SEX STEROID ACTIVITY INHIBITORS

BACKGROUND OF THE INVENTION

This invention relates to novel inhibitors of sex steroid activity such as antiestrogen compounds having effective antagonistic capability while substantially lacking agonistic effects. More particularly, certain preferred embodiments of the invention relate to certain estradiol and diphenylethylene analogs which have high affinity for estrogen receptors but do not activate such receptors and/or which inhibit the production of sex steroids or their precursors.

During the treatment of certain sex steroid-dependent diseases, it is important to greatly reduce or, if possible, eliminate certain sex steroid-induced effects. For this purpose, it is desirable both to block receptor sites stimulated by sex steroids
and also to reduce the amount of sex steroid available to act at these sites. For example, alternative or concurrent therapy to administration of antiestrogens could involve attempts to block the production of estrogens (e.g. by ovariectomy) such that less is available to activate receptor sites. However, prior art methods for blocking estrogen production insufficiently inhibit estrogen-induced functions. Indeed, it is possible that even in the total absence of sex steroid, some receptors may be activated. See Simard and Labrie, "Koexifene shows pure antiestrogenic activity in pituitary gonadotrophs", Mol. Cell. Endocrinol. 39: 141-144, (1985), especially page 144.

Hence, antagonists of sex steroids may produce greater therapeutic results than therapy which only inhibits sex steroid production. Prior art antagonists, however, often have insufficient affinity for receptors, and some, although capable of binding the receptors, may themselves act as agonists and undesirably activate the very receptors they are intended to shield from activation.

There is, therefore, a need in the art for antiestrogens which effectively block estrogen receptors with minimal or no agonistic effect. In Wakeling and Bowler, "Steroidal Pure Antioestrogens", J. Endocrinol. 112: R7-R10 (1987), a steroid derivative is said to act as an antiestrogen but to exhibit some estrogen activity. The net effectiveness of a compound is effected by both its agonistic (undesirable) and antagonistic (desirable) activities.
In U.S. Patent 4,094,994, it is disclosed that the use of certain antiestrogens may inhibit certain human breast tumor cells.

H. Mouridsen et al., Cancer Treatm. Rev. 5: 131-141 (1978), discloses that Tamoxifen, an antiestrogen, is effective in remission of advanced breast cancer in about 30 percent of the women patients treated.

The combined use of the antiestrogen Tamoxifen and a luteinizing hormone-releasing hormone agonist, Buserelin, is also known for treatment of breast cancer. See, for instance, Klijn et al. J. Steroid Biochem. 420: no. 6B, 1381 (1984). The objective remission of such cancers, however, remains unacceptably low.

It has been found that certain 7α-substituted derivatives of estradiol, for example a 7α-(CH₂)₁₀CONMeBu substitution possess antiestrogenic activity (Bowler et al., 1985; Eur. Patent Application 0138504; Wakeling and Bowler, J. Steroid Biochem. 30: 141-147 (1988). See also US patent 4,659,516. The substitution (CH₂)₉SOC₅H₆F₅ has also been used on certain compounds (Wakeling et al., Cancer Res. 51: 3867-3873, 1991).

Estradiol derivatives bearing a carboxyalkyl substituent at the 7α-position maintained their affinity for the estrogen receptor when linked via their carboxy group to agarose or polyacrylamide resin for affinity chromatography purification of the estrogen receptor (Bucourt et al., J. Biol. Chem. 253: 8221, 1978).

Some steroid derivatives, such as 16-methylene estradiol and 16-methylene estrone, have been described as inhibitors of 17β-hydroxysteroid dehydrogenase activity (Thomas et al., J. Biol. Chem. 258: 11500, 1983).

Certain nonsteroidal compounds which are stated to have antiandrogenic effect are described by Furr et al., J. Endocrinol. 113: R7-R9 (1987).

U.S. Pat. No. 4,659,695 relates to a method of treatment of prostate cancer for susceptible male animals including humans whose testicular hormonal secretions are blocked by surgical or chemical means, e.g., by use of an LHRH agonist, e.g., [D-Trp$^6$, des-Gly-NH$_2^{10}$]LHRH ethylamide. The treatment includes administering an antiandrogen, e.g., flutamide in association with at least one inhibitor of sex steroid biosynthesis, e.g., aminoglutethimide and/or ketoconazole. See also PCT/U.S. 85/01454 (International Publication Number...
WO 86/01105) regarding combination therapy for treating hormonal-dependent cancers.

U.S. Pat. No. 4,472,382 relates to a method of treating prostate cancer using the combination of an antiandrogen and an LHRH agonist.

In U.S. Pat. No. 4,386,080 relates to new amide derivatives, and more particularly to novel acylanilides, possessing antiandrogenic properties.

In U.S. Pat. No. 3,995,060, U.S. Pat. No. 4,161,540 and U.S. Pat. No. 4,139,638, it is disclosed that certain 4'-substituted and 3',4'-disubstituted anilides have antiandrogenic properties.

For a number of years, researchers have attempted to develop compounds which can efficiently inhibit androgen and/or estrogen formation without causing adverse effects to healthy tissues. More particularly, the inhibition of 17β-hydroxysteroid dehydrogenase, which is involved in the biosynthesis of testosterone, androst-5-ene-3β,17β-diol and estradiol, has been studied by some workers. Some affinity-label inhibitors for human placental estradiol

Thomas J.L. et al., J. Biol. Chem. 258: 11500 (1983) have described that 16-methylene estradiol and 16-methylene estrone are inhibitors of 17β-hydroxysteroid dehydrogenase activity.

Prior art methods have not been completely effective in inhibiting sex steroid synthesis while avoiding undesirable side effects.

Von Angerer et al. discuss other antiestrogens in "1-(aminoalkyl)-2-phenylindoles as Novel Pure Estrogen Antagonists", J. Med. Chem. 1990; 33: 2635-2640. In U.S. Patent 4,094,994, where it is said that the use of certain antiestrogens inhibit certain human breast tumor cells. See also DE 3821148.

The European counterpart of priority applications 07/377,010 and 07/265,150 was published on May 9, 1990 as European Application No 0367576. The European Search report for that case disclosed the following publications:

As used herein, the term "sex steroid activity inhibitor" includes any compound which suppresses the activity of sex steroids by any mechanism including, for example, inhibition of sex steroid synthesis or antagonistic blocking of sex steroid receptors. "Androgen activity inhibitors" and "estrogen activity inhibitors" are sex steroid inhibitors capable of inhibiting the activity of androgens and estrogens, respectively. For example, estrogen activity inhibitors include, but are not limited to antiestrogens which block estrogen receptors, thereby making them unavailable to estrogen compounds which could otherwise activate those receptors. Sex steroid activity inhibitors also include compounds which inhibit the formation of compounds capable of activating sex steroid receptors such as inhibitors of the production of natural sex steroids (e.g. 17β-estradiol) or inhibitors of production of precursors of natural sex steroids. One mechanism by which these sex steroid production inhibitors may operate is by blocking enzymes which catalyze production of natural sex steroids or their precursors (e.g. inhibitors of enzymes such as aromatase, 17β-hydroxysteroid dehydrogenase, 3β-hydroxysteroid dehydrogenase and the like).
As used herein, the term "estrogenic nucleus" includes any compound which, in the absence of the side chain substituent specified herein, is capable of acting as an estrogen as determined by a weight increase of at least 100 percent over a seven-day period of the uterus of ovariectomized rats treated with the compound in question (0.5 mg twice daily per 100 grams of body weight) versus a control group of ovariectomized rats. Treatment should start on the day of castration. The precise test, other than any parameters set forth in this paragraph, is that reported in Simard et al., Mol. Endocrinol. 2: 775-784 (1988).

The following conventions apply to structural formulae set forth herein. Unless specifically designated to the contrary, substituents may have either α or β stereochemistry or, where valence permits may represent one substituent in α position and another in β position. Presence of optional pi bonds are independent of each other. All structures include salts thereof. Atoms of any estrogenic nucleus for which no substituent is shown or described may optionally be substituted or unsubstituted so long as such substitution does not prevent the nucleus from functioning as an "estrogenic nucleus" as defined herein. Those atoms having a defined substituent may optionally be further substituted by other substituents where their valence permits such further substitution. As used herein, the term "lower", when describing a chemical moiety means a moiety having 8 or fewer atoms. For instance, a "lower alkyl" means a C₁ to C₈ alkyl. Any moiety of more than two atoms may be straight- or branched-chain unless otherwise specified.
BRIEF DESCRIPTION OF DRAWINGS

Figure 1 illustrates a competition binding assay of the affinity of estradiol, diethylstilbestrol, ICI 164384 (Wakeling, A.E. and Bowler, J., 1987; J. Endocrinol. 112: R7-R110) and EM-142 (an antiestrogen having a nonsteroidal nucleus and synthesized in example 1, herein) for the rat uterine cytosol receptor (Asselin et al., 1978; J. Steroid Biochem. 9: 1079-1082).

Figure 2 illustrates the effect of the indicated doses of EM-142 injected twice daily (b.i.d.) on uterine weight (mg) in adult female ovariectomized Balb/C mice treated for 4.5 days in the presence or absence of simultaneous treatment with 17β-estradiol (0.01 µg, b.i.d.).

Figure 3 illustrates the effect of the administration of EM 139 on uterine weight (mg) in adult ovariectomized mice. The compound was administered twice daily (b.i.d.) at the indicated doses for 4.5 days in the presence or absence of 17β-estradiol (0.01 µg, b.i.d.) via the subcutaneous route.

Figure 4 is a graph illustrating that the antiestrogen which is the subject of Figure 3 is also a good inhibitor of sex steroid synthesis.

Figure 5 illustrates the comparative inhibitory activity of increasing concentration of EM 343 (---) and EM 312 (o-o) on the growth of human breast cancer ZR-75-1 cells stimulated by 17β-estradiol. The respective IC50 values are calculated at 2.55 x 10^-10M for EM 343 and 8.43x10^-10M for EM 312, thus indicating a 3-fold higher activity for EM 343.

When a sex steroid nucleus is substituted with the side chain $R^1[-B-R^2_x]_L-L$, it is preferred that the side chain have between about 7 and 30 carbon atoms and that $L$ be separated from the nucleus by at least 3 intervening and preferably 6 atoms. In some embodiments, a polar moiety (G, L or both) is preferably separated from the nucleus by at least 8 intervening atoms.

The following compound of the invention:

![Chemical Structure](image)

was synthesized and tested for its ability to inhibit the growth of ZR-75-1 human breast cancer cell line. The results are reported in Figure 5 as further discussed below.

The synthesis is described in Scheme A (page 66 herein) and Scheme 33 (page 183 herein). The synthesis of the compound 23 is described in Scheme A, and the starting materials and reagents were purchased from Aldrich Chemical Company Inc. (Milwaukee, Wis). Thus, the acid chloride 1 (20.0g; 0.1mol) was added dropwise to methanol (60ml) at room temperature and with stirring. The solution was refluxed for 1h. The solvent was removed under reduced pressure and the resulting oil was dissolved in ethyl acetate. The organic solution was washed with saturated sodium bicarbonate aqueous solution. The organic solution was dried (MgSO₄) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:9) to yield the compound 2 (Scheme A) (18.0g; 92%).
The above ester 2 (21.2g; 0.108mol) and the nitrile 3 (available from Aldrich Chemical Company Inc., Milwaukee, Wis.) (17.5ml; 0.129mol) were dissolved in benzene (750ml). The solution was refluxed and some benzene (100ml) was removed by means of a Dean Stark apparatus. The solution was left to cool down; then sodium ethoxide (9.2g; 0.135mol) was added. The resulting mixture was refluxed for 18h; it was washed with 1N hydrochloric acid aqueous solution. The organic solution was dried (MgSO₄) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:4) to yield compound 4 (23g; 69%). (δ NMR; 300MHz; solvent: CDCl₃; standard: TMS) 3.78 (3H; s; OMe) 3.84 (3H; s; OMe) 3.95 (3H; s; OMe) 5.84 (1H; s; O=C-CH-CN) 6.43 (1H; d; J 2.5Hz; CH phenyl) 6.54 (1H; dd; J 2.5Hz and 8.5Hz; CH phenyl) 6.89 and 7.35 (2H; AB system; J 8.5Hz; CH phenyl) 7.79 (1H; d; J 8.5Hz; CH phenyl).

A solution of the ketone 4 (37.8g; 0.12mol) in acetic acid (400ml) and concentrated hydrochloric acid aqueous solution (200ml) was kept at 90°C for 3h. The reaction mixture was neutralized with concentrated sodium hydroxide aqueous solution and it was extracted with ethyl acetate. The organic extract was dried (MgSO₄) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:9) to yield compounds 5 (17.0g; 49%) and 6 (6.6g; 20%).
Triphenol 23

To a mixture of the ketones 5 (17.0g; 59.4mmol) and 6 (6.6g; 24.3mmol) was added pyridine hydrochloride (90g). The mixture was heated at 220°C for 20min. 1N hydrochloric acid aqueous solution (250ml) was added and the resulting mixture was extracted several times with ethyl acetate. The organic extract was dried (MgSO₄) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 3:7) to yield compound 23 (14.1g; 69%).

The continuation of the synthesis of EM 343 is described below with reference to Scheme 33 (page 183).

Diether 24

To a mixture of the triphenol 23 (14.1g; 57.8mmol) in 3,4-dihydro-2H-pyran (200ml) at 0°C and with vigourous stirring was carefully added p-toluenesulfonic acid monohydrate (2.0g). The reaction mixture was stirred at 0°C for a further 1h. Ether (300ml) was added and the solution was washed with 1N sodium hydroxide aqueous solution. The organic extract was dried (MgSO₄) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:9) to yield compound 24 (23.4g; 98%). (δ NMR; 300MHz; solvent: CDCl₃; standard: TMS) 1.5-2.1 (12H; m; O-CH-CH₂-CH₂-CH₂-CH₂-O THP) 3.55-3.65 (2H; m; O-CH-CH₂-CH₂-CH₂-CH₂-O THP) 3.75-3.95 (2H; m; O-CH-CH₂-CH₂-CH₂-CH₂-O THP) 4.16
(2H; s; Ph-CH₂-C=O) 5.40 (1H; t; J 3Hz; O-CH₂-CH₂-CH₂-CH₂-CH₂-O THP) 5.49 (1H; t; J 3Hz; O-CH₂-CH₂-CH₂-CH₂-O THP) 6.55 (1H; dd; J 2.5Hz and 8.5Hz; CH phenyl) 6.61 (1H; d; J 2.5Hz; CH phenyl) 7.03 and 7.17 (2H; AB system; J 8.5Hz; CH phenyl) 7.77 (1H; d; J 8.5Hz; CH phenyl) 12.60 (1H; s; Ph-OH).

Chroman-4-one 25 (R=H) and Chalcone 26 (R=H)

To a mixture of the diether 24 (24.4g; 59.2mmol) and the aldehyde (OHCC₆H₄OH) (7.6g; 62.18mmol) in dry benzene (750ml) was added piperidine (500µl). The solution was refluxed for 48h and water was continuously removed by means of a Dean Stark apparatus. The solvent was removed under reduced pressure and the residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:9) to yield compounds 25 (R=H) (14.3g; 47%) and 26 (R=H) (8.4g; 27%). This last compound can be converted to compound 25 (R=H) by heating with sodium acetate in methanol.

EM 343

A mixture of compound 25 (R=H) (1.90g; 3.8mmol), 1-(2-chloroethyl)piperidine hydrochloride Cl(CH₂)₂NC₅H₁₀, HCl (1.18 g; 6.5 mmol) and sodium carbonate (0.97g; 9.1 mmol) in acetone (100 ml) was kept under reflux and with stirring for 48h. The precipitate was filtered off and washed thoroughly with acetone. The solvent was removed under reduced pressure and the residue was purified by chromatography on silica gel (hexanes:acetone; 7:3 + a few drops of triethylamine) to yield compound 25 (R=(CH₂)₂NC₅H₁₀) (1.57g; 66%). To a solution of compound 25 (R=(CH₂)₂NC₅H₁₀) (90mg; 143µmol) in ether (30ml) was added methylmagnesium iodide (3.0M solution in ether; 1.2ml; 3.6mmol) at 0°C and with stirring. The mixture was stirred for a further 3h. at room temperature, then washed with saturated ammonium chloride solution. The organic solution was dried (MgSO₄) and the solvent was removed under reduced pressure. The residue was quickly filtered through silica gel (ethyl acetate: acetone; 1:1) to afford compound 27 (R=(CH₂)₂NC₅H₁₀, Rₖ = CH₃)(90mg; 97%) which was used directly in the next reaction.

A solution of compound 27 (R=CH₂)₂NC₅H₁₀, Rₖ = CH₃) (90mg; 139µmol) in a mixture of acetic acid (60ml) and water (6ml) was kept at 100°C for 10min. The solvent was removed under reduced pressure and the residue was purified by chromatography on silica gel (ethyl acetate: acetone; 3:2) to yield compound 28 (EM 343, R=(CH₂)₂NC₅H₁₀, Rₖ = CH₃) (40mg; 62%). (δ NMR; 300MHz; solvent: CD₃OD; standard: TMS), 1.46 (2H; m; cyclo-N-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂) 1.60 (4H;

Mass Spectroscopy: M+ 459.

The product, EM 343, was then prepared for efficacy testing using the ZR-75-1 human breast cancer cell line.

**Maintenance of Stock Cell Cultures**

ZR-75-1 cells (83rd passage) were obtained from the American Type Culture Collection (Rockville, MD) and routinely cultured in phenol-red free RPMI 1640 supplemented with 1 nM E₂, 2 mM L-glutamine, 1 mM sodium pyruvate, 15 mM N-2-hydroxyethyl-piperazine-N’-2-ethanesulfonic acid, 100 IU penicillin/ml, 100 µg streptomycin/ml, and 10% (v/v) fetal bovine serum (HyClone, Logan, UT) under a humidified atmosphere of 95% air, 5% CO₂, at 37°C. All media and medium supplements were purchased from Sigma. Cells were subcultured weekly by treatment with a pancreatic solution containing 0.02% EDTA (w/v). The cell cultures used for the experiments herein described were between passages 89 and 94.
Measurements of Cell Proliferation

Cells in their logarithmic growth phase were harvested, briefly centrifuged, and resuspended in RPMI 1640. Cells were then plated in triplicate in LIMBRO 24-well plastic culture plates (2 cm²/well). Since plating density influences the effect of hormones on ZR-75-1 cell growth, cells were plated at a density of 1 x 10⁴ cells/well. After 72 h, medium was replaced with fresh medium of identical composition containing, in addition, the concentrations of steroids and/or inhibitors (e.g. EM 312 or EM 343) indicated along the X-axis of Figure 5. Control cultures received the ethanol vehicle only. Cells were then allowed to grow at 37°C for 10 days with medium changes (of identical composition) every 2 days. In absence of inhibitors, in 0.1 nM estradiol (E₂)-containing medium, ZR-75-1 cells have doubling time of about 48 h.

After E₂ and/or antiestrogen treatment, cells were harvested by addition of 0.5 ml of a pancreatin solution (Sigma) for 5-10 min at 37 °C before addition of 0.5 ml of RPMI 1640 containing 5% dextran-coated charcoal-fetal bovine serum in order to block enzymatic action. Cell number (0.10-ml aliquot) was determined by measurement of DNA content as previously described (Simard et al., Endocrinology 126: 3223-3231, 1990).

As may be seen from Figure 5, EM 343 provided extensive cell growth inhibition at low concentration. Half-maximal effectiveness occurred at a
concentration of $2.55 \times 10^{-10} M$. Without intending to be bound by theory, it is believed that the B-ring alkyl substitution utilized in certain preferred embodiments of the invention (e.g. the methyl substitution of EM 343) enhances effectiveness relative to compounds lacking such a substitution. For example, another species of the invention.

![Chemical Structure](EM 312)

reported by Saeed et al (J. Med. Chem. 33: 3210-3216, 1990) and Sharma et al. (J. Med. Chem. 33: 3216-3222 and 3222-3229, 1990) to have antiestrogenic activity underperformed EM 343 in comparative testing in our laboratory on the growth of human ZR-75-1 breast cancer cells, the IC$_{50}$ value of EM-312 being 3-fold higher at $8.43 \times 10^{-10} M$ (Fig. 5).

Set forth below are some flow charts description and illustration of a number of preferred synthesis schemes for certain preferred antiestrogens in accordance with the invention. The steps set forth below are set forth merely by way of example. Those of skill in the art will readily recognize alternative synthetic.
pathways and variations capable of producing a variety of antiestrogens and other sex steroid activity inhibitors in accordance with the invention.

Instrumentation

The IR spectra were taken on a Perkin-Elmer 1310 spectrophotometer. Proton NMR spectra were recorded on a Varian EM-160A (60 MHz, when specified) or a Varian XL-200 (MHz) instrument. The following abbreviations have been used: s, singlet; d, doublet; dd, doublet of doublet; t, triplet; q, quadruplet; and m, multiplet. Chemical shifts are reported in δ values in ppm relative to tetramethylsilane (TMS) as internal standard. Mass spectra (MS) were obtained on a V.G. Micromass 16F machine. Thin-layer chromatography (TLC) was performed on 0.25 mm Kieselgel 60F254 plates (E. Merck, Darmstadt, FRG). For flash chromatography, Merck-Kieselgel 60 (230-400 mesh A.S.T.M.) was used. All solvents used in chromatography have been distilled. Unless otherwise noted, starting material and reactant were obtained commercially and were used as such or purified by standard means. All solvents and reactants purified and dried were stored under argon. Anhydrous reactions were performed under an inert atmosphere, the set-up assembled and cooled under argon. Organic solutions were dried over magnesium sulfate, evaporated on a rotatory evaporator and under reduced pressure. Anhydrous solvents were prepared in the following way.

Instrumentation

IR spectra were obtained in a Perkin-Elmer spectrometer 1310. UV spectra were recorded in methanol on a Beckman DU-6 spectrometer. H-NMR spectra were obtained at 200 MHz on a Varian XL-200 spectrometer. Chemical shifts are reported in ppm units with tetramethysilane as internal standard. N-butyl, N-methyl-12,13-Bis (4-hydroxyphenyl)-12-pentadecenoic amide
(REM-142, compound 5 with x=10)

The synthesis of this compound is described in the scheme I (infra) where x=10.

12,13-Bis (4-methoxyphenyl)-11-pentadecenol (3)

4'-methoxy-2-ethyl,2-(4-methoxyphenyl) acetophenone (2) (710 mg, 2.5 mmol, prepared from desoxyanisoin, ethyl bromide and LDA by a known method) in THF (10 ml) were added, under argon, to Grignard reagent prepared from 11-bromo-tetrahydropyranyl undecanol (6.6 g, 19.7 mmoles) and magnesium
(0.6 g, 24.7 mmole) and THF (10 ml). The mixture was stirred for 18 hours, then acidified with 1N HCl and extracted three times with ether. The organic phase was washed with water (X3), dried over anhydrous magnesium sulfate, and evaporated under reduced pressure. The residue was chromatographed on Silica-gel (Kieselgel, 60F254, Merck, 0.063-0.200 mm, 100 g). Elution with a mixture of hexane-ethyl acetate (9:1 v/v) gave 12,13-Bis-(4-methoxyphenyl)-tetrahydropyran-1,12-diol (991 mg, 76%) as a mixture of diastereoisomers; colorless oil, IR νmax (neat) 3480, 1600 cm⁻¹; 'H-NMR (δ, CDCl₃): 0.62 (3H, t, J = 7.3 Hz, CH₂CH₃), 2.73 (1H, 2d, J=9.7 Hz, -CH₂CH₂CH₃), 3.25-4.00 (4H, m, -CH₂OCHOCH₂⁺), 3.76 and 3.79 (6H, 2s, -OCH₃), 4.57 (1H, t, J=1.1 Hz, -O₂-CH-CH₂) and 6.71-7.30 (8H, m, H-Ar) ppm. MS m/e = 523 (M⁺-H₂O).

The above diastereoisomers (920 mg, 1.8 mmol) dissolved in methanol (30 ml) and 5N HCl (5 ml) was refluxed for 1 hour, then collected, and extracted three times with ether. The organic layer was washed with water, dried over anhydrous magnesium sulfate, evaporated under reduced pressure to dryness and finally chromatographed on silica gel (Kieselgel, 60F254, 0.063-0.200 mm, Merck, 100 g). Elution was a mixture of hexane-ethyl acetate (7:3 v/v) gave 12,13-Bis(4-methoxyphenyl)-11-pentadecenol (3) (710 mg, 65% from compound 2), colorless oil, IR νmax (neat), 3340, 1600, 1030 cm⁻¹; UV ʎmax (log ε) = 231 (4.27) nm; 'H-NMR (δ, CDCl₃): 0.88 (3H, t, J = 7.3 Hz, -CH₂CH₃), 3.30 (1H, t, J = 9.7 Hz, -CH-CH₂CH₃), 3.63 (2H, t, J = 6.6 Hz, -CH₂OH), 3.76 and 3.78 (6H, 2s, -OCH₃),
5.51 (1H, t, J = 8.8 Hz, 1 -C = CH-) and 6.63-7.10 8H, m, H-Ar) ppm; MS m/e = 438 (M+).

N-butyl, N-methyl-12,13-Bis (4-methoxyphenyl)-11-pentadecenoic amide (4)

To a cooled solution of alcohol 3 (710 mg, 1.56 mmol) in acetone (17 ml) was added Jones' reagent (8N-chromic acid solution, 0.77 ml). After 30 minutes, isopropanol (5 ml) was added and the mixture was poured in water and extracted three times with ethyl acetate. The organic layer was washed twice with brine, dried over magnesium sulfate and evaporated to dryness. The crude 12,13-Bis (4-methoxyphenyl)-11-pentadecenoic acid was used in the next step without purification. To its solution in anhydrous methylene chloride (4 ml) at -10°C was added, under stirring, triisobutylamine (470 µl, 1.96 mmol) and isobutylchloroformate (280 µl, 2.1 mmol). After 40 minutes, N-methylbutylamine (1.5 ml) was added and the mixture was stirred at room temperature during 1 hour. Methylene chloride (50 ml) was added. The organic solution was washed with 1N HCl, saturated sodium bicarbonate solution and water (3X), dried on magnesium sulfate and evaporated to dryness. The residue was purified by "Flash chromatography" on silica gel (Kieselgel 60, Merck, under 0.063mm, 50 g). Elution with a mixture of hexane-ethyl acetate (4:1 v/v) gave N-butyl, N-methyl-12,13-Bis

N-butyl, N-methyl-12,13-Bis (4-hydroxyphenyl)-12-pentadecenoic amide
(EM-142, compound 5 with x = 10).

To the above dimethoxy amide 4 (117 mg, 0.22 mmol) in CH\(_2\)Cl\(_2\) (1 ml) at 0°C was added, under argon, 1.0 M borane tribromide (675 μl). The solution was stirred for 1 hour, then poured into water and extracted with ether (3x). The organic solution was washed with water, dried on magnesium sulfate, and evaporated to dryness. EXAMPLE 2

EFFECTIVENESS OF ANTIESTROGEN SYNTHESIZED IN EXAMPLE 1

EM-142 from example 1 was tested by competition binding on the rat uterine cytosol estrogen receptor with [³H] estradiol according to Asselin et al. (1976) procedure. Fig. 1 shows the binding affinity of EM-142 compared with estradiol, diethylstilbestrol and ICI 164384 (Wakeling and Bowler, 1987). (incubation was performed at 25°C for 3 hours). It can be seen that EM-142 is only 3 times less potent than 17β-estradiol itself while being more potent than the antiestrogen ICI 164384.

The antiestrogenic activity of EM-142 was measured in vivo by inhibition of the estradiol-induced stimulation of uterine weight in adult female ovariectomized Balb/c mice (body weight = 19-20 g) sacrificed five days after ovariectomy. EM-142, and/or estradiol contained in ethanol were injected subcutaneously in the appropriate groups in a solution of 0.9% (w/v) sodium chloride and 1% (w/v) gelatin at different concentrations in 0.2 ml for EM-142, twice daily, starting on the day of ovariectomy for a total of 9 injections. Estradiol was injected at the dose of 0.01 µg in 0.2 ml, twice daily, starting on the morning after ovariectomy for a total of 8 injections.

After sacrifice, the uteri were rapidly removed, freed from fat and connective tissue and weighted. Results shown in Fig. 2 are the means ± SEM of groups of
9-10 mice. It can be seen that the very low dose of 0.3 μg already has a significant inhibitory effect of an E₂-induced uterine growth and that a complete reversal of E₂ effect is obtained at higher doses. A half-maximal inhibitory effect is in fact observed at approximately 3 μg while, at the doses used, 20 μg causes a complete reversal of estrogenic action. Note that EM-142 has no estrogenic effect on uterine weight, thus demonstrating its potent antiestrogenic activity.

SYNTHESIS OF A STARTING COMPOUND, N-N-BUTYL, N-METHYL-11-(3'-
BENZOXYLOXY-17'-OXO-ESTRA-1',3',5'(10')-TRIEN-7'-YL) UNDECANAMIDE (9)
(SCHHEME 8, INFRA))

19-nor-testosterone-acetate 3-enolacetate (2)

In an apparatus supplied with a drierite drying tube, a solution of
19-nor-testosterone (10) (100 g; 0.365 mole) in acetic anhydride (200 ml), pyridine
(32 ml) and acetychloride (320 ml) was heated at reflux under magnetic stirring,
for 3 h and then concentrated to dryness under vacuum. The dry residue was
triturated in absolute ethanol, filtered and washed with little portions of
absolute ethanol. After drying, 19-nor-testosterone acetate 3-enolacetate was
obtained as a white powder (121.4 g, yield 93%) mp. 176-177°C. The structure
was confirmed by spectroscopic means.

17β-acetoxy-estra-4,6-dien-3-one (3)

To a cooled suspension of enolacetate (121 g; 0.337 mole) in a mixture of DMF
(330 ml) and water (7.2 ml) at 0°C was added, under nitrogen, over a period of 1
h, N-bromosuccinimide (63 g). The resulting solution was stirred for an
additional 0.5 h at 0°C. Then lithium carbonate (60.8 g) and lithium bromide (30.4 g) were added. The mixture was heated at 95°C for 3 h and then poured into 1.7 l of ice-cold water containing 165 ml of glacial acetic acid. After stirring during 15 hours, the crude 17β-acetoxy-estra-4,6-dien-3-one (3) was filtered, washed with water, dried in a desiccating apparatus and recrystallized twice from isopropyl ether (72 g, yield 68%, mp 110°C). The structure was confirmed by spectroscopic means.

7α-(11′-acetoxy-undecyl) 17β-acetoxy estra-4-en-3-one (4)

A. Preparation of reagents and solvents

11-bromo undecanol tetrahydro pyranyl ether

11-bromo-undecanol (100 g, 398 mmol) was dissolved in dry ether (768 ml) and the solution was cooled to 0°C using an ice/H2O bath. To this solution was added HCl gas (2.13 g, 58.4 mmol, 26 ml of HCl/ether).

To this mixture, a solution of 3,4-dihydro-2H-pyran (39.9 g, 43.3 ml) freshly distilled in dry ether (218 ml) was added over a period of 90 min. The solution was then stirred over a period of 16 hours at room temperature. Afterwards,
sodium bicarbonate was added to the mixture. The residue was filtered and the solvent was evaporated under vacuum.

The product was then filtered through basic alumina (250 g, Woelm, grade II) using petroleum ether (30-60) as solvent (112 g, 81%).

**B. Grignard reagent**

In a dry three-neck flask (1000 ml) under dry argon, magnesium (12.0 g, 494 mmol) was placed and activated with iodine. Magnesium was heated with the flame to remove iodine and to dry the apparatus. The system was then cooled to -20°C, and a solution of 11-bromo-undecanol tetrahydropyranyl ether (73.8 g, 211 mmol) in dry THF (420 ml) was added dropwise. The mixture was stirred under dry argon during one day at -20°C.

The mixture was cooled to -35°C (±2°C) using a dry ice/CCl₄/acetone bath. The anhydrous cuprous chloride (1.18 g, 12 mmol) was added and the mixture was stirred over a period of 0.5h.
C. Addition of Grignard reagent

After 0.5 h, using the same apparatus mentioned above (Ar, -35°C), a solution of 17β-acetoxy estra-4,6-diene-3-one (3) (32.0 g, 102 mmol) in dry THF (300 ml) was added dropwise over a period of 6 h to the Grignard reagent (red coloration appeared and disappeared). The mixture was stirred for an additional 1 h and, after removal the cooling bath, acidified (about 0°C) with acetic acid (40 ml), diluted with water and extracted with ether (3x). The ether solution was washed with a saturated sodium bicarbonate solution and water. The organic layer was dried over anhydrous magnesium sulfate and evaporated under reduced pressure to dryness.

The residue was dissolved in MeOH (660 ml) and 5N HCl (180 ml), refluxed for 1 h and 45 min, then concentrated under reduced pressure and cooled in an ice bath. The mixture was then filtered to remove the white precipitate. After the solution had been diluted with water and extracted with methylene chloride (3x), the organic layer was dried over anhydrous MgSO₄ and evaporated under reduced pressure to dryness. Finally, the product (55.9 g, brown oil) was chromatographed on silica gel (Kieselgel 60F254, Merck, 0.063-0.200 mm, 1500 g). Elution with mixtures of methylene chloride and ethyl acetate (4:1 to 1:2 v/v) and then pure ethyl acetate gave crude 7α-(11'-hydroxy-undecyl)-17β-hydroxy estra-4-en-3-one (34.8 g) which was dissolved in dry pyridine (200 ml) and dry
acetic anhydride (200 ml), stirred 17 hr at room temperature and then poured in ice-water. The product was extracted with methylene chloride (3X), washed with 1N hydrochloric acid, water, saturated sodium bicarbonate and water (3X), dried on anhydrous magnesium sulfate and filtered. After evaporation of solvent, the mixture (35 g) of 7α- and 7β-diacetoxyenones and degradation products of Grignard reagent were separated by flash chromatography on silica gel (Kieselgel 60, Merck, 230 mesh ASTM, 2.0 kg) developed with a mixture of hexane and diethyl ether (2:3 v/v). The first product eluted was pure amorphous 7α-(11'-acetoxy undecyl) 17β-acetoxy-estra-4-en-3-one (4) (20.8 g, 39.4 mmol, yield from dienone was 39.0%). Further elution gave the 7β-isomer (5) (5.4 g, 10.3 mmol, 10%). All structures were determined by spectroscopic means.

7α-(11'-hydroxy-undecyl) estra-1,3,5(10)-trien-3,17β-diol (6a)

Under dry argon, a solution of 7α-(11'-acetoxy undecyl) 17β-acetoxy-estra-4-en-3-one (4) (17.0 g, 32.4 mmol) in dry acetonitrile (150 ml) was added rapidly to a suspension of cupric bromide (14.8 g, 66.2 mmol) and lithium bromide (2.89 g, 33.6 mmol) in warm acetonitrile (75 ml). The mixture was heated to reflux over a period of 30 min and stirred vigorously, and then cooled to room temperature. A saturated aqueous solution of sodium bicarbonate (50 ml) was added, and then the organic
compound was extracted with ethyl acetate (3x 150 ml). The organic layers were washed with water, dried over anhydrous magnesium sulfate, filtered and evaporated under vacuum to dryness. The residue was chromatographed on silica gel (Kieselgel 60F254 Merck 0.063-0.200 mm; 1000 g). Elution with hexane-ethyl acetate (1:1 v/v) gave the 7α-(11'-acetox-y-undecyl) estra-1',3',5'(10')-trien-3,17β-diol, 17β-acetate (6b) (8.51 g; 50.3%) and the starting product (1.33 g; 15%).

The above diacetate phenol (8.51 g, 16.2 mmol) was dissolved in methanol (90 ml) and sodium hydroxyde 30% (w/v) (9 ml). The mixture was refluxed for 90 min under dry nitrogen. The solution was then concentrated under vacuum and diluted with hydrochloric acid (10%, v/v). The mixture was extracted using ethyl acetate (4 x 150 ml) and the ethyl acetate extract was washed with water, dried over anhydrous magnesium sulfate, filtered and evaporated under vacuum. The evaporation gave 7α-(11'-hydroxy undecyl) estra-1,3,5(10)-trien-3,17β-diol (6a) (6.99 g, 98% brut) as a yellow foam, the structure of which was confirmed by spectroscopic means.

3-benzoyloxy 7α-(11'-hydroxy undecyl) estra-1,3,5(10)-trien-17β-ol (7)

The above triol (6.99 g; 15.8 mol) was dissolved in acetone (25 ml) and an aqueous solution of sodium hydroxyde (1N, 19.1 ml). The mixture was cooled
to 0°C using an ice/water bath. Benzoyl chloride (2.22 ml, 19.1 mmol) was then added dropwise. The mixture was stirred for 40 min at 0°C and then diluted with water. The solution was extracted using ethyl acetate (3X) and the organic layers were washed with a saturated aqueous solution of sodium bicarbonate and finally with water. The ethyl acetate solution was dried over anhydrous magnesium sulfate, filtered and evaporated under vacuum to dryness. Then, the residue was immediately chromatographed on silica gel (Kieselgel, 60F254, 0.063-0.200 mm; 500 g). The chromatography was carried out, first, using methylene chloride as solvent (about 1 liter) and secondly the pure 3-benzoyloxy-7α-(11'-hydroxy undecyl) estra-1,3,5(10)-trien-17β-ol (7), colorless oil (6.50 g, 75%) was eluted with methylene chloride-ethyl acetate (5:1 about 1 liter and 4:1; v/v). The structure was confirmed by spectroscopic means.

11-(3-benzoyloxy-17'-oxo-estra-1',3',5'(10)-trien-7'α-yl) undecanoic acid (8)

To a cooled solution of 3-benzoyloxy-7α-(11'-hydroxy undecyl) estra-1,3,5(10)-trien-17β-ol (7) (4.3 g) in acetone (100 ml) was added dropwise Jone's reagent (8N-chromic acid solution, 6.7 ml). After 30 min, isopropanol (40 ml) was added and the mixture was concentrated under vacuo. Water was added and the mixture was extracted four times with ethyl acetate. The organic layers were washed twice with brine, dried over magnesium sulfate and evaporated to
dryness. The crude 11-(3'-benzoyloxy-17'-oxo-estra-1',3',5'(10')-trien-7'α-yl) undecanoic acid (8) (3.94 g) was used in the next step without purification.

To 11-(3'-benzoyloxy-17'-oxo-estra-1',3',5'(10')-trien-7'α-yl) undecanoic acid (8) (3.94 g, 7.22 mmol), dissolved in anhydrous CH₂Cl₂ (100 ml) and cooled at -10°C was added tributylamine (2.18 ml, 9.15 mmol) and isobutylchloroformate (1.30 ml, 10.0 mmol). The solution was stirred during 35 min. and N-methylbutylamine (13 ml, 109.7 mmol) was added. The mixture was warmed to room temperature and stirred during 1 h. Afterward, CH₂Cl₂ was added and the organic phase was washed with 1N HCl, water, saturated sodium bicarbonate solution and finally with water, dried with anhydrous MgSO₄ and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel. Elution with mixture of EtOAc/hexane (1.5:8.5 v/v) yielded N-butyl, N-methyl-11-(3'-benzoyloxy-17'-oxo-estra-1',3',5'(10')-trien-7'α-yl) undecanamide (9a) (4.25 g, 96%) as colorless oil; IR ν (neat) 1750, 1725 and 1640 cm⁻¹. undecanamide (10)

The ketone amide 9b (163 mg, 0.50 mmol) was dissolved in isoprenyl acetate (10 ml). p-toluenesulfonic acid (44 mg) was then added and the solution was distilled to about two-thirds of the original volume in 7 h and was then stirred at reflux for 12 h. Afterwards, the solution was cooled with an ice-water bath and extracted with 50 ml of cooled ether. The ether was washed with a cooled saturated sodium bicarbonate and water. The organic phase was dried with anhydrous MgSO₄ and the solvent was removed under reduced pressure. The residue was filtered through alumina (15 mm x 50 mm alumina Woehlm neutral, activity II) using a mixture of benzene-diethyl ether (3:7 v/v) as eluant. The solvent was removed under reduced pressure and, the residue was purified by flash chromatography on silica gel. Elution with mixture of EtOAc/hexane (1:4 v/v) yielded the N-butyl, N-methyl-11-(3',17β-diace toxy-estra-1',3',5'(10'),16'-tetraen-7α-yl) undecanamide (10) (244 mg, 80%) as colorless oil; ¹H-NMR δ (CDCl₃) 0.92 (s,3H,18'-CH₃), 0.92 and 0.95 (2t,3H-3',J=7.0 Hz,N(CH₂)₃CH₃), 2.18 (s,3H,17'-OCOCH₃), 2.28(s,3H'-OCOCH₃), 2.76 app (d,1H,J=16.1 Hz, part of ABX system,6'-H), 2.90 and 2.96 (2s,3H,N-CH₃), 3.26 and 3.35 (2t,app,2H,J=7.6 Hz,N-CH₂-), 5.52 (m,1H,16'-H), 6.80 (broad s,1H,4'-H), 6.85 (dd,1H,J₁=9.1 Hz and J₂=3.0 Hz,2'-H), 7.27 (d,1H,J=9.1 Hz,1'-H); IR ν max(neat)

Efficacy of an Antiestrogen Synthesized in Accordance with Example 9

Compound "EM 139" shown in Scheme 9 above is an estrogen activity inhibitor. "EM 139" has been tested both for efficacy in acting as an antiestrogen by blocking estrogen receptors without substantially activating those receptors (see Figure 3), and for efficacy in inhibiting 17β-hydroxysteroid dehydrogenase (see Figure 4), an enzyme which catalyzes reactions involved in the synthesis of both androgens and estrogen (hereinafter referred to as "17β-HSD").

The antiestrogenic activity of "EM 139" was measured as its ability to inhibit the estradiol-induced stimulation of uterine weight in adult female ovariectomized Balb/c mice (body weight=19-20 g) sacrificed five days after ovariectomy. "EM 139", and/or estradiol dissolved in ethanol were injected subcutaneously in the appropriate groups in a solution of 0.9% (w/v) sodium chloride and 1% (w/v) gelatin at different concentrations of "EM 139" (as noted along the X axis of Figure 3). A dosage of 0.2 ml of the foregoing preparation, was administered twice daily, starting on the day of ovariectomy for a total of 9 injections. Estradiol was injected at the dose of 0.01 μg in 0.2 ml, twice daily, starting on the morning after ovariectomy for a total of 8 injections.

After sacrifice, the uteri were rapidly removed, freed from fat and connective tissue and weighed. Results shown in Figure 3 are the means ± SEM of groups
of 9-10 mice. As may be seen from Figure 3, EM 139 was highly effective in reducing estradiol-induced uterine weight gain.

To test the effect of "EM 139" on the inhibition of sex steroid formation, its effect on the 17β-hydroxysteroid dehydrogenase catalyzed conversion of estradiol to estrone was observed. The reaction was followed by monitoring formation of NADH (at 340 nm). The rate of conversion of cofactor NAD to NADH varies directly with the rate of estradiol conversion to estrone. The ability of "EM 139" to inhibit estrone production is indicative of its ability to inhibit the estrogen-forming reverse reaction because both reactions are catalyzed by 17β-hydroxysteroid dehydrogenase (Thomas et al., J. Biol. Chem. 258: 11500-11504, 1983). 17β-hydroxysteroid dehydrogenase (17β-HSD) was purified to homogeneity from human placenta. A reaction vessel was prepared containing 1 µg 17β-HSD, 5 mM NAD, 20 µM 17β-estradiol, and the concentrations of the test compound "EM 139" which are indicated along the X-axis of Figure 4 in 1.0 ml of a mixture of Tris-HCl (50 mM), EDTA (2 mM), NaN₃ (5 mM). The pH was 7.5. The reaction was allowed to proceed at 25°C for 15 min. Formation of NADH was measured at 340 nm. As shown by Figure 4, increasing concentrations of EM 139 significantly inhibited the reaction.

N-n-butyl, N-methyl-11-(3'-benzoyloxy-16'α-bromo-17'-ethylenedioxy-estra-1' 3',5'(10'), trien-7α-yl) undecanamide (13)

To the above ethylenedioxy amide 12 (370 mg, 0.55 mmol) in anhydrous tetrahydrofuran (10 ml) cooled at 0°C was added dropwise under argon, a solution of pyridinium bromide perbromide (406 mg, 1.36 mmol) in 7 ml of the same solvent. After stirring during 1.5 h at 0°C, sodium iodide (300 mg) was added and the solution was stirred for 25 min. Afterwards, a solution of sodium thiosulfate (10%, v/v, 10 ml) and pyridine (0.5 ml) was added and the mixture was stirred for an additional 4 h and then poured into water and extracted three times with ether. GENERAL PROCEDURE FOR ORTHO ESTER AND DI-THP HYDROLYSIS

The product with ortho ester and di-THP group (0.22-0.63 mmol) was dissolved in MeOH (80-120 mL) and p-toluenesulfonic acid (0.17-0.23 mmol) was added. The solution was stirred at room temperature for 2-3 h. Then, water was added, MeOH was removed under reduced pressure and residue was extracted with ethylacetate. After evaporation of solvent, the crude product was purified by column chromatography (hexane-ethylacetate / 5:5, v/v) to give ester compound with free hydroxyl group.

GENERAL PROCEDURE FOR HYDROLYSIS OF ESTER FOLLOWING BY AMIDE FORMATION

At a solution of ester (0.14-0.49 mmol) in MeOH (12-50 ml) was added aqueous solution of KOH 10% w/v (6-25 ml) and mixture was refluxed under argon atmosphere for 24 h. Thereafter, water was added and MeOH was evaporated under reduced pressure. The resulting solution was acidified with HCl and extracted with ethylacetate. Organic phase was washed with water, brine and dried over MgSO₄. Without purification, the crude carboxylic acid (IR acid band at 1700 and 2400-3600 cm⁻¹) was dissolved in dry CH₂Cl₂ (20-70 ml) and tributylamine (0.58-2.04 mmol). The mixture was cooled at -10°C, isobutyryl chloroformate (0.68-2.41 mmol) was added and allowed to react 30 min. At this time, N-methylbutylamine in excess (4.2-16.0 mmol) was added and the cooling bath was removed. After 2 h, CH₂Cl₂ was added and organic phase was washed with HCl (1N) and dried over MgSO₄. The solvent was removed and crude amide purified by column chromatography (hexane-ethylacetate/7:3, v/v).

Other sex steroid activity inhibitors in accordance with the invention may be synthesized by methods known in the art, by methods analogous to those set forth herein and modifying the syntheses set forth herein in a manner known in the art.
Without intending to be bound by theory, it is believed that diphenyl ethylene and diphenyl ethylene nuclei discussed herein contribute an enhanced affinity for the estrogen receptor. The ethylene version with the optional double bond present is preferred, as is a closed third ring which includes, in its sides the ethyl double bond and one side of one of the phenyl groups. The closed third ring is exemplified by the "B" ring, for example, of formulas XX and XXI below:

```

XX

```

Preferred side chains, which are believed to help provide antagonistic or inhibitory characteristics, include the R^[1-B-R^2] L-G and A'[(Y-A')]_uXR_{21} side
chains discussed and defined above. Preferred additional substituents to the nucleus are those whose presence facilitates synthesis or enhances stability of the compound, or its metabolic half-life without significantly retarding affinity for the receptor. Smaller substituents such as C₁-C₂ alkyl or alkylene groups or halogens may be used.

The R⁶ substituent of formula XX (the G³ substituent of formula XXI) is preferably either hydrogen or a C₁-C₃ hydrocarbon such as methyl, ethyl or propyl. Generally, this substitution location (e.g. the atom receiving R⁶ of formula XX or G³ of formula XXI) is the atom which is both (A) one atom away from the A-ring and (B) one of the two atoms which receives the optional double bond when it is present. In contrast, the preferred side chain (e.g. R¹(B-R²)LG of formula XX and R¹⁰⁰LG¹G² of formula XXI) is preferably substituted, as shown in formulas XX and XXI, at the atom which is both (A) one atom away from the optional pi bond and (B) one atom away from Z. It is believed that a lower hydrocarbon substitution at the R⁶ position of formula XX (the corresponding G³ of formula XXI or the R⁶ position of formula I) substantially enhances the effectiveness of an inhibitor.

While both the A and D rings may be unsubstituted, certain embodiments include hydroxy substitution on one or both of the A and D rings (especially at the 3 and/or 12 positions of formula XXI or the 3 and/or 10 positions of formula XX). Other preferred substituents to the A and D rings include
would be converted to hydroxy in vivo after the pharmaceutical is administered to a patient. Such substituents include, for example, methoxy, ethoxy or esters.
Set forth below are several preferred compounds for use in the pharmaceutical composition of the invention corresponding to the structure:

\( \beta \)-methoxytetralone 1 (0.254 g, 1.4 mmol in 5 ml of THF) was added to a refluxed mixture of (MeO)\(_2\)CO (2.8 mmol) and sodium hydride (38 mg) in THF (20 ml). The mixture was heated at reflux during the night, cooled, water (25 ml) was added and neutralized with 5% HCL and extracted with ether. The ether was washed with a cooled saturated sodium bicarbonate and water. The organic phase was dried with anhydrous MgSO\(_4\) and the solvent was removed under reduced pressure. The residue in THF (5 ml) was added to a mixture of sodium hydride (21 mg, 0.85 mmol) and R-I (CH\(_3\)I, 8.5 mmol) in THF (15 ml) and HMPA (1.7 mmol). The mixture was stirred during the night, water (25 ml) was added and neutralized with 5% HCL and extracted with ether. The ether was washed with a cooled saturated sodium bicarbonate and water. The organic phase was dried with anhydrous MgSO\(_4\) and the solvent was removed under reduced pressure and the compound 2 \((R_c=\text{CH}_3)\) was obtained in the yield of 80%.

The action of MeOCOCON (0.1 ml, 10 min at -78°C) on the compound 2 \((R_c=\text{CH}_3)\) (200 mg in 5 ml THF) in presence of LDA (lithium diisopropyl amine prepared from 0.13 ml diisopropyl amine and 1.6 M butyl lithium (0.6 ml) at -25°C, 30 min) and HMPA (0.15 ml) yield in 83% the compound 3 \((R_c=\text{CH}_3)\). To this compound (290 mg) in THF (20 ml) was added 35% potassium hydride (119 mg, 0.72 mmol) 18-crown-6 (24 mg, 0.06 mmol) and the mixture stirred 8 h at 25°C and then I(CH\(_2\))\(_8\)OTBDMS (657 mg, 1.9 mmol) was added and the mixture heated at reflux 6 h. The extraction with ethyl acetate yield the compound 4 \((n=8, R_c=\text{CH}_3)\) (98%). The decarboalkoxylation with lithium bromide in pyridine yield the compound 5 \((n=8, R_c=\text{CH}_3)\) which was treated by
the Grignard's reagent of 3-bromo-anisole followed by acidic treatment. The resulting compound 6 (n=8, R_c=CH_3) was converted into amide 7 (n=8, R_a=CH_3, R_b=C_4H_9, R_c=CH_3) Thus a cooled solution compound 6 (n=8, R_c=CH_3) (700 mg) in acetone (17 ml) was added Jones' reagent (8N-chromic acid solution, 0.77 ml). After 30 minutes, isopropanol (5 ml) was added and the mixture was poured in water and extracted three times with ethyl acetate. The organic layer was washed twice with brine, dried over magnesium sulfate and evaporated to dryness. The crude acid was used in the next step without purification. To its solution in anhydrous methylene chloride (4 ml) at -10°C was added, under stirring, triisobutylamine (470 µl, 1.96 mmol) and isobutylchloroformate (280 µl, 2.1 mmol). After 40 minutes, N-methylbutylamine (1.5 ml) was added and the mixture was stirred at room temperature during 1 hour. Methylene chloride (50 ml) was added. The organic solution was washed with 1N HCl, saturated sodium bicarbonate solution and water (3X), dried on magnesium sulfate and evaporated to dryness. The residue was purified by "Flash chromatography" on silica gel (Kieselgel 60, Merck, under 0.063mm, 50 g). Elution with a mixture of hexane-ethyl acetate gave the amide 7 (n=8, R_a=CH_3, R_b=C_4H_9, R_c=CH_3) (63%) The removal of the protection into compound 8 (EM 736, n=7, R_a=CH_3, R_b=C_4H_9, R_c=CH_3) is performed with pyridine-HCl.

The compound 6 (n=9, R_c=CH_3) is deprotected with pyridine-HCl and the phenol function is selectively protected as MOM derivative by treatment with CH_3 OCH_2Cl in pyridine. The esterification of the alcohol with PTSCI in pyridine gives the compound 9 (n=9, R_c=CH_3) which is transformed in sulfide 10 (n=9, R_a=C_5H_4F_5, R_c=CH_3) with sodium hydride and R_a SH. The oxidation with mCPBA and the acidic hydrolysis gives the sulfoxide 11 (EM 732, n=9, R_a=C_5H_4F_5, R_c=CH_3).

\( \beta \)-tetralone is alkylated with \((\text{MeO})_2\text{CO}\) and sodium hydride in THF at reflux followed the reaction of sodium hydride and RI \((\text{CH}_3\text{I})\) in THF and HMPA. The action of \(\text{MeOCOCN}\) in presence of LDA yield the compound 12 \((R_c=\text{CH}_3)\) which is alkylated into compound 13 \((R_c=\text{CH}_3)\) by \(\text{IC}_6\text{H}_4\text{OTHP}\) in presence of sodium hydride in THF and HMPA. The decarboxylation with lithium bromide in pyridine followed by the modification of the phenol function (acidic hydrolysis and reaction with Cl \((\text{CH}_2)_2\text{NC}_5\text{H}_{10}\) in presence of \(\text{K}_2\text{CO}_3\)) gives the ketone 14 \((R_aR_b=\text{C}_5\text{H}_{10})\) which is transformed into compound 15 \((R_aR_b=\text{C}_5\text{H}_{10})\) by reaction with the Grignard's reagent of Br \(\text{C}_6\text{H}_4\text{OTMS}\) in ether. The reaction of the o-tolualdehyde with the Grignard's reagent of BrCH₂C₆H₄OR₆ (R₆ = THP) followed by the oxidation of the resulting alcohol by PCC (pyridinum chlorochromate) gave the compound 19. The reaction with OHCC₆H₄O(CH₂)₂NC₅H₁₀ in presence of sodium hydride followed by bromination with N-bromosuccimide on presence of light in CCl₄ gave the enone 20 (R₄R₅ = -C₅H₁₀⁻). The product 21 (R₄R₅ = -C₅H₁₀⁻) is obtained by cyclisation with (L-Bu)₃SnH and AIBN (2'-2'-azobisisobutyronitrile) followed by reduction of the ketone with sodium borohydride and acidic removal of the protection and the alcohol function. The compound 22 (EM 735, R₄R₅ = -C₅H₁₀⁻, R₆=CH₃) was obtained by cyclisation with LDA followed by Grignard's reaction with alkyl bromide and acidic removal of the protection.

The compound 26 (R=H, Rc=H) was reduced with sodium borohydride in ethanol and a mixture of resulting compound (300mg; 0.6mmol), 4-(2-chloroethyl)morpholine hydrochloride (267mg; 1.4mmol) cesium carbonate (978mg; 3.0mmol) and potassium iodide (100mg; 0.6mmol) in N,N-dimethylformamide (10ml) was kept at 90°C and with stirring for 1h. Water was added and the resulting mixture was extracted several times with a mixture of ether and ethyl acetate (1:1). Drying (MgSO₄) and removal of solvent gave a waxy material that was purified by chromatography on silica gel (hexanes: ethyl acetate; 3:7 + a few drops of triethylamine) to yield the dehydrated derivitiv of the compound 27 (R=(CH₂)₂NC₄H₈O, Rc=H) (153mg; 41%).

A solution of above compound (153mg; 249μmol) in a mixture of acetic acid (60ml) and water (6ml) was kept at 100°C for 10min. The solvent was removed under reduced pressure and the residue was purified by chromatography on silica gel (ethyl acetate: acetone; 3:1) to yield compound 28 (EM-349, R=(CH₂)₂NC₄H₈O, Rc=H) (100mg; 90%). Thus the compound 27 (R=H, R_c=H) was reduced with sodium borohydride in
ethanol and a mixture of resulting compound (300mg; 0.6mmol), chloroacetic
acid, piperidyl amide (242mg; 1.5mmol) and cesium carbonate (978mg;
3.0mmol) in N,N-dimethylformamide (10ml) was kept at 90°C and with
stirring for 1h. Water was added and the resulting mixture was extracted
several times with ether. Drying (MgSO_4) and removal of solvent under
reduced pressure gave a gummy residue that was purified by chromatography
on silica gel (hexanes: ethyl acetate; 1:1) to yield compound 27
(R=CH_2CONC_5H_10, R_c=H) (127mg; 34%).

A solution of above compound (127mg; 203μmol) in a mixture of acetic acid
(10ml) and water (1ml) was kept at 100°C for 10min. The solvent was removed
under reduced pressure and the residue was purified by chromatography on
silica gel (ethyl acetate: hexanes; 1:1) to yield compound 28 (EM 350,

4-hydroxy-2-(4-benzoyloxyphenyl) acetophenone 35 prepared from the commercial desoxyanisoin (250 g)(hydrolysis of the methoxyl group with pyridine-HCl at 220 °C followed by the treatment with 120 ml of benzoyl chloride and 20g of dimethylaminopyridine in 2l of methylene chloride during 24h) is bromined as usual manner with bromine in acetic acid at room temperature and the residue was without purification treated overnight with dihydropyran (150 ml) and p-toluenesulfonic acid (10 g) in 2l of methylene chloride at 0 °C. The bromo-compound 36 is isolated (170 g) after flash chromatography on silica gel in using ethyl acetate /hexane mixture containing 0.1% triethylamine. This compound is treated for 10 min at room temperature with sodium methylate in methanol followed with 2-mercaptobenzyl triphenyl phosphonium salt 37 (obtained from reduced commercial thiosalicylic acid and triphenyl phosphine). The resulting mixture was heated at reflux for 3 h with sodium methylate in methanol and the compound 38 (95 g) is isolated after ether extraction and flash chromatography on silica gel with ethyl acetate /hexane mixture containing 0.1% triethylamine. The benzyl protection is hydrolysed with sodium carbonate in methanol-water solution at room temperature and a mixture of resulting compound, N,N, diethyl chloroethylamine HCl and cesium carbonate in N,N-dimethylformamide (20 ml) is kept at 90°C and with stirring for 12h, extracted several times with ether. Drying (MgSO₄) and removal of solvent under reduced pressure gives a gummy residue that is purified by chromatography on silica gel (hexanes: ethyl acetate; 1:1). The resulting compound in methanol (2 l) is heated at reflux with
p-toluenesulfonic acid (5 g) for 3 h. Extraction with ethyl acetate and flash chromatography with silica gel (hexanes: ethyl acetate) gives the compound 39 (EM 547) (68 g) of which structure was determined by spectroscopic means.

EXAMPLE 42

Scheme 36
The compound 40 obtained by acylation and methylation of the commercial m-anisidine is treated in a Friedel-Craft reaction with the 4-methoxyphenylacetoxy chloride 41 and AlCl₃. A mixture of resulted compound 42, the aldehyde 43 (R=THP) and piperidine in benzene is refluxed for 48h by means of a dean-stark apparatus. The solvent is removed under reduced pressure and the resulting oil is purified by chromatography on silica gel. The condensed compound 44 is transformed into compound 45 by alkalin treatment (KOH in methanol) and the protecting group R is remplaced by (CH₂)₂NC₅H₁₀ by the method described in example 33. The resulting compound 45 is treated with methylmagnesium iodide in THF followed by pyridine-HCl treatment to give compound 46 (EM 821, RₐRₕ=C₅H₁₀, Rₖ=CH₃).

The 4-methoxyphenylglycine 47 (prepared from commercial 4-hydroxyphenylglycine) is treated with (COCl)\(_2\). The resulting acid chloride 48 is used in a Friedel-Craft reaction on the 3-methoxybenzyl alcohol 49 in using aluminiumchloride as catalyst. The coupled compound 50 is treated with methyl magnesium iodide in THF followed by the treatment with p-toluenesulfonylchloride in pyridine and CH\(_2\)Cl\(_2\) and dimethylaminopyridine. The resulting compound 51 is heated and reduced with LiAlH\(_4\) into the compound 52. The alkylation with NaH and Br(CH\(_2\))\(_{10}\)CONC\(_4\)H\(_8\) in DMF gives the compound 53 (EM 877, R\(_a\)R\(_b\)=C\(_4\)H\(_8\)).
