LADY'S HAIR ORNAMENT

Siegfried Behr, Flushing, N. Y.

Application July 14, 1945, Serial No. 605,102

1 Claim. (Cl. 132-46)

1

This invention relates generally to ornaments for ladies' hair.

One object of the invention is to provide a hair ornament especially adapted for straight up hairdos.

Another object is to provide such a hair ornament with spaced comb sections for readily attaching and detaching the ornament to and from the hair of the wearer.

Another object is to provide a hair ornament that is simple in construction and economical to manufacture.

Other objects and advantages of the invention will be apparent from the description thereof to follow taken in connection with the accompanying drawing in which—

Fig. 1 is a top plan view of a hair ornament embodying my invention.

Fig. 2 is a sectional view taken on the plane of the line 2-2 of Fig. 1.

Fig. 3 is a fragmentary top plan view of a modified form of overlapping ends.

Fig. 4 is a front view of the device of Fig. 3.

Referring to the drawing, the improved hair ornament comprises a split annular body portion 5 formed of plastic material or other suitable material that flexes. The split ends 6 and 7 normally slightly overlap each other as shown in Fig. 1.

The body portion is rectangular in cross section and between the upper and lower edges thereof the body portion is formed with openings

2

8 which may be of any suitable design for ornamentation purposes.

Formed on the lower edge of the body portion at spaced intervals therealong are a number of horizontally disposed integral comb sections 9, the teeth 10 of which project inwardly as shown in Fig. 1.

In the modified form of the invention shown in Fig. 3 the split end 11 of the body portion is formed with protuberances 12 on its outer surface and the split end 13 carries a ring member 14. When the split end 11 is inserted into the ring member 14, the latter is adapted to engage the protuberances 12 and yieldingly hold the ends together.

I claim:

A lady's hair ornament comprising a split annular flexible body portion formed of plastic material with spaced openings therearound, the end portions of said body portion yieldingly positioned in overlapping relation, spaced comb sections formed integrally with the lower edge of said body portion, the teeth of the separate comb sections being positioned close together and extending inwardly at right angles to the body portion, protuberances on the outer surface of one of said overlapping end portions and a ring member of plastic material carried on the other end portion adapted to coact with said protuberances for yieldingly holding the end portions in overlapping relation.

SIEGFRIED BEHR.
