WO 2015/150565 A1

Isoindolinone Compounds as GPR119 Modulators for the Treatment of Diabetes, Obesity, Dyslipidemia and Related Disorders

5

The present invention relates to isoindolinone compounds of the formula I

10 in which A, X, R1b, R1c, R2a, R2b, R2c, R3, R4, R30, Y and Z are defined as indicated below. The isoindolinone compounds I are GPR119 modulators and useful for the prevention and/or treatment of diabetes, obesity, dyslipidemia and related disorders. The invention furthermore relates to the use of isoindolinone compounds of the formula I as active ingredients in pharmaceuticals, and pharmaceutical compositions comprising

15 them.

GPR119 is a G-protein coupled receptor which is expressed predominantly in the beta cells of the pancreas and in the K- and L-cells of the intestine. In vitro studies have shown, that agonists of GPR119, via activation of the cAMP pathway in gut and

20 pancreas derived cell lines, mediate the secretion of GLP-1 and insulin respectively. This supports the hypothesis, that modulators of GPR119, agonists in particular, may have utility to treat diabetes and related disorders by augmenting the secretion of insulin and intestinal hormones like GIP, GLP-1 and PYY. As the secretion of insulin was found to be strictly glucose-dependent, induction of hypoglycemic episodes may largely be

25 avoided. Furthermore beneficial effects like reduced food intake may be expected from the release of intestinal peptides. Stimulation of the beta cell by activation of GPR119 may also improve beta cell function and beta cell mass. Studies of GPR119 agonists in rodents showed the predicted glucose lowering effects. For some such animal studies decreased food intake and weight loss was reported. Recently clinical trials with

GPR119 agonists added evidence for a positive impact on lipid parameters i.e. elevation of HDL together with lowering of LDL and triglycerides in humans.

WO2013/070463A2 discloses that GPR119 agonists may be used to treat abnormalities in blood lipids. In summary, modulators of GPR119, agonists in particular, may have
5 therapeutic utility in the prevention and/or treatment of metabolic disorders in mammals and especially in humans. Examples of such disorders and diseases include type 2 diabetes mellitus, type 1 diabetes mellitus, impaired glucose tolerance, insulin resistance, loss of beta cell function, hyperglycemia, hypercholesterolemia, dyslipidemia, hypertriglyceridemia, syndrome X, metabolic syndrome, obesity, fatty liver, steatosis,
10 steatohepatitis, cirrhosis, micro- and macrovascular disorders, high blood pressure, chronic low grade inflammation, retinopathy, neuropathy, nephropathy, atherosclerosis, coronary heart disease, endothelial dysfunction and bone-related diseases such as osteoporosis, rheumatoid arthritis or osteoarthritis.

15 Several modulators of GPR119 are known. For example WO2011146335 and WO2012037393 describe piperidiny-substituted lactams as GPR119 modulators. WO2010048149 describes heterocyclic modulators of GPR119 for the treatment of disease and their preparation. WO2004110994 describes the preparation of piperazinyl-aryloxy and piperazinyl-heteroaryloxy-N-aryl lactams as 5-HT_{1B} ligands.

20 It was an aim of the invention to provide novel compounds as active ingredients in pharmaceuticals.

It was another aim of the invention to provide novel compounds which will lower blood glucose in mammals and which are suitable for prevention and/or treatment of diabetes,
25 obesity, dyslipidemia and related disorders.

A further aim was to provide novel GPR119 modulators, especially agonists, which can be used therapeutically for the prevention and/or treatment of diabetes, obesity, dyslipidemia and related disorders.

10 Structural elements such as groups, substituents, hetero ring members, numbers or other features, for example alkyl groups, groups like R5, R5', R7, R7' etc., which can occur several times in the compounds of the formula I, can all independently of one another have at each occurrence any of the indicated meanings and can in each case be identical to or different from one another. For example, the alkyl groups in a dialkylamino group can be identical or different.

15

Herein, the terms "including" and "comprising" are used in their open, non-limiting sense. As used herein, the terms "(C₁-C₆)" and so forth refer to moieties having 1 to 6 carbon atoms and so forth, respectively. Within composed terms like "hydroxy-(C₀-C₄)-alkyl" the option "(C₀)-alkyl refers to a bond (i.e. in this case a directly bound hydroxy group), or in

20 case of an unsubstituted "(C₀)-alkyl" it refers to a hydrogen.

20

The term "alkyl", as used herein, refers to saturated, monovalent hydrocarbon radicals. The term "alkenyl", as used herein, refers to monovalent hydrocarbon radicals, which contain at least one carbon-carbon double bond, wherein each double bond can have

25 E- or Z-configuration. The term "alkynyl", as used herein, refers to monovalent hydrocarbon radicals, which contain at least one carbon-carbon triple bond. The alkyl, alkenyl and alkynyl groups can be linear, i.e. straight-chain, or branched. This also applies when they are part of other groups, for example alkyloxy groups (= alkoxy groups, O-alkyl groups), alkyloxycarbonyl groups or alkyl-substituted amino groups, or

30 when they are substituted. Depending on the respective definition, the number of carbon atoms in an alkyl group can be 1, 2, 3, 4, 5 or 6, or 1, 2, 3, or 4. Examples of alkyl are methyl, ethyl, propyl including n-propyl and isopropyl, butyl including n-butyl, sec-butyl, isobutyl and tert-butyl, pentyl including n-pentyl, 1-methylbutyl, isopentyl, neopentyl and tert-pentyl, hexyl including n-hexyl, 3,3-dimethylbutyl and isohexyl.

30

Double bonds and triple bonds in alkenyl groups and alkynyl groups respectively can be present in any positions. Examples of alkenyl and alkynyl are ethenyl, prop-1-enyl, prop-2-enyl (= allyl), but-2-enyl, 2-methylprop-2-enyl, 3-methylbut-2-enyl, hex-3-enyl, hex-4-enyl, prop-2-ynyl (= propargyl), but-2-ynyl, but-3-ynyl, hex-4-ynyl or hex-5-ynyl.

5 Substituted alkyl groups, alkenyl groups and alkynyl groups can be substituted in any positions, provided that the respective compound is sufficiently stable and is suitable for the desired purpose such as use as a drug substance. The prerequisite that a specific group and a compound of the formula I are sufficiently stable and suitable for the
10 desired purpose such as use as a drug substance, applies in general with respect to the definitions of all groups in the compounds of the formula I.

Independently of one another and independently of any other substituents, alkyl groups, divalent alkyl groups, alkenyl groups, alkynyl groups, cycloalkyl groups and
15 heterocycloalkyl groups are optionally substituted by one or more fluorine substituents which can be located in any positions, i.e., the said groups can be unsubstituted by fluorine substituents or substituted by fluorine substituents, for example by 1, 2 or 3, by 1 or 2, or by 1 fluorine substituents. Examples of fluorine-substituted said groups are trifluoromethyl, difluoromethyl and fluoromethyl.

20 The term "alkanediyl" or "alkylene", as used herein, refers to saturated, divalent hydrocarbon radicals. The term "alkenediyl", as used herein, refers to divalent hydrocarbon radicals, which contain at least one carbon-carbon double bond, wherein each double bond can have E- or Z-configuration. The term "alkynediyl", as used herein, refers to divalent hydrocarbon radicals, which contain at least one carbon-carbon triple
25 bond. As far as applicable, the preceding explanations regarding alkyl, alkenyl and alkynyl groups apply correspondingly to alkanediyl, alkenediyl and alkynediyl groups, which thus can likewise be linear and branched. Examples of divalent alkyl groups are -CH₂- (= methylene), -CH₂-CH₂-, -CH₂-CH₂-CH₂-, -CH₂-CH₂-CH₂-CH₂-, -CH(CH₃)-, -C(CH₃)₂-, -CH(CH₃)-CH₂-, -CH₂-CH(CH₃)-, -C(CH₃)₂-CH₂- and -CH₂-C(CH₃)₂-.

30 The term "cycloalkyl", as used herein, unless otherwise indicated, refers to a monovalent radical of a saturated hydrocarbon ring system, which is monocyclic. In a monocyclic cycloalkyl group the number of ring carbon atoms can be for example 3, 4, 5, 6, 7 or 8. In one embodiment of the invention, the number of ring carbon atoms in a

cycloalkyl group, independently of the number of ring carbon atoms in any other cycloalkyl group is 3, 4, 5 or 6, in another embodiment 3 or 4, in another embodiment 3, in another embodiment 5 or 6, in another embodiment 5, in another embodiment 6.

Examples of cycloalkyl groups are cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl.

- 5 The term “heterocycle”, as used herein, unless otherwise indicated, refers to a cycloalkyl as defined above, in which 1, 2, 3 or 4 carbon atoms are replaced by nitrogen or oxygen atoms, provided that the heterocycloalkyl system is stable and suitable as a subgroup for the desired purpose of the compound of the formula I such as use as a drug substance. Depending on the definition of the respective heterocyclic group, in one
- 10 embodiment of the invention the number of ring heteroatoms which can be present in a heterocyclic group, independently of the number of ring heteroatoms in any other heterocyclic group, is 1 or 2, in another embodiment 2, in another embodiment 1, wherein the ring heteroatoms can be identical or different. The heterocycloalkyl group can be attached by any ring carbon atom or saturated ring nitrogen atom, with the
- 15 exception of spiro- or bridgehead atoms.

Exemplary monocyclic heterocycloalkyl groups are derived from, but not limited to, the ring systems azetidine, oxetane, pyrrolidine, tetrahydrofuran, 1,3-dioxolane, piperidine, piperazine, morpholine, tetrahydropyran or 1,4-dioxane:

In one embodiment monocyclic heterocycloalkyl groups are derived from azetidine, pyrrolidine, piperidine, piperazine or morpholine:

The term “aryl”, as used herein, refers to a radical derived from an aromatic hydrocarbon by removal of one hydrogen, such as phenyl.

The term “heteroaryl” as used herein, refers to a radical derived from a fully unsaturated monocyclic ring system, in which 1, 2 or 3 carbon atoms are replaced by heteroatoms. The ring heteroatoms are generally chosen from N, O and S, wherein N includes ring nitrogen atoms which carry a hydrogen atom or a substituent as well as ring nitrogen atoms which do not carry a hydrogen atom or a substituent. Ring heteroatoms can be located in any position, provided that the heterocyclic system is stable and suitable as a subgroup for the desired purpose of the compound of the formula I such as use as a drug substance. Heteroaryl radicals are derived from 5-membered or 6-membered monocyclic rings.

Exemplary heteroaryl systems are derived from, but not limited to, the following ring systems: pyrrole, furan, thiophene, imidazole, pyrazole, oxazole (= [1,3]oxazole), isoxazole (= [1,2]oxazole), thiazole (= [1,3]thiazole), isothiazole (= [1,2]thiazole), [1,2,3]triazole, [1,2,4]triazole, [1,2,4]oxadiazole, [1,3,4]oxadiazole, [1,2,4]thiadiazole, [1,3,4]thiadiazole, pyridine, pyridazine, pyrimidine, pyrazine, [1,2,3]triazine, [1,2,4]triazine or [1,3,5]triazine:

Groups like phenyl and residues of aromatic heterocycles which are optionally substituted by one or more substituents, can be unsubstituted or substituted, for example by 1, 2 or 3, or by 1 or 2, or by 1, identical or different substituents which can be located in any positions. Aromatic nitrogen heterocycles which in the parent ring system carry a hydrogen atom on a ring nitrogen atom in a 5-membered ring, such as a pyrrole or imidazole ring, for example, can be substituted on ring carbon atoms and/or on such ring nitrogen atoms. In one embodiment of the invention, substituents on such ring nitrogen atoms are chosen from (C₁-C₄)-alkyl groups, i.e. such ring nitrogen atoms

in aromatic heterocycles carry a hydrogen atom or a (C₁-C₄)-alkyl substituent. When it is stated with respect to ring nitrogen atoms in aromatic heterocycles and any other heterocycles that they can carry a hydrogen atom or a substituent, such ring nitrogen atoms either carry a hydrogen atom or a substituent or they do not carry a hydrogen atom or substituent. Ring nitrogen atoms which carry a hydrogen atom or a substituent, occur in a nitrogen-containing aromatic 5-membered ring as is present in pyrrole or imidazole for example, and in a non-aromatic ring including a saturated ring. Ring nitrogen atoms which do not carry a hydrogen atom or a substituent unless they are present in positively charged form, including any further ring nitrogen atoms in addition to ring nitrogen atoms which carry a hydrogen atom or a substituent, occur in an aromatic ring as is present in thiazole, imidazole or pyridine, for example, and in a non-aromatic ring in which they are part of a double bond, and they occur as ring nitrogen atoms via which a ring is bonded. Suitable ring nitrogen atoms in aromatic heterocycles in the compounds of the formula I, such as the ring nitrogen atom in a pyridine ring, can in general also be present as N-oxide or as quaternary salt, for example as N-(C₁-C₄)-alkyl salt such as N-methyl salt, wherein in one embodiment of the invention the counter anion in such quaternary salt is a physiologically acceptable anion which is derived from an acid that forms a physiologically acceptable salt.

In monosubstituted phenyl groups, the substituent can be located in the 2-position, the 3-position or the 4-position. In disubstituted phenyl groups, the substituents can be located in 2,3-position, 2,4-position, 2,5-position, 2,6-position, 3,4-position or 3,5-position. In trisubstituted phenyl groups, the substituents can be located in 2,3,4-position, 2,3,5-position, 2,3,6-position, 2,4,5-position, 2,4,6-position or 3,4,5-position.

Ring heteroatoms can be located in any positions, provided that the heterocyclic system is known in the art and is stable and suitable as a subgroup for the desired purpose of the compound of the formula I such as use as a drug substance. In one embodiment of the invention, two ring oxygen atoms cannot be present in adjacent ring positions of any heterocycle, in another embodiment two ring heteroatoms chosen from oxygen and sulfur cannot be present in adjacent ring positions of any heterocycle. Substituents on heterocyclic groups can be located in any positions. For example, in a pyridin-2-yl group substituents can be located in the 3-position and/or 4-position and/or 5-position and/or 6-position, in a pyridin-3-yl group substituent can be located in the 2-position and/or 4-

position and/or 5-position and/or 6-position, in a pyridin-4-yl group substituents can be located in the 2-position and/or 3-position and/or 5-position and/or 6-position.

When an oxo group is bonded to a carbon atom, it replaces two hydrogen atoms on a carbon atom of the parent system. Thus, if a CH₂ group in a chain or a ring is substituted by oxo, i.e. by a doubly bonded oxygen atom, it becomes a CO group. Evidently, an oxo group cannot occur as a substituent on a carbon atom in an aromatic ring such as in a phenyl group, for example.

The present invention includes all stereoisomeric forms of the compounds of the formula I and their salts and solvates. With respect to each chiral center, independently of any other chiral center, the compounds of the formula I can be present in S configuration or substantially S configuration, or in R configuration or substantially R configuration, or as a mixture of the S isomer and the R isomer in any ratio. The invention includes all possible enantiomers and diastereomers and mixtures of two or more stereoisomers, for example mixtures of enantiomers and/or diastereomers, in all ratios. Thus, compounds according to the invention which can exist as enantiomers can be present in enantiomerically pure form, both as levorotatory and as dextrorotatory antipodes, and in the form of mixtures of the two enantiomers in all ratios including racemates. In the case of a E/Z isomerism, or cis/trans isomerism, for example on double bonds or rings such as cycloalkyl rings, the invention includes both the E form and Z form, or the cis form and the trans form, as well as mixtures of these forms in all ratios. In one embodiment of the invention, a compound which can occur in two or more stereoisomeric forms is a pure, or substantially pure, individual stereoisomer. The preparation of individual stereoisomers can be carried out, for example, by separation of a mixture of isomers by customary methods, for example by chromatography or crystallization, by the use of stereochemically uniform starting materials in the synthesis, or by stereoselective synthesis. Optionally, a derivatization can be carried out before a separation of stereoisomers. The separation of a mixture of stereoisomers can be carried out at the stage of the compound of the formula I or at the stage of a starting material or an intermediate during the synthesis. The present invention also includes all tautomeric forms of the compounds of the formula I and their salts and solvates.

In case the compounds of the formula I contain one or more acidic and/or basic groups, i.e. salt-forming groups, the invention also includes their corresponding physiologically or toxicologically acceptable salts, i.e. non-toxic salts, in particular their pharmaceutically acceptable salts.

5

The present invention furthermore includes all solvates of compounds of the formula I, for example hydrates or adducts with alcohols such as (C₁-C₄)-alkanols, active metabolites of the compounds of the formula I, and also prodrugs and derivatives of the compounds of the formula I which in vitro may not necessarily exhibit pharmacological activity but which in vivo are converted into pharmacologically active compounds, for example esters or amides of carboxylic acid groups.

10

The compounds of the present invention can be widely combined with other pharmacologically active compounds, such as all drugs mentioned in the Rote Liste 2014, e.g. all antidiabetics mentioned in the Rote Liste 2014, chapter 12, all weight-reducing agents or appetite suppressants mentioned in the Rote Liste 2014, chapter 06, all lipid-lowering agents mentioned in the Rote Liste 2014, chapter 58, all antihypertensives mentioned in the Rote Liste 2014 chapter 17, all nephroprotectives mentioned in the Rote Liste, or all diuretics mentioned in the Rote Liste 2014, chapter 36.

The active ingredient combinations can be applied either by separate administration of the active ingredients to the patient or in the form of combination products in which a plurality of active ingredients are present in one pharmaceutical preparation. When administered separately, administration may occur simultaneously or sequentially, in any order. The amount of the compound of the invention and the other pharmaceutically active ingredient(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect. The administration of the combination may be concomitantly in: (1) a unitary pharmaceutical composition including all pharmaceutically active ingredients; or (2) separate pharmaceutical compositions each including at least one of the pharmaceutically active ingredients. Alternatively, the combination may be administered separately in a sequential manner wherein one treatment agent is administered first and the other second or vice versa. Such sequential administration may be close in time or remote in time.

In another aspect, this invention relates to the use of a compound according to the invention or a physiologically acceptable salt thereof combined with at least one of the active substances described above as a combination partner, for preparing a medicament which is suitable for the treatment or prevention of diseases or conditions which can be affected by binding to the GPR119 and modulating its activity. This is

preferably a disease in the context of the metabolic syndrome, particularly one of the diseases or conditions listed above, most particularly diabetes or obesity or complications thereof.

- 5 The use of the compounds according to the invention, or a physiologically acceptable salt thereof, in combination with one or more active substances may take place simultaneously, separately or sequentially.

10 The use of the compound according to the invention, or a physiologically acceptable salt thereof, in combination with another active substance may take place simultaneously or at staggered times, but particularly within a short space of time. If they are administered simultaneously, the two active substances are given to the patient together; if they are used at staggered times, the two active substances are given to the patient within a period of less than or equal to 12 hours, but particularly less than or equal to 6 hours.

15 Consequently, in another aspect, this invention relates to a medicament which comprises compounds according to the invention or a physiologically acceptable salt of such a compound and at least one of the active substances described above as combination partners, optionally together with one or more inert carriers and/or diluents.

20 The compounds according to the invention, or physiologically acceptable salt or solvate thereof, and the additional active substance to be combined therewith may both be present together in one formulation, for example a tablet or capsule, or separately in two identical or different formulations, for example as so-called kit-of-parts.

25 Compounds according to the invention can be administered to animals, in particular to mammals including humans, as pharmaceuticals by themselves, in mixtures with one another, or in the form of pharmaceutical compositions. The administration can be carried out orally, for example in the form of tablets, film-coated tablets, sugar-coated
30 tablets, granules, hard and soft gelatin capsules, solutions including aqueous, alcoholic and oily solutions, juices, drops, syrups, emulsions or suspensions, rectally, for example in the form of suppositories, or parenterally, for example in the form of solutions for subcutaneous, intramuscular or intravenous injection or infusion, in particular aqueous solutions.

Suitable pharmaceutical compositions for oral administration may be in the form of separate units, for example capsules, cachets, lozenges or tablets, each of which contains a defined amount of the compound of formula I; as powders or granules; as
5 solution or suspension in an aqueous or nonaqueous liquid; or as an oil-in-water or water-in-oil emulsion. These compositions may, as already mentioned, be prepared by any suitable pharmaceutical method which includes a step in which the active ingredient and the carrier (which may consist of one or more additional ingredients) are brought into contact. The compositions are generally produced by uniform and homogeneous
10 mixing of the active ingredient with a liquid and/or finely divided solid carrier, after which the product is shaped if necessary. Thus, for example, a tablet can be produced by compressing or molding a powder or granules of the compound, where appropriate with one or more additional ingredients. Compressed tablets can be produced by tableting the compound in free-flowing form such as, for example, a powder or granules, where
15 appropriate mixed with a binder, glidant, inert diluent and/or one (or more) surfactant(s)/dispersant(s) in a suitable machine. Molded tablets can be produced by molding the compound, which is in powder form and has been moistened with an inert liquid diluent, in a suitable machine.

20 Pharmaceutical compositions which are suitable for peroral (sublingual) administration comprise lozenges which contain a compound of formula I with a flavoring, typically sucrose, and gum arabic or tragacanth, and pastilles which comprise the compound in an inert base such as gelatin and glycerol or sucrose and gum arabic.

25 Coated formulations and coated slow-release formulations, especially acid- and gastric juice-resistant formulations, also belong within the framework of the invention. Suitable coatings resistant to gastric juice comprise cellulose acetate phthalate, polyvinyl acetate phthalate, hydroxypropylmethylcellulose phthalate and anionic polymers of methacrylic acid and methyl methacrylate.

30 Pharmaceutical compositions suitable for rectal administration are preferably in the form of single-dose suppositories. These can be produced by mixing a compound of formula I with one or more conventional solid carriers, for example cocoa butter, and shaping the resulting mixture.

Pharmaceutical compositions suitable for parenteral administration comprise preferably sterile aqueous preparations of a compound of formula I, which are preferably isotonic with the blood of the intended recipient. These preparations are preferably administered intravenously, although administration may also take place by subcutaneous,
5 intramuscular or intradermal injection. These preparations can preferably be produced by mixing the compound with water and making the resulting solution sterile and isotonic with blood. Injectable compositions of the invention generally contain 0.1 to 5% by weight of the active compound.

10 Other suitable administration forms are, for example, percutaneous or topical administration, for example in the form of ointments, creams, tinctures, sprays, powders or transdermal therapeutic systems, or inhalative administration, for example in the form of nasal sprays or aerosol mixtures, or forms such as microcapsules, implants or rods.

15 Pharmaceutical compositions suitable for topical use on the skin are preferably in the form of ointment, cream, lotion, paste, spray, aerosol or oil. The carriers used may be petrolatum, lanolin, polyethylene glycols, alcohols and combinations of two or more of these substances. The active ingredient is generally present in a concentration of 0.1 to 15% by weight of the composition, for example 0.5 to 2%.

20 Transdermal administration is also possible. Pharmaceutical compositions suitable for transdermal uses may be in the form of single patches which are suitable for long-term close contact with the patient's epidermis. Such patches suitably contain the active ingredient in an aqueous solution which is buffered where appropriate, dissolved and/or
25 dispersed in an adhesive or dispersed in a polymer. A suitable active ingredient concentration is about 1% to 35%, preferably about 3% to 15%. A particular option is for the active ingredient to be released by electrotransport or iontophoresis as described, for example, in Pharmaceutical Research, 2(6): 318 (1986).

30 Compounds according to the invention can additionally be used in systems for local drug delivery, for example in coated stents for preventing or reducing in-stent restenosis or by applying them locally by means of a catheter. The appropriate administration form depends, among others, on the disease to be treated and on its severity.

The dosing of compounds according to the invention to achieve the desirable therapeutic effect depends on a number of factors, for example the specific compound chosen, the intended use, the mode of administration and the clinical condition of the patient. The daily dose is generally in the range from 0.3 mg to 100 mg (typically from 3 mg to 50 mg) per day and per kilogram of body weight, for example 3-10 mg/kg/day. An intravenous dose may be, for example, in the range from 0.3 mg to 1.0 mg/kg, which can suitably be administered as infusion of 10 ng to 100 ng per kilogram and per minute. Suitable infusion solutions for these purposes may contain, for example, 0.1 ng to 100 mg, typically 1 ng to 100 mg, per milliliter. Single doses may contain, for example, 1 mg to 10 g of the active ingredient. Thus, ampoules for injections may contain, for example, from 1 mg to 100 mg, and orally administrable single-dose formulations, for example tablets or capsules, may contain, for example, from 1.0 to 1000 mg, typically from 10 to 600 mg. For prevention and/or treatment of the abovementioned conditions, the compounds of the formula I themselves may be used as the compound, but they are preferably present with a compatible carrier in the form of a pharmaceutical composition. The carrier must, of course, be acceptable in the sense that it is compatible with the other ingredients of the composition and is not harmful for the patient's health. The carrier may be a solid or a liquid or both and is preferably formulated with the compound as a single dose, for example as a tablet, which may contain 0.05% to 95% by weight of the active ingredient. Other pharmaceutically active substances may likewise be present, including other compounds of formula I. The pharmaceutical compositions of the invention can be produced by one of the known pharmaceutical methods, which essentially consist of mixing the ingredients with pharmacologically acceptable carriers and/or excipients.

Another subject of the present invention are processes for the preparation of the compounds of the formula I and their salts and solvates, by which the compounds are obtainable and which are outlined in the following.

Synthetic Methods

Variables in the formulae of the schemes represent moieties as defined above unless other meanings are given.

- 5 Detailed descriptions of the Typical Procedures to which reference is made in this section can be found in the Examples section.

Compounds of the invention having the formula I may be prepared by combining known synthetic procedures. In a first method 3-hydroxy-pyrrolidin-2-one (A') (commercially available as racemic mixture and in both enantiomeric forms) is coupled with bicyclic
 10 aryl halides B (typically Hal is Br or I) to provide intermediates C. An example for suitable coupling conditions (CuI, *N,N'*-dimethyl-ethane-1,2-diamine, cesium carbonate) can be found in the Typical Procedure 1. Conversion of the hydroxy group in C to a suitable leaving group (LG is for example Br, I, OTs or OPPh₃⁺) can be accomplished with various well known reagents (e.g. PPh₃/I₂, PPh₃/CBr₄, PPh₃/DIAD or TsCl/NEt₃)
 15 providing the intermediates D, which may be isolated or may be reacted without isolation with hydroxy-aryl building blocks of type E using an appropriate base (e.g. Na₂CO₃, K₂CO₃, Cs₂CO₃ or NaH). For example the conditions in the Typical Procedure 3 may be applied to couple intermediates C and E to provide compounds I.

A second method of synthesizing compounds I starts with a pyrrolidin-2-one substituted
 20 with a leaving group (LG) in 3-position (structures F), which may be prepared by reacting A' with the reagents mentioned above. Other procedures for making structures F are known (e.g. base-promoted cyclization of 2,4-dibromo-butamide). Intermediates

F may be isolated or generated in situ to react with hydroxy-aryls E (typically in the presence of a base as described above) to provide intermediates G. As a final step, for example copper-catalyzed coupling with aryl halides B provides the desired compounds I (Scheme 1).

5

Scheme 1.

Isoindolinones B (Hal = Br, A = CH₂) may be prepared by reaction of 5-bromo-2-bromomethyl-benzoic acid methyl esters (X = C-R_{1a}) or 5-bromo-2-bromomethyl-nicotinic acid methyl esters (X = N) with amines R₃₀-NH₂ (Scheme 2a).

10

Scheme 2a.

15

Alkylation of N-unsubstituted isoindolinones B (R₃₀ = H), for example with R₃₀-LG under the exemplary conditions given in Typical Procedure 2, gives access to further intermediates B as illustrated in Scheme 2b.

20

Scheme 2b.

Certain compounds I ($Y = N$; $Z = O, S, NR_6$) may be prepared by coupling aryl halides B with hydroxy-pyridines E ($Y = N$; $Z = O, S, NR_6$). Said hydroxy-pyridines E may be prepared by displacement of a halide (F, Cl, Br or I) in the 2-position of 5-bromo-2-halo-pyridines, which are substituted with R^{2a} , R^{2b} and R^{2c} , using nucleophiles of the type $HZ-R^3-R^4$ ($Z = O, S, NR_6$) followed by conversion of the 5-bromo-substituent to a hydroxy group (e.g. by oxidation of a boronate group introduced by palladium catalyzed coupling with bis-pinacolato-diboron). See Typical Procedure 6 for exemplary conditions for the nucleophilic displacement reaction, Typical Procedures 5 for examples of boronate-oxidation conditions, Typical Procedure 4 for an example of conditions to install a boronate group and Scheme 3 for illustration of the overall method.

A benzyl group ($R^3-R^4 = CH_2-Ph$) in compounds I ($Y = N, Z = O, S$) may be cleaved for example by hydrogenolysis to provide intermediates J, which may be alkylated by $LG-R^{3'}-R^{4'}$, $R^{3'}$ and $R^{4'}$ being defined like R^3 and R^4 respectively, to yield compounds I ($Y = N; Z = O, S$).

For example, the structure J may be a 2-hydroxy-pyridine ($Z = O$), which may be alkylated under Mitsunobu-conditions ($PPh_3/DIAD$; see for example Typical Procedure 3) starting with alcohols $HO-R^{3'}-R^{4'}$. Triphenylphosphine may be introduced into the reaction as polymer. DIAD may be replaced by other azodicarboxylates (e.g. DEAD). Alternatively, structures J may be reacted with alkyl halides as exemplified in Typical Procedure 10.

Scheme 3.

Certain other compounds of the invention may be prepared by reaction of hydroxy-pyrrolidinones C with 6-bromo-pyridin-3-ols under Mitsunobu-conditions and subsequent transition metal catalyzed replacement of the Br-atom by $\text{Z-R}^3\text{-R}^4$.

Variation of the order of the steps in the synthetic sequence provides further methods to prepare compounds I. For example intermediates F may be reacted with 6-bromo-pyridin-3-ols and subsequently the bromo-substituent may be exchanged for $\text{Z-R}^3\text{-R}^4$ to provide intermediates G ($\text{Y} = \text{N}$). In a last step, coupling with aryl halides B again provides compounds I ($\text{Y} = \text{N}$) as illustrated in Scheme 4.

Scheme 4.

Other derivatives of formula I (e.g. with R30 = CH₂COOH) can be obtained by cleaving the ester functionality in structures I (R30 = CH₂COO(C₁-C₆)-alkyl) for example using the conditions described in Typical Procedures 7a, 7b and 7c. Still other compounds I (R30 = CH₂CONR₁₄R₁₅) are provided by the reaction of said acids with amines of the structure HNR₁₄R₁₅ using for example EDCI as coupling reagent (see Typical Procedure 9 for exemplary conditions).

Deuterated solvents were used for NMR spectroscopy.

Examples

The following examples are particular embodiments of the invention. They partially illustrate the scope of the invention without limiting it.

Abbreviations and chemical symbols have their usual and customary meanings unless otherwise indicated.

The examples were prepared, isolated and analyzed by the procedures and methods given. Alternatively they may be prepared by the general synthetic methods detailed above. Further variations of the synthetic procedures may be proposed by a person skilled in the art.

When example compounds containing a basic group were purified by preparative HPLC on reversed phase column material and, as customary, the eluent was a gradient mixture of water and acetonitrile containing trifluoroacetic acid (TFA), they were obtained in part in the form of their addition salt with TFA, depending on the details of the workup such as evaporation or lyophilization conditions. In the names of the example compounds and their structural formulae any such TFA present is not specified.

Preparation of Examples 1

Example 1-01 (Typical Procedure 1)

The reaction of (*R*)-3-[6-(2-cyclopropyl-methoxy)-pyridin-3-yloxy]-pyrrolidin-2-one with 2-(5-bromo-1-methyl-3-oxo-1H-indazol-2(3H)-yl)-N,N-dimethylacetamide according to Typical Procedure 1 provided a crude mixture, which was separated by HPLC (column: Chiralcel OD-H/126, 4.6*250 mm; mobile phase: EtOH/MeOH 1:1 with 0.1% TFA; flow rate: 1.0 mL/min; column temperature: 30°C; UV wavelength: 224 nm) to provide examples 1-41 (R_t = 5.00 min), 1-26 (R_t = 6.89 min), 1-27 (R_t = 7.78 min) and 1-42 (R_t = 12.46 min).

Occasionally carboxylic acids (e.g. Examples 1-03 and 1-14, respectively) were obtained as additional products from the reaction mixture due to (partial) ester hydrolysis (for example in the reaction of methyl 2-(6-bromo-1-oxoisindolin-2-yl)propanoate and methyl 2-(5-bromo-1-methyl-3-oxoisindolin-2-yl)acetate, respectively, with (*R*)-3-[6-(2-cyclopropyl-methoxy)-pyridin-3-yloxy]-pyrrolidin-2-one according to Typical Procedure 1). The carboxylic acids obtained, can be converted to methyl esters (e.g. Examples 1-05 and 1-15, respectively) by dissolving the respective acid in DCM (5 mL/mmol) and methanol (0.5 mL/mmol) and addition of TMSCHN₂ (1.5 equiv.). After the gas evolution has ceased, the reaction mixture is evaporated to provide the desired methyl ester.

10 The biological activity of the compounds of the invention may be demonstrated by known in vitro assays. Examples include in vitro cellular assays for recombinant and non-recombinant GPR119 as described in the following.

Functional Cellular Assays Measuring GPR119-mediated cAMP Release

15 Compounds of the invention, which are agonists of GPR119, were characterized by functional assays measuring the cAMP response of HEK-293 cell lines stably expressing recombinant GPR119 from man, mouse or rat, or by using a hamster cell line HIT-T15 expressing GPR119 endogenously. The cAMP content was determined using a kit based on homogenous time-resolved fluorescence (HTRF) from Cisbio Corp.

20 (cat. no. 62AM4PEC). For preparation, cells were split into T175 culture flasks and grown to near confluency in medium (DMEM / 10% FCS for HEK-293 cells, and F-12K medium / 10% horse serum / 2.5% FCS for HIT-T15 cells, respectively). Medium was then removed and cells washed with PBS lacking calcium and magnesium ions, followed by proteinase treatment with accutase (Sigma-Aldrich, cat. no. A6964).

25 Detached cells were washed and resuspended in assay buffer (1 x HBSS; 20 mM HEPES, 0.1% BSA, 2 mM IBMX) and cellular density determined. They were then diluted to 400000 cells/mL and 25 μ L-aliquots dispensed to the wells of 96-well plates. For measurement, 25 μ L of test compound in assay buffer was added and incubated for 30 minutes at room temperature. After addition of HTRF reagents diluted in lysis buffer,

30 the plates were incubated for 1 hour, followed by measuring the fluorescence ratio at 665 vs. 620 nm. Potency of the agonists was quantified by determining the concentrations that caused 50% of the maximal response/activation (EC₅₀). See Table 7 for exemplary data obtained using the cell line expressing human GPR119.

Compounds of the invention show EC₅₀ values typically in the range of about 0.001 to 100 μ M, preferably from about 0.001 to 10 μ M, more preferably from about 0.001 to 1 μ M and most preferably from about 0.001 to 0.3 μ M.
