WO 2021/204896 A1

MACROCYCLIC DIAMINE DERIVATIVES AS ENT INHIBITORS FOR THE TREATMENT OF CANCERS, AND COMBINATION THEREOF WITH ADENOSINE RECEPTOR ANTAGONISTS

FIELD

[0001] The present invention relates to macrocyclic diamine derivatives, including pharmaceutically acceptable salts and solvates thereof. Compounds of the invention are inhibitors of ENT family transporter, especially of ENT1, and are useful as therapeutic compounds, especially in the treatment of cancers. The invention also relates to the combined use of the macrocyclic diamine derivatives of the invention with an adenosine receptor antagonist, for the treatment of cancers.

BACKGROUND

[0002] The equilibrative nucleoside transporter (ENT) family, also known as SLC29, is a group of plasmalemmal transport proteins which transport nucleoside substrates into cells. There are four known ENTs, designated ENT1, ENT2, ENT3, and ENT4.

[0003] One of the endogenous substrates for ENTs is adenosine, a potent physiological and pharmacological regulator of numerous functions. Cellular signaling by adenosine occurs through four known G-protein-coupled adenosine receptors A1, A2A, A2B, and A3. By influencing the concentration of adenosine available to these receptors, ENTs fulfil important regulatory roles in different physiological processes, such as modulation of coronary blood flow, inflammation, and neurotransmission (Griffith DA and Jarvis SM, *Biochim Biophys Acta*, 1996, 1286, 153-181; Shryock JC and Belardinelli L, *Am J Cardiol*, 1997, 79(12A), 2-10; Anderson CM et al., *J Neurochem*, 1999, 73, 867-873).

[0004] Adenosine is also a potent immunosuppressive metabolite that is often found elevated in the extracellular tumor microenvironment (TME) (Blay J et al., *Cancer Res*, 1997, 57, 2602-2605). Extracellular adenosine is generated mainly by the conversion of ATP by the ectonucleotidases CD39 and CD73 (Stagg J and Smyth MJ, *Oncogene*, 2010, 2, 5346-5358). Adenosine activates four G-protein-coupled receptor subtypes (A1, A2A, A2B, and A3). In particular, activation of the A2A receptor is believed to be the main driver of innate and adaptive immune cell suppression leading to suppression of antitumor immune responses (Ohta and Sitkovsky, *Nature*, 2001, 414, 916-920) (Stagg and Smyth, *Oncogene*, 2010, 2, 5346-5358) (Antonioli L et al., *Nature Reviews Cancer*, 2013, 13, 842-857) (Cekic C and Linden J, *Nature Reviews, Immunology*, 2016, 16, 177-192) (Allard B et al., *Curr Op Pharmacol*, 2016, 29, 7-16) (Vijayan D et al., *Nature Reviews Cancer*, 2017, 17, 709-724).

[0005] The Applicant previously evidenced in PCT/EP2019/076244 that adenosine as well as ATP profoundly suppress T cell proliferation and cytokine secretion (IL-2), and strongly reduce T cell viability. Adenosine- and ATP-mediated suppression of T cell viability and proliferation were successfully restored by using ENTs inhibitors. Moreover, the use of an ENT inhibitor in combination with an adenosine receptor antagonist enabled to restore not only adenosine- and ATP-mediated suppression of T cell

viability and proliferation, but also restored T cell cytokine secretion. These results showed that ENTs inhibitors either alone or in combination with an adenosine receptor antagonist may be useful for the treatment of cancers.

[0006] A variety of drugs such as dilazep, dipyridamole, and draflazine interact with ENTs and alter adenosine levels, and were developed for their cardioprotective or vasodilatory effects.

[0007] Currently, two non-selective ENT1 inhibitors (dilazep and dipyridamole) are on the market (Vlachodimou et al., Bio-Chemical Pharmacology, 2020, 172, 113747). However, their binding kinetics are unknown; moreover, there is still a need for more potent ENTs inhibitors, and especially ENT1 inhibitors to be used for the treatment of cancers, either alone or in combination with an adenosine receptor antagonist.

[0008] Hence, this study focused on finding new and improved ENT1 inhibitors. For that purpose, the Applicant herein provides the macrocyclic diamine derivatives of formula I and II detailed below.

[0164] The compounds of **Table 1** were named using ChemBioDraw® Ultra version 12.0 (PerkinElmer).

[0165] In one embodiment, the present invention also relates to salts, solvates, enantiomers, isomers (including optical, geometric and tautomeric isomers), polymorphs, multi-component complexes, liquid crystals, prodrugs of compounds of formula I or II and subformula thereof, and to isotopically-labeled compounds of formula I or II and subformula thereof.

[0166] In one embodiment, the present invention relates to enantiomers and isomers (including optical, geometric and tautomeric isomers) of compounds of formula I and subformula thereof. Indeed, the compounds of formula I or II and subformula thereof may contain an asymmetric center and thus may exist as different stereoisomeric forms. Accordingly, the present invention includes all possible stereoisomers and includes not only racemic compounds but the individual enantiomers and their non-racemic mixtures as well. When a compound is desired as a single enantiomer, such may be obtained by stereospecific synthesis, by resolution of the final product or any convenient Intermediate compound, or by chiral chromatographic methods as each are known in the art. Resolution of the final product, an Intermediate compound, or a starting material may be performed by any suitable method known in the art.

[0167] In one embodiment, the present invention also relates to salts of compounds of formula I or II and subformula thereof. Especially, the compounds of the invention may be in the form of pharmaceutically acceptable salts. Pharmaceutically acceptable salts of the compounds of formula I or II are, ammonium salt, aspartate, benzoate, besylate, benzenesulfonate, bicarbonate/carbonate, bisulfate/sulfate, bitartrate, borate, calcium edetate, camsylate, citrate, clavulanate, cyclamate, dihydrochloride, edetate, edisylate,

estolate, esylate, formate, fumarate, gluceptate, gluconate, glucuronate, glutamate, glycolylarsanilate, hexafluorophosphate, hexylresorcinate, hibenzate, hydrabamine, hydrochloride/chloride, hydrobromide/bromide, hydroiodide/iodide, hydroxynaphthoate, isethionate, isothionate, lactate, lactobionate, laurate, malate, maleate, malonate, mandelate, mesylate, methylbromide, N-methylglucamine, methylnitrate, methylsulphate, mucate, panoate, naphthylate, 2-napsylate, nicotinate, nitrate, oleate, orotate, oxalate, palmitate, pamoate, pantothenate, phosphate/hydrogen phosphate/dihydrogen phosphate, polygalacturonate, pyroglutamate, saccharate, salicylate, stearate, subacetate, succinate, tannate, tartrate, teoate, tosylate, triethiodide, trifluoroacetate, valerate and xinofoate salts. Preferred pharmaceutically acceptable acid addition salts include hydrochloride/chloride, hydrobromide/bromide, bisulphate/sulphate, nitrate, citrate, tosylate, esylate and acetate. Suitable base salts are formed from bases which form non-toxic salts. Examples include the aluminum, ammonia, arginine, benzathine, N-benzylphenethyl-amine, calcium, chlorprocaine, choline, N,N'-dibenzylethylenediamine, diethanolamine, diethylamine, 2-(diethylamino)ethanol, diolamine, ethanolamine, ethylenediamine, glycine, lithium, lysine, magnesium, meglumine, N-methyl-glutamine, morpholine, 4-(2-hydroxyethyl)morpholine, olamine, ornithine, piperazine, potassium, procaine, sodium, tetramethylammonium hydroxide, tris(hydroxymethyl)aminomethane, tromethamine and zinc salts. Hemisalts of acids and bases may also be formed, for example, hemisulphate and hemicalcium salts. When the compounds of the invention contain a hydrogen-donating heteroatom (e.g. NH), the invention also covers salts and/or isomers formed by transfer of said hydrogen atom to a basic group or atom within the molecule.

[0168] Pharmaceutically acceptable salts of compounds of formula I or II and subformula thereof may be prepared by one or more of these methods:

[0169] (i) by reacting the compound of formula I or II with the desired acid;

[0170] (ii) by reacting the compound of formula I or II with the desired base;

[0171] (iii) by removing an acid- or base-labile protecting group from a suitable precursor of the compound of formula I or II or by ring-opening a suitable cyclic precursor, for example, a lactone or lactam, using the desired acid; or

[0172] (iv) by converting one salt of the compound of formula I or II to another by reaction with an appropriate acid or by means of a suitable ion exchange column.

[0173] All these reactions are typically carried out in solution. The salt may precipitate from solution and be collected by filtration or may be recovered by evaporation of the solvent. The degree of ionization in the salt may vary from completely ionized to almost non-ionized.

[0174] In addition, although generally, with respect to the salts of the compounds of the invention, pharmaceutically acceptable salts are preferred, it should be noted that the invention in its broadest sense also included non-pharmaceutically acceptable salts, which may for example be used in the isolation and/or purification of the compounds of the invention. For example, salts formed with optically active acids or bases may be used to form diastereoisomeric salts that can facilitate the separation of optically

active isomers of the compounds of formula I or II above.

[0175] In one embodiment, the present invention also relates to solvates of compounds of formula I or II and subformula thereof. The compounds of the invention may be in the form of pharmaceutically acceptable solvates. Pharmaceutically acceptable solvates of the compounds of formula I or II and subformula thereof contains stoichiometric or sub-stoichiometric amounts of one or more pharmaceutically acceptable solvent molecule such as ethanol or water. The term “hydrate” refers to when the said solvent is water.

[0176] In one embodiment, the present invention also relates to prodrugs of compounds of formula I or II and subformula thereof. For example, in the case of an alcohol group being present, pharmaceutically acceptable esters can be employed, e.g. acetate, maleate, pivaloyloxymethyl, and the like, and those esters known in the art for modifying solubility or hydrolysis characteristics for use as sustained release or prodrug formulations.

Process of manufacturing

[0177] The compounds of formula I or II can be prepared by different ways with reactions known by one skilled in the art.

[0178] The invention also provides a process of manufacturing of compounds of formula I:

or a pharmaceutically acceptable salt or solvate thereof, wherein R^x , R^1 , R^4 , U, V, and ALK are hereafter defined.

[0179] The invention also provides a process of manufacturing of compounds of formula II:

or a pharmaceutically acceptable salt or solvate thereof, wherein R^x , R^1 , R^4 , X, U, V, and n^1 are hereafter defined.

Formulations

Combined use with adenosine receptor antagonist

[0213] The invention further relates to the combined use of an ENT inhibitor of the invention, of formula I or II or a subformula thereof, as defined above, with an adenosine receptor antagonist.

[0214] The invention thus relates to a combination comprising:

[0215] an effective amount of an ENT inhibitor of the invention, of formula I or II a subformula thereof, as defined above; and (b) an effective amount of an adenosine receptor antagonist.

[0216] In the context of the present invention the term “combination” preferably means a combined occurrence of the ENT inhibitor and of an A2AR antagonist. Therefore, the combination of the invention may occur either as one composition, comprising all the components in one and the same mixture (e.g. a pharmaceutical composition), or may occur as a kit of parts, wherein the different components form different parts of such a kit of parts. The administration of the ENT inhibitor and of the A2AR antagonist may occur either simultaneously or timely staggered, with similar or different timing of administration (i.e. similar or different numbers of administration of each component), either at the same site of administration or at different sites of administration, under similar or different dosage form.

[0217] The invention further relates to a method of treating cancer, comprising: administering, to a patient in need thereof, a combination of an adenosine receptor antagonist and the ENT inhibitor of the invention.

[0218] Above embodiments relative to the ENT inhibitors of the invention also apply to the combination of the invention. Especially, in one embodiment, in the combination of the invention, the ENT inhibitor

may be of formula I or II of the subformula defined above.

[0219] As a second component, the combination of the invention includes at least one adenosine receptor antagonist.

[0220] As defined above, “adenosine receptor antagonist” refers to a compound that, upon administration to a patient, results in inhibition or down-regulation of a biological activity associated with activation of an adenosine receptor in the patient, including any of the downstream biological effects otherwise resulting from the binding to an adenosine receptor of its natural ligand. Such adenosine receptor antagonists include any agent that can block activation of an adenosine receptor or any of the downstream biological effects of an adenosine receptor activation.

[0221] Adenosine receptors (or P1 receptors) are a class of purinergic G protein-coupled receptors with adenosine as endogenous ligand. There are four known types of adenosine receptors in humans: A1, A2A, A2B and A3; each is encoded by a different gene (ADOARA1, ADORA2A, ADORA2B, and ADORA3 respectively).

[0222] In one embodiment, the adenosine receptor antagonist is an antagonist of A1 receptor, A2A receptor, A2B receptor, A3 receptor or of a combination thereof.

[0223] In one embodiment, the adenosine receptor antagonist is an antagonist of A2A receptor, A2B receptor or of a combination thereof. In one embodiment, the adenosine receptor antagonist is an A2A or A2B receptor antagonist.

[0224] In one embodiment, the adenosine receptor antagonist is an antagonist of A2A receptor (A2AR antagonist). In one embodiment, the adenosine receptor antagonist is an antagonist of A2B receptor (A2BR antagonist).

[0225] In one embodiment, the adenosine receptor antagonist is an antagonist which is selective of A2A receptor with respect to other adenosine receptors. In one embodiment, the adenosine receptor antagonist is an antagonist which is selective of A2A receptor with respect to A2B receptor.

[0226] In one embodiment, the adenosine receptor antagonist is an antagonist which is selective of A2B receptor with respect to other adenosine receptors. In one embodiment, the adenosine receptor antagonist is an antagonist which is selective of A2B receptor with respect to A2A receptor.

Compound 24, 27, 29, 30, 110, 111 and compound 41 to compound 106:

[0633] The compounds 24, 27, 29, 30, 110, 111, compound 41 to compound 54 to compound 106, summarized in the table below has been synthesized following the general procedure:

To a solution of compound 38 (30 mg, 0.068 mmol, 1.0 equiv) in DCM (2 mL) was added DMAP (12.4 mg, 0.10 mmol, 1.5 equiv), EDC.HCl (19.5 mg, 0.10 mmol, 1.5 equiv) and the required carboxylic acid (24.1 mg, 0.10 mmol, 1.5 equiv). The reaction mixture was stirred for 16 h at room temperature, and then quenched with water and exacted with DCM. The organic layer was concentrated under vacuum. The residue was purified by preparative HPLC to give the desired compound.

In the case of compound 41 and compound 55, the benzyl protected compound obtained from the above general procedure has been isolated after benzyl deprotection following the general procedure below:

To a solution of the benzyloxy ether (20 mg, 0.03 mmol, 1.0 equiv) in ethanol (10 mL) was added Pd/C (2 mg). The reaction mixture was stirred for 30 min at room temperature under 1 atm H₂. After the reaction was completed, the mixture was filtered to remove the catalyst, and the resulting solution was concentrated under vacuum. The crude product was then purified by preparative HPLC to give the desired compound.

II. BIOLOGY EXAMPLES

EXAMPLE II.1. ASSAY FOR ENT1 ACTIVITY

EXAMPLE II.1.a BINDING ASSAY

Purpose

[0655] The present assay aims at showing that the compounds of the present invention can bind to human ENT1. The principle of the assay is a competition between the compounds of this invention and Sahenta-DY647, an ENT1 inhibitor that emits fluorescence (Ex = 630 nm, Em = 670 nm). By measuring the fluorescence at the end of the assay we could assess the binding potency of the compounds of the present invention.

Method

JAR cells expressing ENT1 were bought from ATCC® (HTB-144TM). Cells were cultured in RPMI 1640 medium (LONZA®, #BE12-702F/U1) supplemented with 10% FBS (GIBCO®, #10270-106), 10 mM Hepes (LONZA®, #BE17-737E), 1 mM Sodium Pyruvate (LONZA®, #BE13-115E) and 2% Penicillin/Streptomycin (LONZA®, #DE17-603E) at 37°C and 5% CO₂.

The assay was conducted on the following buffer: HBSS (LONZA®, #LO-527F) supplemented with 10 mM Hepes (LONZA®, #BE17-737E) and 0.1% BSA (Miltenyi®, #130-091-376) on the day of the assay. JAR cells were resuspended in the described buffer. Compounds of the present invention and Sahenta-DY647 were diluted 200X in the described buffer.

[0656] A total of 50 000 cells were pre-incubated for 30 min at 4°C with the compounds of the present invention before adding the corresponded IC₉₀ of Sahenta-DY647 (100 nM) and incubate once more for 30 min at 4°C. The total volume of the reaction was 100 μL (50 μL of cells, 25 μL of the compounds of the present invention and 25 μL of Sahenta-DY647) in a 96 well plate, U-bottom (Greiner®, #650-180). The plates were washed 2X by centrifugation (4 min, 400 ref at 4°C) in the same buffer. Cells were re-suspended in 70 μL of the buffer and 50 μL was transferred to a Black 384 Optiplat (PerkinElmer®, #6007279). Fluorescence (Ex = 630 nm, Em = 670 nm) was acquired on a Spectramax i3x (Molecular

Devices®).

Results

[0657] Results obtained from this protocol are summarized in Table 5.

EXAMPLE II.1.b FUNCTIONAL ASSAY: Uridine transport inhibition assay

Purpose

[0658] The aim of this study was to determine the potency of equilibrative nucleoside transporter 1 (ENT1) inhibitors by measuring ENT1-mediated transport is the cellular uptake assay. The human ENT1 transporter can be stably expressed in Madin-Darby Canine Kidney II (MDCKII) cells via transduction. Uridine is efficiently transported by ENT1 and is used as probe in the assay as 3H-uridine. The interaction is detected as the modulation of the initial rate of 3H-uridine transport by human ENT1 into MDCKII-ENT1-LV cells stably expressing ENT1 uptake transporter.

Results

Results obtained from this protocol are summarized in Table 6.

Table 3: Assay parameters

Transporter	Incubation time (min) and temperature	Probe substrate (concentration)	Reference inhibitor (concentration)	Signal / Noise ratio
ENT1	1 min at 25 °C	Uridine (1 µM)	Dilazep (2 µM)	>3

EXAMPLE II.1.c FUNCTIONAL ASSAY: T Cell proliferation assay

Purpose

[0659] The aim of this study was to determine the potency of equilibrative nucleoside transporter 1 (ENT1) inhibitors to rescue proliferation by stimulated primary human T cells incubated in the presence of 100 uM Adenosine triphosphate (ATP), in baseline conditions (condition A) or in the presence of various proteins known to bind small molecules (condition B).

Condition A: X-VIVO15

Condition B: X-VIVO15, 2% Human Serum Albumine (HSA) and 0,1% α -1-Acid Glycoprotein (AAG)

CFDA, SE	Life Technologies	C1157
EOS502085_1(Dipyridamole)	Tocris	0691

Method

[0660] Cryopreserved purified human CD3+ T cells were thawed and washed twice with RPMI1640 medium, UltraGlutamine containing 10% hiFBS.

[0661] Cells were suspended in PBS containing 10% hiFBS. Cells were stained with CFSE by adding 2 μ M solution in PBS, to get a final 1 μ M CFSE solution. Cells were incubated while rotating for 5 minutes. Reaction was stopped by adding PBS with 10% FBS and cells were centrifuged for 5 minutes at 1500 rpm.

[0662] Cells were resuspended at 1.6×10^6 cells/mL, either in X-VIVO15 medium or in 4% Human Serum Albumin and 0,2% α -1-Acid Glycoprotein. 50 μ L of cell suspension (8×10^4 T cells) was added to wells of sterile round-bottom 96-well plates. Cells were activated by adding 50 μ L of anti-CD3 anti-CD28 coated microbeads, suspended either in X-VIVO-15 medium or in 4% HSA and 0,2% α -1-Acid Glycoprotein, at a ratio of one microbead per two cells.

Serial dilutions of the ENT1 inhibitors were prepared in X-VIVO15 from 10 mM stock solutions in DMSO, and 50 μ L was added to the wells.

ATP powder was diluted in X-VIVO15, and 50 μ L of this compound was added to the wells to reach a final assay concentration of 100 μ M. Final volume of 200 μ L.

The experiments were also performed in 384 well plates - all volumes reduced by a factor of 4 (12,5 μ L) with a final volume of 50 μ L.

Experiments were performed in duplicate. The cells were placed in a 37°C humidified tissue culture incubator with 5% CO₂ for 72 hours for 96 well plates, 96 hours for 384 well plates. After 72 or 96 hours, proliferation was measured determined by CFSE dilution via flow cytometry.

Results.

Results are detailed below in Table 6. Compounds of the invention have good ENT1 inhibitory properties.

Discussion of Results in Table 6:

[0664] The potency has been determined in two independent functional assays: (1) a transporter assay using cell lines, and (2) a proliferation assay including our primary target immune cells, T cells. Assay (2) also includes a Condition B representative for the challenging conditions in the tumor microenvironment (TME), containing elevated levels of proteins known to bind small molecules (which has a negative impact on potency). A summary of potencies identified in these assays is reported in Table 6. The compound of the invention presents a maintained, or strongly improved potency as compared to dilazep in all functional assays. In particular, the compounds of the invention present a significantly improved potency in the T Cell proliferation assay in baseline conditions (condition A) and in conditions mimicking the TME (condition B) as compared to dilazep. As the compound of the invention has greatly improved potency compared to dilazep in a biologically relevant functional assay, this implies a significantly better safety window regarding off-targets, in particular hERG inhibition.

EXAMPLE II.3. hERG ion channel INHIBITION

[0665] These data have been generated by ApconiX Ltd., BIOHUB at Alderley Park, Mereside, Alderley Edge, Cheshire, SK10 4TG, UK.

Purpose

[0666] The compounds were tested for inhibition of hERG ion channel. 6-Point concentration-response curves were generated on the Patchliner automated patch-clamp using serial dilutions from a maximum test concentration of 100µM.

Methods

[0667] Compounds were solubilised to 33mM in DMSO before dilution in HBPS to 100µM. 6-Point concentration-response curves were generated using serial dilutions from the top test concentration.

Electrophysiological recordings were made from a Chinese Hamster Ovary cell lines stably expressing the full-length ion channel. Single cell ionic currents were measured in whole-cell configuration at room temperature (21-23°C) using a Patchliner (Nanion Technologies). The internal solution for hERG contained (mM): 120 KF, 20 KCl, 10EGTA, 10 HEPES and was buffered to pH 7.3. The external solution (HEPES-buffered saline, HBPS) contained (mM): 138 NaCl, 4.5 KCl, 1.8 CaCl₂, 1.0 MgCl₂, 10 HEPES, 10 glucose, buffered to pH7.4. Cells were clamped at a holding potential of -80mV before a depolarising step appropriate for the hERG channel. Currents were measured from the step and referenced to the holding current. Compounds were incubated for 90 seconds. Concentration-response curves were generated by cumulative addition of compound with concentrations low to high. In all cases, steady-state inhibition was achieved before the next concentration of compound was added.

[0668] The following QC conditions were applied:

- (1) Individual cells with any of the following properties were excluded from subsequent analysis (1) seal resistances <500MΩ (2) ionic currents <150pA (3) seal resistances that changed by >50% during the experiment
- (2) Experiments in which the IC₅₀ of the reference compound was outside of the expected range were failed.

Results

[0669] IC₅₀ values were obtained from a 4-parameter logistic fit of the concentration-response data:

Table 7

Compound 2	2.5 μM
Compound 5	0.8 μM
Compound 4	73.0 μM

[0670] Reference compound values were consistent with those presented in the literature (Elkins et al., 2013 J.Pharm.Tox.Meth. 68:11-122)

EXAMPLE III

T cell stimulation assay

[0671] Peripheral blood mononuclear cells (PBMCs) were first isolated via centrifugation of fresh whole blood over Lymphoprep using SepMate-50 tubes (both from STEMCELL Technologies) according to the manufacturer's instructions. Human T cells were then isolated from the PBMCs using the EasySep

Human T cell Isolation Kit (STEMCELL Technologies) according to the manufacturer's instructions and the cells were cryopreserved in FBS with 10% DMSO until required.

[0672] Cryopreserved human T cells were thawed on the day of the experiment and resuspended in PBS with 10% FBS at approximately 1×10^7 cells/ml. This cell suspension was diluted 1:1 with $2 \mu\text{M}$ CFSE solution (ThermoFisher Scientific) in PBS and incubated for 5 minutes at room temperature. The labelling reaction was quenched by further addition of PBS with 10% FBS, and then the cells were washed into X-VIVO15 medium (Lonza) for use in the T cell assay.

[0673] CFSE-labelled T cells were plated at 2×10^4 cells per well in 384 well plates in the presence of ATP ($100 \mu\text{M}$, Sigma-Aldrich) as a source of adenosine. Activation was driven by the addition of Dynabeads Human T-Activator CD3/CD28 (ThermoFisher Scientific) at a ratio of 0,5 beads per T cell. ENT1 inhibitor molecules including the reference molecule dilazep (Tocris Bioscience) were added, the volume of the wells was adjusted to $50 \mu\text{l}$ with X-VIVO15 medium and the plates were cultured in a humidified incubator for 96h at 37°C with 5% CO_2 . In some experiments the culture was supplemented with human serum albumin (HSA) and alpha-1-acid glycoprotein (AAG, both Sigma-Aldrich) at final concentrations of 2 and 0,1%, respectively.

[0674] Analysis of proliferation via CFSE dilution was performed by flow cytometry using a BD LSR Fortessa with data analysis on FlowJo (BD Biosciences).

Mixed leukocyte reaction assay

[0675] PBMCs were isolated from buffy coats via centrifugation of fresh whole blood over Lymphoprep using SepMate-50 tubes (both from STEMCELL Technologies) according to the manufacturer's instructions. Naïve CD4^+ T cells were isolated from the PBMCs using the Naïve CD4^+ T cell Isolation Kit II, human (Miltenyi Biotec) according to the manufacturer's instructions and cryopreserved in FBS with 10% DMSO until required. CD14^+ monocytes were also isolated from the PBMC samples using CD14 MicroBeads, human (MiltenyiBiotec) according to the manufacturer's instructions and used on the day of isolation.

[0676] Monocytes were resuspended in RPMI (Lonza) with 10% FBS and cultured in a humidified incubator at 37°C with 5% CO_2 for 6 days in the presence of GM-CSF and IL-4 (R&D Systems), each at 50 ng/ml in 24 well plates. On day 3 of culture half of the medium was carefully removed and replaced with fresh medium containing 100 ng/ml of GM-CSF and IL-4.

[0677] On day 6 of culture monocyte-derived dendritic cells (MoDCs) were harvested and washed into X-VIVO15 medium containing 5% human male AB serum (Biowest) and 1 mM sodium pyruvate (Lonza). Naïve CD4^+ T cells from a different donor were thawed and CFSE-labelled as described above and washed into the same medium as the MoDCs. Finally, 1×10^4 MoDCs were cultured with 1×10^5 naïve CD4^+ T cells in the presence of ATP (Sigma-Aldrich), uridine or uracil in 96 round well bottom plates for 72h in a humidified incubator at 37°C with 5% CO_2 .

[0678] Analysis of proliferation of CD4 T cells via CFSE dilution was performed by flow cytometry

using a BD LSR Fortessa with data analysis on FlowJo (BD Biosciences). Cytokines were analysed by alphaLISA (Perkin Elmer) according to the manufacturer's instructions.

CMV antigen recall assay

[0679] Frozen vials of PBMCs from a healthy volunteer donor with history of CMV infection and known HLA-A*02 subtype were purchased from ImmuneXperts. Cells were thawed and washed into X-VIVO15 medium containing 5% human serum and 1 mM sodium pyruvate and plated in 96U bottom plates (1×10^6 cells per well). Cultures at time of plating contained combinations of CMV peptide (NLVPMVATV, 10 $\mu\text{g/ml}$, IBA Lifesciences), IL-7 (5 ng/ml, kind gift from ImmuneXperts), anti-PD1 (10 $\mu\text{g/ml}$, Nivolumab, Bristol Meyers Squibb), ATP (300 μM) and the various ENT1 inhibitors as indicated in FIG. 3. After one day of culture in a humidified incubator at 37°C with 5% CO₂, half the medium was removed from each well and all reagents except the peptide replenished at their original concentrations and the plate returned to the incubator. This was repeated on day 4 of culture with the addition of IL-2 (20 U/ml, Proleukin, Novartis) to all wells. On day 7 of culture the cells were harvested and the frequency of CMV-peptide specific CD8⁺ T cells was assessed via flow cytometry using NLVPMVATV-MHC-I tetramers (Tetramer Shop) by quantifying the frequency of tetramer⁺ cells within the viable CD8⁺ T cell gate.

Description of data

[0680] Proliferation of human T cells was significantly inhibited in the presence of 100 μM ATP as a source of adenosine. This suppression could however be dose-dependently restored with various macrocyclic ENT1 inhibitors as well as the parent molecule of this series, dilazep (FIG. 1A). The order of potency was Compound 2, Compound 8, Compound 11 and then dilazep, with IC₅₀ values of 0,3, 2, 7 and 71 nM, respectively. Human serum albumin (HSA) and alpha-1-acid glycoprotein (AAG) were added to the cultures at final concentrations of 2 and 0,1%, respectively, to determine the potency of the ENT1 inhibitor molecules under high protein binding conditions (FIG. 1B). Whilst this treatment did not change the order of potencies of the molecules, the IC₅₀ values for each was increased (2, 16, 125 and 337 nM, respectively).

[0681] Proliferation of naïve CD4 T cells during MLR experiments was significantly inhibited by 300 μM ATP as a source of adenosine during the culture (FIG. 2). A near complete rescue of this proliferation was observed in the presence of Compound 2, with weaker restoration induced by Compound 11 (FIG. 2). Production of TNF followed a similar trend to the proliferation data, with production inhibited by ATP and clear restoration with Compound 2, even beyond the control level (FIG. 2B). Interestingly, IFN γ production followed a different pattern with low production observed in the presence or absence of ATP. There was however a significant and consistent increase in IFN γ production induced by Compound 2, with a smaller effect for Compound 11 (FIG. 2B). This suggests an unexpected synergy between ATP or adenosine and high potency ENT1 inhibition by macrocyclic ENT1 inhibitors.

[0682] Finally, proliferation of CD8⁺ T cells with TCR specificity for the NLVPMVATV peptide derived from the immunodominant CMV antigen pp65 was significantly inhibited in the presence of ATP (300 μM, added at various stages during the culture) as a source of adenosine in the CMV antigen recall assay (FIG. 3). A significant rescue of proliferation of these cells was observed when Compound 2 or Compound 11 were included in the culture. These data are consistent with adenosine suppressing the proliferation of these CMV peptide-specific CD8⁺ T cells and the highly potent macrocyclic ENT1 inhibitors acting to restrict the uptake of adenosine and thus restore proliferation.

EXAMPLE IV

[0683] To assess the anti-tumor efficacy of compound Compound 8 in syngeneic fibrosarcoma model, C57BL/6 (n=8) were subcutaneously inoculated with 200x10⁵ MCA205 cells in the right flank. At day 8 after inoculation the mice were randomized according tumor size and received oral treatment of Compound 8 at 10mg/kg or its vehicle. The mice were monitored 3 times a week for tumor measurements, and the data plotted below. (FIG 4A) The median tumor growth kinetics show a slight change in tumor size between Compound 8 treated mice and vehicle. (FIG. 4B and FIG. 4C) At day 21 after inoculation, 57% of the mice treated with 10mg/kg of Compound 8 were responsive to Compound 8 treatment and at day 31 15% of the mice presented significant tumor growth delay with tumors below 1000mm³. The statistical analysis was performed in JMP software using linear fixed model.
