ENDOTHELIN RECEPTOR ANTAGONISTS

Field of the Invention

The present invention relates to novel pyrrolopyridazine and pyrrolopyrimidine derivatives, pharmaceutical compositions containing these compounds and their use as endothelin receptor antagonists.

Endothelin (ET) is a highly potent vasoconstrictor peptide synthesized and released by the vascular endothelium. Endothelin exists as three isoforms, ET-1, ET-2 and ET-3. [Unless otherwise stated "endothelin" shall mean any or all of the isoforms of endothelin]. Endothelin has profound effects on the cardiovascular system, and in particular, the coronary, renal and cerebral circulation. Elevated or abnormal release of endothelin is associated with smooth muscle contraction which is involved in the pathogenesis of cardiovascular, cerebrovascular, respiratory and renal pathophysiology. Elevated levels of endothelin have been reported in plasma from patients with essential hypertension, acute myocardial infarction, subarachnoid hemorrhage, atherosclerosis, and patients with uraemia undergoing dialysis.

In vivo, endothelin has pronounced effects on blood pressure and cardiac output. An intravenous bolus injection of ET (0.1 to 3 nmol/kg) in rats causes a transient, dose-related depressor response (lasting 0.5 to 2 minutes) followed by a sustained, dose-dependent rise in arterial blood pressure which can remain elevated for 2 to 3 hours following dosing. Doses above 3 nmol/kg in a rat often prove fatal.

Endothelin appears to produce a preferential effect in the renal vascular bed. It produces a marked, long-lasting decrease in renal blood flow, accompanied by a significant decrease in GFR, urine volume, urinary sodium and potassium excretion. Endothelin produces a sustained antinatriuretic effect, despite significant elevations in atrial natriuretic peptide. Endothelin also stimulates plasma renin activity. These findings suggest that ET is involved in the regulation of renal function and is involved in a variety of renal disorders including acute renal failure, cyclosporine nephrotoxicity, radio contrast induced renal failure and chronic renal failure.

Studies have shown that in vivo, the cerebral vasculature is highly sensitive to both the vasodilator and vasoconstrictor effects of endothelin. Therefore, ET may be an important mediator of cerebral vasospasm, a frequent and often fatal consequence of subarachnoid hemorrhage.

ET also exhibits direct central nervous system effects such as severe apnea.
and ischemic lesions which suggests that ET may contribute to the development of cerebral infarcts and neuronal death.

Further, endothelin has been found to be a potent constrictor of isolated mammalian airway tissue including human bronchus (Uchida et al., Eur. J. of Pharm. 154: 227-228 1988, LaGente, Clin. Exp. Allergy 20: 343-348, 1990; and Springall et al., Lancet, 337: 697-701, 1991). Endothelin may play a role in the pathogenesis of interstitial pulmonary fibrosis and associated pulmonary hypertension, Glard et al., Third International Conference on Endothelin, 1993, p. 34 and ARDS (Adult Respiratory Distress Syndrome), Sanai et al., Supra, p. 112.

Vol. 52, No. 4, pp. 743-746.

Endothelin stimulates both bone resorption and anabolism and may have a role in the coupling of bone remodeling. Tatrai et al., Endocrinology, Vol. 131, p. 603-607.

Thus, endothelin receptor antagonists would offer a unique approach toward the pharmacotherapy of hypertension, renal failure, ischemia induced renal failure, sepsis-endotoxin induced renal failure, prophylaxis and/or treatment of radiocontrast induced renal failure, acute and chronic cyclosporin induced renal failure, cerebrovascular disease, myocardial ischemia, angina, heart failure, asthma, pulmonary hypertension, pulmonary hypertension secondary to intrinsic pulmonary disease, atherosclerosis, Raynaud’s phenomenon, ulcers, sepsis, migraine, glaucoma, endotoxin shock, endotoxin induced multiple organ failure or disseminated intravascular coagulation, cyclosporin-induced renal failure and as an adjunct in angioplasty for prevention of restenosis, diabetes, preclampsia of pregnancy, bone remodeling, kidney transplant, male contraceptives, infertility and priapism and benign prostatic hypertrophy.

SUMMARY OF THE INVENTION

This invention comprises pyrrolopyrazine and pyrrolopyrimidine derivatives represented by Formula (Ia-Ic) and pharmaceutical compositions containing these compounds, and their use as endothelin receptor antagonists which are useful in the treatment of a variety of cardiovascular and renal diseases including but not limited to: hypertension, acute and chronic renal failure, cyclosporine induced nephrotoxicity, stroke, cerebrovascular vasospasm, myocardial ischemia, angina, benign prostatic hypertrophy, pulmonary hypertension, maigraine, heart failure.
atherosclerosis, and as an adjunct in angioplasty for prevention of restenosis.

This invention further constitutes a method of treatment of disease caused by an excess of endothelin, which comprises administering to an animal in need thereof an effective amount of a compound of Formula (Ia-Ic).

**DETAILED DESCRIPTION OF THE INVENTION**

The compounds of this invention are represented by structural Formula (Ia-Ic):

![Structural Formula](image)

wherein:

\[ R_1 \text{ is } -X(CH_2)_n Ar \text{ or } -X(CH_2)_nR_8 \text{ or} \]

![Structure (c)](image)

\[ R_2 \text{ is } Ar \text{ or (c);} \]

\[ P_1 \text{ is } -X(CH_2)_nR_8; \]

\[ P_2 \text{ is } -X(CH_2)_nR_8, \text{ or } -XR_9Y; \]

\[ R_3 \text{ and } R_5 \text{ are independently hydrogen, } R_{11}, \text{ OH, } C_1-galkoxy, \]

\[ S(O)_qR_{11}, N(R_6)_2, \text{ Br, F, I, Cl, CF}_3, \text{ NHCO}_6, -R_{12}CO_2R_7, -XR_9-Y \text{ or } -X(CH_2)_nR_8; \]

-4-
R₄ is hydrogen, R₁₁, OH, C₁₋₅alkoxy, S(O)ₐR₁₁,N(R₆)₂, -X(R₁₁).
Br, F, I, Cl or NHCOR₆ wherein the C₁₋₅alkoxy may be unsubstituted or
substituted by OH, methoxy or halogen;
5 R₆ is independently hydrogen or C₁₋₄alkyl;
R₇ is independently hydrogen, C₁₋₆alkyl or (CH₂)ₙAr;
R₈ is hydrogen, R₁₁, CO₂R₇, PO₃H₂, P(O)(OH)R₇, CN,
-C(O)N(R₆)₂, tetrazole or OR₆;
R₉ is C₁₋₁₀alkylene, C₂₋₁₀alkenylene or phenylene all of which
may be unsubstituted or substituted by one or more OH, N(R₆)₂, COOH, halogen
or
XC₁₋₅alkyl;
10 R₁₀ is R₃ or R₄;
R₁₁ is C₁₋₈alkyl, C₂₋₈alkenyl, C₂₋₈alkynyl all of which may be
unsubstituted or substituted by one or more OH, CH₂OH, N(R₆)₂ or halogen;
15 R₁₂ is C₁₋₈ alkyne; C₂₋₈ alkenylene or C₂₋₈ alkynylene;
X is (CH₂)ₙ, O, NR₆ or S(O)ₐ;
Y is CH₃ or -CH₂X(CH₂)ₙAr;
Ar is:

(a) [Diagram]

(b) [Diagram]
naphthyl, indolyl, pyridyl, thienyl, oxazolidinyl, oxazolyl, thiazolyl,
isothiazolyl, pyrazolyl, triazolyl, tetrazolyl, imidazolyl, imidazolidinyl,
thiazolidinyl, isoxazolyl, oxadiazolyl, thiazoazolyl, morpholinyl, piperidinyl,
piperazinyl, pyrrolyl, or pyrimidyl; all of which may be unsubstituted
or substituted by one or more R₃ or R₄ groups;
25 A is C=O, or (C(R₆)₂)ₘ;
B is -CH₂- or -O-;
q is zero, one or two;
30 n is an integer from 0 to six;
m is 1, 2 or 3;
and the dotted line indicates the optional presence of a double bond; or a
pharmaceutically acceptable salt thereof; provided that when the optional double
bond is present there is no P₁ or R₁₁, and further provided that P₁ and P₂ are not
methyl and P₁ and P₂ are not both hydrogen.

Also included in the invention are pharmaceutically acceptable salt
complexes.

All alkyl, alkenyl, alkynyl, alkoxy, alkylene, alkenylene and alkynylene
groups may be straight or branched. The term "halogen" is used to mean iodo,
fluoro, chloro or bromo. Alkyl groups may be substituted by one or more halogens
up to perhalogenation.

The compounds of the present invention may contain one or more
asymmetric carbon atoms and may exist in racemic and optically active form. All
of these compounds and diastereoisomers are contemplated to be within the scope
of the present invention.

Preferred compounds are those wherein R₁ is X(CH₂)ₙAr, (Ar is (a) or (b)),
dihydrobenzofuranyl, benzodioxanyl, cyclohexyl, or C₁₋₄alkyl; R₂ is (a), (b),
indolyl or hydrogen; R₃ and R₅ are independently hydrogen, OH, C₁₋₅alkoxy,
halogen, R₁₁CO₂R₇, C₁₋₄alkyl, N(R₆)₂, NH(CO)CH₃, -X(CH₂)ₙR₈, -or
S(O)₂C₁₋₅alkyl; R₄ is hydrogen, OH, C₁₋₅alkoxy, halogen, C₁₋₄alkyl, N(R₆)₂,
NH(CO)CH₃ or
S(O)₂C₁₋₅alkyl; P₁ and P₂ are independently hydrogen, CO₂H or tetrazole; Ar is
(a), (b), or pyridyl; X is (CH₂)ₙ or oxygen, and the double bond is present.

More preferred are compounds as above wherein R₃ is hydrogen or
-X(CH₂)ₙR₈, R₁₁CO₂R₇; R₄ and R₅ are independently hydrogen, OH, C₁₋₅alkoxy,
SC₁₋₅alkyl, F, Br, C₁₋₅alkyl or NH₂.

Most preferred are compounds wherein R₁ and R₂ are independently 3,4
methylenedioxyphenyl (substituted or unsubstituted by a C₁₋₃ alkoxy or chloro
group), phenyl substituted by one or two C₁₋₃ alkoxy, O(CH₂)ₙAr or
O-(CH₂)ₙ C(O) N(H)-SO₂-Ar groups wherein Ar is phenyl or pyridyl each of
which may be substituted by CO₂H; P₁ is hydrogen, P₂ is CO₂H; the pyrimidine
and pyrazine rings are unsubstituted and the double bond is present.
The present invention provides compounds of Formulae (Ia, Ib and Ic) above,

\[
\begin{align*}
\text{Ia} & \quad \text{R}_3 \quad \text{N} \quad \text{R}_1 \quad \text{R}_{10} \\
\text{Ib} & \quad \text{R}_3 \quad \text{N} \quad \text{R}_1 \quad \text{R}_{10} \\
\text{Ic} & \quad \text{R}_3 \quad \text{N} \quad \text{R}_1 \quad \text{R}_{10}
\end{align*}
\]

which can be prepared by a process which comprises:

a) for compounds in which the optional double bond is present and there is no \( R_{10} \) or \( P_1 \), reacting (as in this example for pyrrolo[3,2-d]pyrimidines) a compound of Formula (2),

\[
\begin{align*}
\text{R}_3 \quad \text{N} \quad \text{CH}_3 \\
\text{N} \quad \text{NO}_2
\end{align*}
\]

with the appropriate dialkyl oxalate in the presence of a base such as potassium ethoxide in a solvent such as tetrahydrofuran to provide a nitropyridine of formula (3).

\[
\begin{align*}
\text{R}_3 \quad \text{N} \quad \text{CO}_2X \\
\text{N} \quad \text{NO}_2
\end{align*}
\]
Reductive cyclization of compound (3) in the presence of a catalyst, such as palladium on carbon, in a solvent such as ethyl alcohol under an atmosphere of hydrogen provides a pyrrolopyrimidine of formula (4)

\[
R_3 \quad \begin{array}{c} \text{N} \\ \text{N} \\ \text{CO}_2X \\ \text{N} \\ \text{H} \end{array} \\
R_3
\]

(4)

wherein X is C1-5 alkyl. Reacting compound (4) with bromine in a suitable solvent such as dimethylformamide provides a bromopyrrolopyrimidine of Formula (5).

\[
R_3 \quad \begin{array}{c} \text{N} \\ \text{N} \\ \text{Br} \\ \text{CO}_2X \\ \text{N} \\ \text{H} \end{array} \\
R_3
\]

(5)

Coupling of Compound (5) with a boronic acid of formula (6):

\[
R_1 \quad \begin{array}{c} \text{B} \\ \text{OH} \\ \text{OH} \end{array}
\]

(6)

in the presence of a palladium (0) catalyst, such as tetrakis(triphenylphosphine)palladium (0), in a solvent such as toluene/methanol in the presence of a base such as aqueous sodium carbonate, at approximately 100°C, provides a pyrrolopyrimidine of Formula (7).

\[
R_3 \quad \begin{array}{c} \text{N} \\ \text{N} \\ \text{CO}_2X \\ \text{N} \\ \text{H} \end{array} \\
R_3
\]

(7)
Aryl boronic acids of Formula (6) may be prepared by transmetallation of aryl halides of Formula (8):

\[ \text{Ar} \quad \text{Hal} \]  
(8)

wherein Hal is Cl, Br or I, with an alkyllithium, such as n-butyllithium in a solvent such as dry tetrahydrofuran at low temperature (−40° to −78°C) followed by quenching with a trialkylborate, such as tri-isopropylborate, then treatment with an acid such as aqueous hydrochloric.

For compounds in which n is not 0, alkylation of a pyrrolopyrimidine of Formula (7) with an halide of Formula (9):

\[ R_2 \quad (\text{CH}_2)_n \quad \text{Hal} \]  
(9)

in a suitable solvent such as dimethylformamide or hexamethylphosphoramide in the presence of a suitable base such as sodium hydride affords compounds of Formula (10), n is not zero.
Saponification of esters of Formula (10) with aqueous sodium hydroxide in a solvent such as ethanol or isopropanol at reflux affords compounds of Formula (11), n is not zero.

\[ \text{Formula (11)} \]

Alternatively, compounds of Formula (7) may be obtained by coupling of compound (5) with an aryl stannane derivative of Formula (12):

\[ \text{Ar—SnX}_3 \]

(12)

in the presence of a palladium (0) catalyst such as tetrakis(triphenylphosphine)palladium (0) in a solvent such as dioxan or dimethylformamide at approximately 100°C in the presence of anhydrous lithium chloride. Aryl stannanes of Formula (12) may be prepared by transmetallation of aryl halides of Formula (8) with an alkyl lithium, such as n-butyl lithium, in a solvent such as tetrahydrofuran at low temperature (−40°C−78°C) followed by quenching with a trialkylchlorostannane of Formula (13).

\[ \text{Cl—SnX}_3 \]

(13)
b) As an alternative compounds of Formula (5) may be alkylated with an halide of Formula (9), n≠0 in a suitable solvent such as dimethylformamide or hexamethylphosphoramide in the presence of a suitable base such as sodium hydride to afford compounds of Formula (14), n is not O.

![Chemical Structure of Formula 14](image)

(14)

10 Coupling of Compound (14) with a boronic acid of formula (6) in the presence of a palladium (0) catalyst, such as tetrakis(triphenylphosphine)palladium (0), in a solvent such as toluene/methanol in the presence of a base such as aqueous sodium carbonate, at approximately 100°C, provides compounds of Formula (10) n is not zero.

15 As an alternative compounds of Formula (10), n is not zero, may be obtained by coupling of compound (14) with an aryl stannane derivative of Formula (12) in the presence of a palladium (0) catalyst such as tetrakis(triphenylphosphine)palladium (0) in a solvent such as dioxan or dimethylformamide at approximately 100°C in the presence of anhydrous lithium chloride.

c) As a further alternative, pyrrolopyrimidines and pyrrolopyrazines may be prepared (as in this example for pyrrolo[2,3-d]pyrimidines) by a process which comprises:

alkylation of an ester of acetoacetic acid (15)

![Chemical Structure of Formula 15](image)

(15)
with a halide of Formula (16)

\[ \text{R}_1 \text{CH}_2 \text{Hal} \]  

(16)

in a suitable solvent such as acetonitrile and a base such as 1,8
diazabicyclo[5.4.0]undec-7-ene to afford compounds of Formula (17).

Alternatively tetrahydrofuran may be used as the solvent and sodium hydride as the base for the alkylation.

\[ \text{O} \quad \text{O} \quad \text{OX} \]  

(17)

Treatment of a compound of type (17) with an aryl diazonium chloride of Formula (18)

\[ \begin{array}{c}
\text{N} \\
\text{N} \\
\text{R}_3 \end{array} + \text{N} \equiv \text{N} \quad \text{Cl}^- \]  

(18)

in a suitable solvent such as ethyl acetate in the presence of a base such as aqueous
sodium hydroxide solution affords, by Japp-Klingemann rearrangement,
hydrazones of Formula (19).

\[ \begin{array}{c}
\text{N} \\
\text{N} \\
\text{R}_3 \end{array} + \text{N} \equiv \text{N} + \text{CO}_2 \text{X} \]  

(19)
Thermal cyclisation of hydrazones of type (19) in a solvent such as ethylene glycol affords pyrrolo[2,3-b]pyrimidines of Formula (20)

\[
\begin{align*}
\text{R}_2 & \quad \text{R}_1 \\
\text{N} & \quad \text{N} \\
\text{N} & \quad \text{N} \\
\text{H} & \\
\text{CO}_2\text{X}
\end{align*}
\] (20)

which can be alkylated similarly to compound (7) to provide compounds of formula (21).

\[
\begin{align*}
\text{R}_2 & \quad \text{R}_1 \\
\text{N} & \quad \text{N} \\
\text{N} & \quad \text{N} \\
\text{(CH)}_n & \\
\text{R}_2
\end{align*}
\] (21)

d) Compounds of type (1a-1c) where \( n = 0-6 \) may be prepared as in this example for pyrrolo[2,3-c]pyrimidines by a process which comprises:

- treatment of a compound of Formula (22)

\[
\begin{align*}
\text{R}_2 & \quad \text{R}_1 \\
\text{N} & \quad \text{N} \\
\text{N} & \quad \text{N} \\
\text{(CH)}_n & \\
\text{R}_2
\end{align*}
\] (22)
with aqueous formaldehyde solution at reflux affords a product of Formula (23).

\[
\begin{array}{c}
  \begin{array}{c}
    \text{R}_3 \\
    \text{N} \\
    \text{N} \\
    \text{O} \\
    \text{N} \\
    \text{N} \\
    \text{N} \\
    \text{R}_3 \\
    (\text{CH}_2)_n \\
    \text{R}_2
  \end{array}
\end{array}
\]

(23)

Treatment of compounds of type (23) with aqueous potassium cyanide at approximately 40°-50°C, affords nitriles of Formula (24).

\[
\begin{array}{c}
  \begin{array}{c}
    \text{R}_3 \\
    \text{N} \\
    \text{N} \\
    \text{CO}_2\text{H} \\
    \text{N} \\
    \text{N} \\
    \text{CN} \\
    (\text{CH}_2)_n \\
    \text{R}_2
  \end{array}
\end{array}
\]

(24)

Hydrolysis of a nitrile of type (24) with aqueous sodium hydroxide at reflux followed by acidification with an acid such as hydrochloric affords diacids of Formula (25).

\[
\begin{array}{c}
  \begin{array}{c}
    \text{R}_3 \\
    \text{N} \\
    \text{N} \\
    \text{CO}_2\text{H} \\
    \text{N} \\
    \text{N} \\
    \text{CO}_2\text{H} \\
    (\text{CH}_2)_n \\
    \text{R}_2
  \end{array}
\end{array}
\]

(25)

Diesterification of compounds of type (24) is achieved by treatment with a suitable base such as 1,8 diazabicyclo[5.4.0]undec-7-ene in a solvent such as acetonitrile or
dimethylformamide followed by addition of iodomethane to afford compounds of Formula (26).

\[ R_3 \text{CO}_2\text{Me} \]
\[ R_3 \text{N} \text{N} \text{N} \text{N} \text{N} \text{N} \text{CO}_2\text{Me} \]
\[ \text{(CH}_2\text{)}_n \]
\[ R_2 \]

(26)

Dieckmann cyclization of diesters of type (26) using a base such as sodium methoxide and methanol as solvent at reflux affords products of Formula (27).

\[ R_3 \text{N} \text{N} \text{N} \text{N} \text{N} \text{N} \text{CO}_2\text{Me} \]
\[ \text{(CH}_2\text{)}_n \]
\[ R_2 \text{OH} \]

(27)

Treatment of compounds of type (27) with trifluoromethanesulfonic anhydride in pyridine as solvent affords triflates of Formula (28).

\[ R_3 \text{N} \text{N} \text{N} \text{N} \text{N} \text{N} \text{OSO}_2\text{CF}_3 \]
\[ \text{(CH}_2\text{)}_n \]
\[ R_2 \text{CO}_2\text{Me} \]

(28)

Compounds of Formula (21), X=Me, may be obtained by coupling of compound (28) with an aryl stannane derivative of Formula (12) in the presence of a palladium (0) catalyst such as tetrakis(triphenylphosphine)palladium (0) in a solvent such as dioxan or dimethylformamide at approximately 100°C in the presence of anhydrous lithium chloride.
As an alternative compounds of Formula (21), \( X=\text{Me} \), can be prepared by coupling of compound (28) with a boronic acid of formula (6) in the presence of a palladium (0) catalyst, such as tetrakis(triphenylphosphine)palladium (0), in a solvent such as toluene/methanol in the presence of a base such as aqueous sodium carbonate, at approximately 100\(^\circ\)C.

Saponification of compounds of Formula (21), \( X=\text{Me} \), to provides pyrrolo[2,3-d]pyrimidines-2-carboxylic acids of Formula (29) can be achieved by treatment with aqueous sodium hydroxide in a solvent such as ethanol or isopropanol at reflux.

\[
\begin{align*}
&\text{R}_9 \\
&\text{N} \\
&\text{N} \\
&\text{N} \\
&\text{CO}_2\text{H} \\
&\text{R}_3 \\
&(\text{CH}_2)_n \\
&\text{R}_2
\end{align*}
\]

(29)

With appropriate manipulation and protection of any chemical functionalities, synthesis of the remaining compounds of the Formula (Ia-Ic) is accomplished by methods analogous to those above and to those described in the Experimental section.

In order to use a compound of the Formula (Ia-Ic) or a pharmaceutically acceptable salt thereof for the treatment of humans and other mammals it is normally formulated in accordance with standard pharmaceutical practice as a pharmaceutical composition.

Compounds of Formula (Ia-Ic) and their pharmaceutically acceptable salts may be administered in a standard manner for the treatment of the indicated diseases, for example orally, parenterally, sub-lingually, transdermally, rectally, via inhalation or via buccal administration.

Compounds of Formula (Ia-Ic) and their pharmaceutically acceptable salts which are active when given orally can be formulated as syrups, tablets, capsules and lozenges. A syrup formulation will generally consist of a suspension or solution of the compound or salt in a liquid carrier for example, ethanol, peanut oil,
olive oil, glycerine or water with a flavouring or colouring agent. Where the
composition is in the form of a tablet, any pharmaceutical carrier routinely used for
preparing solid formulations may be used. Examples of such carriers include
magnesium stearate, terra alba, talc, gelatin, agar, pectin, acacia, stearic acid,
starch, lactose and sucrose. Where the composition is in the form of a capsule, any
routine encapsulation is suitable, for example using the aforementioned carriers in a
hard gelatin capsule shell. Where the composition is in the form of a soft gelatin
shell capsule any pharmaceutical carrier routinely used for preparing dispersions or
susensions may be considered, for example aqueous gums, cellulosics, silicates or
oils and are incorporated in a soft gelatin capsule shell.

Typical parenteral compositions consist of a solution or suspension of the
compound or salt in a sterile aqueous or non-aqueous carrier optionally containing a
parenterally acceptable oil, for example polyethylene glycol, polyvinylpyrrolidone,
lecithin, arachis oil, or sesame oil.

Typical compositions for inhalation are in the form of a solution, suspension
or emulsion that may be administered as a dry powder or in the form of an aerosol
using a conventional propellant such as dichlorodifluoromethane or
trichlorofluoromethane.

A typical suppository formulation comprises a compound of Formula (1a-
1c) or a pharmaceutically acceptable salt thereof which is active when administered
in this way, with a binding and/or lubricating agent, for example polymeric glycols,
gelatin, cocoa-butter or other low melting vegetable waxes or fats or their
synthetic analogues.

Typical transdermal formulations comprise a conventional aqueous or non-
aqueous vehicle, for example a cream, ointment, lotion or paste or are in the form
of a medicated plaster, patch or membrane.
Preferably the composition is in unit dosage form, for example a tablet, capsule or metered aerosol dose, so that the patient may administer to themselves a single dose.

Each dosage unit for oral administration contains suitably from 0.1 mg to 500 mg/Kg, and preferably from 1 mg to 100 mg/Kg, and each dosage unit for parenteral administration contains suitably from 0.1 mg to 100 mg, of a compound of Formula (Ia-Ic) or a pharmaceutically acceptable salt thereof calculated as the free acid. Each dosage unit for intranasal administration contains suitably 1-400 mg and preferably 10 to 200 mg per person. A topical formulation contains suitably 0.01 to 1.0% of a compound of Formula (Ia-Ic).

The daily dosage regimen for oral administration is suitably about 0.01 mg/Kg to 40 mg/Kg, of a compound of Formula (Ia-Ic) or a pharmaceutically acceptable salt thereof calculated as the free acid. The daily dosage regimen for parenteral administration is suitably about 0.001 mg/Kg to 40 mg/Kg, of a compound of the Formula (Ia-Ic) or a pharmaceutically acceptable salt thereof calculated as the free acid. The daily dosage regimen for intranasal administration and oral inhalation is suitably about 10 to about 500 mg/person. The active ingredient may be administered from 1 to 6 times a day, sufficient to exhibit the desired activity.

No unacceptable toxicological effects are expected when compounds of the invention are administered in accordance with the present invention.

The biological activity of the compounds of Formula (Ia-Ic) are demonstrated by the following tests:

I. Binding Assay
   A) Membrane Preparation (Rat cerebellum or kidney cortex)

   Rat cerebellum or kidney cortex were rapidly dissected and frozen immediately in liquid nitrogen or used fresh. The tissues, 1-2 g for cerebellum or 3-5 g for kidney cortex, were homogenized in 15 mls of buffer containing 20mM Tris HCl and 5mM EDTA, pH 7.5 at 4°C using a motor-driven homogenizer. The homogenates were filtered through cheesecloth and centrifuged at 20,000 x g for 10 minutes at 4°C. The supernatant was removed and centrifuged at 40,000 x g for 30 minutes at 4°C. The resulting pellet was resuspended in a small volume of buffer containing 50 mM Tris, 10 mM MgCl₂, pH 7.5; aliquotted with small vials and frozen in liquid nitrogen. The membranes were diluted to give 1 and 5 micrograms
of protein for each tube for cerebellum and kidney cortex in the binding assay.

Freshly isolated rat mesenteric artery and collateral vascular bed were
washed in ice cold saline (on ice) and lymph nodes were removed from along the
major vessel. Then, the tissue was homogenized using a polytron in buffer
containing 20 mM Tris and 5mM EDTA, pH 7.5 at 4°C in 15 ml volume for ~6 gm
of mesenteric artery bed. The homogenate was strained through cheesecloth and
centrifuged at 2,000 xg for 10 min. at 4°C. The supernatant was removed and
centrifuged at 40,000 xg for 30 min. at 4°C. The resulting pellet was resuspended as
explained above for cerebellum and kidney cortex. Approximately 10 micrograms of
membrane protein was used for each tube in binding experiments.

B) CHO Cell Membrane Preparation

CHO cells stably transfected with human ET<sub>A</sub> and ET<sub>B</sub> receptors
were grown in 245 mmx 245 mm tissue culture plates in Dulbecco's modified Eagle's
medium (DMEM) supplemented with 10% fetal bovine serum (FBS). The confluent
cells were washed with DPBS (Dulbecco's phosphate buffered saline) containing
protease inhibitor cocktail (5 mM EDTA, 0.5 mM PMSF, 5 ug/ml leupeptin, and 0.1
U/ml aprotinin) and scraped in the same buffer. After centrifugation at 800 xg, the
cells were lysed by freezing in liquid nitrogen and thawing on ice followed by
homogenization (30 times using glass dounce homogenizer) in lysis buffer containing
20 mM Tris HCl, pH 7.5 and the protease inhibitor cocktail. After an initial
centrifugation at 800xg for 10 min to remove unbroken cells and nuclei, the
 supernatants were centrifuged at 40,000xg for 15 min and the pellet was
resuspended in 50 mM Tris HCl, pH 7.5 and 10 mM MgCl<sub>2</sub> and stored in small
aliquots at -70°C after freezing in liquid N<sub>2</sub>. Protein was determined using BCA
method and bovine serum albumin as the standard.

C) [¹²⁵I]ET-1 Binding Protocol

[¹²⁵I]ET-1 binding to membranes from rat cerebellum (2-5 mg
protein/assay tube) or kidney cortex (3-8 micrograms protein/assay tube) or CHO
cell membranes (containing 4-6 and 1-2 micrograms of membrane protein for ET<sub>A</sub>
and ET<sub>B</sub> receptors, respectively) were measured after 60 minutes incubation at 30°C
in 50 mM Tris HCl, 10 mM MgCl<sub>2</sub>, 0.05% BSA, pH 7.5 buffer in a total volume of
100 microliters. Membrane protein was added to tubes containing either buffer or
indicated concentration of compounds. [¹²⁵I]ET-1 (2200 Ci/mmol) was diluted in
the same buffer containing BSA to give a final concentration of 0.2-0.5 nM ET-1.
Total and nonspecific binding were measured in the absence and presence of 100 nM unlabelled ET-1. After the incubation, the reactions were stopped with 3.0 ml cold buffer containing 50 mM Tris and 10 mM MgCl₂, pH 7.5. Membrane bound radioactivity was separated from free ligand by filtering through Whatman GF/C filter paper and washing the filters 5 times with 3 ml of cold buffer using a Brandel cell harvester. Filter papers were counted in a gamma counter with an efficiency of 75%. IC₅₀'s for the compounds of this invention range from 0.01 nm to 50 µM.

II. **In Vitro Vascular Smooth Muscle Activity**

Rat aorta are cleaned of connective tissue and adherent fat, and cut into ring segments approximately 3 to 4 mm in length. Vascular rings are suspended in organ bath chambers (10 ml) containing Krebs-bicarbonate solution of the following composition (millimolar): NaCl, 112.0; KCl, 4.7; KH₂PO₄, 1.2; MgSO₄, 1.2; CaCl₂, 2.5; NaHCO₃, 25.0; and dextrose, 11.0. Tissue bath solutions are maintained at 37°C and aerated continuously with 95% O₂/5% CO₂. Resting tensions of aorta are maintained at 1 g and allowed to equilibrate for 2 hrs., during which time the bathing solution is changed every 15 to 20 min. Isometric tensions are recorded on Beckman R-611 dynographs with Grass FT03 force-displacement transducer. Cumulative concentration-response curves to ET-1 or other contractile agonists are constructed by the method of step-wise addition of the agonist. ET-1 concentrations are increased only after the previous concentration produces a steady-state contractile response. Only one concentration-response curve to ET-1 is generated in each tissue. ET receptor antagonists are added to paired tissues 30 min prior to the initiation of the concentration-response to contractile agonists.

ET-1 induced vascular contractions are expressed as a percentage of the response elicited by 60 mM KCl for each individual tissue which is determined at the beginning of each experiment. Data are expressed as the mean ± S.E.M. Dissociation constants (Kᵦ) of competitive antagonists were determined by the standard method of Arunlakshana and Schild. The potency range for compounds of this invention range from 0.1 nM to 50 mm.
The following examples are illustrative and are not limiting of the compounds of this invention.

EXEMPLARY 1

3-(4-Methoxyphenyl)-1-(3,4-methylenedioxyphenylmethyl) pyrrolo[2,3-d] pyrimidine-2-carboxylic acid

a) Ethyl 2-(4-methoxybenzyl)-3-oxobutyrate. A solution of ethyl acetoacetate and 4-methoxybenzyl chloride is stirred under an argon atmosphere with 1,8-diazabicyclo[5.4.0]undec-7-ene at room temperature in CH3CN. The mixture is partitioned between 3 N HCl and EtOAc. The organic extract is washed successively with H2O, aqueous NaHCO3, H2O and saturated aqueous NaCl and dried (Na2SO4). The solvent is removed in vacuo to afford the title compound.

b) Ethyl 3-(4-methoxyphenyl)pyrrolo[2,3-d]pyrimidine-2-carboxylate. To a solution of ethyl 2-(4-methoxybenzyl)-3-oxobutyrate in EtOAc stirred at ice bath temperature under an argon atmosphere is added an aqueous solution of NaOH. This is immediately followed by the addition of an aqueous solution of pyrimid-4-yl diazonium chloride [prepared from 4-aminopyrimidine in 6 N HCl and NaNO2]. The mixture is partitioned between EtOAc and H2O. The aqueous layer is washed with EtOAc. The combined organic extracts are washed with saturated aqueous NaCl solution, dried (Na2SO4) and the solvent is removed in vacuo. The residue is dissolved in ethylene glycol. This is refluxed then cooled to room temperature and partitioned EtOAc and H2O. The aqueous layer is washed with EtOAc. The combined organic extract is washed with H2O then saturated aqueous NaCl solution, dried (Na2SO4) and the solvent is removed in vacuo. The residue is purified by chromatography to afford the title compound.

c) Ethyl 1-(3,4-methylenedioxybenzyl)-3-(4-methoxyphenyl)pyrrolo[2,3-d]pyrimidine-2-carboxylate. To a solution of ethyl 3-(4-methoxyphenyl)pyrrolo[2,3-d]pyrimidine-2-carboxylate in HMPA stirred at ice bath temperature under an argon atmosphere is added NaH. A solution of piperonyl chloride in HMPA is added and the ice bath removed. The reaction mixture is stirred at room temperature then partitioned between 3 N HCl and EtOAc. The organic extract is washed successively with H2O, aqueous NaHCO3, H2O and
saturated aqueous NaCl and dried (Na₂SO₄). The solvent is removed \textit{in vacuo}. The residue is purified by chromatography to afford the title compound.

d) 1-(3,4-Methylenedioxybenzyl)-3-(4-methoxyphenyl)-pyrrolo[2,3-
dl]pyrimidine-2-carboxylic acid. A solution of ethyl 1-(3,4-methylenedioxybenzyl)-3-(4-methoxyphenyl)pyrrolo[2,3-b]pyrimidine-2-carboxylate in EtOH with aqueous 1 N NaOH is stirred under an argon atmosphere first at room temperature then at reflux temperature. The reaction mixture is cooled to room temperature then poured into H₂O and the solvent volume reduced \textit{in vacuo}. The aqueous solution is extracted with Et₂O and the Et₂O extract discarded. The aqueous layer is acidified with 6 N HCl and the product extracted into EtOAc. The organic extract is washed with H₂O then saturated aqueous NaCl, dried (Na₂SO₄) and the solvent removed \textit{in vacuo} to afford the title compound.

\textbf{EXAMPLE 2}

3-[2-(2-carboxyphenylmethoxy)-4-methoxyphenyl-1-(3,4-methylenedioxybenzyl)
pyrrolo[2,3-d]pyrimidine-2-carboxylic acid

\textbf{EXAMPLE 3}

3-[4-methoxy-2-(N-phenylsulfonylcarboxamidomethoxy)phenyl]-1-(3,4-
methylenedioxybenzyl)pyrrolo[2,3-d]pyrimidine-2-carboxylic acid

\textbf{EXAMPLE 4}

Formulations for pharmaceutical use incorporating compounds of the present invention can be prepared in various forms and with numerous excipients. Examples of such formulations are given below.

\textit{Inhalant Formulation}

A compound of formula Ia, Ib or Ic, (1 mg to 100 mg) is aerosolized from a metered dose inhaler to deliver the desired amount of drug per use.

\textbf{Tablets/Ingredients} \hspace{1cm} \textbf{Per Tablet}

1. Active ingredient (Cpd of Form. Ia, Ib or Ic) \hspace{1cm} 40 mg
2. Corn Starch  
3. Alginic acid  
5 4. Sodium alginate  
5. Mg stearate

**Procedure for tablets:**

10 Step 1 Blend ingredients No. 1, No. 2, No. 3 and No. 4 in a suitable mixer/blender.

15 Step 2 Add sufficient water portion-wise to the blend from Step 1 with careful mixing after each addition. Such additions of water and mixing until the mass is of a consistency to permit its conversion to wet granules.

20 Step 3 The wet mass is converted to granules by passing it through an oscillating granulator using a No. 8 mesh (2.38 mm) screen.

25 Step 4 The wet granules are then dried in an oven at 140°F (60°C) until dry.

25 Step 5 The dry granules are lubricated with ingredient No. 5.

25 Step 6 The lubricated granules are compressed on a suitable tablet press.

**Parenteral Formulation**

A pharmaceutical composition for parenteral administration is prepared by dissolving an appropriate amount of a compound of formula 1a, 1b and or 1c in polyethylene glycol with heating. This solution is then diluted with water for injections Ph Eur. (to 100 ml). The solution is then sterilized by filtration through a 0.22 micron membrane filter and sealed in sterile containers.
CLAIMS:

1. A compound of the formula (Ia, Ib and Ic)

wherein:

10 R₁ is -X(CH₂)ₙAr or -X(CH₂)ₙR₈ or

![Chemical Structure](image)

(c)

15 R₂ is Ar or (c);
P₁ is -X(CH₂)ₙR₈;
P₂ is -X(CH₂)ₙR₈ or -XR₉Y;
R₃ and R₅ are independently hydrogen, R₁₁, OH, C₁-alkoxy,
S(O)ₚR₁₁, N(R₆)₂, Br, F, I, Cl, CF₃, NHCOR₆, -R₁₂CO₂R₇, -XR₉-Y or

20 -X(CH₂)ₙR₈;
R₄ is hydrogen, R₁₁, OH, C₁-alkoxy, S(O)ₚR₁₁,N(R₆)₂, -X(R₁₁),
Br, F, I, Cl or NHCOR₆ wherein the C₁-alkoxy may be unsubstituted or
substituted by OH, methoxy or halogen;
R₆ is independently hydrogen or C₁-alkyl;

25 R₇ is independently hydrogen, C₁-alkyl or (CH₂)ₙAr;
R₈ is hydrogen, R₁₁, CO₂R₇, PO₃H₂, P(O)(OH)R₇, CN,
-C(O)N(R₆)₂, tetrazole or OR₆;

-24-
R₉ is C₁-₁₀alkylene, C₂-₁₀alkenylene or phenylene all of which may be unsubstituted or substituted by one or more OH, N(R₆)₂, COOH, halogen or XC₁-₅alkyl;

R₁₀ is R₃ or R₄;
R₁₁ is C₁-₈alkyl, C₂-₈alkenyl, C₂-₈alkynyl all of which may be unsubstituted or substituted by one or more OH, CH₂OH, N(R₆)₂ or halogen;
R₁₂ is C₁-₈alkylene, C₂-₈alkenylene or C₂-₈alkynylene;
X is (CH₂)ₙ, O, NR₆ or S(O)q;
Y is CH₃ or -CH₂X(CH₂)ₙAr;
Ar is:

![Diagram](attachment:image.png)

(a)  
(b)

naphthyl, indolyl, pyridyl, thieryl, oxazolidinyl, oxazolyl, thiazolyl, isothiazolyl, pyrazolyl, triazolyl, tetrazolyl, imidazolyl, imidazolidinyl, thiazolidinyl, isoxazolyl, oxadiazolyl, thiadiazolyl, morpholinyl, piperidinyl, piperazinyl, pyrrolyl, or pyrimidyl; all of which may be unsubstituted or substituted by one or more R₃ or R₄ groups;

A is C=O, or (C(R₆)₂)m;
B is -CH₂- or -O-;
q is zero, one or two;
n is an integer from 0 to six;
m is 1, 2 or 3;

and the dotted line indicates the optional presence of a double bond; or a pharmaceutically acceptable salt thereof; provided that when the optional double bond is present there is no P₁ or R₁₀; and further provided that P₁ and P₂ are not methyl and P₁ and P₂ are not both hydrogen.
2. A compound of Claim 1 wherein R₁ is X(CH₂)ₙAr, dihydrobenzofuranyl, benzodioxanyl, cyclohexyl, or C₁₋₄alkyl; R₂ is (a), (b), indolyl or hydrogen; R₃ and R₅ are independently hydrogen, OH, C₁₋₅alkoxy, halogen, R₁₁CO₂R₇, C₁₋₄alkyl, N(R₆)₂, NH(CO)CH₃, -X(CH₂)ₙR₈, or S(O)₂C₁₋₅alkyl; R₄ is hydrogen, OH, C₁₋₅alkoxy, halogen, C₁₋₄alkyl, N(R₆)₂, NH(CO)CH₃ or S(O)₂C₁₋₅alkyl; P₁ and P₂ are independently hydrogen, CO₂H or tetrazole; Aᵣ is (a), (b) or pyridyl; and X is (CH₂)ₙ or oxygen.

3. A pharmaceutical composition comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

4. A method of treatment of diseases caused by an excess of endothelin comprising administering to a subject in need thereof, an effective amount to antagonize endothelin receptors of a compound of Claim 1.

5. A method of treating hypertension which comprises administering to a subject in need thereof an effective amount of a compound of Claim 1.

6. A method of treating renal failure which comprises administering to a subject in need thereof, an effective amount of a compound of Claim 1.

7. A method of treating cerebrovascular disease which comprises administering to a subject in need thereof, an effective amount of a compound of Claim 1.

* Special categories of cited documents:

- "A" document defining the general state of the art which is not considered to be of particular relevance

- "E" earlier document published on or after the international filing date

- "I" document which may throw doubts on priority claimed or which is cited to establish the publication date of another citation or other special reason (as specified)

- "O" document referring to an oral disclosure, use, exhibition or other means

- "P" document published prior to the international filing date but later than the priority date claimed

- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

- "Z" document member of the same patent family
