UNITED STATES PATENT OFFICE.

WILLIAM TRIBBLE, OF ALTON, ILLINOIS, ASSIGNOR OF ONE-HALF TO
SAMUEL H. WYSS, OF SAME PLACE.

CIGAR-BOX.

SPECIFICATION forming part of Letters Patent No. 622,932, dated April 11, 1899.

Application filed July 19, 1898. Serial No. 686,380. (No model.)

To all whom it may concern:

Be it known that I, WILLIAM TRIBBLE, of Alton, in the county of Madison and State of Illinois, have invented a new and Improved
5 Cigar-Box, of which the following is a full, clear, and exact description.

This invention relates to improvements in cigar-boxes; and the object is to provide a cigar-box so arranged that the several cigars
10 originally placed therein may be successively drawn out by mechanical means—such, for instance, as in a coin-controlled vending-machine, and particularly the machine for which I applied for Letters Patent under date of
15 March 23, 1898, Serial No. 674,891.

I will describe a cigar-box embodying my invention and then point out the novel features in the appended claims.

Reference is to be had to the accompanying
20 drawings, forming a part of this specification, in which similar characters of reference indicate corresponding parts in both figures.

Figure 1 is a section through the line 1 1 of Fig. 2 of a cigar-box embodying my invention,
25 and Fig. 2 is an end elevation thereof.

The box 1 is substantially of the ordinary form; but arranged in the box is a flexible drawing device 2, here shown in the form of a ribbon, with one end secured to an end wall
30 of the box near its top, as indicated at 3.

When the cigars are originally packed, the drawing device is passed back and forth between the layers of cigars, with the fastened end extended over the top layer. The free
35 end of the drawing device passes under the lower layer and is designed to project through an opening 4 at the bottom of an end wall of the box. This opening may be formed by breaking away a portion of the end wall before placing the box in a vending-machine.

By pulling outward on the drawing device it is obvious that the cigars may be discharged one at a time through the opening 4.

If desired, parting-strips 5, of cardboard or similar material, may be placed between the
45 lengths of ribbon between layers of cigars. These strips 5 will serve to hold an upper layer of cigars in proper alinement while cigars of a lower layer are discharged from the box. It is to be understood, however, that
50 the strips 5 may be omitted without departing from the spirit of my invention.

Having thus described my invention, I claim as new and desire to secure by Letters Patent—

1. As a new article of manufacture, a cigar-box having an opening in one end and provided with a ribbon or the like secured to the end of the box having the opening, said ribbon being adapted to extend between the
60 outermost layers of cigars and the box, and between the several layers of cigars, with two thicknesses between adjacent layers and out through the opening of the box, as set forth.

2. A cigar-box having an opening in one
65 end at the bottom and provided with a ribbon or the like secured to the end of the box having the opening near the top thereof, said ribbon being adapted to extend between the outermost layers of cigars and the box and
70 between the several layers of cigars, with two thicknesses between adjacent layers, and out through the opening of the box, and parting-strips arranged between the two thicknesses of ribbon between the layers of cigars, substantially as shown and described.

WILLIAM TRIBBLE.
