), 3.77 (t, J=8.61 Hz, 1H),
3.43 (t, J=8.60 Hz, 1H), 3.26 (q, J=5.90 Hz, 1H), 2.58 (dd, J=14.6 Hz, 4.9 Hz, 1H), 2.36 (dd, J=14.6 Hz, 9.9 Hz, 1H), 2.16-0.8 (m, 23H), 1.01 (d, J=5.9 Hz, 6H), 0.94 (s, 3H), 0.94 (d, J=5.1 Hz, 3H), 0.87 (s, 3H), 0.85 (s, 3H), 0.82 (s, 3H).

Utility

The cholesterol biosynthesis inhibition activities of the compounds of formula 1 were assayed by measuring $^{14}$C-acetate incorporation into the biosynthesis of cholesterol as described in detail below. This assay is identical to that disclosed in Example 31 of WO 91/13903 which is incorporated herein by reference. In addition, the 3-Hydroxy-3-methylglutaryl Coenzyme A Reductase (HMGR) Suppression Assay, disclosed in Example 26 of WO 91/13903, and method "Lowering Blood Cholesterol Levels in Hamsters" of Example 27 of WO 91/13903 are also both incorporated herein by reference.

Assay of $^{14}$C-Acetate Incorporation into the Biosynthesis of Cholesterol

The HepG2 cells (a human hepatoma cell line) used in the assay were obtained from the American Type Culture Collection (ATCC, Rockville, MD). They were maintained in Dulbecco's Modified Eagles Medium and Ham's F12 Medium (1:1) supplemented with 10% heat inactivated Fetal Bovine serum, 10 mM Herpes, 1 mM sodium pyruvate, 1 x Non-essential Amino Acids (Gibco) and 2 mM L-glutamine.

The cells were harvested by washing cultures with 10 ml Hank's Balanced Salt Solution (2x) and incubating with 0.125% Trypsin in Versene (0.02% EDTA) for approximately one minute. After the cells are visibly rounded and loosened from the flask, 9 ml of the above medium is added. The cells are transferred to a 100 mM culture dish and syringed up and down through a 20 gauge needle to break up aggregated clumps of cells. Cell
cultures are plated at 0.1 x 10^6/ml and 0.075 x 10^6/ml in two 24 well plates, respectively, aliquoting 1 ml cells/well. The cells are allowed to attach for 24 hours (48 hours for the lower density plate) before washing 2x with HBSS and refed with 1 ml of the above medium with 1% Cabosil delipidated serum instead of Fetal Bovine Serum. The cells are treated with the test compounds after 24 hours of exposure to the delipidated serum media.

Chemicals are routinely prepared as a 10 mM solution in 100% ethanol or dimethyl sulfoxide (DMSO). All test compounds are added at 50 mM, 25 mM, 10 mM, 1 mM at a final concentration of 0.45% solvent, 0.25% Bovine Serum Albumin (BSA) suspension per well. The solvent BSA is sonicated for 10 seconds to ensure maximum solubilization before addition to the cells. Control wells receive solvent/BSA at the same concentrations as the drug treated cultures. After incubation for one hour at 37 °C, 5% CO_2, 20 mCi/ml ^3H-MVAL is added per well in ethanol/medium so the final concentration of solvent is 1.2%. After 22 hours of incubation with the test compounds 2.5 mCi of ^14C-acetate is added per well for an additional 2 hours so that the final concentration of ethanol is 1.6%.

Two known cholesterol biosynthesis inhibitors are incubated with each assay, namely 25-hydroxycholesterol and Lovastatin, to determine the reliability and validity of each assay.

The cultures are harvested by aspirating the media and washing twice with ice cold 0.5 M Tris, 0.15 M NaCl, pH 7.4 to remove excess radiolabel not incorporated into the cells. Stop Reagent (1 ml of 15% potassium hydroxide, 85% methanol, 100 mg/ml butylated hydroxytoluene (BHT) is added to each well and the plate is sonicated in a mild water sonicating bath to release the cells from the bottom of the well. The digested cell extracts are transferred to 15 ml extraction tubes. Each well is rinsed with an additional 1 ml of the Tris/NaCl buffer which is added to the appropriate
extraction tube. An aliquot (100 ml) is removed for protein determination at this point if desired.

The cell extracts are saponified at 80 °C for 30 minutes. After cooling 8 ml petroleum ether is added and the tubes are twirled on a rotary extractor for 5-10 minutes to extract the sterols into the organic solvent phase. The top organic phase is removed and passed through a Silica Seppak (Waters) which binds all sterols and free fatty acids. Sterols are eluted with a 5 ml diethyl ether:hexane (1:1) rinse. This sterols extraction is automated using Millilab (Waters) to ensure reproducibility and accuracy from sample to sample.

The eluted sterols are dried under nitrogen gas and resuspended in 150 ml ethanol. A 15 ml aliquot is removed from each sample and added to a scintillation vial filled with formula 989 (NEN). The samples are counted on the dual label ³H:¹⁴C program on the Beckman scintillation counter Model LS 7800.

The incorporation of both radiolabeled precursors into sterols is compared between the treated and non-treated (control) cultures and expressed as "% control" for each precursor. Test compounds are classified as being "active" or "inactive" from these results and IC₅₀ values were determined for the active compounds.

Analysis of sterol profiles is performed on the remainder of the sample by reversed phase HPLC. Analyses are done using an Ultrasphere octyl column (Altex) (0.46 x 25 cm), with a mobile phase consisting of acetonitrile:methanol:H₂O (44.5:44.5:10). Chromatography is performed at a flow rate of 1.5 ml per minute at 45 °C.

Cholesterol biosynthesis inhibition activities of the compounds of formula 1, which were determined by the method described above, are shown in the Table 1. The IC₅₀ values represent the level of inhibition of the incorporation of ¹⁴C-acetate into the cholesterol biosynthesis pathway.

The compounds of this invention have greater potency in cholesterol biosynthesis inhibition than any of the compounds specifically disclosed and tested in WO 91/13903. The compounds of this invention exhibited cholesterol biosynthesis inhibition activity approximately 2 to 80 fold higher than the most active compounds specifically disclosed in WO 91/13903 which have been tested. Thus, Applicant has shown the compounds of the present invention to be unexpectedly superior to those disclosed and tested in PCT application WO 91/13903 in an identicle assay. These results indicate that compounds of the present invention have excellent potential as effective hypcholesterolemic agents.

Formulations

Compounds of this invention can be administered to treat said deficiencies by means that produces contact of the active agent with the agent's site of action in the body of a mammal. The compounds can be administered by any conventional means available for use in conjunction with pharmaceuticals either as individual therapeutic agent or in combination of therapeutic agents. They can be administered alone, but are generally administered with a
pharmaceutical carrier selected on the basis of the chosen route of administration and standard pharmaceutical practice.

The dosage administered will vary depending on the use and known factors such as pharmacodynamic character of the particular agent, and its mode and route of administration; the recipient's age, weight, and health; nature and extent of symptoms; kind of concurrent treatment; frequency of treatment; and desired effect. For use in the treatment of said diseases or conditions, the compounds of this invention can be orally administered daily at a dosage of the active ingredient of 0.002 to 200 mg/kg of body weight. Ordinarily, a dose of 0.01 to 10 mg/kg in divided doses one to four times a day, or in sustained release formulation was effective in obtaining the desired pharmacological effect.

Dosage forms (compositions) suitable for administration contain from about .1 mg to about 1000 mg of active ingredient per unit. In these pharmaceutical compositions, the active ingredient will ordinarily be present in an amount of about 0.5 to 95% by weight based on the total weight of the composition.

The active ingredient can be administered orally is solid dosage forms, such as capsules, tablets and powders; or in liquid forms such as elixirs, syrups, and/or suspensions. The compounds of this invention can also be administered parenterally in sterile liquid dose formulations.

Gelatin capsules can be used to contain the active ingredient and a suitable carrier such as but not limited to lactose, starch, magnesium stearate, steric acid, or cellulose derivatives. Similar diluents can be used to make compressed tablets. Both tablets and capsules can be manufactured as sustained release products to provide for continuous release of medication over a period of time. Compressed tablets can be sugar-coated or film-coated to mask any unpleasant taste, or used to protect the active ingredients from the atmosphere, or to allow selective disintegration of the tablet in the gastrointestinal tract.
Liquid dose forms for oral administration can contain coloring of flavoring agents to increase patient acceptance.

In general, water, pharmaceutically acceptable oils, saline, aqueous dextrose (glucose), and related sugar solutions and glycols, such as propylene glycol or polyethylene glycol, are suitable carriers for parenteral solutions. Solutions for parenteral administration preferably contain a water soluble salt of the active ingredient, suitable stabilizing agents, and if necessary, butter substances. Antioxidizing agents, such as sodium bisulfite, sodium sulfite, or ascorbic acid, either alone or in combination, are suitable stabilizing agents. Also used are citric acid and its salts, and EDTA. In addition, parenteral solutions can contain preservatives such as benzalkonium chloride, methyl- or propyl-paraben, and chlorobutanol.

Suitable pharmaceutical carriers are described in "Remington's Pharmaceutical Sciences", A. Osol, a standard reference in the field.

Useful pharmaceutical dosage-forms for administration of the compounds of this invention can be illustrated as follows:

**Capsules**

A large number of units capsules are prepared by filling standard two-piece hard gelatin capsules each with 100 mg of powdered active ingredient, 150 mg lactose, 50 mg cellulose, and 6 mg magnesium stearate.

**Soft Gelatin Capsules**

A mixture of active ingredient in a digestible oil such as soybean, cottonseed oil, or olive oil is prepared and injected by means of a positive displacement was pumped into gelatin to form soft gelatin capsules containing 100 mg of the active ingredient. The capsules were washed and dried.
**Tablets**

A large number of tablets are prepared by conventional procedures so that the dosage unit was 100 mg active ingredient, 0.2 mg of colloidal silicon dioxide, 5 mg of magnesium stearate, 275 mg of microcrystalline cellulose, 11 mg of starch, and 98.8 mg lactose. Appropriate coatings may be applied to increase palatability or delayed adsorption.

The compounds of this invention may also be used as reagents or standards in the biochemical study of neurological function, dysfunction, and disease.
WHAT IS CLAIMED IS:

1. A compound of formula:

![Chemical Structure](image)

wherein:

R is \( \text{CH}_2\text{CH}_3 \), \( \text{CHOHCH}_2\text{CH}_3 \), or \( \text{CH}_2\text{CH}=\text{CH}_2 \).

2. A pharmaceutical composition for decreasing cholesterol formation in mammals, said composition comprising a pharmaceutically acceptable carrier and a therapeutically effective amount of a compound of Claim 1.

3. A method of decreasing cholesterol formation in mammals in need of such therapy, said method comprising administering a therapeutically effective amount of a compound of Claim 1.
