(54) Title: GLUTARALDEHYDE BASED BIOCIDAL COMPOSITIONS AND METHODS OF USE

(57) Abstract: Provided are biocidal compositions comprising glutaraldehyde and a compound selected from the group consisting of 1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane; tris(hydroxymethyl)-nitromethane; and a hexahydrotriazine compound. The compositions are useful for controlling microorganisms in aqueous or water-containing systems.

WO 2010/138420 A3

GLUTARALDEHYDE BASED BIOCIDAL COMPOSITIONS AND METHODS OF USECross-Reference to Related Application(s)

This application claims benefit of priority from United States Provisional Patent
5 Application Number 61/180,941, filed May 26, 2009, which application is incorporated by
reference herein in its entirety.

Field of the Invention

The invention relates to biocidal compositions and methods of their use for the
control of microorganisms in aqueous and water-containing systems. The compositions
10 comprise glutaraldehyde together with a second biocide.

Background of the Invention

Protecting water-containing systems from microbial contamination is critical to the
success of many industrial production processes, especially oil or natural gas production
operations. In oil and gas operations, microorganism contamination from both aerobic and
15 anaerobic bacteria can cause serious problems such as reservoir souring (mainly caused by
anaerobic sulfate-reducing bacteria (SRB)), microbiologically influenced corrosion (MIC)
on metal surfaces of equipment and pipelines, and degradation of polymer additives.

Microbial contamination can occur anywhere throughout oil and gas operations
including injection water, produced water, downhole, near wellbore areas, deaeration
20 towers, transmission pipelines, source water for waterflooding and hydraulic fracturing such
as pond water and holding tank water, oil and gas storage tanks, and functional water-based
fluids such as drilling muds, completion or workover fluids, hydrotest fluids, stimulation
fluids, packer fluids, and fracturing fluids.

Biocides are commonly used to disinfect and control the growth of microorganisms in aqueous systems such as those found in oil and gas applications. However, not all biocides are effective against a wide range of microorganisms and/or temperatures, and some are incompatible with other chemical treatment additives. In addition, some biocides do not provide microbial control over long enough time periods. In oil and gas applications, the presence of H₂S and high temperature (up to 120 °C or higher) present significant and unique challenges for biocide treatments.

Glutaraldehyde is an effective fast-acting biocide and is widely used in oil and gas applications. However, it is not stable under certain conditions such as high temperature (e.g. 80 °C and above) and, therefore, cannot provide long term microbial control in a downhole environment for example. It would be a significant advance in the art to provide thermally stable, fast acting, and long lasting biocides for oil and gas applications, including for downhole treatment where anaerobic SRB control is critical.

Throughout the description and claims of the specification the word “comprise” and variations of the word, such as “comprising” and “comprises”, is not intended to exclude other additives, components, integers or steps.

A reference herein to a patent document or other matter which is given as prior art is not to be taken as an admission that that document or matter was known or that the information it contains was part of the common general knowledge as at the priority date of any of the claims.

BRIEF SUMMARY OF THE INVENTION

In one aspect, the invention provides biocidal compositions. The compositions are useful for controlling microbial growth in aqueous or water-containing systems, and are particularly suited for applications in the oil and natural gas industry. The compositions of the invention comprise glutaraldehyde together with a biocidal compound selected from the group consisting of 1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane; tris(hydroxymethyl)-nitromethane; and a hexahydrotriazine compound.

In another aspect the present invention provides a composition comprising: glutaraldehyde; and 1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane wherein the weight ratio of glutaraldehyde to 1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane is from 9:1 to 1:9.

In yet another aspect, the invention provides a method for controlling microorganisms in aqueous or water-containing systems. The method comprises treating the system with an effective amount of a biocidal composition as described herein.

DETAILED DESCRIPTION OF THE INVENTION

As noted above, the invention provides biocidal compositions and methods of using them in the control of microorganisms. The compositions comprise glutaraldehyde together with a biocidal compound selected from the group consisting of: 1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane; tris(hydroxymethyl)-nitromethane; and a hexahydrotriazine compound. It has surprisingly been discovered that combinations of glutaraldehyde with other biocidal compounds as described herein are synergistic when used for microorganism control in aqueous or water-containing media. That is, the combined materials result in improved biocidal properties than would otherwise be expected based on their individual performance at the particular use-concentration. The observed synergy permits reduced amounts of the materials to be used to achieve acceptable biocidal properties, thus potentially reducing environmental impact and materials cost.

In addition to exhibiting synergy, the compositions of the invention are particularly effective at controlling anaerobic microorganisms. Further, the compositions are functional at both low and high temperature, and they also maintain their efficacy in systems that contain reducing agents, such as those that contain sulfide. As a result of these attributes, the compositions are particularly useful in the oil and natural gas industry where biocidal agents are needed that are capable of controlling microorganisms, including anaerobic microorganisms, over varying temperature ranges, and that continue to be effective even when reducing agents, such as sulfides, are present.

For the purposes of this specification, the meaning of "microorganism" includes, but is not limited to, bacteria, fungi, algae, and viruses. The words "control" and "controlling" should be broadly construed to include within their meaning, and without being limited

thereto, inhibiting the growth or propagation of microorganisms, killing microorganisms, disinfection, and/or preservation against microorganism growth.

In a first embodiment, the composition of the invention comprises: glutaraldehyde and 1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane ("CTAC"). The CTAC compound
5 may be the cis isomer, the trans isomer, or a mixture of cis and trans isomers. Preferably, it is the cis isomer or a mixture of the cis and trans isomers.

Preferably, the glutaraldehyde to CTAC weight ratio in the first embodiment of the invention is about 100:1 to 1:100, more preferably 50:1 to 1:50, and even more preferably 20:1 to 1:20.

10 In a further preferred embodiment, particularly suited for use against anaerobic bacteria, the weight ratio of glutaraldehyde to CTAC is between about 9:1 to 1:11.

In a still further preferred embodiment, the microorganism is anaerobic and the aqueous system to be treated contains reducing agent, such as sulfide. Under this embodiment, the glutaraldehyde to CTAC weight ratio is preferably between about 2:1 to
15 1:11.

Glutaraldehyde and CTAC are commercially available from The Dow Chemical Company and/or can be readily prepared by those skilled in the art using well known techniques.

In a second embodiment, the composition of the invention comprises glutaraldehyde
20 and tris(hydroxymethyl)nitromethane ("tris nitro"). Preferably, the glutaraldehyde to tris(hydroxymethyl)nitromethane weight ratio in this second embodiment is between about 100:1 to 1:100, more preferably 50:1 to 1:50, and even more preferably 20:1 to 1:20.

In a further preferred embodiment, the microorganism is anaerobic. Under this embodiment, the glutaraldehyde to tris nitro weight ratio is preferably about 9:1 to 1:4.

In a still further embodiment, the microorganism is anaerobic and the aqueous system to be treated contains a reducing agent, such as sulfide. Under this embodiment, the glutaraldehyde to tris nitro weight ratio is preferably between about 4:1 to 1:4.

Tris(hydroxymethyl)nitromethane is commercially available from The Dow
5 Chemical Company and/or can be readily prepared by those skilled in the art using well known techniques.

In a third embodiment, the composition of the invention comprises glutaraldehyde and a hexahydrotriazine compound. Preferably, the hexahydrotriazine compound is of the formula I:

I

10 wherein R₁, R₂, and R₃ are independently selected from the group consisting of hydrogen, C₁-C₅ alkyl, C₁-C₅ hydroxyalkyl, or an alkoxyalkylene group having the structure -R₄-O-R₅, where R₄ is independently an alkylene radical of 1 to 5 carbon atoms, and R₅ is
15 independently an alkyl radical of 1 to 5 carbon atoms.

Preferred hexahydrotriazines according to formula I include compounds in which R₁, R₂, and R₃ are the same and are either alkyl or hydroxyalkyl. More preferably they are ethyl or hydroxyethyl. Particularly preferred compounds are hexahydro-1,3,5-tris(2-hydroxyethyl)-s-triazine and hexahydro-1,3,5-triethyl-s-triazine.

Preferably, the glutaraldehyde to hexahydrotriazine weight ratio in the third embodiment of the invention is between about 100:1 to 1:100, more preferably 50:1 to 1:50, and even more preferably 20:1 to 1:20.

In a further preferred embodiment, particularly suited for use against anaerobic
5 bacteria, the weight ratio of glutaraldehyde to hexahydrotriazine is between about 9:1 to 1:9.

In a still further embodiment, the microorganism is anaerobic and the aqueous system to be treated contains reducing agent, such as sulfide. Under this embodiment, the glutaraldehyde to hexahydrotriazine weight ratio is preferably between about 1:1 to 1:2.

Hexahydrotriazines according to formula I are commercially available and/or can be
10 readily prepared by those skilled in the art using well known techniques (e.g. as described in US 3,981,998, US 4,978,512, and/or US 5,347,007).

The compositions of the invention are useful for controlling microorganisms in aqueous or water-containing systems, such as those present in oil and natural gas applications. Examples of such systems include, but are not limited to, injection and
15 produced water, source water for waterflooding and hydraulic fracturing such as pond water and holding tank water, functional fluids such as drilling muds, completion or workover fluids, hydrotest fluids, stimulation fluids, packer fluids, and fracturing fluids, oil and gas wells, separation, storage, and transportation systems, oil and gas pipelines, oil and gas vessels, or fuel.

20 The inventive compositions may also be used for controlling microorganisms in other industrial and water-containing systems such as cooling towers, heat exchangers, boiler systems, pulp and paper manufacture, other industrial process water, ballast water, wastewater treatment systems, reverse osmosis water processing, metalworking fluids, leather manufacture, paints and coatings, aqueous emulsions, latexes, adhesives, inks,

pigment dispersions, personal care and household products, mineral slurries, caulks and adhesives, tape joint compounds, disinfectants, cleaners, textile fluids, or a system used therewith.

In addition, the blends may be employed in other areas where glutaraldehyde is used
5 as a biocide and reduced loadings of glutaraldehyde are desired.

The compositions of the invention are suitable for use over a wide temperature range. In a preferred embodiment, the compositions are used in aqueous or water-containing systems at a temperature of 40 °C or greater. In further embodiments, the temperature of the aqueous or water containing system is 60 °C or greater, or is 80 °C or
10 greater.

The compositions are also further effective when a reducing agent such as a source of sulfide ion is present in the aqueous or water-containing system.

The compositions are also additionally effective when a reducing agent such as a source of sulfide ion is present in the aqueous or water-containing system and the
15 temperature of the aqueous or water containing system is elevated. Preferably, the temperature of the aqueous or water containing system in this embodiment is 40 °C or greater, or 60 °C or greater, or 80 °C or greater.

A person of ordinary skill in the art can readily determine, without undue experimentation, the concentration of the composition that should be used in any particular
20 application. By way of illustration, a suitable active concentration (total for both glutaraldehyde and the second biocide) is typically between 1 and 2500 ppm, preferably between 5 and 1000 ppm, based on the total weight of the aqueous or water-containing system including the biocides. In some embodiments for oil and gas applications, it is preferred that active concentrations of the composition range from about 5 to about 500 ppm

by weight, preferably about 10 to 300 ppm, for top side treatment, and from about 30 to about 1000 ppm, preferably about 50 to about 500 ppm, for downhole treatment.

The components of the inventive compositions can be added to the aqueous or water-containing system separately, or preblended prior to addition. A person of ordinary skill in the art can easily determine the appropriate method of addition. The composition can be used in the system with other additives such as, but not limited to, surfactants, ionic/nonionic polymers and scale and corrosion inhibitors, oxygen scavengers, and/or additional biocides.

"Alkyl," as used in this specification, encompasses straight and branched chain aliphatic groups. Preferred alkyl groups include, without limitation, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl, tert-butyl, and pentyl.

By "hydroxyalkyl" is meant an alkyl group as defined herein above that is substituted with a hydroxyl group. Preferred hydroxyalkyl groups include, without limitation, hydroxymethyl and hydroxyethyl.

By "alkylene" is meant an alkyl group as defined herein above that is positioned between and serves to connect two other chemical groups. Preferred alkylene groups include, without limitation, methylene, ethylene, propylene, and butylene.

The following examples are illustrative of the invention but are not intended to limit its scope. Unless otherwise indicated, ratios, percentages, parts, and the like used herein are by weight.

EXAMPLES

The synergy indexes reported in the following examples are calculated using the following equation:

$$\text{Synergy Index} = C_a / C_A + C_b / C_B$$

where Ca: Concentration of biocide A required to achieve a certain level or complete bacterial kill when used in combination;

CA: Concentration of biocide A required to achieve a certain level or complete bacterial kill when used alone;

5 Cb: Concentration of biocide B required to achieve a certain level or complete bacterial kill when used in combination; and

CB: Concentration of biocide B required to achieve a certain level or complete bacterial kill when used alone.

10 A synergy index (SI) of 1 indicates additivity, a synergy index of less than 1 indicates synergy, and a synergy index greater than 1 indicates antagonism.

Various methods known to those skilled in the art can be used for evaluating biocidal efficacy. In the examples below, aliquots of the biocide-treated samples are removed at predetermined time points and the biocide concentration required to achieve a
15 certain level or complete bacterial kill is determined by culture-based methods including serial dilution. In some examples, the method is based or adapted (e.g., for high temperature testing or for the presence of sulfide) from the methodology described in international patent publication WO 2009/039004, which is incorporated herein by reference.

Example 1.

20 Evaluation of glutaraldehyde/CTAC, glutaraldehyde/ tris(hydroxymethyl)nitromethane (tris nitro), and glutaraldehyde/ hexahydro-1,3,5-tris(2-hydroxyethyl)-s-triazine (HHT) combinations against anaerobic bacteria

Inside an anaerobic chamber, a deaerated sterile salt solution (3.1183 g of NaCl,
25 1.3082 mg of NaHCO₃, 47.70 mg of KCl, 72.00 mg of CaCl₂, 54.49 mg of MgSO₄, 172.28 mg of Na₂SO₄, 43.92 mg of Na₂CO₃ in 1 L water) is contaminated with an oil field isolated anaerobic SRB consortium at final bacterial concentrations of 10⁵-10⁶ CFU/mL. Aliquots of this contaminated water are then treated with biocide solution (single or in combination) at various concentrations. After the mixtures are incubated at 40 °C for 24
30 hour, the minimum biocide concentration to achieve complete bacteria kill (MBC) is determined. Table 1 summarizes the results for glutaraldehyde/CTAC combinations, Table

2 summarizes the results for glutaraldehyde/tris nitro, and Table 3 summarizes the results for glutaraldehyde/HHT combinations.

Table 1. Biocidal efficacy of glutaraldehyde, CTAC, and glutaraldehyde/CTAC combinations against anaerobic bacteria.

Ratio of Glutaraldehyde to CTAC (active w/w)	MBC (active ppm)		Synergy Index
	Glutaraldehyde	CTAC	
1:0	5.3	0.0	
9:1	5.2	0.6	0.98
3:1	3.4	1.1	0.64
1:1	3.1	3.1	0.61
1:3	3.8	11.3	0.80
1:9	3.6	32.3	0.92
0:1	0.0	133.3	

5

Table 2. Biocidal efficacy of glutaraldehyde, tris nitro, and glutaraldehyde/tris nitro combinations against anaerobic bacteria.

Ratio of Glutaraldehyde to Tris Nitro (active w/w)	MBC (active ppm)		Synergy Index
	Glutaraldehyde	Tris Nitro	
1:0	4.0	0.0	
9:1	3.8	0.4	0.96
3:1	3.6	1.2	0.93
1:1	3.0	3.0	0.83
1:3	3.1	9.4	0.99
1:9	2.4	21.6	1.09
0:1	0.0	44.4	

10 Table 3. Biocidal efficacy of glutaraldehyde, HHT, and glutaraldehyde/HHT combinations against anaerobic bacteria.

Ratio of Glutaraldehyde to HHT (active w/w)	MBC (active ppm)		Synergy Index
	Glutaraldehyde	HHT	
1:0	4.0	0.0	
9:1	3.9	0.4	0.97
3:1	3.8	1.3	0.95
1:1	3.4	3.4	0.89
1:3	2.7	8.2	0.74
1:9	2.5	22.7	0.80
0:1	0.0	133.3	

As shown in Tables 1-3, glutaraldehyde in combination with CTAC, tris nitro, or HHT exhibits a synergistic effect against anaerobic SRB at certain weight ratios. Lower dosages can therefore be used for good bacterial control when the biocides are used in combination instead of separately.

5 Example 2.

Evaluation of glutaraldehyde/CTAC, glutaraldehyde/tris(hydroxymethyl)nitromethane (tris nitro), and glutaraldehyde/hexahydro-1,3,5-tris(2-hydroxyethyl)-s-triazine (HHT) combinations against anaerobic bacteria for high temperature and sulfide-rich conditions

- 10 Inside an anaerobic chamber, biocide solutions (single or in combination) are prepared at various concentrations in a salt solution (3.1183 g of NaCl, 1.3082 mg of NaHCO₃, 47.70 mg of KCl, 72.00 mg of CaCl₂, 54.49 mg of MgSO₄, 172.28 mg of Na₂SO₄, 43.92 mg of Na₂CO₃ in 1 L water). The biocide solutions are challenged with 10⁴ to 10⁵ CFU/mL of an oil field isolated anaerobic SRB consortium and 10 ppm sulfide ion.
- 15 The mixtures are incubated at 80 °C under anaerobic conditions for 2 hours after which the biocidal efficacy against the field SRB consortium is evaluated. The biocidal efficacy is determined by selecting the lowest biocide concentration required to achieve at least a 99.9% bacterial reduction in 2 hours. Synergy index is then calculated. Table 4 summarizes the results for glutaraldehyde/CTAC combinations, Table 5 summarizes the results for
- 20 glutaraldehyde/tris nitro, and Table 6 summarizes the results for glutaraldehyde/HHT combinations.

Table 4. Biocidal efficacy of glutaraldehyde, CTAC, and glutaraldehyde/CTAC combinations against anaerobic bacteria for high temperature and sulfide-rich conditions.

Ratio of Glutaraldehyde to CTAC (active w/w)	Dosage required for 99.9% bacterial kill in 2h (active ppm)		Synergy Index
	Glutaraldehyde	CTAC	
1:0	8.7	0.0	
1.5:1	4.3	2.9	0.51
1:1.3	4.3	5.9	0.51

1:10.8	2.2	23.4	0.31
0:1	0.0	375.0	

5 Table 5. Biocidal efficacy of glutaraldehyde, tris nitro, and glutaraldehyde/tris nitro combinations against anaerobic bacteria for high temperature and sulfide-rich conditions.

Ratio of Glutaraldehyde to Tris Nitro (active w/w)	Dosage required for 99.9% bacterial kill in 2h (active ppm)		Synergy Index
	Glutaraldehyde	Tris Nitro	
1:0	22.5	0.0	
4:1	11.3	2.8	0.52
2:1	11.3	5.6	0.53
1:1	11.3	11.3	0.56
1:2	11.3	22.5	0.63
1:4	5.6	22.5	0.38
0:1	0.0	180.0	

Table 6. Biocidal efficacy of glutaraldehyde, HHT, and glutaraldehyde/HHT combinations against anaerobic bacteria for high temperature and sulfide-rich conditions.

Ratio of Glutaraldehyde to HHT (active w/w)	Dosage required for 99% bacterial kill in 2h (active ppm)		Synergy Index
	Glutaraldehyde	HHT	
1:0	15.6	0.0	
2:1	15.6	7.8	1.06
1:1	7.8	7.8	0.56
1:2	7.8	15.6	0.63
1:4	15.8	62.5	1.51
1:8	15.8	125.0	2.01
0:1	0.0	125.0	

10 As can be seen in Tables 4-6, glutaraldehyde in combination with CTAC, tris nitro, or HHT exhibits a synergistic effect against anaerobic SRB for high temperature and sulfide-rich

conditions at certain weight ratios. Lower dosages can therefore be used for good bacterial control when the biocides are used in combination instead of separately.

While the invention has been described above according to its preferred embodiments, it can be modified within the spirit and scope of this disclosure. This
5 application is therefore intended to cover any variations, uses, or adaptations of the invention using the general principles disclosed herein. Further, the application is intended to cover such departures from the present disclosure as come within the known or customary practice in the art to which this invention pertains and which fall within the limits of the following claims.

The claims defining the invention are as follows:

1. A synergistic composition comprising:

glutaraldehyde; and

1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane wherein the weight ratio of
glutaraldehyde to 1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane is from 9:1 to 1:9.

2. A method for controlling microorganisms in an aqueous or water-containing system,
the method comprising treating the system with an effective amount of a composition
according to claim 1.

3. A method according to claim 2 wherein the aqueous or water-containing system is used
or is present in oil and or gas production.

4. A method according to claim 2 wherein the aqueous or water-containing system is
cooling towers, heat exchangers, boiler systems, pulp and paper manufacture, other industrial
process water, ballast water, wastewater treatment systems, reverse osmosis water processing,
metalworking fluids, leather manufacture, paints and coatings, aqueous emulsions, latexes,
adhesives, inks, pigment dispersions, personal care and household products, mineral slurries,
caulks and adhesives, tape joint compounds, disinfectants, cleaners, textile fluids, or a system
used therewith.

5. A method according to any one of claims 2 to 4 wherein the aqueous or water-
containing system is at 40 °C or above.

6. A method according to any one of claims 2 to 5 wherein the aqueous or water-
containing system contains a reducing agent.

7. The composition according to claim 1, substantially as hereinbefore described with reference to any one of the Examples.
8. The method according to any one of claims 2 to 6, substantially as hereinbefore described with reference to any one of the Examples.
