US012067229B2

(12) **United States Patent**
Bernstein et al.

(10) **Patent No.: US 12,067,229 B2**
(45) **Date of Patent: Aug. 20, 2024**

(54) **DEVICE, METHOD, AND GRAPHICAL USER INTERFACE FOR PROVIDING FEEDBACK FOR CHANGING ACTIVATION STATES OF A USER INTERFACE OBJECT**

(71) Applicant: **Apple Inc.**, Cupertino, CA (US)

(72) Inventors: **Jeffrey Traer Bernstein**, San Francisco, CA (US); **Julian K. Missig**, Burlingame, CA (US); **Avi E. Cieplinski**, San Francisco, CA (US); **B. Michael Victor**, Castro Valley, CA (US)

(73) Assignee: **APPLE INC.**, Cupertino, CA (US)

(*) Notice: Subject to any disclaimer, the term of this patent is extended or adjusted under 35 U.S.C. 154(b) by 0 days.

(21) Appl. No.: **17/728,909**

(22) Filed: **Apr. 25, 2022**

(65) **Prior Publication Data**

(57) **ABSTRACT**

An electronic device detects a contact on a touch-sensitive surface of the electronic device, including a first portion of a gesture made with the contact, a second portion of the gesture that follows the first portion, and lift-off of the contact from the touch-sensitive surface during or after the second portion of the gesture. In response to detecting the second portion of the gesture, if a modifier input was detected while detecting the first portion of the gesture made with the contact, the electronic device performs a first operation and generates a first tactile output on the touch-sensitive surface. If the modifier input was not detected while detecting the first portion of the gesture, the electronic device performs a second operation different from the first operation and generates a second tactile output on the touch-sensitive surface, wherein the second tactile output is different from the first tactile output.

Notice of Allowance, dated Nov. 30, 2017, received in U.S. Appl. No. 14/536,367, 9 pages.
Notice of Allowance, dated May 16, 2018, received in U.S. Appl. No. 14/536,367, 5 pages.
Office Action, dated Dec. 17, 2015, received in U.S. Appl. No. 14/536,426, 28 pages.
Final Office Action, dated May 6, 2016, received in U.S. Appl. No. 14/536,426, 23 pages.
Office action, dated Aug. 3, 2017, received in U.S. Appl. No. 14/536,426, 10 pages.
Office Action, dated Jul. 15, 2015, received in Australian Patent Application No. 2013259606, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Notice of Allowance, dated May 23, 2016, received in Australian Patent Application No. 2013259606, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Certificate of Grant, dated Sep. 15, 2016, received in Australian Patent Australian Patent Application No. 20133259606, which corresponds with U.S. Appl. No. 14/536,426, 1 page.
Office Action, dated Nov. 18, 2015, received in Australian Patent Application No. 2015101231, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Office Action, dated May 15, 2017, received in Australian Patent Application No. 2016216580, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Office Action, dated May 8, 2018, received in Australian Patent Application No. 2016216580, which corresponds with U.S. Appl. No. 14/536,426, 5 pages.
Notice of Allowance, dated May 17, 2018, received in Australian Patent Application No. 2016216580, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Certificate of Grant, dated Sep. 13, 2018, received in Australian Patent Application No. 2016216580, which corresponds with U.S. Appl. No. 14/536,426, 1 page.
Office Action, dated Apr. 12, 2019, received in Australian Patent Application No. 2018223021, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Office Action, dated Nov. 18, 2019, received in Australian Patent Application No. 2018223021, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Office Action, dated Feb. 18, 2020, received in Australian Patent Application No. 2018223021, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Notice of Allowance, dated Mar. 27, 2020, received in Australian Patent Application No. 2018223021, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Certificate of Grant, dated Jul. 23, 2020, received in Australian Patent Application No. 2018223021, which corresponds with U.S. Appl. No. 14/536,426, 4 pages.
Office Action, dated Sep. 19, 2017, received in Chinese Patent Application No. 201380035982.1, which corresponds with U.S. Appl. No. 14/536,426, 5 pages.
Notice of Allowance, dated May 10, 2018, received in Chinese Patent Application No. 201380035982.1, which corresponds with U.S. Appl. No. 14/536,426, 2 pages.
Patent, dated Aug. 17, 2018, received in Chinese Patent Application No. 201380035982.1, which corresponds with U.S. Appl. No. 14/536,426, 4 pages.
Office Action, dated Sep. 20, 2017, received in Chinese Patent Application No. 201510566550.4, which corresponds with U.S. Appl. No. 14/536,426, 11 pages.
Notice of Allowance, dated Aug. 8, 2018, received in Chinese Patent Application No. 201510566550.4, which corresponds with U.S. Appl. No. 14/536,426, 3 pages.
Patent, dated Oct. 23, 2018, received in Chinese Patent Application No. 20151056650.4, which corresponds with U.S. Appl. No. 14/536,426, 4 pages.
Office Action, dated Jan. 4, 2021, received in Chinese Patent Application No. 201810826224.6, which corresponds with U.S. Appl. No. 14/536,426, 6 pages.

Patent, dated Oct. 23, 2018, received in Chinese Patent Application No. 201380035893.7, which corresponds with U.S. Appl. No. 14/536,141, 4 pages.
Office Action, dated Jan. 7, 2016, received in European Patent Application No. 13726053.5, which corresponds with U.S. Appl. No. 14/536,141, 10 pages.
Office Action, dated Aug. 31, 2016, received in European Patent Application No. 13726053.5, which corresponds with U.S. Appl. No. 14/536,141, 10 pages.
Office Action, dated Apr. 9, 2018, received in European Patent Application No. 13726053.5, which corresponds with U.S. Appl. No. 14/536,141, 9 pages.
Office Action, dated Mar. 7, 2019, received in European Patent Application No. 13726053.5, which corresponds with U.S. Appl. No. 14/536,141, 5 pages.
Intention to Grant, dated Sep. 6, 2019, received in European Patent Application No. 13726053.5, which corresponds with U.S. Appl. No. 14/536,141, 7 pages.
Decision to Grant, dated Jan. 23, 2020, received in European Patent Application No. 13726053.5, which corresponds with U.S. Appl. No. 14/536,141, 1 page.
Patent, dated Feb. 19, 2020, received in European Patent Application No. 13726053.5, which corresponds with U.S. Appl. No. 14/536,141, 4 page.
Office Action, dated Feb. 29, 2016, received in Japanese Patent Application No. 2015-511646, which corresponds with U.S. Appl. No. 14/536,141, 3 pages.
Office Action, dated Oct. 25, 2016, received in Japanese Patent Application No. 2015-511646, which corresponds with U.S. Appl. No. 14/536,141, 6 pages.
Notice of Allowance, dated Jun. 30, 2017, received in Japanese Patent Application No. 2015-511646, which corresponds with U.S. Appl. No. 14/536,141, 5 pages.
Patent, dated Jul. 28, 2017, received in Japanese Patent Application No. 2015-511646, which corresponds with U.S. Appl. No. 14/536,141, 3 pages.
Office Action, dated Aug. 10, 2018, received in Japanese Patent Application No. 2017-141953, which corresponds with U.S. Appl. No. 14/536,141, 6 pages.
Office Action, dated Jul. 5, 2019, received in Japanese Patent Application No. 2017-141953, which corresponds with U.S. Appl. No. 14/536,141, 6 pages.
Office Action, dated Dec. 8, 2016, received in U.S. Appl. No. 14/608,942, 9 pages.
Notice of Allowance, dated May 12, 2017, received in U.S. Appl. No. 14/608,942, 10 pages.
Office Action, dated Jan. 29, 2016, received in Australian Patent Application No. 2013368443, which corresponds with U.S. Appl. No. 14/608,942, 3 pages.
Notice of Allowance, dated Mar. 11, 2016, received in Australian Patent Application No. 2013368443, which corresponds with U.S. Appl. No. 14/608,942, 2 pages.
Certificate of Grant, dated Jul. 7, 2016, received in Australian Patent Application No. 14/608,942, which corresponds with U.S. Appl. No. 14/608,942, 3 pages.
Office Action, dated Mar. 29, 2017, received in Australian Patent Application No. 2016201303, which corresponds with U.S. Appl. No. 14/608,942, 3 pages.
Notice of Acceptance, dated Mar. 7, 2018, received in Australian Patent Application No. 2016201303, which corresponds with U.S. Appl. No. 14/608,942, 3 pages.
Certificate of Grant, dated Jul. 5, 2018, received in Australian Patent Application No. 2016201303, which corresponds with U.S. Appl. No. 14/608,942, 4 pages.
Office Action, dated Jun. 16, 2017, received in Chinese Patent Application No. 201380068295.X, which corresponds with U.S. Appl. No. 14/608,942, 6 pages.
Office Action, dated Mar. 28, 2018, received in Chinese Patent Application No. 201380068295.X, which corresponds with U.S. Appl. No. 14/608,942, 5 pages.
Office Action, dated Oct. 8, 2018, received in Chinese Patent Application No. 201380068295.X, which corresponds with U.S. Appl. No. 14/608,942, 3 pages.
Notice of Allowance, dated May 7, 2019, received in Chinese Patent Application No. 201380068295.X, which corresponds with U.S. Appl. No. 14/608,942, 3 pages.
Patent, dated Jul. 5, 2019, received in Chinese Patent Application No. 201380068295.X, which corresponds with U.S. Appl. No. 14/608,942, 8 pages.
Office Action, dated Oct. 7, 2016, received in European Patent Application No. 13798464.7, which corresponds with U.S. Appl. No. 14/608,942, 7 pages.
Decision to Grant, dated Sep. 13, 2018, received in European Patent Application No. 13798464.7, which corresponds with U.S. Appl. No. 14/608,942, 2 pages.
Intention to Grant, dated Nov. 8, 2019, received in European Patent Application No. 18194127.9, which corresponds with U.S. Appl. No. 14/608,942, 7 pages.
Decision to Grant, dated Aug. 20, 2020, received in European Patent Application No. 18194127.9, which corresponds with U.S. Appl. No. 14/608,942, 4 pages.
Patent, dated Sep. 16, 2020, received in European Patent Application No. 18194127.9, which corresponds with U.S. Appl. No. 14/608,942, 4 pages.
Certificate of Grant, dated Jul. 26, 2019, received in Hong Kong, which corresponds with U.S. Appl. No. 14/608,942, 4 pages.
Office Action, dated Jul. 4, 2016, received in Japanese Patent Application No. 2015-549393, which corresponds with U.S. Appl. No. 14/608,942, 4 pages.
Notice of Allowance, dated May 12, 2017, received in Japanese Patent Application No. 2015-549393, which corresponds with U.S. Appl. No. 14/608,942, 5 pages.
Patent, dated Jun. 16, 2017, received in Japanese Patent Application No. 2015-549393, which corresponds with U.S. Appl. No. 14/608,942, 3 pages.
Office Action, dated Apr. 5, 2016, received in Korean Patent Application No. 2015-7018448, which corresponds with U.S. Appl. No. 14/608,942, 6 pages.
Office Action, dated Feb. 24, 2017, received in Korean Patent Application No. 2015-7018448, which corresponds with U.S. Appl. No. 14/608,942, 4 pages.
Notice of Allowance, dated Jan. 15, 2019, received in Korean Patent Application No. 2015-7018448, which corresponds with U.S. Appl. No. 14/608,942, 5 pages.
Patent, dated Mar. 8, 2019, received in Korean Patent Application No. 2015-7018448, which corresponds with U.S. Appl. No. 14/608,942, 4 pages.
Office Action, dated Jul. 17, 2017, received in U.S. Appl. No. 14/536,166, 19 pages.
Notice of Allowance, dated Feb. 28, 2018, received in U.S. Appl. No. 14/536,166, 5 pages.
Office Action, dated Aug. 1, 2016, received in U.S. Appl. No. 14/536,203, 14 pages.
Notice of Allowance, dated Feb. 1, 2017, received in U.S. Appl. No. 14/536,203, 9 pages.

Decision to Grant, dated Nov. 29, 2018, received in European Patent Application No. 16177863.4, which corresponds with U.S. Appl. No. 14/536,267, 4 pages.
Patent, dated Dec. 26, 2018, received in European Patent Application No. 16177863.4, which corresponds with U.S. Appl. No. 14/536,267, 4 pages.
Office Action, dated Aug. 29, 2019, received in European Patent Application No. 18183789.9, which corresponds with U.S. Appl. No. 16/262,800, 9 pages.
Office Action, dated Aug. 21, 2020, received in European Patent Application No. 18183789.9, which corresponds with U.S. Appl. No. 16/262,800, 9 pages.
Patent, dated Aug. 30, 2019, received in Hong Kong Patent Application No. 15107537.8, which corresponds with U.S. Appl. No. 14/536,267, 9 pages.
Patent, dated Nov. 8, 2019, received in Hong Kong Patent Application No. 15108890.7, which corresponds with U.S. Appl. No. 14/536,267, 4 pages.
Office Action, dated Jan. 29, 2016, received in Japanese Patent Application No. 2015-511652, which corresponds with U.S. Appl. No. 14/536,267, 3 pages.
Notice of Allowance, dated Sep. 26, 2016, received in Japanese Patent Application No. 2015-511652, which corresponds with U.S. Appl. No. 14/536,267, 5 pages.
Office Action, dated Mar. 3, 2017, received in Japanese Patent Application No. 2016-125839, which corresponds with U.S. Appl. No. 14/536,267, 6 pages.
Notice of Allowance, dated Nov. 17, 2017, received in Japanese Patent Application No. 2016-125839, which corresponds with U.S. Appl. No. 14/536,267, 5 pages.
Office Action, dated Feb. 4, 2019, received in Japanese Patent Application No. 2017-237035, which corresponds with U.S. Appl. No. 14/536,267, 7 pages.
Notice of Allowance, dated Sep. 9, 2019, received in Japanese Patent Application No. 2017-237035, which corresponds with U.S. Appl. No. 14/536,267, 5 pages.
Patent, dated Sep. 27, 2019, received in Japanese Patent Application No. 2017-237035, which corresponds with U.S. Appl. No. 14/536,267, 3 pages.
Office Action, dated Dec. 4, 2015, received in Korean Patent Application No. 2014-7034530, which corresponds with U.S. Appl. No. 14/536,267, 3 pages.

Office Action, dated Jul. 16, 2019, received in Chinese Patent Application No. 201610131415.1, which corresponds with U.S. Appl. No. 14/866,981, 4 pages.
Office Action, dated Mar. 16, 2020, received in Chinese Patent Application No. 201610131415.1, which corresponds with U.S. Appl. No. 14/866,981, 3 pages.
Notice of Allowance, dated Dec. 4, 2020, received in Chinese Patent Application No. 201610131415.1, which corresponds with U.S. Appl. No. 14/866,981, 3 pages.
Patent, dated Jan. 22, 2021, received in Chinese Patent Application No. 201610131415.1, which corresponds with U.S. Appl. No. 14/866,981, 6 pages.
Notice of Allowance, dated Jul. 27, 2016, received in Chinese Patent Application No. 201620176169.7, which corresponds with U.S. Appl. No. 14/866,981, 3 pages.
Patent, dated Sep. 28, 2016, received in Chinese Patent Application No. 201620176169.7, which corresponds with U.S. Appl. No. 14/866,981, 4 pages.
Certificate of Registration, dated Jun. 20, 2016, received in German Patent Application No. 202016001514.2, which corresponds with U.S. Appl. No. 14/864,737, 3 pages.
Office Action, dated Mar. 18, 2016, received in Danish Patent Application No. 201500575, which corresponds with U.S. Appl. No. 14/866,981, 9 pages.
Office Action, dated Dec. 5, 2016, received in Danish Patent Application No. 201500575, which corresponds with U.S. Appl. No. 14/866,981, 3 pages.
Office Action, dated Jul. 7, 2017, received in Danish Patent Application No. 201500575, 4 pages.
Patent, Nov. 16, 2017, received in Dutch Patent Application No. 2016375, which corresponds with U.S. Appl. No. 14/866,981, 2 pages.
Office Action, dated Dec. 15, 2017, received in U.S. Appl. No. 14/866,159, 35 pages.
Notice of Allowance, dated May 18, 2018, received in U.S. Appl. No. 14/866,159, 8 pages.
Office Action, dated May 19, 2016, received in Australian Patent Application No. 2016100251, which corresponds with U.S. Appl. No. 14/866,159, 5 pages.
Office Action, dated Jun. 5, 2018, received in Chinese Patent Application No. 201610137839.9, which corresponds with U.S. Appl. No. 14/866,159, 11 pages.
Notice of Allowance, dated Dec. 6, 2018, received in Chinese Patent Application No. 201610137839.9, which corresponds with U.S. Appl. No. 14/866,159, 3 pages.
Patent, dated Feb. 19, 2019, received in Chinese Patent Application No. 201610137839.9, which corresponds with U.S. Appl. No. 14/866,159, 6 pages.
Office Action, dated Jul. 5, 2016, received in Chinese Patent Application No. 201620186008.6, which corresponds with U.S. Appl. No. 14/866,159, 3 pages.
Certificate of Registration, dated Jun. 16, 2016, received in German Patent No. 202016001483.9, which corresponds with U.S. Pat. No. 14,866,159, 3 pages.
Office Action, dated Mar. 9, 2016, received in Danish Patent Application No. 201500574, which corresponds with U.S. Appl. No. 14/866,159, 11 pages.
Office Action, dated Sep. 27, 2016, received in Danish Patent Application No. 201500574, which corresponds with U.S. Appl. No. 14/866,159, 4 pages.
Office Action, dated Mar. 14, 2017, received in Danish Patent Application No. 14/866,159, which corresponds with U.S. Appl. No. 14/866,159, 5 pages.
Office Action, dated Jul. 6, 2017, received in Danish Patent Application No. 201500574, which corresponds with U.S. Appl. No. 14/866,159, 3 pages.
Office Action, dated Jan. 10, 2018, received in Danish Patent Application No. 201500574, which corresponds with U.S. Appl. No. 14/866,159, 2 pages.
Notice of Allowance, dated Mar. 21, 2018, received in Danish Patent Application No. 201500574, which corresponds with U.S. Appl. No. 14/866,159, 2 pages.
Patent, dated May 22, 2018, received in Danish Patent Application No. 201500574, which corresponds with U.S. Appl. No. 14/866,159, 2 pages.
Intention to Grant, dated Oct. 28, 2019, received in European Patent Application No. 16707356.8, which corresponds with U.S. Appl. No. 14/866,159, 7 pages.
Decision to Grant, dated Mar. 5, 2020, received in European Patent Application No. 16707356.8, which corresponds with U.S. Appl. No. 14/866,159, 2 pages.
Patent, dated Apr. 1, 2020, received in European Patent Application No. 16707356.8, which corresponds with U.S. Appl. No. 14/866,159, 3 pages.
Patent, dated Sep. 7, 2017, received in Dutch Patent Application No. 2016377, which corresponds with U.S. Appl. No. 14/866,159, 4 pages.
Office Action, dated Oct. 6, 2017, received in U.S. Appl. No. 14/868,078, 40 pages.
Notice of Allowance, dated May 24, 2018, received in U.S. Appl. No. 14/868,078, 6 pages.
Innovation Patent, dated Aug. 4, 2016, received in Australian Patent Application No. 2016101201, which corresponds with U.S. Appl. No. 14/868,078, 1 page.
Office Action, dated Oct. 12, 2016, received in Australian Patent Application No. 2016101201, which corresponds with U.S. Appl. No. 14/868,078, 3 pages.
Notice of Allowance, dated Sep. 1, 2017, received in Australian Patent Application No. 2016229421, which corresponds with U.S. Appl. No. 14/868,078, 3 pages.

Notice of Allowance, dated Dec. 28, 2016, received in U.S. Appl. No. 14/864,580, 8 pages.
Office Action, dated Aug. 19, 2016, received in Australian Patent Application No. 2016100648, which corresponds with U.S. Appl. No. 14/864,580, 6 pages.
Office Action, dated Jul. 1, 2019, received in Australian Patent Application No. 2019200872, which corresponds with U.S. Appl. No. 14/864,580, 6 pages.
Notice of Acceptance, dated Sep. 19, 2019, received in Australian Patent Application No. 2019200872, which corresponds with U.S. Appl. No. 14/864,580, 3 pages.
Certificate of Grant, dated Jan. 23, 2020, received in Australian Patent Application No. 2019200872, which corresponds with U.S. Appl. No. 14/864,580, 3 pages.
Office Action, dated Nov. 7, 2018, received in Chinese Patent Application No. 201610342151.4, which corresponds with U.S. Appl. No. 14/864,580, 3 pages.
Notice of Allowance, dated Jun. 14, 2019, received in Chinese Patent Application No. 201610342151.4, which corresponds with U.S. Appl. No. 14/864,580, 3 pages.
Patent, dated Jul. 30, 2019, received in Chinese Patent Application No. 201610342151.4, which corresponds with U.S. Appl. No. 14/864,580, 6 pages.
Notice of Allowance, dated Nov. 8, 2016, received in Chinese Patent Application No. 201620470247.4, which corresponds with U.S. Appl. No. 14/864,580, 3 pages.
Certificate of Registration, dated Oct. 14, 2016, received in German Patent Application No. 20201600003234.9, which corresponds with U.S. Appl. No. 14/864,580, 3 pages.
Office Action, dated Apr. 8, 2016, received in Danish Patent Application No. 201500584, which corresponds with U.S. Appl. No. 14/864,580, 9 pages.
Office Action, dated Oct. 7, 2016, received in Danish Patent Application No. 201500584, which corresponds with U.S. Appl. No. 14/864,580, 3 pages.
Office Action, dated May 5, 2017, received in Danish Patent Application No. 201500584, which corresponds with U.S. Appl. No. 14/864,580, 3 pages.
Office Action, dated Dec. 15, 2017, received in Danish Patent Application No. 201500584, which corresponds with U.S. Appl. No. 14/864,580, 4 pages.
Office Action, dated Jun. 17, 2021, received in European Patent Application No. 19194418.0, which corresponds with U.S. Appl. No. 14/864,580, 7 pages.
Notice of Allowance, dated Aug. 14, 2019, received in Korean Patent Application No. 2019-7018317, which corresponds with U.S. Appl. No. 14/864,580, 6 pages.
Patent, dated Nov. 12, 2019, received in Korean Patent Application No. 2019-7018317, which corresponds with U.S. Appl. No. 14/864,580, 6 pages.
Notice of Allowance, dated Nov. 23, 2016, received in U.S. Appl. No. 14/864,601, 12 pages.
Notice of Allowance, dated Apr. 20, 2017, received in U.S. Appl. No. 14/864,601, 13 pages.
Office Action, dated Aug. 31, 2018, received in Australian Patent Application No. 14/864,601, which corresponds with U.S. Appl. No. 14/864,601, 3 pages.
Certificate of Grant, dated Feb. 21, 2019, received in Australian Patent Application No. 2016276030, which corresponds with U.S. Appl. No. 14/864,601, 4 pages.
Office Action, dated Feb. 4, 2019, received in European Patent Application No. 16730554.9, which corresponds with U.S. Appl. No. 14/864,601, 10 pages.
Intention to Grant, dated Jul. 18, 2019, received in European Patent Application No. 16730554.9, which corresponds with U.S. Appl. No. 14/864,601, 5 pages.
Decision to Grant, dated Sep. 12, 2019, received in European Patent Application No. 16730544.9, which corresponds with U.S. Appl. No. 14/864,601, 2 pages.

Patent, dated May 19, 2020, received in Chinese Patent Application No. 201610871466.8, which corresponds with U.S. Appl. No. 14/871,236, 8 pages.
Office Action, dated Apr. 8, 2016, received in Danish Patent Application No. 201500595, which corresponds with U.S. Appl. No. 14/871,236, 12 pages.
Office Action, dated May 26, 2016, received in Danish Patent Application No. 201500595, which corresponds with U.S. Appl. No. 14/871,236, 14 pages.
Office Action, dated Sep. 30, 2016, received in Danish Patent Application No. 201500595, which corresponds with U.S. Appl. No. 14/871,236, 10 pages.
Office Action, dated Jun. 15, 2017, received in Danish Patent Application No. 201500595, which corresponds with U.S. Appl. No. 14/871,236, 4 pages.
Office Action, dated Jan. 29, 2018, received in Danish Patent Application No. 201500595, which corresponds with U.S. Appl. No. 14/871,236, 2 pages.
Notice of Allowance, dated Apr. 26, 2018, received in Danish Patent Application No. 201500595, which corresponds with U.S. Appl. No. 14/871,236, 2 pages.
Patent, dated Jun. 18, 2018, received in Danish Patent Application No. 201500595, which corresponds with U.S. Appl. No. 14/871,236, 3 pages.
Intention to Grant, dated Dec. 4, 2019, received in European Patent Application No. 18168941.5, which corresponds with U.S. Appl. No. 14/871,236, 8 pages.
Intention to Grant, dated Oct. 5, 2020, received in European Patent Application No. 18168941.5, which corresponds with U.S. Appl. No. 14/871,236, 8 pages.
Decision to Grant, dated Mar. 25, 2021, received in European Patent Application No. 18168941.5, which corresponds with U.S. Appl. No. 14/871,236, 2 pages.
Patent, dated Apr. 21, 2021, received in European Patent Application No. 18168941.5, which corresponds with U.S. Appl. No. 14/871,236, 3 pages.
Office Action, dated Mar. 17, 2020, received in Mx/a/2017/011610, which corresponds with U.S. Appl. No. 14/871,236, 4 pages.
Notice of Allowance, dated Sep. 7, 2020, received in Mx/a/2017/011610, which corresponds with U.S. Appl. No. 14/871,236, 12 pages.
Patent, dated Dec. 2, 2020, received in Mx/a/2017/011610, which corresponds with U.S. Appl. No. 14/871,236, 4 pages.
Office Action, dated Jul. 19, 2018, received in Russian Patent Application No. 2017131408, which corresponds with U.S. Appl. No. 14/871,236, 8 pages.
Patent, dated Feb. 15, 2019, received in Russian Patent Application No. 2017131408, which corresponds with U.S. Appl. No. 14/871,236, 2 pages.
Office Action, dated Sep. 1, 2017, received in U.S. Appl. No. 14/870,754, 22 pages.
Final Office Action, dated Mar. 9, 2018, received in U.S. Appl. No. 14/870,754, 19 pages.
Notice of Allowance, dated Jul. 2, 2018, received in U.S. Appl. No. 14/870,754, 9 pages.
Notice of Allowance, dated Dec. 3, 2018, received in U.S. Appl. No. 14/870,754, 8 pages.
Office Action, dated Nov. 14, 2017, received in U.S. Appl. No. 14/870,882, 25 pages.
Final Office Action, dated Apr. 20, 2018, received in U.S. Appl. No. 14/870,882, 7 pages.
Notice of Allowance, dated Jul. 12, 2018, received in U.S. Appl. No. 14/870,882, 5 pages.
Notice of Allowance, dated Dec. 5, 2018, received in U.S. Appl. No. 14/870,882, 8 pages.
Innovation Patent, dated Aug. 25, 2016, received in Australian Patent Application No. 2016101436, which corresponds with U.S. Appl. No. 14/871,236, 1 pages.
Office Action, dated Oct. 31, 2016, received in Australian Patent Application No. 2016101438, which corresponds with U.S. Appl. No. 14/871,236, 6 pages.
Office Action, dated Nov. 28, 2019, received in Chinese Patent Application No. 201610870912.3, which corresponds with U.S. Appl. No. 14/870,882, 10 pages.
Office Action, dated Aug. 3, 2020, received in Chinese Patent Application No. 201610870912.3, which corresponds with U.S. Appl. No. 14/870,882, 4 pages.
Office Action, dated Dec. 21, 2020, received in Chinese Patent Application No. 201610870912.3, which corresponds with U.S. Appl. No. 14/870,882, 5 pages.
Notice of Allowance, dated Mar. 22, 2021, received in Chinese Patent Application No. 201610870912.3, which corresponds with U.S. Appl. No. 14/870,882, 1 pages.
Patent, dated May 25, 2021, received in Chinese Patent Application No. 201610870912.3, which corresponds with U.S. Appl. No. 14/870,882, 8 pages.
Office Action, dated Apr. 6, 2016, received in Danish Patent Application No. 201500596, which corresponds with U.S. Appl. No. 14/870,882, 7 pages.
Office Action, dated Jun. 9, 2016, received in Danish Patent Application No. 201500596, which corresponds with U.S. Appl. No. 14/870,882, 9 pages.
Notice of Allowance, dated Oct. 31, 2017, received in Danish Patent Application No. 201500596, which corresponds with U.S. Appl. No. 14/870,882, 2 pages.
Patent, dated Jan. 29, 2018, received in Danish Patent Application No. 201500596, which corresponds with U.S. Appl. No. 14/870,882, 4 pages.
Office Action, dated Feb. 11, 2019, received in European Patent Application No. 17171972.7, which corresponds with U.S. Appl. No. 14/870,882, 7 pages.
Office Action, dated Sep. 1, 2017, received in U.S. Appl. No. 14/870,988, 14 pages.
Final Office Action, dated Feb. 16, 2018, received in U.S. Appl. No. 14/870,988, 18 pages.
Notice of Allowance, dated Aug. 27, 2018, received in U.S. Appl. No. 14/870,988, 11 pages.
Office Action, dated Nov. 22, 2017, received in U.S. Appl. No. 14/871,227, 24 pages.
Notice of Allowance, dated Jun. 11, 2018, received in U.S. Appl. No. 14/871,227, 11 pages.
Office Action, dated Oct. 17, 2016, received in Australian Patent Application No. 2016203040, which corresponds with U.S. Appl. No. 14/871,227, 7 pages.
Office Action, dated Oct. 16, 2017, received in Australian Patent Application No. 2016203040, which corresponds with U.S. Appl. No. 14/871,227, 5 pages.
Notice of Acceptance, dated Oct. 30, 2018, received in Australian Patent Application No. 2016203040, which corresponds with U.S. Appl. No. 14/871,227, 4 pages.

Office Action, dated Oct. 25, 2016, received in Chinese Patent Application No. 201620176221.9, which corresponds with U.S. Appl. No. 14/867,990, 7 pages.
Certificate of Registration, dated Jun. 16, 2016, received in German Patent No. 202016001489.8, which corresponds with U.S. Appl. No. 14/867,990, 3 pages.
Office Action, dated Mar. 18, 2016, received in Danish Patent Application No. 201500581, which corresponds with U.S. Appl. No. 14/867,990, 9 pages.
Office Action, dated Sep. 26, 2016, received in Danish Patent Application No. 201500581, which corresponds with U.S. Appl. No. 14/867,990, 5 pages.
Office Action, dated May 3, 2017, received in Danish Patent Application No. 201500581, which corresponds with U.S. Appl. No. 14/867,990, 5 pages.
Office Action, dated Feb. 19, 2018, received in Danish Patent Application No. 201500581, which corresponds with U.S. Appl. No. 14/867,990, 4 pages.
Office Action, dated Feb. 21, 2020, received in European Patent Application No. 16711725.8, which corresponds with U.S. Appl. No. 14/867,990, 13 pages.
Office Action, dated May 14, 2021, received in European Patent Application No. 16711725.8, which corresponds with U.S. Appl. No. 14/867,990, 7 pages.
Office Action, dated Apr. 19, 2018, received in U.S. Appl. No. 14/869,703, 19 pages.
Final Office Action, dated Oct. 26, 2018, received in U.S. Appl. No. 14/869,703, 19 pages.
Notice of Allowance, dated Mar. 12, 2019, received in U.S. Appl. No. 14/869,703, 6 pages.
Office Action, dated Dec. 12, 2017, received in U.S. Appl. No. 15/009,668, 32 pages.
Final Office Action, dated Jul. 3, 2018, received in U.S. Appl. No. 15/009,668, 19 pages.
Office Action, dated Jan. 10, 2019, received in U.S. Appl. No. 15/009,668, 17 pages.
Notice of Allowance, dated May 1, 2019, received in U.S. Appl. No. 15/009,668, 12 pages.

Office Action, dated Nov. 25, 2016, received in U.S. Appl. No. 15/081,771, 17 pages.
Final Office Action, dated Jun. 2, 2017, received in U.S. Appl. No. 15/081,771, 17 pages.
Notice of Allowance, dated Dec. 4, 2017, received in U.S. Appl. No. 15/081,771, 10 pages.
Office Action, dated Feb. 1, 2018, received in Australian U.S. Appl. No. 15/081,771, which corresponds with U.S. Appl. No. 15/081,771, 4 pages.
Notice of Acceptance, dated Jan. 24, 2019, received in Australian Patent Application No. 2017202058, which corresponds with U.S. Appl. No. 15/081,771, 3 pages.
Certificate of Grant, dated May 23, 2019, received in Australian Patent Application No. 2017202058, which corresponds with U.S. Appl. No. 15/081,771, 1 page.
Office Action, dated Mar. 2, 2022, received in Chinese Patent Application No. 201811561188.1, which corresponds with U.S. Appl. No. 15/081,771, 1 page.
Office Action, dated Jan. 24, 2020, received in European Patent Application No. 18205283.7, which corresponds with U.S. Appl. No. 15/081,771, 4 pages.
Intention to Grant, dated Apr. 30, 2020, received in European Patent Application No. 18205283.7, which corresponds with U.S. Appl. No. 15/081,771, 7 pages.
Decision to Grant, dated Aug. 27, 2020, received in European Patent Application No. 18205283.7, which corresponds with U.S. Appl. No. 15/081,771, 4 pages.
Patent, dated Sep. 23, 2020, received in European Patent Application No. 18205283.7, which corresponds with U.S. Appl. No. 15/081,771, 4 pages.
Office Action, dated Jan. 26, 2018, received in Japanese Patent Application No. 2017-086460, which corresponds with U.S. Appl. No. 15/081,771, 6 pages.
Notice of Allowance, dated Oct. 12, 2018, received in Japanese Patent Application No. 2017-086460, which corresponds with U.S. Appl. No. 15/081,771, 5 pages.
Office Action, dated Aug. 29, 2017, received in Korean Patent Application No. 2017-7014536, which corresponds with U.S. Appl. No. 15/081,771, 5 pages.
Notice of Allowance, dated Jun. 28, 2018, received in Korean Patent Application No. 2017-7014536, which corresponds with U.S. Appl. No. 15/081,771, 4 pages.
Patent, dated Sep. 28, 2018, received in Korean Patent Application No. 2017-7014536, which corresponds with U.S. Appl. No. 15/081,771, 3 pages.
Final Office Action, dated May 1, 2017, received in U.S. Appl. No. 15/136,782, 18 pages.
Notice of Allowance, dated Oct. 20, 2017, received in U.S. Appl. No. 15/136,782, 9 pages.
Office Action, dated May 4, 2018, received in Australian Patent Application No. 2018202855, which corresponds with U.S. Appl. No. 15/136,782, 3 pages.
Notice of Acceptance, dated Sep. 10, 2018, received in Australian Patent Application No. 2018202855, which corresponds with U.S. Appl. No. 15/136,782, 3 pages.
Certificate of Grant, dated Jan. 17. 2019, received in Australian Patent Application No. 2018202855, which corresponds with U.S. Appl. No. 15/136,782, 4 pages.
Office Action, dated Sep. 27, 2019, received in Chinese Patent Application No. 201810119007.3, which corresponds with U.S. Appl. No. 15/136,782, 6 pages.
Notice of Allowance, dated Feb. 26, 2020, received in Chinese Patent Application No. 201810119007.3, which corresponds with U.S. Appl. No. 15/136,782, 3 pages.
Patent, dated Apr. 7, 2020, received in Chinese Patent Application No. 201810119007.3, which corresponds with U.S. Appl. No. 15/136,782, 7 pages.
Office Action, dated May 23, 2017, received in Danish Patent Application No. 201770190, which corresponds with U.S. Appl. No. 15/136,782, 7 pages.
Office Action, dated Jan. 8, 2018, received in Danish Patent Application No. 2011770190, which corresponds with U.S. Appl. No. 15/136,782, 2 pages.
Notice of Allowance, dated Mar. 19, 2018, received in Danish Patent Application No. 201770190, which corresponds with U.S. Appl. No. 15/136,782, 2 pages.
Patent, dated May 22, 2018, received in Danish Patent Application No. 201770190, which corresponds with U.S. Appl. No. 15/136,782, 2 pages.
Office Action, dated Apr. 17, 2019, received in European Patent Application No. 18171453.6, which corresponds with U.S. Appl. No. 15/136,782, 4 pages.
Office Action, dated Oct. 2, 2019, received in European Patent Application No. 18171453.6, which corresponds with U.S. Appl. No. 15/136,782, 5 pages.
Office Action, dated May 12, 2020, received in European Patent Application No. 18171453.6, which corresponds with U.S. Appl. No. 15/136,782, 5 pages.
Patent, dated Feb. 5, 2021, received in Hong Kong Patent Application No. 1257553, which corresponds with U.S. Appl. No. 15/136,782, 14 pages.
Office Action, dated Jun. 1, 2018, received in Japanese Patent Application No. 2018-062161, which corresponds with U.S. Appl. No. 15/136,782, 5 pages.
Office Action, dated Nov. 12, 2018, received in Japanese Patent Application No. 2018-062161, which corresponds with U.S. Appl. No. 15/136,782, 5 pages.
Notice of Allowance, dated Feb. 18, 2019, received in Japanese Patent Application No. 2018-062161, which corresponds with U.S. Appl. No. 15/136,782, 5 pages.
Patent, dated Mar. 22, 2019, received in Japanese Patent Application No. 2018-062161, which corresponds with U.S. Appl. No. 15/136,782, 5 pages.
Office Action, dated Oct. 31, 2018, received in Korean Patent Application No. 2018-7020659, which corresponds with U.S. Appl. No. 15/136,782, 5 pages.
Notice of Allowance, dated Feb. 25, 2019, received in Korean Patent Application No. 2018-7020659, which corresponds with U.S. Appl. No. 15/136,782, 5 pages.
Patent, dated Apr. 3, 2019, received in Korean Patent Application No. 2018-7020659, which corresponds with U.S. Appl. No. 15/136,782, 5 pages.
Office Action, dated Jan. 20, 2017, received in U.S. Appl. No. 15/231,745, 21 pages.
Notice of Allowance, dated Jul. 6, 2017, received in U.S. Appl. No. 15/231,745, 18 pages.
Office Action, dated Oct. 17, 2016, received in Danish Patent Application No. 201670587, which corresponds with U.S. Appl. No. 15/231,745, 9 pages.
Office Action, dated Jun. 29, 2017, received in Danish Patent Application No. 201670587, which corresponds with U.S. Appl. No. 15/231,745, 4 pages.
Office Action, dated Feb. 22, 2018, received in Danish Patent Application No. 201670587, which corresponds with U.S. Appl. No. 15/231,745, 4 pages.
Office Action, dated Dec. 18, 2018, received in Danish Patent Application No. 201670587, which corresponds with U.S. Appl. No. 15/231,745, 4 pages.

Patent, dated Aug. 18, 2021, received in Japanese Patent Application No. 2019-200174, which corresponds with U.S. Appl. No. 15/499,693, 3 pages.
Office Action, dated Aug. 2, 2019, received in Korean Patent Application No. 2019-7009439, which corresponds with U.S. Appl. No. 15/499,693, 3 pages.
Notice of Allowance, dated Dec. 27, 2019, received in Korean Patent Application No. 2019-7009439, which corresponds with U.S. Appl. No. 15/499,693, 5 pages.
Patent, dated Mar. 27, 2020, received in Korean Patent Application No. 2019-7009439, which corresponds with U.S. Appl. No. 15/499,693, 4 pages.
Office Action, dated Aug. 30, 2017, received in U.S. Appl. No. 15/655,749, 22 pages.
Final Office Action, dated May 10, 2018, received in U.S. Appl. No. 15/655,749, 19 pages.
Office Action, dated Jan. 24, 2019, received in U.S. Appl. No. 15/655,749, 25 pages.
Final Office Action, dated Jul. 1, 2019, received in U.S. Appl. No. 15/655,749, 24 pages.
Notice of Allowance, dated Feb. 20, 2020, received in U.S. Appl. No. 15/655,749, 10 pages.
Office Action, dated Feb. 3, 2020, received in Chinese Patent Application No. 201710331254.5, which corresponds with U.S. Appl. No. 15/655,749, 8 pages.
Office Action, dated Mar. 22, 2021, received in Chinese Patent Application No. 201710331254.5, which corresponds with U.S. Appl. No. 15/655,749, 4 pages.
Notice of Allowance, dated May 27, 2021, received in Chinese Patent Application No. 201710331254.5, which corresponds with U.S. Appl. No. 15/655,749, 1 page.
Patent, dated Jun. 25, 2021, received in Chinese Patent Application No. 201710331254.5, which corresponds with U.S. Appl. No. 15/655,749, 7 pages.
Notice of Allowance, dated Apr. 18, 2019, received in Korean Patent Application No. 2017-7034248, which corresponds with U.S. Appl. No. 15/655,749, 5 pages.
Patent, dated Jul. 3, 2019, received in Korean Patent Application No. 2017-7034248, which corresponds with U.S. Appl. No. 15/655,749, 5 pages.
Office Action, dated Aug. 1, 2019, received in U.S. Appl. No. 15/785,372, 22 pages.
Final Office Action, dated Feb. 5, 2020, received in U.S. Appl. No. 15/785,372, 26 pages.
Office Action, dated Jul. 23, 2020, received in U.S. Appl. No. 15/785,372, 23 pages.
Final Office Action, dated Nov. 18, 2020, received in U.S. Appl. No. 15/785,372, 27 pages.
Notice of Allowance, dated Jul. 14, 2021, received in U.S. Appl. No. 15/785,372, 11 pages.
Notice of Allowance, dated Oct. 22, 2021, received in U.S. Appl. No. 15/785,372, 11 pages.
Office Action, dated Oct. 31, 2017, received in U.S. Appl. No. 15/723,069, 7 pages.
Notice of Allowance, dated Dec. 21, 2017, received in U.S. Appl. No. 15/723,069, 7 pages.
Office Action, dated Apr. 11, 2019, received in U.S. Appl. No. 15/889,115, 9 pages.
Final Office Action, dated Oct. 28, 2019, received in U.S. Appl. No. 15/889,115, 12 pages.
Notice of Allowance, dated May 19, 2020, received in U.S. Appl. No. 15/889,115, 9 pages.
Office Action, dated Jul. 25, 2019, received in U.S. Appl. No. 15/979,347, 14 pages.
Final Office Action, dated Feb. 27, 2020, received in U.S. Appl. No. 15/979,347, 19 pages.
Office Action, dated Jul. 14, 2020, received in U.S. Appl. No. 15/979,347, 10 pages.
Final Office Action, dated Jan. 25, 2021, received in U.S. Appl. No. 15/979,347, 12 pages.
Office Action, dated Sep. 25, 2020, received in U.S. Appl. No. 15/994,843, 5 pages.
Notice of Allowance, dated Jan. 22, 2021, received in U.S. Appl. No. 15/994,843, 8 pages.
Office Action, dated Nov. 25, 2019, received in U.S. Appl. No. 16/049,725, 9 pages.
Notice of Allowance, dated May 14, 2020, received in U.S. Appl. No. 16/049,725, 9 pages.
Office Action, dated May 31, 2019, received in Australian Patent Application No. 2018253539, which corresponds with U.S. Appl. No. 16/049,725, 3 pages.
Notice of Acceptance, dated Apr. 2, 2020, received in Australian Patent Application No. 2018253539, which corresponds with U.S. Appl. No. 16/049,725, 3 pages.
Certificate of Grant, dated Aug. 13, 2020, received in Australian Patent Application No. 2018253539, which corresponds with U.S. Appl. No. 16/049,725, 3 pages.
Notice of Allowance, dated Oct. 10, 2019, received in U.S. Appl. No. 16/102,409, 9 pages.

International Preliminary Report on Patentability, dated Jun. 30, 2015, received in International Patent Application No. PCT/US2013/069472, which corresponds with U.S. Appl. No. 14/608,895, 18 pages.
International Search Report and Written Opinion dated Aug. 7, 2013, received in International Application No. PCT/US2013/040054, which corresponds to U.S. Appl. No. 14/536,235, 12 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/US2013/040054, which corresponds to U.S. Appl. No. 14/536,235, 11 pages.
International Search Report and Written Opinion dated Aug. 7, 2013, received in International Application No. PCT/US2013/040056, which corresponds to U.S. Appl. No. 14/536,367, 12 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/US2013/040056, which corresponds to U.S. Appl. No. 14/536,367, 11 pages.
Extended European Search Report, dated Nov. 6, 2015, received in European Patent Application No. 15183980.0, which corresponds with U.S. Appl. No. 14/536,426, 7 pages.
Extended European Search Report, dated Jul. 30, 2018, received in European Patent Application No. 14/536,426, which corresponds with U.S. Appl. No. 14/536,426, 7 pages.
International Search Report and Written Opinion dated Aug. 6, 2013, received in International Application No. PCT/US2013/040058, which corresponds to U.S. Appl. No. 14/536,426, 12 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/US2013/040058, which corresponds to U.S. Appl. No. 14/536,426, 11 pages.
International Search Report and Written Opinion dated Feb. 5, 2014, received in International Application No. PCT/US2013/040061, which corresponds to U.S. Appl. No. 14/536,464, 30 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/US2013/040061, which corresponds to U.S. Appl. No. 14/536,464, 26 pages.
International Search Report and Written Opinion dated May 8, 2014, received in International Application No. PCT/US2013/040067, which corresponds to U.S. Appl. No. 14/536,644, 45 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/US2013/040067, which corresponds to U.S. Appl. No. 14/536,644, 36 pages.
International Search Report and Written Opinion dated Mar. 12, 2014, received in International Application No. PCT/US2013/069479, which corresponds with U.S. Appl. No. 14/608,926, 14 pages.
International Preliminary Report on Patentability, dated Jun. 30, 2015, received in International Patent Application No. PCT/US2013/069479, which corresponds with U.S. Appl. No. 14/608,926, 11 pages.
International Search Report and Written Opinion dated Aug. 7, 2013, received in International Application No. PCT/US2013/040070, which corresponds to U.S. Appl. No. 14/535,646, 12 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/US2013/040070, which corresponds to U.S. Appl. No. 14/535,646, 10 pages.
International Search Report and Written Opinion dated Apr. 7, 2014, received in International Application No. PCT/US2013/040072, which corresponds to U.S. Appl. No. 14/536,141, 38 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/US2013/040072, which corresponds to U.S. Appl. No. 14/536,141, 32 pages.
Extended European Search Report, dated Dec. 5, 2018, received in European Patent Application No. 18194127.9, which corresponds with U.S. Appl. No. 14/608,942, 8 pages.
International Search Report and Written Opinion dated Apr. 7, 2014, received in International Application No. PCT/US2013/069483, which corresponds with U.S. Appl. No. 14/608,942, 18 pages.
International Preliminary Report on Patentability, dated Jun. 30, 2015, received in International Application No. PCT/2013/069483, which corresponds to U.S. Appl. No. 14/608,942, 13 pages.
International Search Report and Written Opinion dated Mar. 3, 2014, received in International Application No. PCT/US2013/040087, which corresponds to U.S. Appl. No. 14/536,166, 35 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/2013/040087, which corresponds to U.S. Appl. No. 14/536,166, 29 pages.
International Search Report and Written Opinion dated Aug. 7, 2013, received in International Application No. PCT/US2013/040093, which corresponds to U.S. Appl. No. 14/536,203, 11 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/2013040093, which corresponds to U.S. Pat. No. 14,536,203, 9 pages.
International Search Report and Written Opinion dated Jul. 9, 2014, received in International Application No. PCT/US2013/069484, which corresponds with U.S. Appl. No. 14/608,965, 17 pages.
International Preliminary Report on Patentability, dated Jun. 30, 2015, received in International Patent Application No. PCT/US2013/069484, which corresponds with U.S. Appl. No. 14/608,965, 12 pages.
International Search Report and Written Opinion dated Feb. 5, 2014, received in International Application No. PCT/US2013/040098, which corresponds to U.S. Appl. No. 14/536,247, 35 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/2013/040098, which corresponds to U.S. Appl. No. 14/536,247, 27 pages.
Extended European Search Report, dated Oct. 7, 2016, received in European Patent Application No. 16177863.4, which corresponds with U.S. Appl. No. 14/536,267, 12 pages.
Extended European Search Report, dated Oct. 30, 2018, received in European Patent Application No. 18183789.9, which corresponds with U.S. Appl. No. 14/536,267, 11 pages.
International Search Report and Written Opinion dated Jan. 27, 2014, received in International Application No. PCT/US2013/040101, which corresponds to U.S. Appl. No. 14/536,267, 30 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/2013/040101, which corresponds to U.S. Appl. No. 14/536,267, 24 pages.
Extended European Search Report, dated Nov. 24, 2017, received in European Patent Application No. 17186744.3, which corresponds with U.S. Appl. No. 14/536,291, 10 pages.
International Search Report and Written Opinion dated Jan. 8, 2014, received in International Application No. PCT/US2013/040108, which corresponds to U.S. Appl. No. 14/536,291, 30 pages.
International Preliminary Report on Patentability dated Nov. 20, 2014, received in International Application No. PCT/2013/040108, which corresponds to U.S. Appl. No. 14/536,291, 25 pages.
International Search Report and Written Opinion dated Jun. 2, 2014, received in International Application No. PCT/US2013/069486, which corresponds with U.S. Appl. No. 14/608,985, 7 pages.
International Preliminary Report on Patentability, dated Jun. 30, 2015, received in International Patent Application No. PCT/US2013/069486, which corresponds with U.S. Appl. No. 14/608,985, 19 pages.
International Search Report and Written Opinion dated Mar. 6, 2014, received in International Application No. PCT/US2013/069489, which corresponds with U.S. Appl. No. 14/609,006, 12 pages.
International Preliminary Report on Patentability, dated Jun. 30, 2015, received in International Patent Application No. PCT/US2013/069489, which corresponds with U.S. Appl. No. 14/609,006, 10 pages.
Extended European Search Report, dated Mar. 15, 2017, received in European Patent Application No. 17153418.3, which corresponds with U.S. Appl. No. 14/536,648, 7 pages.
Search Report, dated Apr. 13, 2017, received in Dutch Patent Application No. 2016452, which corresponds with U.S. Appl. No. 14/864,737, 22 pages.
Search Report, dated Jun. 22, 2017, received in Dutch Patent Application No. 2016375, which corresponds with U.S. Appl. No. 14/866,981, 17 pages.

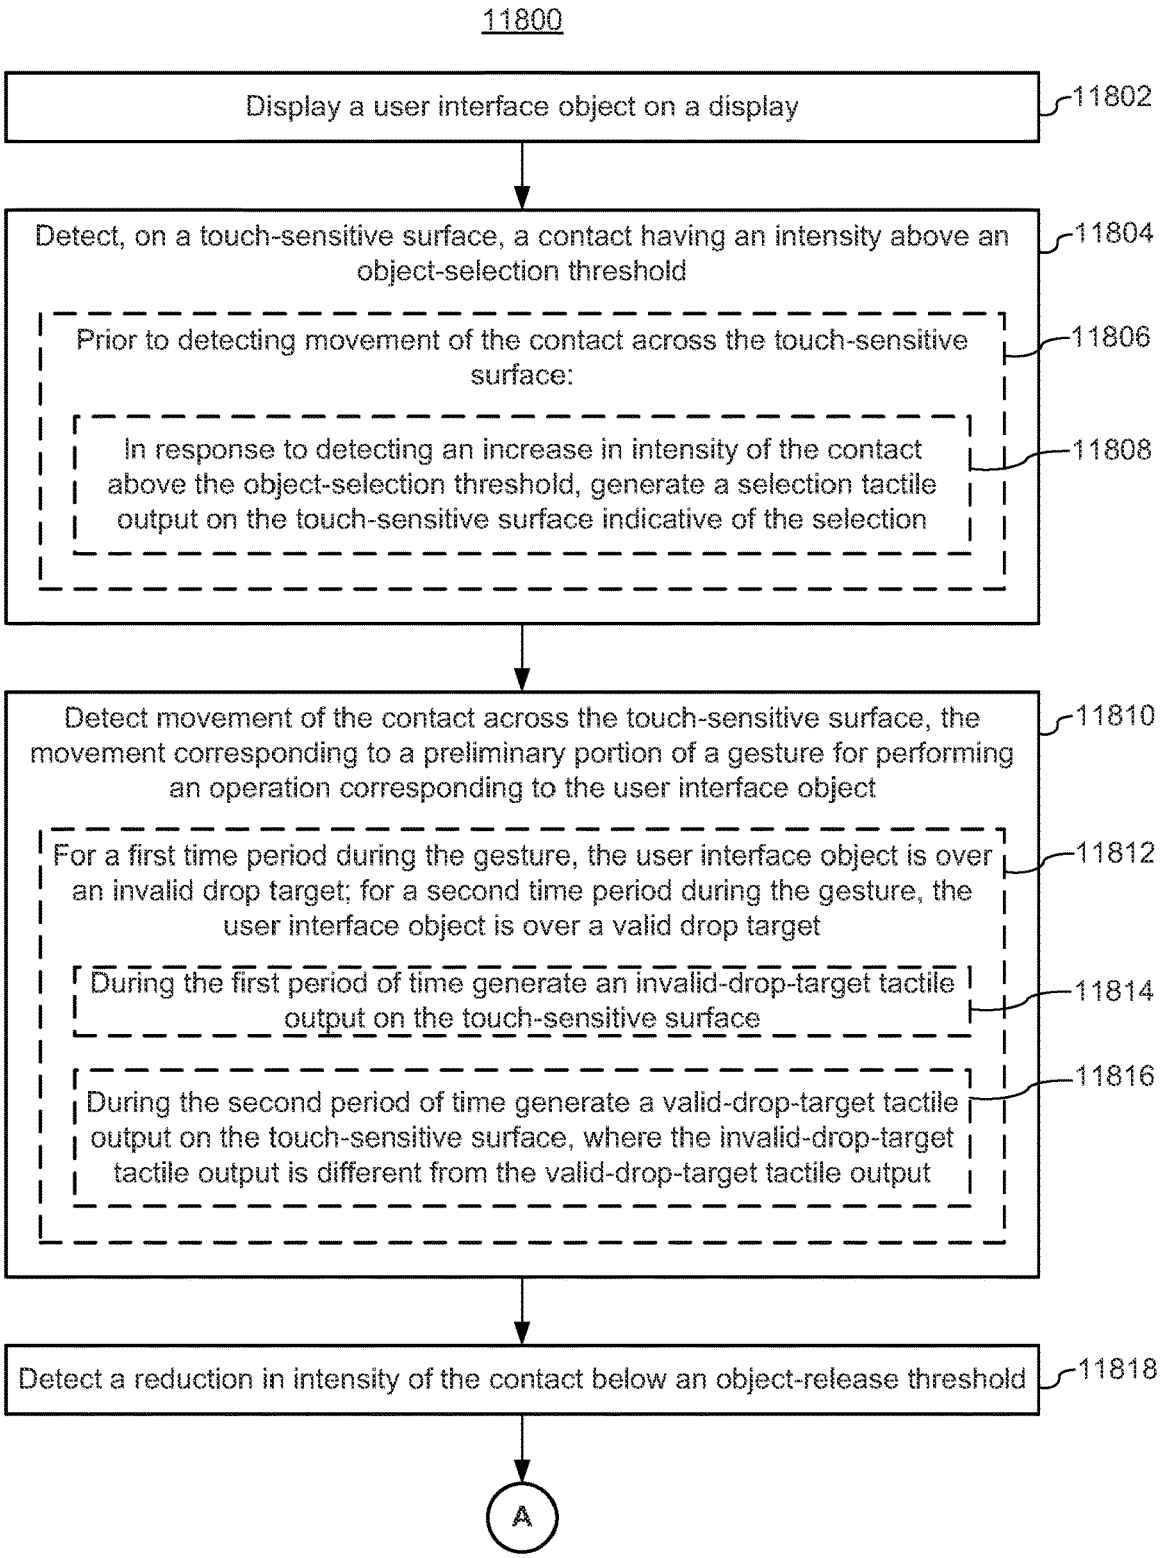
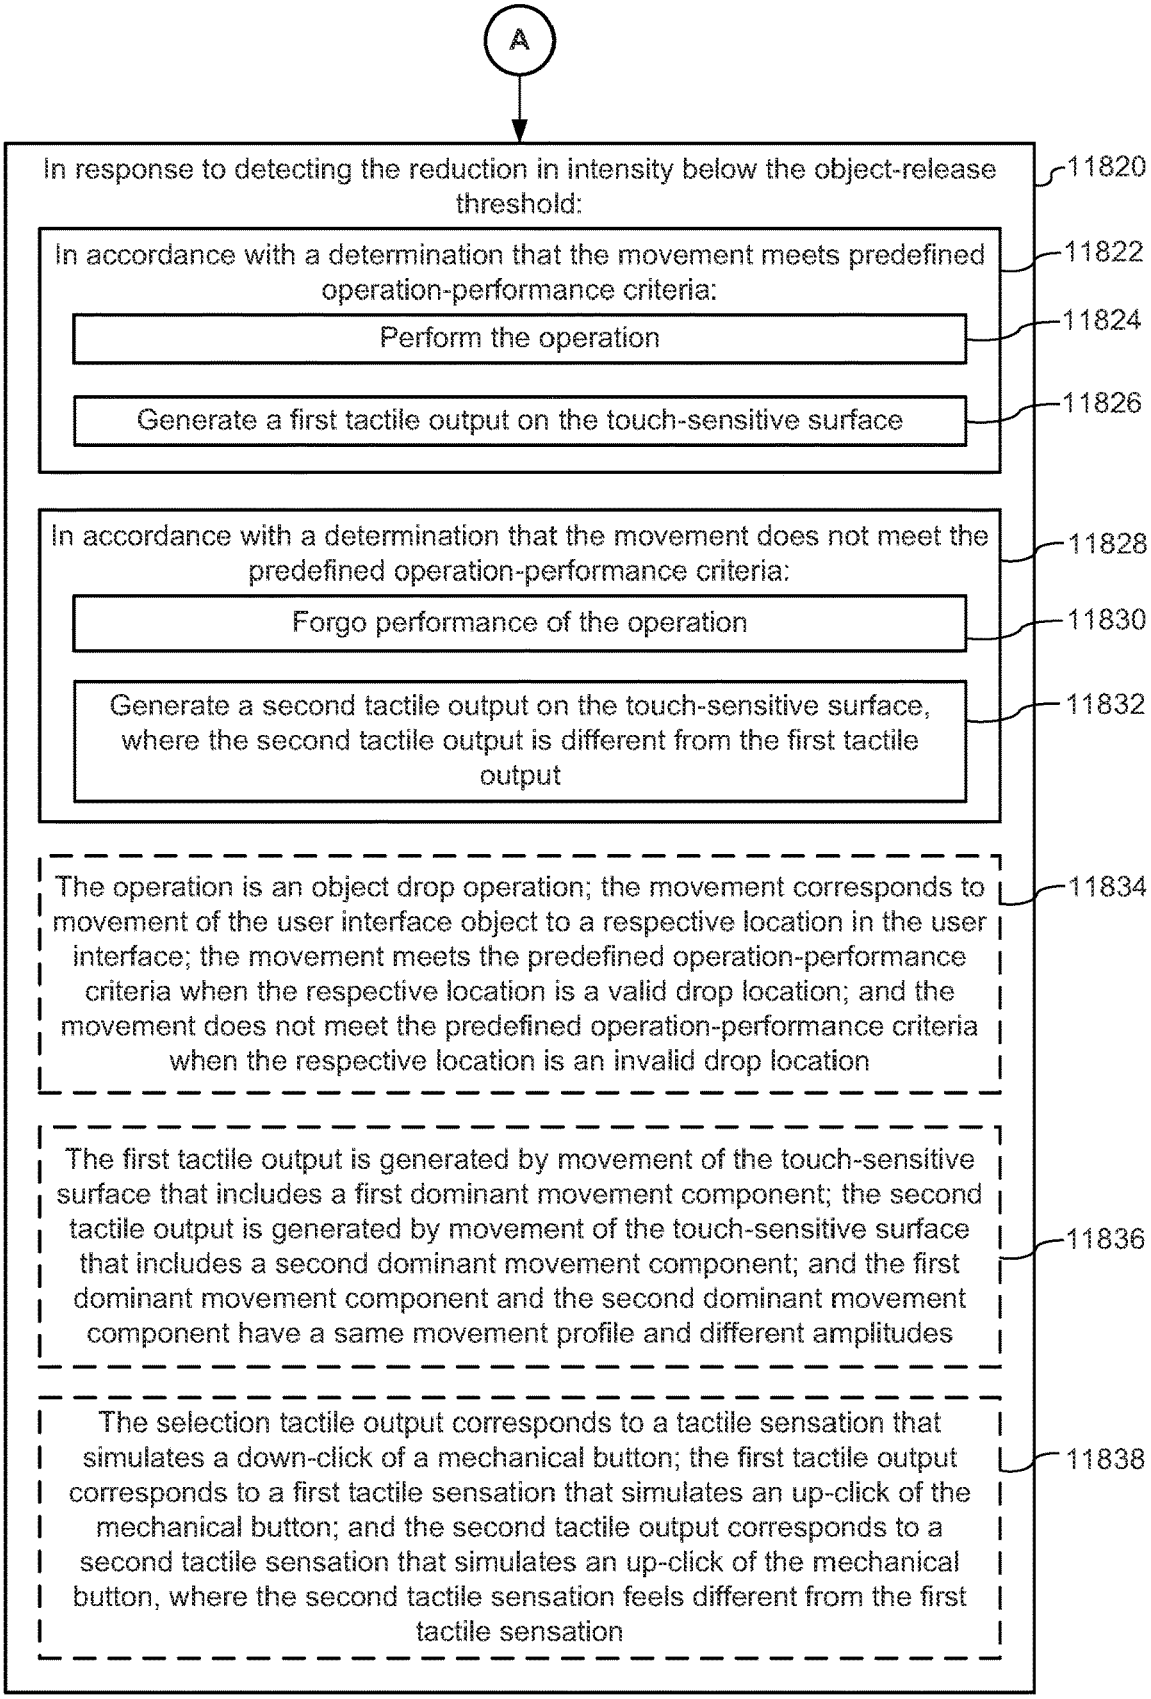
Figure 5W



11800
Display a user interface object on a display
11802
Detect, on a touch-sensitive surface, a contact having an intensity above an object-selection threshold
11804
Prior to detecting movement of the contact across the touch-sensitive surface:
11806
In response to detecting an increase in intensity of the contact above the object-selection threshold, generate a selection tactile output on the touch-sensitive surface indicative of the selection
11808
Detect movement of the contact across the touch-sensitive surface, the movement corresponding to a preliminary portion of a gesture for performing an operation corresponding to the user interface object
11810
For a first time period during the gesture, the user interface object is over an invalid drop target; for a second time period during the gesture, the user interface object is over a valid drop target
11812
During the first period of time generate an invalid-drop-target tactile output on the touch-sensitive surface
11814
During the second period of time generate a valid-drop-target tactile output on the touch-sensitive surface, where the invalid-drop-target tactile output is different from the valid-drop-target tactile output
11816
Detect a reduction in intensity of the contact below an object-release threshold
11818
A

Figure 6A



A
In response to detecting the reduction in intensity below the object-release threshold:
11820
In accordance with a determination that the movement meets predefined operation-performance criteria:
11822
Perform the operation
11824
Generate a first tactile output on the touch-sensitive surface
11826
In accordance with a determination that the movement does not meet the predefined operation-performance criteria:
11828
Forgo performance of the operation
11830
Generate a second tactile output on the touch-sensitive surface, where the second tactile output is different from the first tactile output
11832
The operation is an object drop operation; the movement corresponds to movement of the user interface object to a respective location in the user interface; the movement meets the predefined operation-performance criteria when the respective location is a valid drop location; and the movement does not meet the predefined operation-performance criteria when the respective location is an invalid drop location
11834
The first tactile output is generated by movement of the touch-sensitive surface that includes a first dominant movement component; the second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component; and the first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes
11836
The selection tactile output corresponds to a tactile sensation that simulates a down-click of a mechanical button; the first tactile output corresponds to a first tactile sensation that simulates an up-click of the mechanical button; and the second tactile output corresponds to a second tactile sensation that simulates an up-click of the mechanical button, where the second tactile sensation feels different from the first tactile sensation

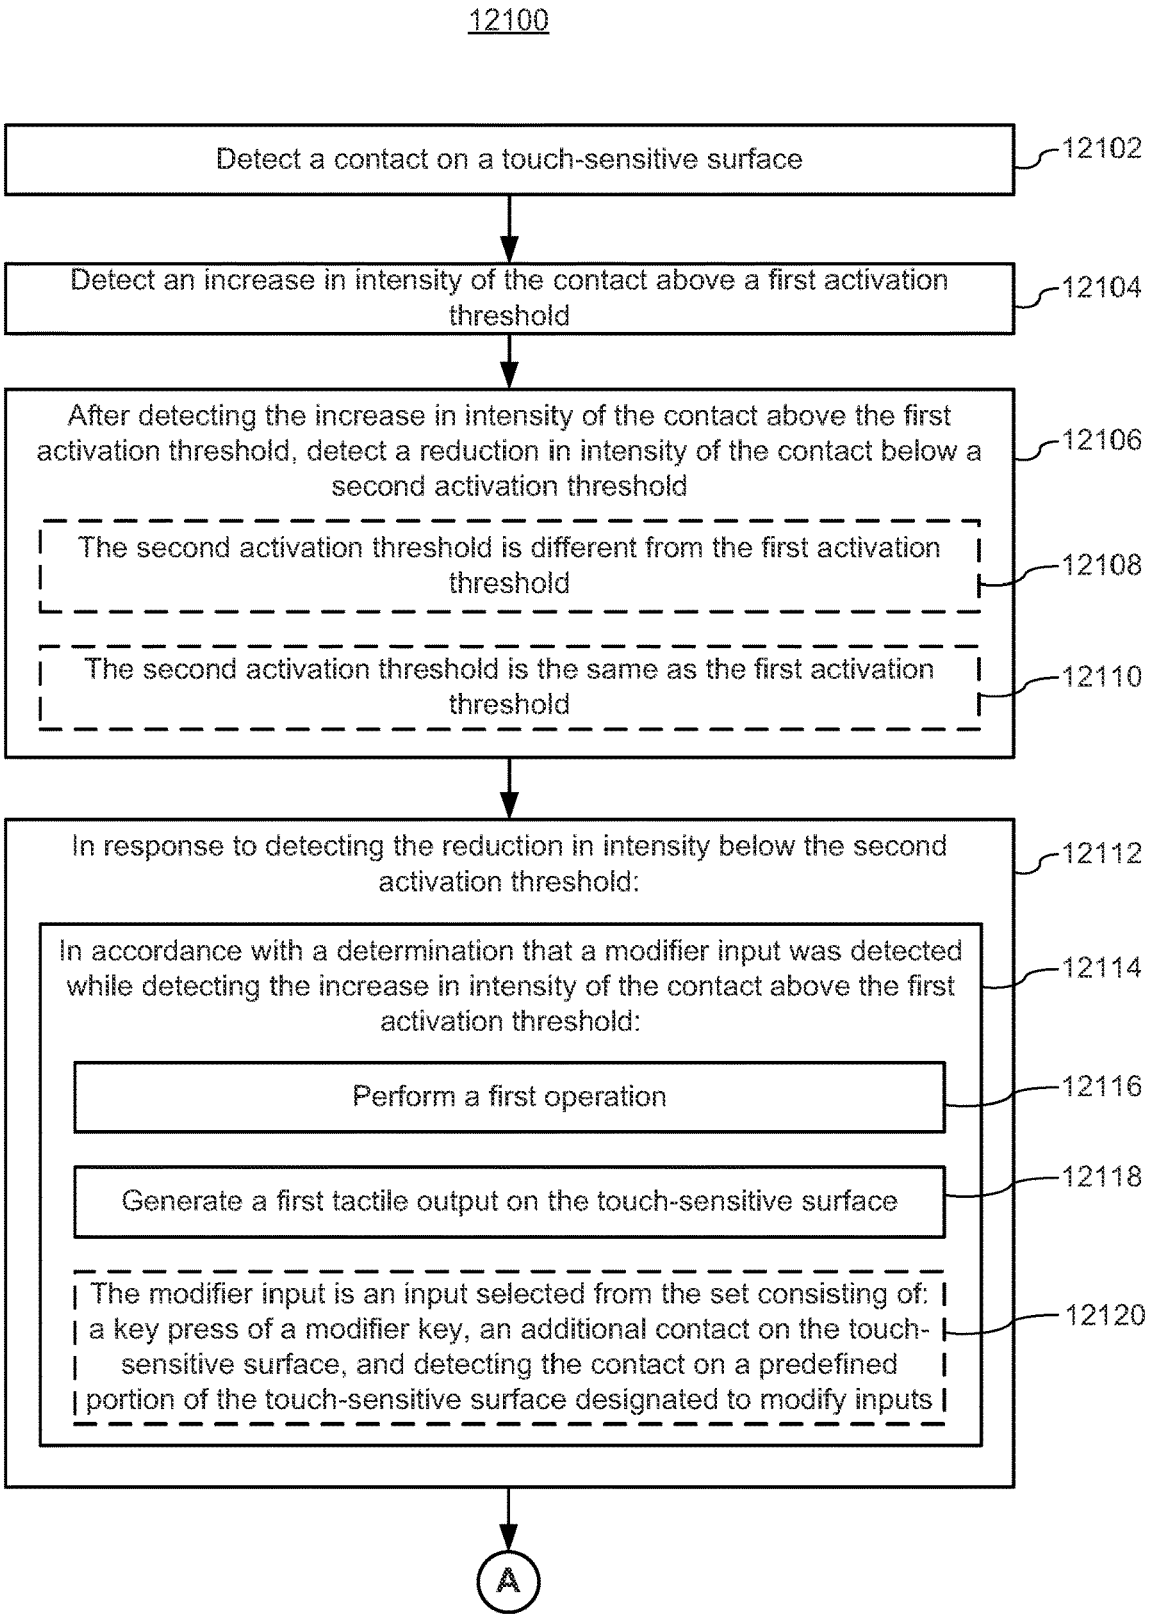
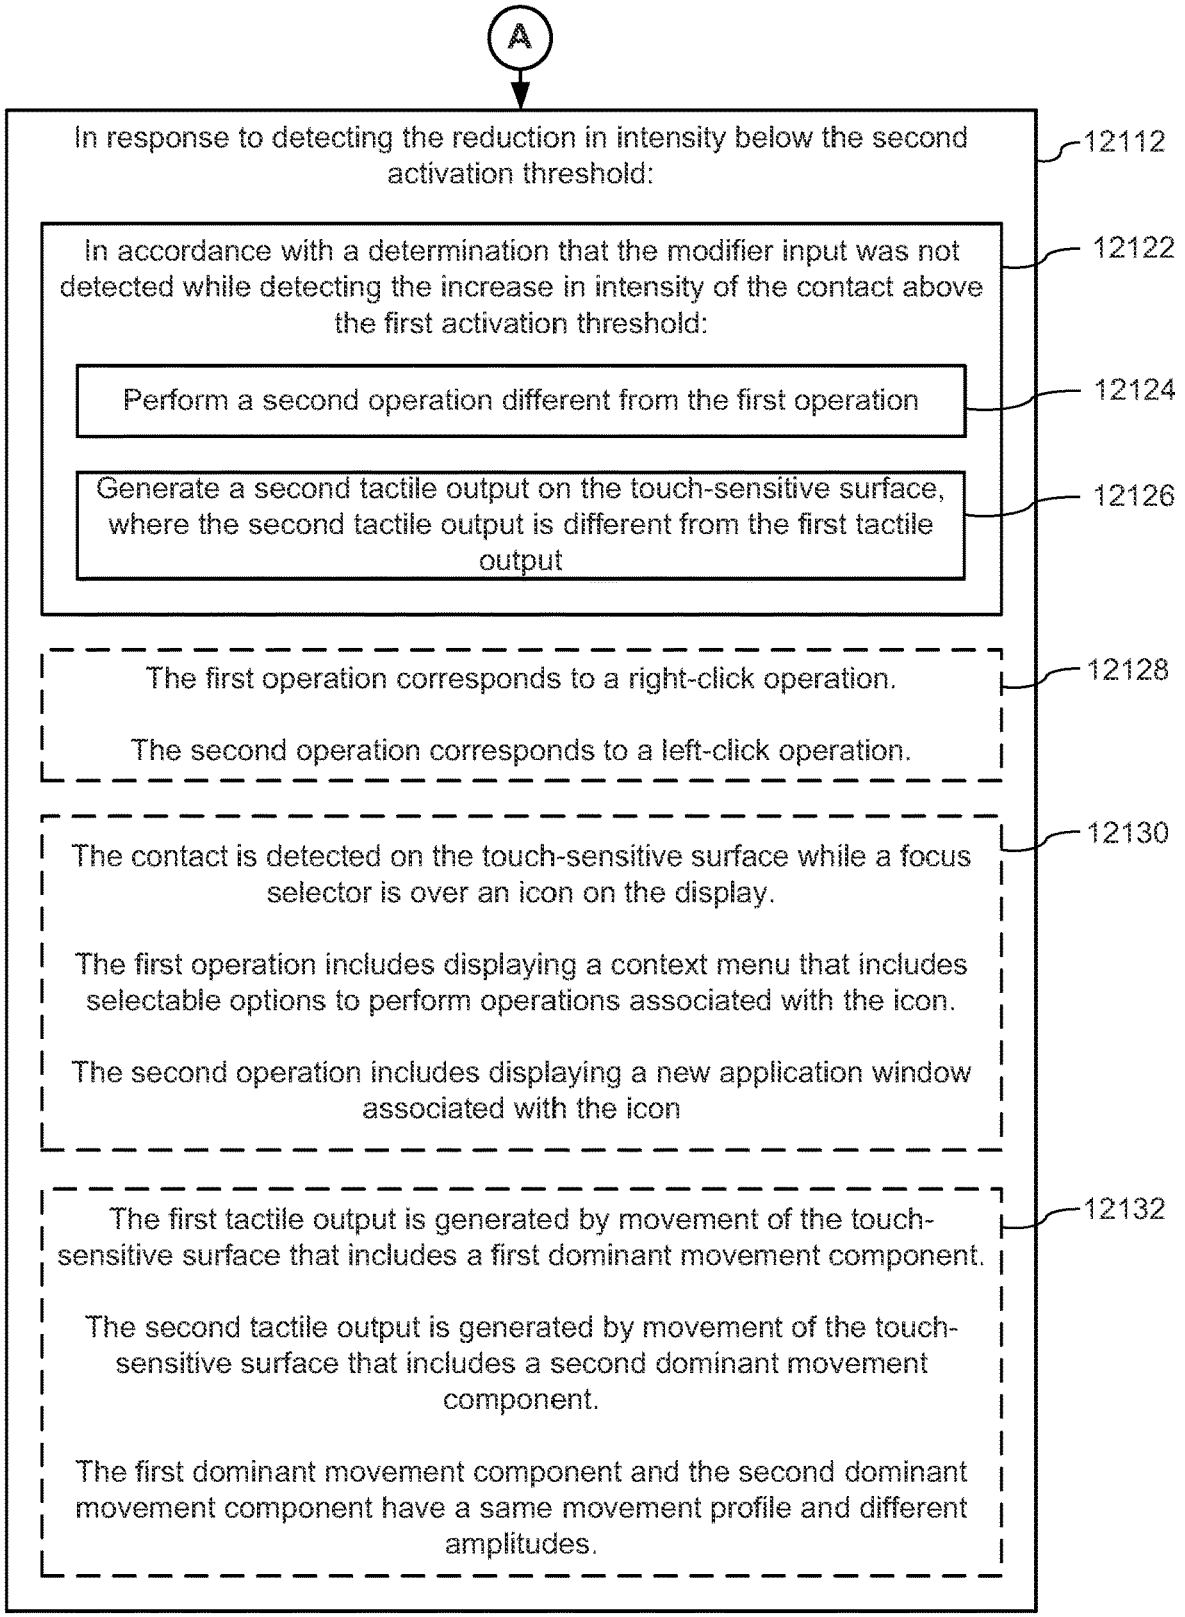
Figure 8V



12100
Detect a contact on a touch-sensitive surface
12102
Detect an increase in intensity of the contact above a first activation threshold
12104
After detecting the increase in intensity of the contact above the first activation threshold, detect a reduction in intensity of the contact below a second activation threshold
12106
The second activation threshold is different from the first activation threshold
12108
The second activation threshold is the same as the first activation threshold
12110
In response to detecting the reduction in intensity below the second activation threshold:
12112
In accordance with a determination that a modifier input was detected while detecting the increase in intensity of the contact above the first activation threshold:
12114
Perform a first operation
12116
Generate a first tactile output on the touch-sensitive surface
12118
The modifier input is an input selected from the set consisting of: a key press of a modifier key, an additional contact on the touch-sensitive surface, and detecting the contact on a predefined portion of the touch-sensitive surface designated to modify inputs
12120
A

Figure 9A



A
In response to detecting the reduction in intensity below the second activation threshold:
12112
In accordance with a determination that the modifier input was not detected while detecting the increase in intensity of the contact above the first activation threshold:
12122
Perform a second operation different from the first operation
12124
Generate a second tactile output on the touch-sensitive surface, where the second tactile output is different from the first tactile output
12126
The first operation corresponds to a right-click operation.
The second operation corresponds to a left-click operation.
12128
The contact is detected on the touch-sensitive surface while a focus selector is over an icon on the display.
The first operation includes displaying a context menu that includes selectable options to perform operations associated with the icon.
The second operation includes displaying a new application window associated with the icon
12130
The first tactile output is generated by movement of the touch-sensitive surface that includes a first dominant movement component.
The second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component.
The first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes.

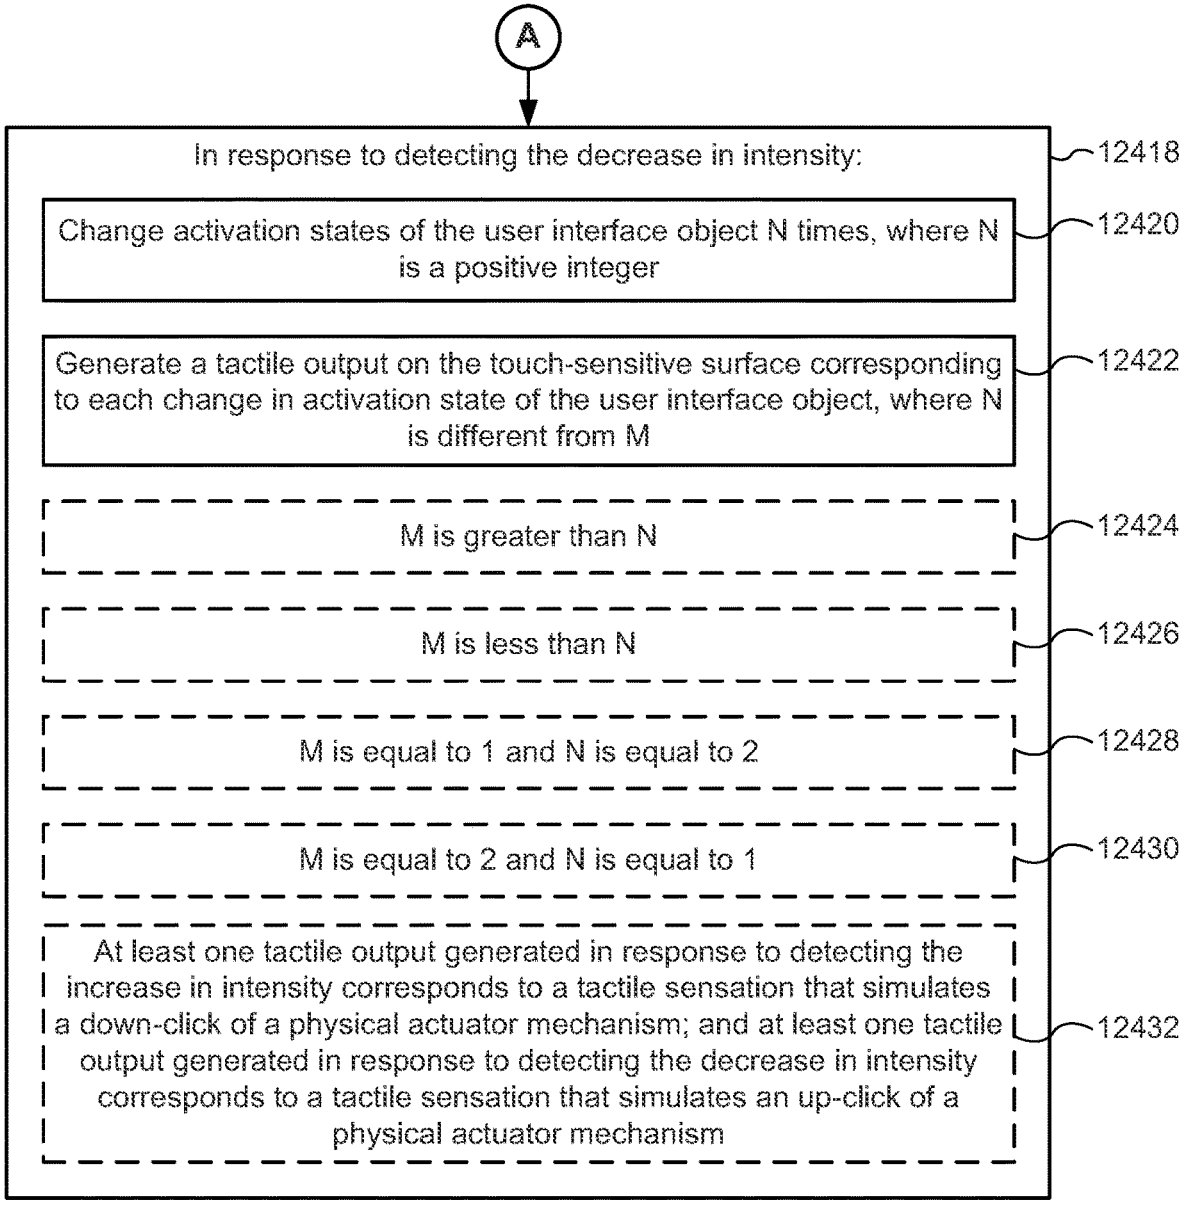
12400
Display a user interface object on the display, wherein the user interface object has a plurality of activation states
12402
Detect a contact on the touch-sensitive surface
12404
Detect an increase of intensity of the contact on the touch-sensitive surface from a first intensity to a second intensity
12406
In response to detecting the increase in intensity:
12408
Change activation states of the user interface object M times, where M is a positive integer
12410
Generate a tactile output on the touch-sensitive surface corresponding to each change in activation state of the user interface object
12412
The user interface object has a first appearance in a first activation state; the user interface object has a second appearance, different from the first appearance, in a second activation state; in response to detecting the increase in intensity, display an animation of the user interface object transitioning from the first appearance to the second appearance
12414
Detect a decrease of intensity of the contact from the second intensity to the first intensity
12416
A

Figure 12A



A
In response to detecting the decrease in intensity:
12418
Change activation states of the user interface object N times, where N is a positive integer
12420
Generate a tactile output on the touch-sensitive surface corresponding to each change in activation state of the user interface object, where N is different from M
12422
M is greater than N
12424
M is less than N
12426
M is equal to 1 and N is equal to 2
12428
M is equal to 2 and N is equal to 1
12430
At least one tactile output generated in response to detecting the increase in intensity corresponds to a tactile sensation that simulates a down-click of a physical actuator mechanism; and at least one tactile output generated in response to detecting the decrease in intensity corresponds to a tactile sensation that simulates an up-click of a physical actuator mechanism

No. 61/681,098, filed on Aug. 8, 2012, entitled "Adaptive Haptic Feedback for Electronic Devices," which are incorporated herein by reference in their entireties.

TECHNICAL FIELD

This relates generally to electronic devices with touch-sensitive surfaces, including but not limited to electronic devices with touch-sensitive surfaces that detect inputs for manipulating user interfaces.

BACKGROUND

The use of touch-sensitive surfaces as input devices for computers and other electronic computing devices has increased significantly in recent years. Exemplary touch-sensitive surfaces include touch pads and touch screen displays. Such surfaces are widely used to manipulate user interface objects on a display.

Exemplary manipulations include adjusting the position and/or size of one or more user interface objects or activating buttons or opening files/applications represented by user interface objects, as well as associating metadata with one or more user interface objects or otherwise manipulating user interfaces. Exemplary user interface objects include digital images, video, text, icons, control elements such as buttons and other graphics. A user will, in some circumstances, need to perform such manipulations on user interface objects in a file management program (e.g., Finder from Apple Inc. of Cupertino, California), an image management application (e.g., Aperture or iPhoto from Apple Inc. of Cupertino, California), a digital content (e.g., videos and music) management application (e.g., iTunes from Apple Inc. of Cuper-

tino, California), a drawing application, a presentation application (e.g., Keynote from Apple Inc. of Cupertino, California), a word processing application (e.g., Pages from Apple Inc. of Cupertino, California), a website creation application (e.g., iWeb from Apple Inc. of Cupertino, California), a disk authoring application (e.g., iDVD from Apple Inc. of Cupertino, California), or a spreadsheet application (e.g., Numbers from Apple Inc. of Cupertino, California).

But existing methods for performing these manipulations are cumbersome and inefficient. In addition, existing methods take longer than necessary, thereby wasting energy. This latter consideration is particularly important in battery-operated devices.

SUMMARY

Accordingly, there is a need for electronic devices with faster, more efficient methods and interfaces for manipulating user interfaces. Such methods and interfaces optionally complement or replace conventional methods for manipulating user interfaces. Such methods and interfaces reduce the cognitive burden on a user and produce a more efficient human-machine interface. For battery-operated devices, such methods and interfaces conserve power and increase the time between battery charges.

The above deficiencies and other problems associated with user interfaces for electronic devices with touch-sensitive surfaces are reduced or eliminated by the disclosed devices. In some embodiments, the device is a desktop computer. In some embodiments, the device is portable (e.g., a notebook computer, tablet computer, or handheld device). In some embodiments, the device has a touchpad. In some embodiments, the device has a touch-sensitive display (also known as a "touch screen" or "touch screen display"). In some embodiments, the device has a graphical user interface (GUI), one or more processors, memory and one or more modules, programs or sets of instructions stored in the memory for performing multiple functions. In some embodiments, the user interacts with the GUI primarily through finger contacts and gestures on the touch-sensitive surface. In some embodiments, the functions optionally include image editing, drawing, presenting, word processing, website creating, disk authoring, spreadsheet making, game playing, telephoning, video conferencing, e-mailing, instant messaging, workout support, digital photographing, digital videoing, web browsing, digital music playing, and/or digital video playing. Executable instructions for performing these functions are, optionally, included in a non-transitory computer readable storage medium or other computer program product configured for execution by one or more processors.

There is a need for electronic devices with faster, more efficient methods and interfaces for selecting a tactile output corresponding to a change in intensity of a contact when relocating user interface objects. Such methods and interfaces may complement or replace conventional methods for relocating user interface objects. Such methods and interfaces reduce the cognitive burden on a user and produce a more efficient human-machine interface. For battery-operated devices, such methods and interfaces conserve power and increase the time between battery charges.

The above deficiencies and other problems associated with user interfaces for electronic devices with touch-sensitive surfaces are reduced or eliminated by the disclosed devices. In some embodiments, the device is a desktop computer. In some embodiments, the device is portable (e.g., a notebook computer, tablet computer, or handheld device). In some embodiments, the device has a touchpad. In some embodiments, the device has a touch-sensitive display (also known as a "touch screen" or "touch screen display"). In some embodiments, the device has a graphical user interface (GUI), one or more processors, memory and one or more modules, programs or sets of instructions stored in the memory for performing multiple functions. In some embodiments, the user interacts with the GUI primarily through finger contacts and gestures on the touch-sensitive surface. In some embodiments, the functions may include image editing, drawing, presenting, word processing, website creating, disk authoring, spreadsheet making, game playing, telephoning, video conferencing, e-mailing, instant messaging, workout support, digital photographing, digital videoing, web browsing, digital music playing, and/or digital video playing. Executable instructions for performing these functions may be included in a non-transitory computer readable storage medium or other computer program product configured for execution by one or more processors.

In accordance with some embodiments, a method is performed at an electronic device with a touch-sensitive surface and a display, where the device includes one or more sensors to detect intensity of contacts with the touch-sensitive surface. The method includes: displaying a user interface object on the display; detecting, on the touch-sensitive surface, a contact having an intensity above an object-selection threshold; detecting movement of the contact across the touch-sensitive surface, the movement corresponding to a preliminary portion of a gesture for performing an operation corresponding to the user interface object; detecting a reduction in intensity of the contact below an object-release threshold; and in response to detecting the reduction in intensity below the object-release threshold: in accordance with a determination that the movement meets predefined operation-performance criteria: performing the operation and generating a first tactile output on the touch-sensitive surface; and in accordance with a determination that the movement does not meet the predefined operation-performance criteria: forgoing performance of the operation and generating a second tactile output on the touch-sensitive surface, where the second tactile output is different from the first tactile output.

In accordance with some embodiments, an electronic device comprises a display unit configured to display a user interface object; a touch-sensitive surface unit configured to receive contacts; one or more sensor units configured to detect intensity of contacts with the touch-sensitive surface unit; and a processing unit coupled to the display unit, the touch-sensitive surface unit, and the sensor units. The processing unit is configured to: detect, on the touch-sensitive surface unit, a contact having an intensity above an object-selection threshold; detect movement of the contact across the touch-sensitive surface unit, the movement corresponding to a preliminary portion of a gesture for performing an operation corresponding to the user interface object; detect a reduction in intensity of the contact below an object-release threshold; and in response to detecting the reduction in intensity below the object-release threshold: in accordance with a determination that the movement meets predefined operation-performance criteria: perform the operation; and generate a first tactile output on the touch-sensitive surface unit; and in accordance with a determination that the movement does not meet the predefined operation-performance criteria: forgo performance of the operation; and generate a second tactile output on the touch-sensitive surface unit, wherein the second tactile output is different from the first tactile output.

Thus, electronic devices with displays, touch-sensitive surfaces, and one or more sensors to detect intensity of contacts with the touch-sensitive surfaces are provided with faster, more efficient methods and interfaces for selecting a tactile output corresponding to a change in intensity of a contact when relocating user interface objects, thereby increasing the effectiveness, efficiency, and user satisfaction with such devices. Such methods and interfaces optionally complement or replace conventional methods for dragging and dropping user interface objects.

There is a need for electronic devices with faster, more efficient methods and interfaces for providing feedback corresponding to modifier inputs. Such methods and interfaces may complement or replace conventional methods for providing feedback corresponding to modifier inputs. Such methods and interfaces reduce the cognitive burden on a user and produce a more efficient human-machine interface. For battery-operated devices, such methods and interfaces conserve power and increase the time between battery charges.

In accordance with some embodiments, a method is performed at an electronic device with a display, a touch-sensitive surface and one or more sensors to detect intensity of contacts with the touch-sensitive surface. The method includes: detecting a contact on the touch-sensitive surface; detecting an increase in intensity of the contact above a first activation threshold; after detecting the increase in intensity of the contact above the first activation threshold, detecting a reduction in intensity of the contact below a second activation threshold; and in response to detecting the reduction in intensity of the contact below the second activation threshold: in accordance with a determination that a modifier input was detected while detecting the increase in intensity of the contact above the first activation threshold: performing a first operation and generating a first tactile output on the touch-sensitive surface; and in accordance with a determination that the modifier input was not detected while detecting the increase in intensity of the contact above the first activation threshold: performing a second operation different from the first operation and generating a second tactile output on the touch-sensitive surface, where the second tactile output is different from the first tactile output.

In accordance with some embodiments, an electronic device includes a display unit; a touch-sensitive surface unit configured to receive contacts; one or more sensor units configured to detect intensity of contacts with the touch-sensitive surface unit; and a processing unit coupled to the display unit, the touch-sensitive surface unit and the sensor units. The processing unit is configured to: detect a contact on the touch-sensitive surface unit; detect an increase in intensity of the contact above a first activation threshold; after detecting the increase in intensity of the contact above the first activation threshold, detect a reduction in intensity of the contact below a second activation threshold; and in response to detecting the reduction in intensity of the contact below the second activation threshold: in accordance with a determination that a modifier input was detected while detecting the increase in intensity of the contact above the first activation threshold: perform a first operation and generate a first tactile output on the touch-sensitive surface unit; and in accordance with a determination that the modifier input was not detected while detecting the increase in intensity of the contact above the first activation threshold: perform a second operation different from the first operation and generate a second tactile output on the touch-sensitive surface unit, where the second tactile output is different from the first tactile output.

Thus, electronic devices with displays, touch-sensitive surfaces and one or more sensors to detect intensity of contacts with the touch-sensitive surfaces are provided with faster, more efficient methods and interfaces for providing feedback corresponding to modifier inputs, thereby increasing the effectiveness, efficiency, and user satisfaction with such devices. Such methods and interfaces may complement or replace conventional methods for providing feedback corresponding to modifier inputs.

There is a need for electronic devices with more efficient methods and interfaces for providing feedback for changing activation states of a user interface object. Such methods and interfaces may complement or replace conventional methods for providing feedback for changing activation states of a user interface object. Such methods and interfaces reduce the cognitive burden on a user and produce a more efficient human-machine interface. For battery-operated devices, such methods and interfaces conserve power and increase the time between battery charges.

In accordance with some embodiments, a method is performed at an electronic device with a display, a touch-sensitive surface and one or more sensors to detect intensity of contacts with the touch-sensitive surface. The method includes: displaying a user interface object on the display, where the user interface object has a plurality of activation states; detecting a contact on the touch-sensitive surface; detecting an increase of intensity of the contact on the touch-sensitive surface from a first intensity to a second intensity; in response to detecting the increase in intensity: changing activation states of the user interface object M times, where M is a positive integer, and generating a tactile output on the touch-sensitive surface corresponding to each change in activation state of the user interface object; detecting a decrease of intensity of the contact from the second intensity to the first intensity; and in response to detecting the decrease in intensity: changing activation states of the user interface object N times, where N is a positive integer, and generating a tactile output on the touch-sensitive surface corresponding to each change in activation state of the user interface object, where N is different from M.

In accordance with some embodiments, an electronic device includes a display unit configured to display a user interface object, where the user interface object has a plurality of activation states, a touch-sensitive surface unit configured to receive contacts, one or more sensor units configured to detect intensity of contacts with the touch-sensitive surface unit, and a processing unit coupled to the display unit, the touch-sensitive surface unit, and the sensor units. The processing unit is configured to: detect a contact on the touch-sensitive surface unit; detect an increase of intensity of the contact on the touch-sensitive surface unit from a first intensity to a second intensity; in response to detecting the increase in intensity: change activation states of the user interface object M times, where M is a positive integer, and generate a tactile output on the touch-sensitive surface unit corresponding to each change in activation state of the user interface object; detect a decrease of intensity of the contact from the second intensity to the first intensity; and in response to detecting the decrease in intensity: change activation states of the user interface object N times, where N is a positive integer, and generate a tactile output on the touch-sensitive surface unit corresponding to each change in activation state of the user interface object, where N is different from M.

Thus, electronic devices with displays, touch-sensitive surfaces and one or more sensors to detect intensity of

contacts with the touch-sensitive surface are provided with more efficient methods and interfaces for providing feedback for changing activation states of a user interface object, thereby increasing the effectiveness, efficiency, and user satisfaction with such devices. Such methods and interfaces may complement or replace conventional methods for providing feedback for changing activation states of a user interface object.

There is a need for electronic devices with faster, more efficient methods and interfaces for providing feedback for changing activation states of a user interface object. Such methods and interfaces may complement or replace conventional methods for providing feedback for changing activation states of a user interface object. Such methods and interfaces reduce the cognitive burden on a user and produce a more efficient human-machine interface. For battery-operated devices, such methods and interfaces conserve power and increase the time between battery charges.

In accordance with some embodiments, a method is performed at an electronic device with a display, a touch-sensitive surface and one or more sensors to detect intensity of contacts with the touch-sensitive surface. The method includes: displaying a user interface object on the display, where the user interface object has a first activation state and a second activation state; detecting a contact on the touch-sensitive surface; detecting an increase of intensity of the contact on the touch-sensitive surface from a first intensity to a second intensity; in response to detecting the increase in intensity: changing activation states of the user interface object from the first activation state to the second activation state; and generating M distinct tactile outputs on the touch-sensitive surface, where M is a positive integer; detecting a decrease of intensity of the contact from the second intensity to the first intensity; and in response to detecting the decrease in intensity: changing activation states of the user interface object from the second activation state to the first activation state; and generating N distinct tactile outputs on the touch-sensitive surface, where N is a positive integer and N is different from M.

In accordance with some embodiments, an electronic device includes a display unit configured to display a user interface object, where the user interface object has a first activation state and a second activation state; a touch-sensitive surface unit configured to receive contacts; one or more sensor units configured to detect intensity of contacts with the touch-sensitive surface unit; and a processing unit coupled to the display unit, the touch-sensitive surface unit and the sensor units. The processing unit is configured to: detect a contact on the touch-sensitive surface unit; detect an increase of intensity of the contact on the touch-sensitive surface unit from a first intensity to a second intensity; in response to detecting the increase in intensity: change activation states of the user interface object from the first activation state to the second activation state; and generate M distinct tactile outputs on the touch-sensitive surface unit, where M is a positive integer; detect a decrease of intensity of the contact from the second intensity to the first intensity; and in response to detecting the decrease in intensity: change activation states of the user interface object from the second activation state to the first activation state; and generate N distinct tactile outputs on the touch-sensitive surface unit, where N is a positive integer and N is different from M.

Thus, electronic devices with displays, touch-sensitive surfaces and one or more sensors to detect intensity of contacts with the touch-sensitive surface are provided with faster, more efficient methods and interfaces for providing feedback for changing activation states of a user interface object, thereby increasing the effectiveness, efficiency, and user satisfaction with such devices. Such methods and interfaces may complement or replace conventional methods for providing feedback for changing activation states of a user interface object.

In accordance with some embodiments, an electronic device includes a display, a touch-sensitive surface, optionally one or more sensors to detect intensity of contacts with the touch-sensitive surface, one or more processors, memory, and one or more programs; the one or more programs are stored in the memory and configured to be executed by the one or more processors and the one or more programs include instructions for performing the operations of any of the methods referred to in the fifth paragraph of the Description of Embodiments. In accordance with some embodiments, a graphical user interface on an electronic device with a display, a touch-sensitive surface, optionally one or more sensors to detect intensity of contacts with the touch-sensitive surface, a memory, and one or more processors to execute one or more programs stored in the memory includes one or more of the elements displayed in any of the methods referred to in the fifth paragraph of the Description of Embodiments, which are updated in response to inputs, as described in any of the methods referred to in the fifth paragraph of the Description of Embodiments. In accordance with some embodiments, a computer readable storage medium has stored therein instructions which when executed by an electronic device with a display, a touch-sensitive surface, and optionally one or more sensors to detect intensity of contacts with the touch-sensitive surface, cause the device to perform the operations of any of the methods referred to in the fifth paragraph of the Description of Embodiments. In accordance with some embodiments, an electronic device includes: a display, a touch-sensitive surface, and optionally one or more sensors to detect intensity of contacts with the touch-sensitive surface; and means for performing the operations of any of the methods referred to in the fifth paragraph of the Description of Embodiments. In accordance with some embodiments, an information processing apparatus, for use in an electronic device with a display and a touch-sensitive surface, optionally one or more sensors to detect intensity of contacts with the touch-sensitive surface, includes means for performing the operations of any of the methods referred to in the fifth paragraph of the Description of Embodiments.

BRIEF DESCRIPTION OF THE DRAWINGS

For a better understanding of the various described embodiments, reference should be made to the Description of Embodiments below, in conjunction with the following drawings in which like reference numerals refer to corresponding parts throughout the figures.

FIG. **1**A is a block diagram illustrating a portable multifunction device with a touch-sensitive display in accordance with some embodiments.

FIG. **1**B is a block diagram illustrating exemplary components for event handling in accordance with some embodiments.

FIG. **2** illustrates a portable multifunction device having a touch screen in accordance with some embodiments.

FIG. **3** is a block diagram of an exemplary multifunction device with a display and a touch-sensitive surface in accordance with some embodiments.

FIG. **4**A illustrates an exemplary user interface for a menu of applications on a portable multifunction device in accordance with some embodiments.

FIG. **4**B illustrates an exemplary user interface for a multifunction device with a touch-sensitive surface that is separate from the display in accordance with some embodiments.

FIGS. **5**A-**5**W illustrate exemplary user interfaces for selecting a tactile output corresponding to a change in intensity of a contact in accordance with some embodiments.

FIGS. **6**A-**6**B are flow diagrams illustrating a method of selecting a tactile output corresponding to a change in intensity of a contact in accordance with some embodiments.

FIG. **7** is a functional block diagram of an electronic device in accordance with some embodiments.

FIGS. **8**A-**8**V illustrate exemplary user interfaces for providing feedback corresponding to modifier inputs in accordance with some embodiments.

FIGS. **9**A-**9**B are flow diagrams illustrating a method of providing feedback corresponding to modifier inputs in accordance with some embodiments.

FIG. **10** is a functional block diagram of an electronic device in accordance with some embodiments.

FIGS. **11**A-**11**N illustrate exemplary user interfaces for providing feedback for changing activation states of a user interface object in accordance with some embodiments.

FIGS. **12**A-**12**B are flow diagrams illustrating a method of providing feedback for changing activation states of a user interface object in accordance with some embodiments.

FIG. **13** is a functional block diagram of an electronic device in accordance with some embodiments.

FIGS. **14**A-**14**N illustrate exemplary user interfaces for providing feedback for changing activation states of a user interface object in accordance with some embodiments.

FIGS. **15**A-**15**C are flow diagrams illustrating a method of providing feedback for changing activation states of a user interface object in accordance with some embodiments.

FIG. **16** is a functional block diagram of an electronic device in accordance with some embodiments.

DESCRIPTION OF EMBODIMENTS

The methods, devices and GUIs described herein provide visual and/or haptic feedback that makes manipulation of user interface objects more efficient and intuitive for a user. For example, in a system where the clicking action of a trackpad is decoupled from the contact intensity (e.g., contact force, contact pressure, or a substitute therefore) that is needed to reach an activation threshold, the device can generate different tactile outputs (e.g., "different clicks") for different activation events (e.g., so that clicks that accomplish a particular result are differentiated from clicks that do not produce any result or that accomplish a different result from the particular result). Additionally, tactile outputs can be generated in response to other events that are not related to increasing intensity of a contact, such as generating a tactile output (e.g., a "detent") when a user interface object is moved to a particular position, boundary or orientation, or when an event occurs at the device.

Additionally, in a system where a trackpad or touch-screen display is sensitive to a range of contact intensity that includes more than one or two specific intensity values (e.g., more than a simple on/off, binary intensity determination), the user interface can provide responses (e.g., visual or tactile cues) that are indicative of the intensity of the contact within the range. In some implementations, a pre-activation-threshold response and/or a post-activation-threshold response to an input are displayed as continuous animations. As one example of such a response, a preview of an operation is displayed in response to detecting an increase in contact intensity that is still below an activation threshold for performing the operation. As another example of such a response, an animation associated with an operation continues even after the activation threshold for the operation has been reached. Both of these examples provide a user with a continuous response to the force or pressure of a user's contact, which provides a user with visual and/or haptic feedback that is richer and more intuitive. More specifically, such continuous force responses give the user the experience of being able to press lightly to preview an operation and/or press deeply to push "past" or "through" a predefined user interface state corresponding to the operation.

Additionally, for a device with a touch-sensitive surface that is sensitive to a range of contact intensity, multiple contact intensity thresholds can be monitored by the device and different functions can be mapped to different contact intensity thresholds. This serves to increase the available "gesture space" providing easy access to advanced features for users who know that increasing the intensity of a contact at or beyond a second "deep press" intensity threshold will cause the device to perform a different operation from an operation that would be performed if the intensity of the contact is between a first "activation" intensity threshold and the second "deep press" intensity threshold. An advantage of assigning additional functionality to a second "deep press" intensity threshold while maintaining familiar functionality at a first "activation" intensity threshold is that inexperienced users who are, in some circumstances, confused by the additional functionality can use the familiar functionality by just applying an intensity up to the first "activation" intensity threshold, whereas more experienced users can take advantage of the additional functionality by applying an intensity at the second "deep press" intensity threshold.

Additionally, for a device with a touch-sensitive surface that is sensitive to a range of contact intensity, the device can provide additional functionality by allowing users to perform complex operations with a single continuous contact. For example, when selecting a group of objects, a user can move a continuous contact around the touch-sensitive surface and can press while dragging (e.g., applying an intensity greater than a "deep press" intensity threshold) to add additional elements to a selection. In this way, a user can intuitively interact with a user interface where pressing harder with a contact causes objects in the user interface to be "stickier."

A number of different approaches to providing an intuitive user interface on a device where a clicking action is decoupled from the force that is needed to reach an activation threshold and/or the device is sensitive to a wide range of contact intensities are described below. Using one or more of these approaches (optionally in conjunction with each other) helps to provide a user interface that intuitively provides users with additional information and functionality, thereby reducing the user's cognitive burden and improving the human-machine interface. Such improvements in the human-machine interface enable users to use the device faster and more efficiently. For battery-operated devices, these improvements conserve power and increase the time between battery charges. For ease of explanation, systems, methods and user interfaces for including illustrative examples of some of these approaches are described below, as follows:

Many electronic devices have graphical user interfaces including one or more user interface objects. When users attempt to perform operations associated with

these user interface objects, these operations are sometimes successful and sometimes unsuccessful. For example, in some circumstances, moving a user interface object to a disallowed portion of the user interface will be unsuccessful, whereas moving the same user interface object to an allowed portion of the user interface will be successful. One approach to indicating whether an operation was successful or unsuccessful is providing visual feedback indicative of the successful performance of an operation. However, visual feedback can easily be missed by a user, thereby leaving the user confused as to whether or not the operation has been performed. The embodiments described below improve on these methods by providing additional cues to the user, including tactile outputs, to indicate whether or not an operation was successful, thereby providing a more convenient and efficient user interface. In particular, FIGS. **5**A-**5**W illustrate exemplary user interfaces for relocating a user interface object in accordance with some embodiments. FIGS. **6**A-**6**B are flow diagrams illustrating a method of selecting a tactile output corresponding to a change in intensity of a contact in accordance with some embodiments. The user interfaces in FIGS. **5**A-**5**W are used to illustrate the processes described below, including the processes in FIGS. **6**A-**6**B.

Many electronic devices include a mouse or similar input device that provides left-click functionality and right-click functionality for activating different operations. As devices economize on the number of buttons and input devices, the left-click functionality and right-click functionality is, optionally, invoked using one input device, such as a trackpad. In some methods, when either functionality is invoked using the one input device, the user is not given sufficient feedback indicating whether the activated operation was an operation not associated with a modifier input (e.g., a left-click operation) or an operation associated with a modifier input (e.g., a right-click operation). The embodiments below improve on the these methods by providing different tactile output when device detects an input while a modifier input is detected than when the device detects a similar input while a modifier input is not detected, thereby providing a more convenient and efficient user interface. In particular, FIGS. **8**A-**8**V illustrate exemplary user interfaces for providing feedback corresponding to modifier inputs. FIGS. **9**A-**9**B are flow diagrams illustrating a method of providing feedback corresponding to modifier inputs. The user interfaces in FIGS. **8**A-**8**V are used to illustrate the processes in FIGS. **9**A-**9**B.

Many electronic devices have graphical user interfaces that include user interface objects, such as virtual buttons and switches. In some circumstances, a user activates a user interface object to perform an operation or adjust a parameter or property. One approach to indicating an activation state of a user interface object is to mimic the behavior of a corresponding physical object. However, physical objects, such as real buttons and switches, will, in some circumstances provide excessive tactile feedback in some circumstances, and too little feedback in others. The embodiments described below provide tactile feedback that corresponds to changes in activation states of a virtual button, switch or other user interface object rather than tactile feedback that corresponds 1:1 to tactile sensations that would be felt by a user when using a physical control to perform similar operations, thereby providing a more convenient and intuitive user interface. In particular, FIGS. **11**A-**11**N illustrate exemplary user interfaces for providing feedback for changing activation states of a user interface object. FIGS. **12**A-**12**B are flow diagrams illustrating a method of providing feedback for changing activation states of a user interface object. The user interfaces in FIGS. **11**A-**11**N are used to illustrate the processes in FIGS. **12**A-**12**B.

Many electronic devices have graphical user interfaces that include user interface objects, such as buttons and switches. In some circumstances, a user activates a user interface object to perform an operation or adjust a parameter or property. One approach to indicating an activation state of a user interface object is to mimic the behavior of a corresponding physical object. However, physical objects, such as real buttons and switches, will, in some circumstances provide excessive tactile feedback in some circumstances, and too little feedback in others. In some devices, a tactile sensation is, in some circumstances, perceived by the user for corresponding physical inputs, such as clicks of a physical actuator mechanism (e.g., a mouse button) that activate a switch. The embodiments described below provide tactile feedback that is not tied to actuations of a physical actuator mechanism. For example, tactile sensations related to activation state changes are, optionally, provided. When tactile sensations not tied to physical actuations are provided for, the user can better discern the activation state of the virtual button without being distracted by too much or too little tactile feedback, thereby providing a more convenient and intuitive user interface. Below, FIGS. **14**A-**14**N illustrate exemplary user interfaces for providing feedback for changing activation states of a user interface object. FIGS. **15**A-**15**C are flow diagrams illustrating a method of providing feedback for changing activation states of a user interface object. The user interfaces in FIGS. **14**A-**14**N are used to illustrate the processes in FIGS. **15**A-**15**C.

Exemplary Devices

Reference will now be made in detail to embodiments, examples of which are illustrated in the accompanying drawings. In the following detailed description, numerous specific details are set forth in order to provide a thorough understanding of the various described embodiments. However, it will be apparent to one of ordinary skill in the art that the various described embodiments may be practiced without these specific details. In other instances, well-known methods, procedures, components, circuits, and networks have not been described in detail so as not to unnecessarily obscure aspects of the embodiments.

It will also be understood that, although the terms first, second, etc. are, in some instances, used herein to describe various elements, these elements should not be limited by these terms. These terms are only used to distinguish one element from another. For example, a first contact could be termed a second contact, and, similarly, a second contact could be termed a first contact, without departing from the scope of the various described embodiments. The first contact and the second contact are both contacts, but they are not the same contact.

The terminology used in the description of the various described embodiments herein is for the purpose of describing particular embodiments only and is not intended to be limiting. As used in the description of the various described embodiments and the appended claims, the singular forms

"a", "an" and "the" are intended to include the plural forms as well, unless the context clearly indicates otherwise. It will also be understood that the term "and/or" as used herein refers to and encompasses any and all possible combinations of one or more of the associated listed items. It will be further understood that the terms "includes," "including," "comprises," and/or "comprising," when used in this specification, specify the presence of stated features, integers, steps, operations, elements, and/or components, but do not preclude the presence or addition of one or more other features, integers, steps, operations, elements, components, and/or groups thereof.

As used herein, the term "if" is, optionally, construed to mean "when" or "upon" or "in response to determining" or "in response to detecting," depending on the context. Similarly, the phrase "if it is determined" or "if [a stated condition or event] is detected" is, optionally, construed to mean "upon determining" or "in response to determining" or "upon detecting [the stated condition or event]" or "in response to detecting [the stated condition or event]," depending on the context.

Embodiments of electronic devices, user interfaces for such devices, and associated processes for using such devices are described. In some embodiments, the device is a portable communications device, such as a mobile telephone, that also contains other functions, such as PDA and/or music player functions. Exemplary embodiments of portable multifunction devices include, without limitation, the iPhone®, iPod Touch®, and iPad® devices from Apple Inc. of Cupertino, California Other portable electronic devices, such as laptops or tablet computers with touch-sensitive surfaces (e.g., touch screen displays and/or touch pads), are, optionally, used. It should also be understood that, in some embodiments, the device is not a portable communications device, but is a desktop computer with a touch-sensitive surface (e.g., a touch screen display and/or a touch pad).

In the discussion that follows, an electronic device that includes a display and a touch-sensitive surface is described. It should be understood, however, that the electronic device optionally includes one or more other physical user-interface devices, such as a physical keyboard, a mouse and/or a joystick.

The device typically supports a variety of applications, such as one or more of the following: a drawing application, a presentation application, a word processing application, a website creation application, a disk authoring application, a spreadsheet application, a gaming application, a telephone application, a video conferencing application, an e-mail application, an instant messaging application, a workout support application, a photo management application, a digital camera application, a digital video camera application, a web browsing application, a digital music player application, and/or a digital video player application.

The various applications that are executed on the device optionally use at least one common physical user-interface device, such as the touch-sensitive surface. One or more functions of the touch-sensitive surface as well as corresponding information displayed on the device are, optionally, adjusted and/or varied from one application to the next and/or within a respective application. In this way, a common physical architecture (such as the touch-sensitive surface) of the device optionally supports the variety of applications with user interfaces that are intuitive and transparent to the user.

Attention is now directed toward embodiments of portable devices with touch-sensitive displays. FIG. **1A** is a block diagram illustrating portable multifunction device **100** with touch-sensitive displays **112** in accordance with some embodiments. Touch-sensitive display **112** is sometimes called a "touch screen" for convenience, and is sometimes known as or called a touch-sensitive display system. Device **100** includes memory **102** (which optionally includes one or more computer readable storage mediums), memory controller **122**, one or more processing units (CPU's) **120**, peripherals interface **118**, RF circuitry **108**, audio circuitry **110**, speaker **111**, microphone **113**, input/output (I/O) subsystem **106**, other input or control devices **116**, and external port **124**. Device **100** optionally includes one or more optical sensors **164**. Device **100** optionally includes one or more intensity sensors **165** for detecting intensity of contacts on device **100** (e.g., a touch-sensitive surface such as touch-sensitive display system **112** of device **100**). Device **100** optionally includes one or more tactile output generators **167** for generating tactile outputs on device **100** (e.g., generating tactile outputs on a touch-sensitive surface such as touch-sensitive display system **112** of device **100** or touchpad **355** of device **300**). These components optionally communicate over one or more communication buses or signal lines **103**.

As used in the specification and claims, the term "intensity" of a contact on a touch-sensitive surface refers to the force or pressure (force per unit area) of a contact (e.g., a finger contact) on the touch sensitive surface, or to a substitute (proxy) for the force or pressure of a contact on the touch sensitive surface. The intensity of a contact has a range of values that includes at least four distinct values and more typically includes hundreds of distinct values (e.g., at least 256). Intensity of a contact is, optionally, determined (or measured) using various approaches and various sensors or combinations of sensors. For example, one or more force sensors underneath or adjacent to the touch-sensitive surface are, optionally, used to measure force at various points on the touch-sensitive surface. In some implementations, force measurements from multiple force sensors are combined (e.g., a weighted average) to determine an estimated force of a contact. Similarly, a pressure-sensitive tip of a stylus is, optionally, used to determine a pressure of the stylus on the touch-sensitive surface. Alternatively, the size of the contact area detected on the touch-sensitive surface and/or changes thereto, the capacitance of the touch-sensitive surface proximate to the contact and/or changes thereto, and/or the resistance of the touch-sensitive surface proximate to the contact and/or changes thereto are, optionally, used as a substitute for the force or pressure of the contact on the touch-sensitive surface. In some implementations, the substitute measurements for contact force or pressure are used directly to determine whether an intensity threshold has been exceeded (e.g., the intensity threshold is described in units corresponding to the substitute measurements). In some implementations, the substitute measurements for contact force or pressure are converted to an estimated force or pressure and the estimated force or pressure is used to determine whether an intensity threshold has been exceeded (e.g., the intensity threshold is a pressure threshold measured in units of pressure).

As used in the specification and claims, the term "tactile output" refers to physical displacement of a device relative to a previous position of the device, physical displacement of a component (e.g., a touch-sensitive surface) of a device relative to another component (e.g., housing) of the device, or displacement of the component relative to a center of mass of the device that will be detected by a user with the user's sense of touch. For example, in situations where the device or the component of the device is in contact with a

surface of a user that is sensitive to touch (e.g., a finger, palm, or other part of a user's hand), the tactile output generated by the physical displacement will be interpreted by the user as a tactile sensation corresponding to a perceived change in physical characteristics of the device or the component of the device. For example, movement of a touch-sensitive surface (e.g., a touch-sensitive display or trackpad) is, optionally, interpreted by the user as a "down click" or "up click" of a physical actuator button. In some cases, a user will feel a tactile sensation such as an "down click" or "up click" even when there is no movement of a physical actuator button associated with the touch-sensitive surface that is physically pressed (e.g., displaced) by the user's movements. As another example, movement of the touch-sensitive surface is, optionally, interpreted or sensed by the user as "roughness" of the touch-sensitive surface, even when there is no change in smoothness of the touch-sensitive surface. While such interpretations of touch by a user will be subject to the individualized sensory perceptions of the user, there are many sensory perceptions of touch that are common to a large majority of users. Thus, when a tactile output is described as corresponding to a particular sensory perception of a user (e.g., an "up click," a "down click," "roughness"), unless otherwise stated, the generated tactile output corresponds to physical displacement of the device or a component thereof that will generate the described sensory perception for a typical (or average) user.

It should be appreciated that device **100** is only one example of a portable multifunction device, and that device **100** optionally has more or fewer components than shown, optionally combines two or more components, or optionally has a different configuration or arrangement of the components. The various components shown in FIG. **1A** are implemented in hardware, software, or a combination of both hardware and software, including one or more signal processing and/or application specific integrated circuits.

Memory **102** optionally includes high-speed random access memory and optionally also includes non-volatile memory, such as one or more magnetic disk storage devices, flash memory devices, or other non-volatile solid-state memory devices. Access to memory **102** by other components of device **100**, such as CPU **120** and the peripherals interface **118**, is, optionally, controlled by memory controller **122**.

Peripherals interface **118** can be used to couple input and output peripherals of the device to CPU **120** and memory **102**. The one or more processors **120** run or execute various software programs and/or sets of instructions stored in memory **102** to perform various functions for device **100** and to process data.

In some embodiments, peripherals interface **118**, CPU **120**, and memory controller **122** are, optionally, implemented on a single chip, such as chip **104**. In some other embodiments, they are, optionally, implemented on separate chips.

RF (radio frequency) circuitry **108** receives and sends RF signals, also called electromagnetic signals. RF circuitry **108** converts electrical signals to/from electromagnetic signals and communicates with communications networks and other communications devices via the electromagnetic signals. RF circuitry **108** optionally includes well-known circuitry for performing these functions, including but not limited to an antenna system, an RF transceiver, one or more amplifiers, a tuner, one or more oscillators, a digital signal processor, a CODEC chipset, a subscriber identity module (SIM) card, memory, and so forth. RF circuitry **108** optionally communicates with networks, such as the Internet, also referred to as the World Wide Web (WWW), an intranet and/or a wireless network, such as a cellular telephone network, a wireless local area network (LAN) and/or a metropolitan area network (MAN), and other devices by wireless communication. The wireless communication optionally uses any of a plurality of communications standards, protocols and technologies, including but not limited to Global System for Mobile Communications (GSM), Enhanced Data GSM Environment (EDGE), high-speed downlink packet access (HSDPA), high-speed uplink packet access (HSDPA), Evolution, Data-Only (EV-DO), HSPA, HSPA+, Dual-Cell HSPA (DC-HSPDA), long term evolution (LTE), near field communication (NFC), wideband code division multiple access (W-CDMA), code division multiple access (CDMA), time division multiple access (TDMA), Bluetooth, Wireless Fidelity (Wi-Fi) (e.g., IEEE 802.11a, IEEE 802.11b, IEEE 802.11g and/or IEEE 802.11n), voice over Internet Protocol (VoIP), Wi-MAX, a protocol for e-mail (e.g., Internet message access protocol (IMAP) and/or post office protocol (POP)), instant messaging (e.g., extensible messaging and presence protocol (XMPP), Session Initiation Protocol for Instant Messaging and Presence Leveraging Extensions (SIMPLE), Instant Messaging and Presence Service (IMPS)), and/or Short Message Service (SMS), or any other suitable communication protocol, including communication protocols not yet developed as of the filing date of this document.

Audio circuitry **110**, speaker **111**, and microphone **113** provide an audio interface between a user and device **100**. Audio circuitry **110** receives audio data from peripherals interface **118**, converts the audio data to an electrical signal, and transmits the electrical signal to speaker **111**. Speaker **111** converts the electrical signal to human-audible sound waves. Audio circuitry **110** also receives electrical signals converted by microphone **113** from sound waves. Audio circuitry **110** converts the electrical signal to audio data and transmits the audio data to peripherals interface **118** for processing. Audio data is, optionally, retrieved from and/or transmitted to memory **102** and/or RF circuitry **108** by peripherals interface **118**. In some embodiments, audio circuitry **110** also includes a headset jack (e.g., **212**, FIG. **2**). The headset jack provides an interface between audio circuitry **110** and removable audio input/output peripherals, such as output-only headphones or a headset with both output (e.g., a headphone for one or both ears) and input (e.g., a microphone).

I/O subsystem **106** couples input/output peripherals on device **100**, such as touch screen **112** and other input control devices **116**, to peripherals interface **118**. I/O subsystem **106** optionally includes display controller **156**, optical sensor controller **158**, intensity sensor controller **159**, haptic feedback controller **161** and one or more input controllers **160** for other input or control devices. The one or more input controllers **160** receive/send electrical signals from/to other input or control devices **116**. The other input control devices **116** optionally include physical buttons (e.g., push buttons, rocker buttons, etc.), dials, slider switches, joysticks, click wheels, and so forth. In some alternate embodiments, input controller(s) **160** are, optionally, coupled to any (or none) of the following: a keyboard, infrared port, USB port, and a pointer device such as a mouse. The one or more buttons (e.g., **208**, FIG. **2**) optionally include an up/down button for volume control of speaker **111** and/or microphone **113**. The one or more buttons optionally include a push button (e.g., **206**, FIG. **2**).

Touch-sensitive display **112** provides an input interface and an output interface between the device and a user.

Display controller **156** receives and/or sends electrical signals from/to touch screen **112**. Touch screen **112** displays visual output to the user. The visual output optionally includes graphics, text, icons, video, and any combination thereof (collectively termed "graphics"). In some embodiments, some or all of the visual output corresponds to user-interface objects.

Touch screen **112** has a touch-sensitive surface, sensor or set of sensors that accepts input from the user based on haptic and/or tactile contact. Touch screen **112** and display controller **156** (along with any associated modules and/or sets of instructions in memory **102**) detect contact (and any movement or breaking of the contact) on touch screen **112** and converts the detected contact into interaction with user-interface objects (e.g., one or more soft keys, icons, web pages or images) that are displayed on touch screen **112**. In an exemplary embodiment, a point of contact between touch screen **112** and the user corresponds to a finger of the user.

Touch screen **112** optionally uses LCD (liquid crystal display) technology, LPD (light emitting polymer display) technology, or LED (light emitting diode) technology, although other display technologies are used in other embodiments. Touch screen **112** and display controller **156** optionally detect contact and any movement or breaking thereof using any of a plurality of touch sensing technologies now known or later developed, including but not limited to capacitive, resistive, infrared, and surface acoustic wave technologies, as well as other proximity sensor arrays or other elements for determining one or more points of contact with touch screen **112**. In an exemplary embodiment, projected mutual capacitance sensing technology is used, such as that found in the iPhone®, iPod Touch®, and iPad® from Apple Inc. of Cupertino, California.

Touch screen **112** optionally has a video resolution in excess of 100 dpi. In some embodiments, the touch screen has a video resolution of approximately 160 dpi. The user optionally makes contact with touch screen **112** using any suitable object or appendage, such as a stylus, a finger, and so forth. In some embodiments, the user interface is designed to work primarily with finger-based contacts and gestures, which can be less precise than stylus-based input due to the larger area of contact of a finger on the touch screen. In some embodiments, the device translates the rough finger-based input into a precise pointer/cursor position or command for performing the actions desired by the user.

In some embodiments, in addition to the touch screen, device **100** optionally includes a touchpad (not shown) for activating or deactivating particular functions. In some embodiments, the touchpad is a touch-sensitive area of the device that, unlike the touch screen, does not display visual output. The touchpad is, optionally, a touch-sensitive surface that is separate from touch screen **112** or an extension of the touch-sensitive surface formed by the touch screen.

Device **100** also includes power system **162** for powering the various components. Power system **162** optionally includes a power management system, one or more power sources (e.g., battery, alternating current (AC)), a recharging system, a power failure detection circuit, a power converter or inverter, a power status indicator (e.g., a light-emitting diode (LED)) and any other components associated with the generation, management and distribution of power in portable devices.

Device **100** optionally also includes one or more optical sensors **164**. FIG. **1A** shows an optical sensor coupled to optical sensor controller **158** in I/O subsystem **106**. Optical sensor **164** optionally includes charge-coupled device (CCD) or complementary metal-oxide semiconductor (CMOS) phototransistors. Optical sensor **164** receives light from the environment, projected through one or more lens, and converts the light to data representing an image. In conjunction with imaging module **143** (also called a camera module), optical sensor **164** optionally captures still images or video. In some embodiments, an optical sensor is located on the back of device **100**, opposite touch screen display **112** on the front of the device, so that the touch screen display is enabled for use as a viewfinder for still and/or video image acquisition. In some embodiments, another optical sensor is located on the front of the device so that the user's image is, optionally, obtained for videoconferencing while the user views the other video conference participants on the touch screen display.

Device **100** optionally also includes one or more contact intensity sensors **165**. FIG. **1A** shows a contact intensity sensor coupled to intensity sensor controller **159** in I/O subsystem **106**. Contact intensity sensor **165** optionally includes one or more piezoresistive strain gauges, capacitive force sensors, electric force sensors, piezoelectric force sensors, optical force sensors, capacitive touch-sensitive surfaces, or other intensity sensors (e.g., sensors used to measure the force (or pressure) of a contact on a touch-sensitive surface). Contact intensity sensor **165** receives contact intensity information (e.g., pressure information or a proxy for pressure information) from the environment. In some embodiments, at least one contact intensity sensor is collocated with, or proximate to, a touch-sensitive surface (e.g., touch-sensitive display system **112**). In some embodiments, at least one contact intensity sensor is located on the back of device **100**, opposite touch screen display **112** which is located on the front of device **100**.

Device **100** optionally also includes one or more proximity sensors **166**. FIG. **1A** shows proximity sensor **166** coupled to peripherals interface **118**. Alternately, proximity sensor **166** is coupled to input controller **160** in I/O subsystem **106**. In some embodiments, the proximity sensor turns off and disables touch screen **112** when the multifunction device is placed near the user's ear (e.g., when the user is making a phone call).

Device **100** optionally also includes one or more tactile output generators **167**. FIG. **1A** shows a tactile output generator coupled to haptic feedback controller **161** in I/O subsystem **106**. Tactile output generator **167** optionally includes one or more electroacoustic devices such as speakers or other audio components and/or electromechanical devices that convert energy into linear motion such as a motor, solenoid, electroactive polymer, piezoelectric actuator, electrostatic actuator, or other tactile output generating component (e.g., a component that converts electrical signals into tactile outputs on the device). Contact intensity sensor **165** receives tactile feedback generation instructions from haptic feedback module **133** and generates tactile outputs on device **100** that are capable of being sensed by a user of device **100**. In some embodiments, at least one tactile output generator is collocated with, or proximate to, a touch-sensitive surface (e.g., touch-sensitive display system **112**) and, optionally, generates a tactile output by moving the touch-sensitive surface vertically (e.g., in/out of a surface of device **100**) or laterally (e.g., back and forth in the same plane as a surface of device **100**). In some embodiments, at least one tactile output generator sensor is located on the back of device **100**, opposite touch screen display **112** which is located on the front of device **100**.

Device **100** optionally also includes one or more accelerometers **168**. FIG. **1**A shows accelerometer **168** coupled to peripherals interface **118**. Alternately, accelerometer **168** is, optionally, coupled to an input controller **160** in I/O subsystem **106**. In some embodiments, information is displayed on the touch screen display in a portrait view or a landscape view based on an analysis of data received from the one or more accelerometers. Device **100** optionally includes, in addition to accelerometer(s) **168**, a magnetometer (not shown) and a GPS (or GLONASS or other global navigation system) receiver (not shown) for obtaining information concerning the location and orientation (e.g., portrait or landscape) of device **100**.

In some embodiments, the software components stored in memory **102** include operating system **126**, communication module (or set of instructions) **128**, contact/motion module (or set of instructions) **130**, graphics module (or set of instructions) **132**, text input module (or set of instructions) **134**, Global Positioning System (GPS) module (or set of instructions) **135**, and applications (or sets of instructions) **136**. Furthermore, in some embodiments memory **102** stores device/global internal state **157**, as shown in FIGS. **1**A and **3**. Device/global internal state **157** includes one or more of: active application state, indicating which applications, if any, are currently active; display state, indicating what applications, views or other information occupy various regions of touch screen display **112**; sensor state, including information obtained from the device's various sensors and input control devices **116**; and location information concerning the device's location and/or attitude.

Operating system **126** (e.g., Darwin, RTXC, LINUX, UNIX, OS X, WINDOWS, or an embedded operating system such as VxWorks) includes various software components and/or drivers for controlling and managing general system tasks (e.g., memory management, storage device control, power management, etc.) and facilitates communication between various hardware and software components.

Communication module **128** facilitates communication with other devices over one or more external ports **124** and also includes various software components for handling data received by RF circuitry **108** and/or external port **124**. External port **124** (e.g., Universal Serial Bus (USB), FIREWIRE, etc.) is adapted for coupling directly to other devices or indirectly over a network (e.g., the Internet, wireless LAN, etc.). In some embodiments, the external port is a multi-pin (e.g., 30-pin) connector that is the same as, or similar to and/or compatible with the 30-pin connector used on iPod (trademark of Apple Inc.) devices.

Contact/motion module **130** optionally detects contact with touch screen **112** (in conjunction with display controller **156**) and other touch sensitive devices (e.g., a touchpad or physical click wheel). Contact/motion module **130** includes various software components for performing various operations related to detection of contact, such as determining if contact has occurred (e.g., detecting a finger-down event), determining an intensity of the contact (e.g., the force or pressure of the contact or a substitute for the force or pressure of the contact) determining if there is movement of the contact and tracking the movement across the touch-sensitive surface (e.g., detecting one or more finger-dragging events), and determining if the contact has ceased (e.g., detecting a finger-up event or a break in contact). Contact/motion module **130** receives contact data from the touch-sensitive surface. Determining movement of the point of contact, which is represented by a series of contact data, optionally includes determining speed (magnitude), velocity (magnitude and direction), and/or an acceleration (a change in magnitude and/or direction) of the point of contact. These operations are, optionally, applied to single contacts (e.g., one finger contacts) or to multiple simultaneous contacts (e.g., "multitouch"/multiple finger contacts). In some embodiments, contact/motion module **130** and display controller **156** detect contact on a touchpad.

In some embodiments, contact/motion module **130** uses a set of one or more intensity thresholds to determine whether an operation has been performed by a user (e.g., to determine whether a user has "clicked" on an icon). In some embodiments at least a subset of the intensity thresholds are determined in accordance with software parameters (e.g., the intensity thresholds are not determined by the activation thresholds of particular physical actuators and can be adjusted without changing the physical hardware of device **100**). For example, a mouse "click" threshold of a trackpad or touch screen display can be set to any of a large range of predefined thresholds values without changing the trackpad or touch screen display hardware. Additionally, in some implementations a user of the device is provided with software settings for adjusting one or more of the set of intensity thresholds (e.g., by adjusting individual intensity thresholds and/or by adjusting a plurality of intensity thresholds at once with a system-level click "intensity" parameter).

Contact/motion module **130** optionally detects a gesture input by a user. Different gestures on the touch-sensitive surface have different contact patterns and intensities. Thus, a gesture is, optionally, detected by detecting a particular contact pattern. For example, detecting a finger tap gesture includes detecting a finger-down event followed by detecting a finger-up (lift off) event at the same position (or substantially the same position) as the finger-down event (e.g., at the position of an icon). As another example, detecting a finger swipe gesture on the touch-sensitive surface includes detecting a finger-down event followed by detecting one or more finger-dragging events, and subsequently followed by detecting a finger-up (lift off) event.

Graphics module **132** includes various known software components for rendering and displaying graphics on touch screen **112** or other display, including components for changing the visual impact (e.g., brightness, transparency, saturation, contrast or other visual property) of graphics that are displayed. As used herein, the term "graphics" includes any object that can be displayed to a user, including without limitation text, web pages, icons (such as user-interface objects including soft keys), digital images, videos, animations and the like.

In some embodiments, graphics module **132** stores data representing graphics to be used. Each graphic is, optionally, assigned a corresponding code. Graphics module **132** receives, from applications etc., one or more codes specifying graphics to be displayed along with, if necessary, coordinate data and other graphic property data, and then generates screen image data to output to display controller **156**.

Haptic feedback module **133** includes various software components for generating instructions used by tactile output generator(s) **167** to produce tactile outputs at one or more locations on device **100** in response to user interactions with device **100**.

Text input module **134**, which is, optionally, a component of graphics module **132**, provides soft keyboards for entering text in various applications (e.g., contacts **137**, e-mail **140**, IM **141**, browser **147**, and any other application that needs text input).

GPS module **135** determines the location of the device and provides this information for use in various applications

(e.g., to telephone **138** for use in location-based dialing, to camera **143** as picture/video metadata, and to applications that provide location-based services such as weather widgets, local yellow page widgets, and map/navigation widgets).

Applications **136** optionally include the following modules (or sets of instructions), or a subset or superset thereof:

- contacts module **137** (sometimes called an address book or contact list);
- telephone module **138**;
- video conferencing module **139**;
- e-mail client module **140**;
- instant messaging (IM) module **141**;
- workout support module **142**;
- camera module **143** for still and/or video images;
- image management module **144**;
- browser module **147**;
- calendar module **148**;
- widget modules **149**, which optionally include one or more of: weather widget **149-1**, stocks widget **149-2**, calculator widget **149-3**, alarm clock widget **149-4**, dictionary widget **149-5**, and other widgets obtained by the user, as well as user-created widgets **149-6**;
- widget creator module **150** for making user-created widgets **149-6**;
- search module **151**;
- video and music player module **152**, which is, optionally, made up of a video player module and a music player module;
- notes module **153**;
- map module **154**; and/or
- online video module **155**.

Examples of other applications **136** that are, optionally, stored in memory **102** include other word processing applications, other image editing applications, drawing applications, presentation applications, JAVA-enabled applications, encryption, digital rights management, voice recognition, and voice replication.

In conjunction with touch screen **112**, display controller **156**, contact module **130**, graphics module **132**, and text input module **134**, contacts module **137** are, optionally, used to manage an address book or contact list (e.g., stored in application internal state **192** of contacts module **137** in memory **102** or memory **370**), including: adding name(s) to the address book; deleting name(s) from the address book; associating telephone number(s), e-mail address(es), physical address(es) or other information with a name; associating an image with a name; categorizing and sorting names; providing telephone numbers or e-mail addresses to initiate and/or facilitate communications by telephone **138**, video conference **139**, e-mail **140**, or IM **141**; and so forth.

In conjunction with RF circuitry **108**, audio circuitry **110**, speaker **111**, microphone **113**, touch screen **112**, display controller **156**, contact module **130**, graphics module **132**, and text input module **134**, telephone module **138** are, optionally, used to enter a sequence of characters corresponding to a telephone number, access one or more telephone numbers in address book **137**, modify a telephone number that has been entered, dial a respective telephone number, conduct a conversation and disconnect or hang up when the conversation is completed. As noted above, the wireless communication optionally uses any of a plurality of communications standards, protocols and technologies.

In conjunction with RF circuitry **108**, audio circuitry **110**, speaker **111**, microphone **113**, touch screen **112**, display controller **156**, optical sensor **164**, optical sensor controller **158**, contact module **130**, graphics module **132**, text input module **134**, contact list **137**, and telephone module **138**, videoconferencing module **139** includes executable instructions to initiate, conduct, and terminate a video conference between a user and one or more other participants in accordance with user instructions.

In conjunction with RF circuitry **108**, touch screen **112**, display controller **156**, contact module **130**, graphics module **132**, and text input module **134**, e-mail client module **140** includes executable instructions to create, send, receive, and manage e-mail in response to user instructions. In conjunction with image management module **144**, e-mail client module **140** makes it very easy to create and send e-mails with still or video images taken with camera module **143**.

In conjunction with RF circuitry **108**, touch screen **112**, display controller **156**, contact module **130**, graphics module **132**, and text input module **134**, the instant messaging module **141** includes executable instructions to enter a sequence of characters corresponding to an instant message, to modify previously entered characters, to transmit a respective instant message (for example, using a Short Message Service (SMS) or Multimedia Message Service (MMS) protocol for telephony-based instant messages or using XMPP, SIMPLE, or IMPS for Internet-based instant messages), to receive instant messages and to view received instant messages. In some embodiments, transmitted and/or received instant messages optionally include graphics, photos, audio files, video files and/or other attachments as are supported in a MMS and/or an Enhanced Messaging Service (EMS). As used herein, "instant messaging" refers to both telephony-based messages (e.g., messages sent using SMS or MMS) and Internet-based messages (e.g., messages sent using XMPP, SIMPLE, or IMPS).

In conjunction with RF circuitry **108**, touch screen **112**, display controller **156**, contact module **130**, graphics module **132**, text input module **134**, GPS module **135**, map module **154**, and music player module **146**, workout support module **142** includes executable instructions to create workouts (e.g., with time, distance, and/or calorie burning goals); communicate with workout sensors (sports devices); receive workout sensor data; calibrate sensors used to monitor a workout; select and play music for a workout; and display, store and transmit workout data.

In conjunction with touch screen **112**, display controller **156**, optical sensor(s) **164**, optical sensor controller **158**, contact module **130**, graphics module **132**, and image management module **144**, camera module **143** includes executable instructions to capture still images or video (including a video stream) and store them into memory **102**, modify characteristics of a still image or video, or delete a still image or video from memory **102**.

In conjunction with touch screen **112**, display controller **156**, contact module **130**, graphics module **132**, text input module **134**, and camera module **143**, image management module **144** includes executable instructions to arrange, modify (e.g., edit), or otherwise manipulate, label, delete, present (e.g., in a digital slide show or album), and store still and/or video images.

In conjunction with RF circuitry **108**, touch screen **112**, display system controller **156**, contact module **130**, graphics module **132**, and text input module **134**, browser module **147** includes executable instructions to browse the Internet in accordance with user instructions, including searching, linking to, receiving, and displaying web pages or portions thereof, as well as attachments and other files linked to web pages.

In conjunction with RF circuitry **108**, touch screen **112**, display system controller **156**, contact module **130**, graphics

module **132**, text input module **134**, e-mail client module **140**, and browser module **147**, calendar module **148** includes executable instructions to create, display, modify, and store calendars and data associated with calendars (e.g., calendar entries, to do lists, etc.) in accordance with user instructions.

In conjunction with RF circuitry **108**, touch screen **112**, display system controller **156**, contact module **130**, graphics module **132**, text input module **134**, and browser module **147**, widget modules **149** are mini-applications that are, optionally, downloaded and used by a user (e.g., weather widget **149-1**, stocks widget **149-2**, calculator widget **149-3**, alarm clock widget **149-4**, and dictionary widget **149-5**) or created by the user (e.g., user-created widget **149-6**). In some embodiments, a widget includes an HTML (Hypertext Markup Language) file, a CSS (Cascading Style Sheets) file, and a JavaScript file. In some embodiments, a widget includes an XML (Extensible Markup Language) file and a JavaScript file (e.g., Yahoo! Widgets).

In conjunction with RF circuitry **108**, touch screen **112**, display system controller **156**, contact module **130**, graphics module **132**, text input module **134**, and browser module **147**, the widget creator module **150** are, optionally, used by a user to create widgets (e.g., turning a user-specified portion of a web page into a widget).

In conjunction with touch screen **112**, display system controller **156**, contact module **130**, graphics module **132**, and text input module **134**, search module **151** includes executable instructions to search for text, music, sound, image, video, and/or other files in memory **102** that match one or more search criteria (e.g., one or more user-specified search terms) in accordance with user instructions.

In conjunction with touch screen **112**, display system controller **156**, contact module **130**, graphics module **132**, audio circuitry **110**, speaker **111**, RF circuitry **108**, and browser module **147**, video and music player module **152** includes executable instructions that allow the user to download and play back recorded music and other sound files stored in one or more file formats, such as MP3 or AAC files, and executable instructions to display, present or otherwise play back videos (e.g., on touch screen **112** or on an external, connected display via external port **124**). In some embodiments, device **100** optionally includes the functionality of an MP3 player, such as an iPod (trademark of Apple Inc.).

In conjunction with touch screen **112**, display controller **156**, contact module **130**, graphics module **132**, and text input module **134**, notes module **153** includes executable instructions to create and manage notes, to do lists, and the like in accordance with user instructions.

In conjunction with RF circuitry **108**, touch screen **112**, display system controller **156**, contact module **130**, graphics module **132**, text input module **134**, GPS module **135**, and browser module **147**, map module **154** are, optionally, used to receive, display, modify, and store maps and data associated with maps (e.g., driving directions; data on stores and other points of interest at or near a particular location; and other location-based data) in accordance with user instructions.

In conjunction with touch screen **112**, display system controller **156**, contact module **130**, graphics module **132**, audio circuitry **110**, speaker **111**, RF circuitry **108**, text input module **134**, e-mail client module **140**, and browser module **147**, online video module **155** includes instructions that allow the user to access, browse, receive (e.g., by streaming and/or download), play back (e.g., on the touch screen or on an external, connected display via external port **124**), send an e-mail with a link to a particular online video, and otherwise manage online videos in one or more file formats, such as H.264. In some embodiments, instant messaging module **141**, rather than e-mail client module **140**, is used to send a link to a particular online video.

Each of the above identified modules and applications correspond to a set of executable instructions for performing one or more functions described above and the methods described in this application (e.g., the computer-implemented methods and other information processing methods described herein). These modules (i.e., sets of instructions) need not be implemented as separate software programs, procedures or modules, and thus various subsets of these modules are, optionally, combined or otherwise re-arranged in various embodiments. In some embodiments, memory **102** optionally stores a subset of the modules and data structures identified above. Furthermore, memory **102** optionally stores additional modules and data structures not described above.

In some embodiments, device **100** is a device where operation of a predefined set of functions on the device is performed exclusively through a touch screen and/or a touchpad. By using a touch screen and/or a touchpad as the primary input control device for operation of device **100**, the number of physical input control devices (such as push buttons, dials, and the like) on device **100** is, optionally, reduced.

The predefined set of functions that are performed exclusively through a touch screen and/or a touchpad optionally include navigation between user interfaces. In some embodiments, the touchpad, when touched by the user, navigates device **100** to a main, home, or root menu from any user interface that is displayed on device **100**. In such embodiments, a "menu button" is implemented using a touchpad. In some other embodiments, the menu button is a physical push button or other physical input control device instead of a touchpad.

FIG. **1B** is a block diagram illustrating exemplary components for event handling in accordance with some embodiments. In some embodiments, memory **102** (in FIG. **1A**) or **370** (FIG. **3**) includes event sorter **170** (e.g., in operating system **126**) and a respective application **136-1** (e.g., any of the aforementioned applications **137-151**, **155**, **380-390**).

Event sorter **170** receives event information and determines the application **136-1** and application view **191** of application **136-1** to which to deliver the event information. Event sorter **170** includes event monitor **171** and event dispatcher module **174**. In some embodiments, application **136-1** includes application internal state **192**, which indicates the current application view(s) displayed on touch sensitive display **112** when the application is active or executing. In some embodiments, device/global internal state **157** is used by event sorter **170** to determine which application(s) is (are) currently active, and application internal state **192** is used by event sorter **170** to determine application views **191** to which to deliver event information.

In some embodiments, application internal state **192** includes additional information, such as one or more of: resume information to be used when application **136-1** resumes execution, user interface state information that indicates information being displayed or that is ready for display by application **136-1**, a state queue for enabling the user to go back to a prior state or view of application **136-1**, and a redo/undo queue of previous actions taken by the user.

Event monitor **171** receives event information from peripherals interface **118**. Event information includes information about a sub-event (e.g., a user touch on touch-sensitive display **112**, as part of a multi-touch gesture).

Peripherals interface **118** transmits information it receives from I/O subsystem **106** or a sensor, such as proximity sensor **166**, accelerometer(s) **168**, and/or microphone **113** (through audio circuitry **110**). Information that peripherals interface **118** receives from I/O subsystem **106** includes information from touch-sensitive display **112** or a touch-sensitive surface.

In some embodiments, event monitor **171** sends requests to the peripherals interface **118** at predetermined intervals. In response, peripherals interface **118** transmits event information. In other embodiments, peripheral interface **118** transmits event information only when there is a significant event (e.g., receiving an input above a predetermined noise threshold and/or for more than a predetermined duration).

In some embodiments, event sorter **170** also includes a hit view determination module **172** and/or an active event recognizer determination module **173**.

Hit view determination module **172** provides software procedures for determining where a sub-event has taken place within one or more views, when touch sensitive display **112** displays more than one view. Views are made up of controls and other elements that a user can see on the display.

Another aspect of the user interface associated with an application is a set of views, sometimes herein called application views or user interface windows, in which information is displayed and touch-based gestures occur. The application views (of a respective application) in which a touch is detected optionally correspond to programmatic levels within a programmatic or view hierarchy of the application. For example, the lowest level view in which a touch is detected is, optionally, called the hit view, and the set of events that are recognized as proper inputs are, optionally, determined based, at least in part, on the hit view of the initial touch that begins a touch-based gesture.

Hit view determination module **172** receives information related to sub-events of a touch-based gesture. When an application has multiple views organized in a hierarchy, hit view determination module **172** identifies a hit view as the lowest view in the hierarchy which should handle the sub-event. In most circumstances, the hit view is the lowest level view in which an initiating sub-event occurs (i.e., the first sub-event in the sequence of sub-events that form an event or potential event). Once the hit view is identified by the hit view determination module, the hit view typically receives all sub-events related to the same touch or input source for which it was identified as the hit view.

Active event recognizer determination module **173** determines which view or views within a view hierarchy should receive a particular sequence of sub-events. In some embodiments, active event recognizer determination module **173** determines that only the hit view should receive a particular sequence of sub-events. In other embodiments, active event recognizer determination module **173** determines that all views that include the physical location of a sub-event are actively involved views, and therefore determines that all actively involved views should receive a particular sequence of sub-events. In other embodiments, even if touch sub-events were entirely confined to the area associated with one particular view, views higher in the hierarchy would still remain as actively involved views.

Event dispatcher module **174** dispatches the event information to an event recognizer (e.g., event recognizer **180**). In embodiments including active event recognizer determination module **173**, event dispatcher module **174** delivers the event information to an event recognizer determined by active event recognizer determination module **173**. In some embodiments, event dispatcher module **174** stores in an event queue the event information, which is retrieved by a respective event receiver module **182**.

In some embodiments, operating system **126** includes event sorter **170**. Alternatively, application **136-1** includes event sorter **170**. In yet other embodiments, event sorter **170** is a stand-alone module, or a part of another module stored in memory **102**, such as contact/motion module **130**.

In some embodiments, application **136-1** includes a plurality of event handlers **190** and one or more application views **191**, each of which includes instructions for handling touch events that occur within a respective view of the application's user interface. Each application view **191** of the application **136-1** includes one or more event recognizers **180**. Typically, a respective application view **191** includes a plurality of event recognizers **180**. In other embodiments, one or more of event recognizers **180** are part of a separate module, such as a user interface kit (not shown) or a higher level object from which application **136-1** inherits methods and other properties. In some embodiments, a respective event handler **190** includes one or more of: data updater **176**, object updater **177**, GUI updater **178**, and/or event data **179** received from event sorter **170**. Event handler **190** optionally utilizes or calls data updater **176**, object updater **177** or GUI updater **178** to update the application internal state **192**. Alternatively, one or more of the application views **191** includes one or more respective event handlers **190**. Also, in some embodiments, one or more of data updater **176**, object updater **177**, and GUI updater **178** are included in a respective application view **191**.

A respective event recognizer **180** receives event information (e.g., event data **179**) from event sorter **170**, and identifies an event from the event information. Event recognizer **180** includes event receiver **182** and event comparator **184**. In some embodiments, event recognizer **180** also includes at least a subset of: metadata **183**, and event delivery instructions **188** (which optionally include sub-event delivery instructions).

Event receiver **182** receives event information from event sorter **170**. The event information includes information about a sub-event, for example, a touch or a touch movement. Depending on the sub-event, the event information also includes additional information, such as location of the sub-event. When the sub-event concerns motion of a touch, the event information optionally also includes speed and direction of the sub-event. In some embodiments, events include rotation of the device from one orientation to another (e.g., from a portrait orientation to a landscape orientation, or vice versa), and the event information includes corresponding information about the current orientation (also called device attitude) of the device.

Event comparator **184** compares the event information to predefined event or sub-event definitions and, based on the comparison, determines an event or sub-event, or determines or updates the state of an event or sub-event. In some embodiments, event comparator **184** includes event definitions **186**. Event definitions **186** contain definitions of events (e.g., predefined sequences of sub-events), for example, event 1 (**187-1**), event 2 (**187-2**), and others. In some embodiments, sub-events in an event **187** include, for example, touch begin, touch end, touch movement, touch cancellation, and multiple touching. In one example, the definition for event 1 (**187-1**) is a double tap on a displayed object. The double tap, for example, comprises a first touch (touch begin) on the displayed object for a predetermined phase, a first lift-off (touch end) for a predetermined phase,

a second touch (touch begin) on the displayed object for a predetermined phase, and a second lift-off (touch end) for a predetermined phase. In another example, the definition for event 2 (**187-2**) is a dragging on a displayed object. The dragging, for example, comprises a touch (or contact) on the displayed object for a predetermined phase, a movement of the touch across touch-sensitive display **112**, and lift-off of the touch (touch end). In some embodiments, the event also includes information for one or more associated event handlers **190**.

In some embodiments, event definition **187** includes a definition of an event for a respective user-interface object. In some embodiments, event comparator **184** performs a hit test to determine which user-interface object is associated with a sub-event. For example, in an application view in which three user-interface objects are displayed on touch-sensitive display **112**, when a touch is detected on touch-sensitive display **112**, event comparator **184** performs a hit test to determine which of the three user-interface objects is associated with the touch (sub-event). If each displayed object is associated with a respective event handler **190**, the event comparator uses the result of the hit test to determine which event handler **190** should be activated. For example, event comparator **184** selects an event handler associated with the sub-event and the object triggering the hit test.

In some embodiments, the definition for a respective event **187** also includes delayed actions that delay delivery of the event information until after it has been determined whether the sequence of sub-events does or does not correspond to the event recognizer's event type.

When a respective event recognizer **180** determines that the series of sub-events do not match any of the events in event definitions **186**, the respective event recognizer **180** enters an event impossible, event failed, or event ended state, after which it disregards subsequent sub-events of the touch-based gesture. In this situation, other event recognizers, if any, that remain active for the hit view continue to track and process sub-events of an ongoing touch-based gesture.

In some embodiments, a respective event recognizer **180** includes metadata **183** with configurable properties, flags, and/or lists that indicate how the event delivery system should perform sub-event delivery to actively involved event recognizers. In some embodiments, metadata **183** includes configurable properties, flags, and/or lists that indicate how event recognizers interact, or are enabled to interact, with one another. In some embodiments, metadata **183** includes configurable properties, flags, and/or lists that indicate whether sub-events are delivered to varying levels in the view or programmatic hierarchy.

In some embodiments, a respective event recognizer **180** activates event handler **190** associated with an event when one or more particular sub-events of an event are recognized. In some embodiments, a respective event recognizer **180** delivers event information associated with the event to event handler **190**. Activating an event handler **190** is distinct from sending (and deferred sending) sub-events to a respective hit view. In some embodiments, event recognizer **180** throws a flag associated with the recognized event, and event handler **190** associated with the flag catches the flag and performs a predefined process.

In some embodiments, event delivery instructions **188** include sub-event delivery instructions that deliver event information about a sub-event without activating an event handler. Instead, the sub-event delivery instructions deliver event information to event handlers associated with the series of sub-events or to actively involved views. Event handlers associated with the series of sub-events or with actively involved views receive the event information and perform a predetermined process.

In some embodiments, data updater **176** creates and updates data used in application **136-1**. For example, data updater **176** updates the telephone number used in contacts module **137**, or stores a video file used in video player module **145**. In some embodiments, object updater **177** creates and updates objects used in application **136-1**. For example, object updater **177** creates a new user-interface object or updates the position of a user-interface object. GUI updater **178** updates the GUI. For example, GUI updater **178** prepares display information and sends it to graphics module **132** for display on a touch-sensitive display.

In some embodiments, event handler(s) **190** includes or has access to data updater **176**, object updater **177**, and GUI updater **178**. In some embodiments, data updater **176**, object updater **177**, and GUI updater **178** are included in a single module of a respective application **136-1** or application view **191**. In other embodiments, they are included in two or more software modules.

It shall be understood that the foregoing discussion regarding event handling of user touches on touch-sensitive displays also applies to other forms of user inputs to operate multifunction devices **100** with input-devices, not all of which are initiated on touch screens. For example, mouse movement and mouse button presses, optionally coordinated with single or multiple keyboard presses or holds; contact movements such as taps, drags, scrolls, etc., on touch-pads; pen stylus inputs; movement of the device; oral instructions; detected eye movements; biometric inputs; and/or any combination thereof are optionally utilized as inputs corresponding to sub-events which define an event to be recognized.

FIG. **2** illustrates a portable multifunction device **100** having a touch screen **112** in accordance with some embodiments. The touch screen optionally displays one or more graphics within user interface (UI) **200**. In this embodiment, as well as others described below, a user is enabled to select one or more of the graphics by making a gesture on the graphics, for example, with one or more fingers **202** (not drawn to scale in the figure) or one or more styluses **203** (not drawn to scale in the figure). In some embodiments, selection of one or more graphics occurs when the user breaks contact with the one or more graphics. In some embodiments, the gesture optionally includes one or more taps, one or more swipes (from left to right, right to left, upward and/or downward) and/or a rolling of a finger (from right to left, left to right, upward and/or downward) that has made contact with device **100**. In some implementations or circumstances, inadvertent contact with a graphic does not select the graphic. For example, a swipe gesture that sweeps over an application icon optionally does not select the corresponding application when the gesture corresponding to selection is a tap.

Device **100** optionally also includes one or more physical buttons, such as "home" or menu button **204**. As described previously, menu button **204** is, optionally, used to navigate to any application **136** in a set of applications that are, optionally executed on device **100**. Alternatively, in some embodiments, the menu button is implemented as a soft key in a GUI displayed on touch screen **112**.

In one embodiment, device **100** includes touch screen **112**, menu button **204**, push button **206** for powering the device on/off and locking the device, volume adjustment button(s) **208**, Subscriber Identity Module (SIM) card slot **210**, head set jack **212**, and docking/charging external port **124**. Push button **206** is, optionally, used to turn the power

on/off on the device by depressing the button and holding the button in the depressed state for a predefined time interval; to lock the device by depressing the button and releasing the button before the predefined time interval has elapsed; and/or to unlock the device or initiate an unlock process. In an alternative embodiment, device **100** also accepts verbal input for activation or deactivation of some functions through microphone **113**. Device **100** also, optionally, includes one or more contact intensity sensors **165** for detecting intensity of contacts on touch screen **112** and/or one or more tactile output generators **167** for generating tactile outputs for a user of device **100**.

FIG. **3** is a block diagram of an exemplary multifunction device with a display and a touch-sensitive surface in accordance with some embodiments. Device **300** need not be portable. In some embodiments, device **300** is a laptop computer, a desktop computer, a tablet computer, a multimedia player device, a navigation device, an educational device (such as a child's learning toy), a gaming system, or a control device (e.g., a home or industrial controller). Device **300** typically includes one or more processing units (CPU's) **310**, one or more network or other communications interfaces **360**, memory **370**, and one or more communication buses **320** for interconnecting these components. Communication buses **320** optionally include circuitry (sometimes called a chipset) that interconnects and controls communications between system components. Device **300** includes input/output (I/O) interface **330** comprising display **340**, which is typically a touch screen display. I/O interface **330** also optionally includes a keyboard and/or mouse (or other pointing device) **350** and touchpad **355**, tactile output generator **357** for generating tactile outputs on device **300** (e.g., similar to tactile output generator(s) **167** described above with reference to FIG. **1**A), sensors **359** (e.g., optical, acceleration, proximity, touch-sensitive, and/or contact intensity sensors similar to contact intensity sensor(s) **165** described above with reference to FIG. **1**A). Memory **370** includes high-speed random access memory, such as DRAM, SRAM, DDR RAM or other random access solid state memory devices; and optionally includes non-volatile memory, such as one or more magnetic disk storage devices, optical disk storage devices, flash memory devices, or other non-volatile solid state storage devices. Memory **370** optionally includes one or more storage devices remotely located from CPU(s) **310**. In some embodiments, memory **370** stores programs, modules, and data structures analogous to the programs, modules, and data structures stored in memory **102** of portable multifunction device **100** (FIG. **1**A), or a subset thereof. Furthermore, memory **370** optionally stores additional programs, modules, and data structures not present in memory **102** of portable multifunction device **100**. For example, memory **370** of device **300** optionally stores drawing module **380**, presentation module **382**, word processing module **384**, website creation module **386**, disk authoring module **388**, and/or spreadsheet module **390**, while memory **102** of portable multifunction device **100** (FIG. **1**A) optionally does not store these modules.

Each of the above identified elements in FIG. **3** are, optionally, stored in one or more of the previously mentioned memory devices. Each of the above identified modules corresponds to a set of instructions for performing a function described above. The above identified modules or programs (i.e., sets of instructions) need not be implemented as separate software programs, procedures or modules, and thus various subsets of these modules are, optionally, combined or otherwise re-arranged in various embodiments. In some embodiments, memory **370** optionally stores a subset of the modules and data structures identified above. Furthermore, memory **370** optionally stores additional modules and data structures not described above.

Attention is now directed towards embodiments of user interfaces ("UI") that is, optionally, implemented on portable multifunction device **100**.

FIG. **4**A illustrates an exemplary user interface for a menu of applications on portable multifunction device **100** in accordance with some embodiments. Similar user interfaces are, optionally, implemented on device **300**. In some embodiments, user interface **400** includes the following elements, or a subset or superset thereof:

- Signal strength indicator(s) **402** for wireless communication(s), such as cellular and Wi-Fi signals;
- Time **404**;
- Bluetooth indicator **405**;
- Battery status indicator **406**;
- Tray **408** with icons for frequently used applications, such as:
  - Icon **416** for telephone module **138**, labeled "Phone," which optionally includes an indicator **414** of the number of missed calls or voicemail messages;
  - Icon **418** for e-mail client module **140**, labeled "Mail," which optionally includes an indicator **410** of the number of unread e-mails;
  - Icon **420** for browser module **147**, labeled "Browser;" and
  - Icon **422** for video and music player module **152**, also referred to as iPod (trademark of Apple Inc.) module **152**, labeled "iPod;" and
- Icons for other applications, such as:
  - Icon **424** for IM module **141**, labeled "Text;"
  - Icon **426** for calendar module **148**, labeled "Calendar;"
  - Icon **428** for image management module **144**, labeled "Photos;"
  - Icon **430** for camera module **143**, labeled "Camera;"
  - Icon **432** for online video module **155**, labeled "Online Video"
  - Icon **434** for stocks widget **149-2**, labeled "Stocks;"
  - Icon **436** for map module **154**, labeled "Map;"
  - Icon **438** for weather widget **149-1**, labeled "Weather;"
  - Icon **440** for alarm clock widget **149-4**, labeled "Clock;"
  - Icon **442** for workout support module **142**, labeled "Workout Support;"
  - Icon **444** for notes module **153**, labeled "Notes;" and
  - Icon **446** for a settings application or module, which provides access to settings for device **100** and its various applications **136**.

It should be noted that the icon labels illustrated in FIG. **4**A are merely exemplary. For example, icon **422** for video and music player module **152** are labeled "Music" or "Music Player." Other labels are, optionally, used for various application icons. In some embodiments, a label for a respective application icon includes a name of an application corresponding to the respective application icon. In some embodiments, a label for a particular application icon is distinct from a name of an application corresponding to the particular application icon.

FIG. **4**B illustrates an exemplary user interface on a device (e.g., device **300**, FIG. **3**) with a touch-sensitive surface **451** (e.g., a tablet or touchpad **355**, FIG. **3**) that is separate from the display **450** (e.g., touch screen display **112**). Device **300** also, optionally, includes one or more contact intensity sensors (e.g., one or more of sensors **357**) for detecting intensity of contacts on touch-sensitive surface

451 and/or one or more tactile output generators 359 for generating tactile outputs for a user of device 300.

Although some of the examples which follow will be given with reference to inputs on touch screen display 112 (where the touch sensitive surface and the display are combined), in some embodiments, the device detects inputs on a touch-sensitive surface that is separate from the display, as shown in FIG. 4B. In some embodiments the touch sensitive surface (e.g., 451 in FIG. 4B) has a primary axis (e.g., 452 in FIG. 4B) that corresponds to a primary axis (e.g., 453 in FIG. 4B) on the display (e.g., 450). In accordance with these embodiments, the device detects contacts (e.g., 460 and 462 in FIG. 4B) with the touch-sensitive surface 451 at locations that correspond to respective locations on the display (e.g., in FIG. 4B, 460 corresponds to 468 and 462 corresponds to 470). In this way, user inputs (e.g., contacts 460 and 462, and movements thereof) detected by the device on the touch-sensitive surface (e.g., 451 in FIG. 4B) are used by the device to manipulate the user interface on the display (e.g., 450 in FIG. 4B) of the multifunction device when the touch-sensitive surface is separate from the display. It should be understood that similar methods are, optionally, used for other user interfaces described herein.

Additionally, while the following examples are given primarily with reference to finger inputs (e.g., finger contacts, finger tap gestures, finger swipe gestures), it should be understood that, in some embodiments, one or more of the finger inputs are replaced with input from another input device (e.g., a mouse based input or stylus input). For example, a swipe gesture is, optionally, replaced with a mouse click (e.g., instead of a contact) followed by movement of the cursor along the path of the swipe (e.g., instead of movement of the contact). As another example, a tap gesture is, optionally, replaced with a mouse click while the cursor is located over the location of the tap gesture (e.g., instead of detection of the contact followed by ceasing to detect the contact). Similarly, when multiple user inputs are simultaneously detected, it should be understood that multiple computer mice are, optionally, used simultaneously, or a mouse and finger contacts are, optionally, used simultaneously.

As used herein, the term "focus selector" refers to an input element that indicates a current part of a user interface with which a user is interacting. In some implementations that include a cursor or other location marker, the cursor acts as a "focus selector," so that when an input (e.g., a press input) is detected on a touch-sensitive surface (e.g., touchpad 355 in FIG. 3 or touch-sensitive surface 451 in FIG. 4B) while the cursor is over a particular user interface element (e.g., a button, window, slider or other user interface element), the particular user interface element is adjusted in accordance with the detected input. In some implementations that include a touch-screen display (e.g., touch-sensitive display system 112 in FIG. 1A or touch screen 112 in FIG. 4A) that enables direct interaction with user interface elements on the touch-screen display, a detected contact on the touch-screen acts as a "focus selector," so that when an input (e.g., a press input by the contact) is detected on the touch-screen display at a location of a particular user interface element (e.g., a button, window, slider or other user interface element), the particular user interface element is adjusted in accordance with the detected input. In some implementations focus is moved from one region of a user interface to another region of the user interface without corresponding movement of a cursor or movement of a contact on a touch-screen display (e.g., by using a tab key or arrow keys to move focus from one button to another button); in these implementations, the focus selector moves in accordance with movement of focus between different regions of the user interface. Without regard to the specific form taken by the focus selector, the focus selector is generally the user interface element (or contact on a touch-screen display) that is controlled by the user so as to communicate the user's intended interaction with the user interface (e.g., by indicating, to the device, the element of the user interface with which the user is intending to interact). For example, the location of a focus selector (e.g., a cursor, a contact or a selection box) over a respective button while a press input is detected on the touch-sensitive surface (e.g., a touchpad or touch screen) will indicate that the user is intending to activate the respective button (as opposed to other user interface elements shown on a display of the device).

The user interface figures described below include various intensity diagrams that show the current intensity of the contact on the touch-sensitive surface relative to one or more intensity thresholds (e.g., a contact detection intensity threshold IT_0, a light press intensity threshold IT_L, a deep press intensity threshold IT_D, and/or one or more other intensity thresholds). This intensity diagram is typically not part of the displayed user interface, but is provided to aid in the interpretation of the figures. In some embodiments, the light press intensity threshold corresponds to an intensity at which the device will perform operations typically associated with clicking a button of a physical mouse or a trackpad. In some embodiments, the deep press intensity threshold corresponds to an intensity at which the device will perform operations that are different from operations typically associated with clicking a button of a physical mouse or a trackpad. In some embodiments, when a contact is detected with an intensity below the light press intensity threshold (e.g., and above a nominal contact-detection intensity threshold IT_0 below which the contact is no longer detected), the device will move a focus selector in accordance with movement of the contact on the touch-sensitive surface without performing an operation associated with the light press intensity threshold or the deep press intensity threshold. Generally, unless otherwise stated, these intensity thresholds are consistent between different sets of user interface figures.

An increase of intensity of the contact from an intensity below the light press intensity threshold IT_L to an intensity between the light press intensity threshold IT_L and the deep press intensity threshold IT_D is sometimes referred to as a "light press" input. An increase of intensity of the contact from an intensity below the deep press intensity threshold IT_D to an intensity above the deep press intensity threshold IT_D is sometimes referred to as a "deep press" input. An increase of intensity of the contact from an intensity below the contact-detection intensity threshold IT_0 to an intensity between the contact-detection intensity threshold IT_0 and the light press intensity threshold IT_L is sometimes referred to as detecting the contact on the touch-surface. A decrease of intensity of the contact from an intensity above the contact-detection intensity threshold IT_0 to an intensity below the contact intensity threshold IT_0 is sometimes referred to as detecting liftoff of the contact from the touch-surface. In some embodiments IT_0 is zero. In some embodiments IT_0 is greater than zero. In some illustrations a shaded circle or oval is used to represent intensity of a contact on the touch-sensitive surface. In some illustrations a circle or oval without shading is used represent a respective contact on the touch-sensitive surface without specifying the intensity of the respective contact.

In some embodiments described herein, one or more operations are performed in response to detecting a gesture that includes a respective press input or in response to detecting the respective press input performed with a respective contact (or a plurality of contacts), where the respective press input is detected based at least in part on detecting an increase in intensity of the contact (or plurality of contacts) above a press-input intensity threshold. In some embodiments, the respective operation is performed in response to detecting the increase in intensity of the respective contact above the press-input intensity threshold (e.g., a "down stroke" of the respective press input). In some embodiments, the press input includes an increase in intensity of the respective contact above the press-input intensity threshold and a subsequent decrease in intensity of the contact below the press-input intensity threshold, and the respective operation is performed in response to detecting the subsequent decrease in intensity of the respective contact below the press-input threshold (e.g., an "up stroke" of the respective press input).

In some embodiments, the device employs intensity hysteresis to avoid accidental inputs sometimes termed "jitter," where the device defines or selects a hysteresis intensity threshold with a predefined relationship to the press-input intensity threshold (e.g., the hysteresis intensity threshold is X intensity units lower than the press-input intensity threshold or the hysteresis intensity threshold is 75%, 90% or some reasonable proportion of the press-input intensity threshold). Thus, in some embodiments, the press input includes an increase in intensity of the respective contact above the press-input intensity threshold and a subsequent decrease in intensity of the contact below the hysteresis intensity threshold that corresponds to the press-input intensity threshold, and the respective operation is performed in response to detecting the subsequent decrease in intensity of the respective contact below the hysteresis intensity threshold (e.g., an "up stroke" of the respective press input). Similarly, in some embodiments, the press input is detected only when the device detects an increase in intensity of the contact from an intensity at or below the hysteresis intensity threshold to an intensity at or above the press-input intensity threshold and, optionally, a subsequent decrease in intensity of the contact to an intensity at or below the hysteresis intensity, and the respective operation is performed in response to detecting the press input (e.g., the increase in intensity of the contact or the decrease in intensity of the contact, depending on the circumstances).

For ease of explanation, the description of operations performed in response to a press input associated with a press-input intensity threshold or in response to a gesture including the press input are, optionally, triggered in response to detecting either: an increase in intensity of a contact above the press-input intensity threshold, an increase in intensity of a contact from an intensity below the hysteresis intensity threshold to an intensity above the press-input intensity threshold, a decrease in intensity of the contact below the press-input intensity threshold, and/or a decrease in intensity of the contact below the hysteresis intensity threshold corresponding to the press-input intensity threshold. Additionally, in examples where an operation is described as being performed in response to detecting a decrease in intensity of a contact below the press-input intensity threshold, the operation is, optionally, performed in response to detecting a decrease in intensity of the contact below a hysteresis intensity threshold corresponding to, and lower than, the press-input intensity threshold.

User Interfaces and Associated Processes

Selecting a Tactile Output Corresponding to a Change in Intensity of a Contact

Many electronic devices have graphical user interfaces including one or more user interface objects. When users attempt to perform operations associated with these user interface objects, these operations are sometimes successful and sometimes unsuccessful. For example, attempting to move a user interface object to a region of a user interface that does not accept user interface objects will be unsuccessful. In many user interfaces, there are one or more visual or audible cues as to whether or not the operation associated with the user interface object was successful. However, in some situations the user will miss a visual or audible cue as to whether or not an operation was successful (e.g., because the user was not looking at the display and/or has the volume of the device turned down or turned off, or because the user was distracted when the cue was provided). A missed cue can result in the user attempting to repeat an operation that was successfully performed or proceeding to perform other operations without realizing that the attempted operation was not performed. Thus, it would be advantageous to provide additional cues to the user to indicate whether or not an operation was successful. In a touch-sensitive surface with an integrated mechanical button, the sensation of reducing the intensity of a contact on touch-sensitive surface is determined based on the mechanism of the mechanical button and thus is the same (for the same user input) without regard to whether or not an operation associated with the contact was performed. In contrast, when the touch-sensitive surface is associated with sensors for determining the intensity of the contact with the touch-sensitive surface and a separate actuator generates a software controlled tactile output on the touch-sensitive surface, the tactile output generated after the user has attempted to perform an operation can be varied depending on whether or not the operation was successfully performed (e.g., because the tactile outputs are decoupled from the intensity inputs). Providing such tactile feedback as to whether or not an attempted operation has been performed improves the machine-user interface by providing the user with timely, accurate feedback regarding performance of the operation.

FIGS. **5**A-**5**W illustrate exemplary user interfaces for selecting a tactile output corresponding to a change in intensity of a contact in accordance with some embodiments. The user interfaces in these are used to illustrate the processes described below, including the processes in FIGS. **6**A-**6**B. FIGS. **5**A-**5**W include intensity diagrams that show the current intensity of the contact on the touch-sensitive surface relative to a plurality of intensity thresholds including an object-selection intensity threshold (e.g., "IT_L") and an object-release threshold (e.g., "IT_1"). In some embodiments, the object-selection intensity threshold is different from (e.g., higher than) the object-release intensity threshold. In some embodiments, the object-selection intensity threshold is IT_D and the object-release intensity threshold is IT_D or an intensity threshold slightly below IT_D.

FIG. **5**A illustrates user interface **11700** (e.g., a desktop user interface or a drawing input area within a drawing or graphics application) displayed on display **450** (e.g., display **340**) of a device (e.g., device **300**). One or more user interface objects **11702** are displayed in user interface

11700. In FIG. 5A, user interface objects 11702-1 through 11702-3 are displayed in user interface 11700. A user interface object 11702 is, optionally one of, an application shortcut or launch icon, a shape or object within a drawing or graphics program, or other icon, widget, or object. One or more windows 11704 are, optionally, displayed in user interface 11700 as well. A window 11704 is, optionally, an application window corresponding to a respective application.

Cursor 11706 is also displayed in user interface 11700 on display 450. In some embodiments, cursor 11706 is a mouse pointer. Cursor 11706 is an example of a focus selector. A user optionally positions cursor 11706 at any location in user interface 11700 by making a contact (for example, a finger contact or a stylus contact) on touch-sensitive surface 451 (e.g., touchpad 355) of the device and moving the contact on touch-sensitive surface 451 as desired. In response to the detection of the contact and movement of the contact on touch-sensitive surface 451, cursor 11706 is positioned at a position in user interface 11700 that corresponds to the current position of the contact on touch-sensitive surface 451 and moves in accordance with movement of the contact on touch-sensitive surface 451. In FIG. 5A, contact 11708 is detected at a position on touch-sensitive surface 451, and cursor 11706 is positioned at a corresponding position in user interface 11700, over user interface object 11702-2, as shown.

The device includes one or more sensors that detect the intensity of contacts with touch-sensitive surface 451. In FIG. 5A, the intensity of contact 11708 is detected to be below an object-selection threshold (e.g., "IT_L" in FIGS. 5A-5W). The intensity of contact 11708 below the object-selection threshold is represented by the empty background in contact 11708 as shown in FIG. 5A.

The intensity of contact 11708 is increased by, for example, the user applying more pressure on touch-sensitive surface 451 with contact 11708. The change in intensity of contact 11708 is detected by the contact intensity sensors in the device. In response to the detection of an increase in the intensity of contact 11708 above the object-selection threshold (with the intensity that is above the object-selection threshold represented by the densely dotted background in contact 11708 as shown in FIG. 5B), a user interface object over which cursor 11706 is positioned is selected. In FIG. 5B, cursor 11706 is positioned over user interface object 11702-2, and thus user interface object 11702-2 is selected. User interface object 11706-2 is, optionally, visually highlighted (for example, with a different color; with thicker borders, as shown in FIG. 5B) to indicate the selection. In some embodiments, a tactile output indicative of the selection of user interface object 11702-2 is generated on the touch-sensitive surface. The tactile output indicative of the selection is, optionally, generated in accordance with a movement profile associated with selection of a user interface object. In some embodiments, the selection tactile output corresponds to a tactile sensation that simulates a down-click of a mechanical button (for example, a click sensation of pressing a mouse button or a trackpad with an integrated button).

While the intensity of contact 11708 remains above an object-release threshold (e.g., "IT_1" in FIGS. 5A-5W) and user interface object 11702-2 remains selected, the user moves contact 11708 on touch-sensitive surface 451. In response to detection of the movement of contact 11708, user interface object 11702-2, as well as cursor 11706, is moved across user interface 11700 in accordance with the movement of contact 11708; user interface object 11702-2 is dragged across user interface 11700 in accordance with the movement of contact 11708. For example, as shown in FIGS. 5C-5D, in response to the movement of contact 11708 in direction 11710 on touch-sensitive surface 451, user interface object 11702-2 moves in direction 11712 to another position in user interface 11700. The new position of user interface object 11702-2, as shown in FIG. 5D, is over "empty space" in user interface 11700, away from window 11704 and other user interface objects 11702.

The object-release threshold is an intensity threshold that determines whether a selected user interface object is released from selection. In some embodiments, the object-release threshold is below the object-selection threshold. In some other embodiments, the object-release threshold is the same as the object-selection threshold.

While user interface object 11702-2 is located at the new position in user interface 11700, as shown in FIG. 5D, the user reduces the intensity of contact 11708, such as by reducing the pressure on touch-sensitive surface 451 with contact 11708 (including, for example, completely releasing contact 11708 from touch-sensitive surface 451). As shown in FIG. 5E, the intensity of contact 11708 is reduced below the object-release threshold, with the intensity below the object-release threshold represented by the sparsely dotted background in contact 11708 and the intensity meter shown in FIG. 5E. In response to the reduction in intensity of contact 11708 below the object-release threshold, an attempt to relocate (or "drop") user interface object 11702-2 at the new position is made. The "empty space" in user interface 11700 is a valid drop location, as that empty space is not already occupied by a user interface object 11702 or a window 11704, and thus the relocation of user interface object 11702-2 to the new position is successful. As a result, user interface object 11702-2 is dropped at the new position in user interface 11700 and de-selected (i.e., released from selection). A tactile output is generated on touch-sensitive surface 451, along with the dropping of user interface object 502-2, in response to detection of the reduction in intensity of contact 11708 below the object-release threshold.

Returning to FIG. 5B, selected user interface object 11702-2 moves in response to detection of movement of contact 11708, as described above. FIGS. 5F-5G show user interface object 11702-2 moving in direction 11716 in user interface 11700 to a new position that is over window 11704, in response to detection of movement of contact 11708 in direction 11714 on touch-sensitive surface 451; user interface object 11702-2 is dragged across user interface 11700 in accordance with the movement of contact 11708.

While user interface object 11702-2 is located at the new position over window 11704, as shown in FIG. 5G, the user reduces the intensity of contact 11708, such as by reducing the pressure on touch-sensitive surface 451 with contact 11708 (including, for example, lifting contact 11708 off of touch-sensitive surface 451). As shown in FIG. 5H, the intensity of contact 11708 has been reduced below the object-release threshold. In response to the reduction in intensity of contact 11708 below the object-release threshold, an attempt to relocate user interface object 11702-2 at the new position is made (e.g., the position of user interface object 11702-2 in FIG. 5G). The position over window 11704 within user interface 11700 is an invalid drop location, as the position is already occupied by window 11704, and thus the relocation of user interface object 11702-2 at the new position is unsuccessful. As a result, user interface object 11702-2 is returned to its original location and de-selected. A tactile output that is different from the tactile output generated for the successful drop of user interface

object **11702-2**, described above with reference to FIG. **5**E, is generated on touch-sensitive surface **451**, along with the return of user interface object **11702-2** to its original position, in response to detection of the reduction in intensity of contact **11708** below the object-release threshold.

Thus, after selection of user interface object **11702-2**, movement of contact **11708** and a decrease in the intensity of contact **11708** below the object-release threshold is performed by the user. In response to the detection of the decrease in intensity below the object-release threshold, an attempt to drop user interface object **11702-2** at a new position is made. Depending on whether the new position is a valid drop target/location or an invalid drop target/location, the drop is successful (i.e., the drop is performed) or unsuccessful (i.e., performance of the drop is not performed).

As described above, different tactile outputs are, optionally, generated for a successful drop of a user interface object (for example, as described above with reference to FIG. **5**E) and for an unsuccessful drop of a user interface object (for example, as described above with reference to FIG. **5**H). In some embodiments, the tactile output for the successful drop and the tactile output for the unsuccessful drop both correspond to tactile sensations that simulate of an up-click of a mechanical button (for example, releasing a clicked-and-held mouse button). In some embodiments, the tactile outputs for a successful drop and an unsuccessful drop have different amplitudes but are otherwise both generated in accordance with the same movement profile. For example, the tactile output for the successful drop has a higher amplitude than, but otherwise have the same movement profile (e.g., square waveform) as, the tactile output for the unsuccessful drop.

In some other embodiments, the tactile output for a successful drop and the tactile output for an unsuccessful drop have different movement profiles. For example, the tactile output for the successful drop is, optionally, generated in accordance with a sinusoidal movement profile, and the tactile output for the unsuccessful drop is, optionally, generated in accordance with a sawtooth waveform movement profile.

Returning to FIG. **5**B, selected user interface object **11702-2** moves in response to detection of movement of contact **11708**, as described above. FIGS. **5**I-**5**K show user interface object **11702-2** moving, continuously, in direction **11722** and then direction **11724** in user interface **11700**, in response to detection of continuous movement of contact **11708** in direction **11718** and then direction **11720**, respectively, on touch-sensitive surface **451**. User interface object **11702-2** moves to a position over window **11704** and then to "empty space" in user interface **11700**; user interface object **11702-2** is dragged across user interface **11700** in accordance with the movement of contact **11708**, over empty space and window **11704** at different times. Thus, during the movement, user interface object **11702-2** moves over an invalid drop location for a period of time and over a valid drop location for another period of time.

As user interface object **11702-2** is moving, while user interface object **11702-2** is over window **11704**, as shown in FIG. **5**J, a tactile output associated with an invalid drop location is, optionally, generated on touch-sensitive surface **451**. The tactile output alerts the user that the current position of the user interface object **11702-2** is an invalid drop location.

As user interface object **11702-2** continues to move, while user interface object **11702-2** is over empty space in user interface **11700**, as shown in FIG. **5**K, a tactile output associated with a valid drop location is, optionally, generated on touch-sensitive surface **451**. The tactile output alerts the user that the current position of the user interface object **11702-2** is a valid drop location. The tactile output associated with a valid drop location is different from the tactile output associated with an invalid drop location. For example, the valid drop location tactile output has a higher amplitude and/or different movement profile from the invalid drop location tactile output. In some embodiments, the tactile output associated with a valid drop target/location is generated according to the same movement profile and amplitude as a tactile output associated with a successful drop. Similarly, the tactile output associated with an invalid drop target/location is generated according to the same movement profile and amplitude as a tactile output associated with an unsuccessful drop. For example, the touch-sensitive surface optionally provides a high frequency periodic tactile output (e.g., a slight buzzing) while user interface object **11702-2** is over an invalid drop target and either does not provide any tactile output or provides a low frequency periodic tactile output (e.g., a periodic ping) while user interface object **11702-2** is over a valid drop target.

When the intensity of contact **11708** is reduced below the object-release threshold while user interface object **11702-2** is over empty space in user interface **11700**, as shown in FIG. **5**L, user interface object **11702-2** is dropped successfully at its new position.

It should be appreciated that the criteria for a valid drop target/location and an invalid drop target/location described above (whether a location is already occupied by a user interface object **11702** or window **11704**) are merely exemplary, and other criteria are, optionally, employed in other embodiments, implementations, or for different categories of user interface objects or for different operations within an embodiment or implementation. For example, dropping an application shortcut or launch icon at a position over another application shortcut/launch icon or over an application window is invalid, while dropping a shape within a drawing program at a position over another shape is valid. As another example, dropping an application shortcut/launch icon at a position over another application shortcut/launch icon is valid if the operation includes swapping the locations of the application shortcuts/launch icons affected.

As described above, tactile outputs are, optionally, generated for a selection of a user interface object, a valid drop, an invalid drop, a valid drop location, and an invalid drop location. FIGS. **5**M-**5**O illustrate example waveforms of movement profiles for generating these tactile outputs. FIG. **5**M illustrates a sawtooth waveform. FIG. **5**N illustrates a square waveform, and FIG. **5**O illustrates a square waveform that has a lower amplitude than the square waveform of FIG. **5**N. The sawtooth movement profile in FIG. **5**M is, optionally, associated with selection of a user interface object; the tactile output generated for selection of a user interface object is, optionally, generated in accordance with the sawtooth movement profile. The high-amplitude square movement profile in FIG. **5**N is, optionally, associated with a successful drop (or a valid drop target/location); the tactile output generated for a successful drop or valid drop target/location is, optionally, generated in accordance with a high-amplitude square movement profile. The low-amplitude square movement profile in FIG. **5**O is, optionally, associated with an unsuccessful drop (or an invalid drop target/location); the tactile output generated for an unsuccessful drop or invalid drop target/location is, optionally, generated in accordance with a low-amplitude square movement profile.

FIGS. **5**P-**5**W illustrate an example of the user interfaces described above, with reference to FIGS. **5**A-**5**O, implemented on a device (e.g., device **100**) with a touch-sensitive display **112**. FIG. **5**P illustrates user interface **11736** (e.g., a home menu or screen interface, a desktop user interface, a drawing input area within a drawing or graphics application) displayed on touch-sensitive display **112** of a device. One or more user interface objects **11732** are, optionally displayed in user interface **11736**. In FIG. **5**P, user interface objects **11732-1** through **11732-3** are displayed in user interface **11736**. A user interface object **11732** is, for example, an application shortcut or launch icon, a shape or object within a drawing or graphics program, or other icon, widget, or object. One or more windows **11734** are, optionally, displayed in user interface **11736** as well. A window **11734** is, for example, an application window corresponding to a respective application. Contact **11738** is detected on touch-sensitive display at a location over user interface object **11732-2**.

The device includes one or more sensors that detect the intensity of contacts with touch-sensitive display **112**. In FIG. **5**P, the intensity of contact **11738** is detected to be below an object-selection threshold. The intensity of contact **11738** below the object-selection threshold is represented by the empty background in contact **11738** as shown in FIG. **5**P.

The intensity of contact **11738** is increased by, for example, the user applying more pressure on touch-sensitive display **112** with contact **11738**. The change in intensity of contact **11738** is detected by the contact intensity sensors in the device. In response to the detection of an increase in the intensity of contact **11738** above the object-selection threshold (with the intensity that is above the object-selection threshold represented by the densely dotted background in contact **11738** and the intensity meter shown in FIG. **5**Q), a user interface object over which contact **11738** is positioned is selected. In FIG. **5**Q, contact **11738** is positioned over user interface object **11732-2**, and thus user interface object **11732-2** is selected. User interface object **11736-2** is, optionally, visually highlighted (for example, with a different color; with thicker borders, as shown in FIG. **5**Q) to indicate the selection. In some embodiments, a tactile output indicative of the selection of user interface object **11732-2** is generated on touch-sensitive display **112**. The tactile output indicative of the selection is, optionally, generated in accordance with a movement profile associated with selection of a user interface object. In some embodiments, the selection tactile output corresponds to a tactile sensation that simulates a down-click of a mechanical button (for example, a click sensation of a pressing mouse button).

While the intensity of contact **11738** remains above an object-release threshold and user interface object **11732-2** remains selected, the user moves contact **11738** on touch-sensitive display **112**. In response to detection of the movement of contact **11738**, user interface object **11732-2** is moved across user interface **11736** in accordance with the movement of contact **11738**; user interface object **11732-2** is dragged across user interface **11736** in accordance with the movement of contact **11738**. For example, as shown in FIGS. **5**R-**5**S, in response to movement of contact **11738** in direction **11740** on touch-sensitive display **112**, user interface object **11732-2** moves in the same direction as contact **11738** to another position in user interface **11736**. The new position of user interface object **11732-2**, as shown in FIG. **5**S, is over "empty space" in user interface **11736**, away from window **11734** and other user interface objects **11732-1** and **11732-3**.

While user interface object **11732-2** is located at the new position in user interface **11736**, as shown in FIG. **5**S, the user reduces the intensity of contact **11738**, such as by reducing the pressure on touch-sensitive display **112** with contact **11738** (including, for example, lifting contact **11738** off of touch-sensitive display **112**). As shown in FIG. **5**T, the intensity of contact **11738** is reduced below the object-release threshold, with the intensity below the object-release threshold represented by the sparsely dotted background in contact **11738** and the intensity meter. In response to the reduction in intensity of contact **11738** below the object-release threshold, an attempt to relocate (or "drop") user interface object **11732-2** at the new position is made. The "empty space" in user interface **11736** is a valid drop location, as that empty space is not already occupied by a user interface object **11732** or a window **11734**, and thus the relocation of user interface object **11732-2** to the new position is successful. As a result, user interface object **11732-2** is dropped at the new position in user interface **11736** and de-selected (i.e., released from selection). A tactile output is generated on touch-sensitive display **112**, along with the dropping of user interface object **532-2**, in response to detection of the reduction in intensity of contact **11738** below the object-release threshold.

Returning to FIG. **5**Q, selected user interface object **11732-2** moves in response to detection of movement of contact **11738**, as described above. FIGS. **5**U-**5**V show user interface object **11732-2** moving in direction **11742** in user interface **11736** to a new position that is over window **11734**, in response to detection of movement of contact **11738** in direction **11742** on touch-sensitive display **112**; user interface object **11732-2** is dragged across user interface **11736** in accordance with the movement of contact **11738**.

While user interface object **11732-2** is located at the new position over window **11734**, as shown in FIG. **5**V, the user reduces the intensity of contact **11738**, such as by reducing the pressure on touch-sensitive display **112** with contact **11738** (including, for example, completely releasing contact **11738** from touch-sensitive display **112**). As shown in FIG. **5**W, the intensity of contact **11738** has been reduced below the object-release threshold. In response to the reduction in intensity of contact **11738** below the object-release threshold, an attempt to relocate user interface object **11732-2** at the new position is made. The position over window **11734** within user interface **11736** is an invalid drop location, as the position is already occupied by window **11734**, and thus the relocation of user interface object **11732-2** at the new position is unsuccessful. As a result, user interface object **11732-2** is returned to its original location and de-selected. A tactile output that is different from the tactile output generated for the successful drop of user interface object **11732-2**, described above with reference to FIG. **5**T, is generated on touch-sensitive display **112**, along with the return of user interface object **11732-2** to its original position, in response to detection of the reduction in intensity of contact **11738** below the object-release threshold.

FIGS. **6**A-**6**B are flow diagrams illustrating a method **11800** of selecting a tactile output corresponding to a change in intensity of a contact in accordance with some embodiments. The method **11800** is performed at an electronic device (e.g., device **300**, FIG. **3**, or portable multifunction device **100**, FIG. **1**A) with a display, a touch-sensitive surface, and one or more sensors to detect intensity of contacts with the touch-sensitive surface. In some embodiments, the display is a touch screen display and the touch-sensitive surface is on the display. In some embodiments, the display is separate from the touch-sensitive surface. Some

operations in method **11800** are, optionally, combined and/or the order of some operations is, optionally, changed.

As described below, the method **11800** provides an intuitive way to relocate a user interface object. The method reduces the cognitive burden on a user when relocating user interface objects, thereby creating a more efficient human-machine interface. For battery-operated electronic devices, enabling a user to relocate a user interface object faster and more efficiently conserves power and increases the time between battery charges.

The device displays (**11802**) a user interface object on the display. FIG. **5**A, for example, shows user interface objects **11702-1** through **11702-3** displayed on display **450**. As another example, FIG. **5**P shows user interface objects **11732-1** through **11732-3** displayed on touch-sensitive display **112**.

The device detects (**11804**), on the touch-sensitive surface, a contact (e.g., a finger contact or a stylus contact) having an intensity above an object-selection threshold (e.g., "IT_L"). The device can, using the one or more sensors, detect an intensity of a contact on the touch-sensitive surface (e.g., touchpad **355**). In FIG. **5**B, for example, contact **11708** which has an intensity greater than an object-selection threshold, is detected. Similarly, in FIG. **5**Q, contact **11738**, which has an intensity greater than an object-selection threshold, is detected.

In some embodiments, prior to detecting movement of the contact across the touch-sensitive surface (**11806**), in response to detecting an increase in intensity of the contact above the object-selection threshold, the device generates (**11808**) a selection tactile output on the touch-sensitive surface indicative of the selection. The contact that is detected as having an intensity above the object-selection threshold has the intensity above the object-selection threshold as a result of an increase in intensity of the contact from below the object-selection threshold to above the object-selection threshold. When the increase in intensity above the object-selection threshold is detected prior to movement of the contact across the touch-sensitive surface, a user interface object is selected and a selection tactile output is generated in response.

For example, in FIG. **5**A, contact **11708** on touch-sensitive surface **451** has an intensity below the object-selection threshold, and a focus selector (e.g., cursor **11706**) is positioned over user interface object **11702-2** in accordance with the position of contact **11708** on touch-sensitive surface **451**. When, prior to movement of contact **11708** across touch-sensitive surface **451**, the intensity of contact **11708** is detected to have increased above the object-selection threshold, as shown in FIG. **5**B, user interface object **11702-2** is selected and a tactile output associated with selection of a user interface object is generated on touch-sensitive surface **451**. The tactile output indicates to the user that user interface object **502-2** has been selected. Similarly, a tactile output is generated in response to detection of the increase in the intensity of contact **11738** above the object-selection threshold.

The device detects (**11810**) movement of the contact across the touch-sensitive surface, the movement corresponding to a preliminary portion of a gesture for performing an operation corresponding to the user interface object. For example, the movement is part of an operation to relocate an icon representing a file stored on the device, which will be completed if the icon is moved to a valid drop target and dropped onto the valid drop target (e.g., in response to detecting a liftoff of the contact or a reduction in intensity/pressure of the contact on the touch sensitive surface below an object-release threshold, such as "IT_1" or "IT_L"). For example, in FIGS. **5**C-**5**D, contact **11708** moves in direction **11710** on touch-sensitive surface **451**, and the movement is detected by the device. In FIGS. **5**F-**5**G, contact **11708** moves in direction **11714** on touch-sensitive surface **451**, and the movement is detected by the device. In FIGS. **5**I-**5**K, contact **11708** moves in direction **11718** and then **11720** on touch-sensitive surface **451**. In response to the detection of the respective movement of contact **11708**, user interface object **11702-2** is moved in user interface **11700** in accordance with the detected movement of contact **11708**. The movement is part of a gesture to relocate user interface object **11702-2** in user interface **11700**. As another example, in FIGS. **5**Q-**5**R, movement of contact **11738** in direction **11740** is detected, and in FIGS. **5**U-**5**V, movement of contact **11738** in direction **11742** is detected.

In some embodiments, for a first time period during the gesture, the user interface object is over an invalid drop target, and for a second time period during the gesture, the user interface object is over a valid drop target (**11812**). The device, during the first period of time, generates (**11814**) an invalid-drop-target tactile output on the touch-sensitive surface. The device, during the second period of time, generates (**11816**) a valid-drop-target tactile output on the touch-sensitive surface, where the invalid-drop-target tactile output is different from the valid-drop-target tactile output. In some situations, when a user interface object is moved, the user interface object is over a valid drop target or location for a time period and is over an invalid drop target or location for another time period (e.g., as illustrated in FIGS. **5**I-**5**K). During the time period when the user interface object is over a valid drop target or location, a tactile output is generated on touch-sensitive surface **451**. During the time period when the user interface object is over an invalid drop target or location, a different tactile output is generated on touch-sensitive surface **451**.

For example, in FIGS. **5**I-**5**K, user interface object **11702-2** is moved in accordance with the movement of contact **11708** on touch-sensitive surface **451**. In FIG. **5**J, user interface object **11702-2** moves over window **11704**, an invalid drop target. In FIG. **5**K, user interface object **11702-2** moves over empty space in user interface **11700**, a valid drop target. During the period when user interface object **11702-2** is moving over window **11704**, a tactile output is generated. During the period when user interface object **11702-2** is moving over empty space in user interface **11700**, a tactile output different from that generated for the period when user interface object **11702-2** is moving over window **11704** is generated. The tactile outputs is different with respect to amplitude and/or movement profile. For example, the touch-sensitive surface optionally provides a high frequency periodic tactile output (e.g., a slight buzzing) while user interface object **11702-2** is over an invalid drop target and either does not provide any tactile output or provides a low frequency periodic tactile output (e.g., a periodic ping) while user interface object **11702-2** is over a valid drop target.

The device detects (**11818**) a reduction in intensity of the contact below an object-release threshold. When user interface object **11702-2** is moved to the target location for the drop, the user reduces the intensity of contact **11708** below the object-release threshold (e.g., reducing intensity of the contact while maintaining the contact or lifting the contact off of the touch-sensitive surface) to make the drop attempt, as shown in FIG. **5**E, **5**H, or **5**L, for example. As another example, when user object **11732-2** is moved to the target location for the drop, the user reduces the intensity of

contact **11738** below the object-release threshold (e.g., reducing intensity of the contact while maintaining the contact or lifting the contact off of the touch-sensitive surface) to make the drop attempt, as shown in FIG. **5**T or **5**W.

In response to detecting the reduction in intensity below the object-release threshold (**11820**), in accordance with a determination that the movement meets predefined operation-performance criteria (**11822**), the device performs (**11824**) the operation and generates (**11826**) a first tactile output on the touch-sensitive surface. In accordance with a determination that the movement does not meet the predefined operation-performance criteria (**11828**), the device forgoes (**11830**) performance of the operation and generates (**11832**) a second tactile output on the touch-sensitive surface, where the second tactile output is different from the first tactile output. For example, in response to the reduction in intensity of contact **11708** or **11738** below the object-release threshold (e.g., a reduction in intensity of the contact while maintaining the contact or lifting the contact off of the touch-sensitive surface), an attempt to drop user interface object **11702-2** or **11732-2**, respectively is made. Whether the drop is performed (e.g., if the drop is successful or not) depends on whether one or more predefined operation-performance criteria are satisfied. In some embodiments, for a drop operation, a criterion for operation performance is whether the drop target/location is valid. If user interface object **11702-2** or **11732-2** is over a valid drop target (and thus a determination is made that the predefined operation-performance criteria for a drop are satisfied), such as empty space in user interface **11700** or **11736**, the drop is performed, as shown in FIG. **5**E, **5**L, or **5**T, respectively, and a tactile output associated with a successful drop is generated on touch-sensitive surface **451** or touch-sensitive display **112**. If user interface object **11702-2** or **11732-2** is over an invalid drop target (and thus a determination is made that the predefined operation-performance criteria for a drop are not satisfied), such as window **11704** or **11734**, the drop is not performed, as shown in FIG. **5**H or **5**W, respectively, and a tactile output associated with an unsuccessful drop is generated on touch-sensitive surface **451** or touch-sensitive display **112**.

In some embodiments, the operation is an object drop operation (e.g., a file move operation such as dragging an icon representing a file to a new location in a file manager user interface), the movement corresponds to movement of the user interface object to a respective location in the user interface, the movement meets the predefined operation-performance criteria when the respective location is a valid drop location, and the movement does not meet the predefined operation-performance criteria when the respective location is an invalid drop location (**11834**). As described above, the movement of contact **11708** is, optionally, part of a gesture for performing a drag and drop operation in user interface object **11702-2** that corresponds to movement of user interface object **11702-2** to a new location in user interface **11700**. When user interface object **11702-2** is moved to a valid drop target/location, the movement in the gesture is considered to satisfy the criteria for performing a drop operation, and the drop is performed, as shown in FIG. **5**E or **5**L, for example. On the other hand, when user interface object **11702-2** is moved to an invalid drop target/location, the movement in the gesture is considered to not satisfy the criteria for performing a drop operation, and the drop is not performed, as shown in FIG. **5**H, for example. Similarly, movement of contact **11738** is, optionally, part of a gesture for performing a drag and drop operation in user interface object **11732-2** that corresponds to movement of user interface object **11732-2** to a new location in user interface **11736**. When user interface object **11732-2** is moved to a valid drop target/location, the movement in the gesture is considered to satisfy the criteria for performing a drop operation; the drop is performed, as shown in FIG. **5**T, for example. On the other hand, when user interface object **11732-2** is moved to an invalid drop target/location, the movement in the gesture is considered to not satisfy the criteria for performing a drop operation; the drop is not performed, as shown in FIG. **5**W, for example.

In some embodiments, the first tactile output is generated by movement of the touch-sensitive surface that includes a first dominant movement component (e.g., movement corresponding to the initial impulse, ignoring any unintended resonance), the second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component, and the first dominant movement component and the second dominant movement component have a same movement profile (e.g., same waveform shape such as square, sine, squine, sawtooth or triangle; and/or approximately the same width/period) and different amplitudes (**11836**). The tactile output for a successful drop and the tactile output for an unsuccessful drop both have respective dominant movement components that have respective movement profiles (for example, the movement profiles depicted in FIGS. **5**N and **5**O, respectively). The two tactile outputs optionally have the same movement profile but different amplitudes, as shown in FIGS. **5**N and **5**O, for example. Thus, in some embodiments, the tactile outputs for a successful drop and an unsuccessful drop optionally differ in amplitude rather than in the movement profile; one sensation is a more intense version of the other sensation.

In some embodiments, the selection tactile output corresponds to a tactile sensation that simulates a down-click of a mechanical button, the first tactile output corresponds to a first tactile sensation that simulates an up-click of the mechanical button, and the second tactile output corresponds to a second tactile sensation that simulates an up-click of the mechanical button, where the second tactile sensation feels different (e.g., to a user of the device) from the first tactile sensation (**11838**). The selection tactile output corresponds to a simulation of, for example, a click-and-hold of a mouse button on mouse **350** or trackpad of device **300**. The first tactile output corresponds to a tactile sensation that simulates a release of the mouse button (or trackpad button). The second tactile output corresponds to a tactile sensation that simulates the release of the mouse button (or trackpad button) in a way that is different from the first tactile output. The first and second tactile sensations optionally simulate the mouse button release differently by using, for example, different amplitudes and/or different movement profiles.

It should be understood that the particular order in which the operations in FIGS. **6**A-**6**B have been described is merely exemplary and is not intended to indicate that the described order is the only order in which the operations could be performed. One of ordinary skill in the art would recognize various ways to reorder the operations described herein. Additionally, it should be noted that details of other processes described herein with respect to other methods described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments) are also applicable in an analogous manner to method **11800** described above with respect to FIGS. **6**A-**6**B. For example, the contacts, user interface objects, tactile outputs, intensity thresholds, and

focus selectors described above with reference to method **11800** optionally have one or more of the characteristics of the contacts, gestures, user interface objects, tactile outputs, intensity thresholds, and focus selectors described herein with reference to other methods described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments). For brevity, these details are not repeated here.

In accordance with some embodiments, FIG. **7** shows a functional block diagram of an electronic device **11900** configured in accordance with the principles of the various described embodiments. The functional blocks of the device are, optionally, implemented by hardware, software, or a combination of hardware and software to carry out the principles of the various described embodiments. It is understood by persons of skill in the art that the functional blocks described in FIG. **7** are, optionally, combined or separated into sub-blocks to implement the principles of the various described embodiments. Therefore, the description herein optionally supports any possible combination or separation or further definition of the functional blocks described herein. As shown in FIG. **7**, an electronic device **11900** includes a display unit **11902** configured to display a user interface object, a touch-sensitive surface unit **11904** configured to receive contacts, one or more sensor units **11905** configured to detect intensity of contacts with the touch-sensitive surface unit **11904**, and a processing unit **11906** coupled to the display unit **11902**, the touch-sensitive surface unit **11904**, and the sensor units **11905**. In some embodiments, the processing unit **11906** includes a detecting unit **11908**, a performing unit **11910**, and a generating unit **11912**.

The processing unit **11906** configured to: detect, on the touch-sensitive surface unit **11904**, a contact having an intensity above an object-selection threshold (e.g., with the detecting unit **11908**); detect movement of the contact across the touch-sensitive surface unit **11904**, the movement corresponding to a preliminary portion of a gesture for performing an operation corresponding to the user interface object (e.g., with the detecting unit **11908**); detect a reduction in intensity of the contact below an object-release threshold (e.g., with the detecting unit **11908**); and in response to detecting the reduction in intensity below the object-release threshold: in accordance with a determination that the movement meets predefined operation-performance criteria: perform the operation (e.g., with the performing unit **11910**); and generate a first tactile output on the touch-sensitive surface unit **11904** (e.g., with the generating unit **11912**); and in accordance with a determination that the movement does not meet the predefined operation-performance criteria: forgo performance of the operation (e.g., with the performing unit **11910**); and generate a second tactile output on the touch-sensitive surface unit **11904**, wherein the second tactile output is different from the first tactile output (e.g., with the generating unit **11912**).

In some embodiments, the operation is an object drop operation, the movement corresponds to movement of the user interface object to a respective location in the user interface, the movement meets the predefined operation-performance criteria when the respective location is a valid drop location, and the movement does not meet the predefined operation-performance criteria when the respective location is an invalid drop location.

In some embodiments, the processing unit **11906** is configured to, prior to detecting movement of the contact across the touch-sensitive surface unit **11904**: in response to detecting an increase in intensity of the contact above the object-selection threshold, generate a selection tactile output on the touch-sensitive surface unit **11904** indicative of the selection (e.g., with the generating unit **11912**).

In some embodiments, the selection tactile output corresponds to a tactile sensation that simulates a down-click of a mechanical button, the first tactile output corresponds to a first tactile sensation that simulates an up-click of the mechanical button, and the second tactile output corresponds to a second tactile sensation that simulates an up-click of the mechanical button, where the second tactile sensation feels different from the first tactile sensation.

In some embodiments, the first tactile output is generated by movement of the touch-sensitive surface unit **11904** that includes a first dominant movement component, the second tactile output is generated by movement of the touch-sensitive surface unit **11904** that includes a second dominant movement component, and the first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes.

In some embodiments, for a first time period during the gesture, the user interface object is over an invalid drop target, for a second time period during the gesture, the user interface object is over a valid drop target, and the processing unit **11906** is configured to: during the first period of time generate an invalid-drop-target tactile output on the touch-sensitive surface unit **11904** (e.g., with the generating unit **11912**), and during the second period of time generate a valid-drop-target tactile output on the touch-sensitive surface unit **11904**, where the invalid-drop-target tactile output is different from the valid-drop-target tactile output (e.g., with the generating unit **11912**).

The operations in the information processing methods described above are, optionally implemented by running one or more functional modules in information processing apparatus such as general purpose processors (e.g., as described above with respect to FIGS. **1**A and **3**) or application specific chips.

The operations described above with reference to FIGS. **6**A-**6**B are, optionally, implemented by components depicted in FIGS. **1**A-**1**B or FIG. **7**. For example, detection operations **11804**, **11810**, and **11818**, performing operation **11824**, forgoing operation **11830**, and generating operations **11826** and **11832** are, optionally, implemented by event sorter **170**, event recognizer **180**, and event handler **190**. Event monitor **171** in event sorter **170** detects a contact on touch-sensitive display **112**, and event dispatcher module **174** delivers the event information to application **136-1**. A respective event recognizer **180** of application **136-1** compares the event information to respective event definitions **186**, and determines whether a first contact at a first location on the touch-sensitive surface corresponds to a predefined event or sub-event, such as selection of an object on a user interface. When a respective predefined event or sub-event is detected, event recognizer **180** activates an event handler **190** associated with the detection of the event or sub-event. Event handler **190** optionally utilizes or calls data updater **176** or object updater **177** to update the application internal state **192**. In some embodiments, event handler **190** accesses a respective GUI updater **178** to update what is displayed by the application. Similarly, it would be clear to a person having ordinary skill in the art how other processes can be implemented based on the components depicted in FIGS. **1**A-**1**B, **3**.

Performing Operations Based on Modified Inputs

Many electronic devices include a mouse or similar input device that provides left-click functionality and right-click

functionality for activating different operations. As devices economize on the number of buttons and input devices, the left-click functionality and right-click functionality is, optionally, invoked using one input device, such as a track-pad. In existing methods, when either functionality is invoked using the one input device, the user is not given sufficient feedback indicating whether the activated operation was an operation not associated with a modifier input (e.g., a left-click operation) or an operation associated with a modifier input (e.g., a right-click operation). The embodiments below improve on the existing methods by providing different tactile output when device detects an input while a modifier input is detected than when the device detects a similar input while a modifier input is not detected. Thus, the device provides the user with tactile feedback indicating whether or not the modifier input was detected instead of or in addition to any visual or audible feedback indicating that the modifier input was detected. This additional (or alternative) feedback enables the user to operate the device more quickly and efficiently, thereby creating a more efficient human-machine interface.

FIGS. **8**A-**8**V illustrate exemplary user interfaces for providing feedback corresponding to modifier inputs in accordance with some embodiments. The user interfaces in these figures are used to illustrate the processes described below, including the processes in FIGS. **9**A-**9**B. FIGS. **8**A-**8**V include intensity diagrams that show the current intensity of the contact on the touch-sensitive surface relative to a plurality of intensity thresholds including a first activation threshold (e.g., "IT_L") and a second activation threshold (e.g., "IT_1" or "IT_L"). In some embodiments, operations similar to those described below with reference to "IT_L" are performed with reference to a different intensity threshold (e.g., "IT_D").

FIG. **8**A illustrates user interface **12000** (e.g., a desktop user interface) displayed on display **450** (e.g., display **340**) of a device (e.g., device **300**). One or more user interface objects **12002** are, optionally, displayed on user interface **12000**. In FIG. **8**A, user interface objects **12002-1** through **12002-3** are displayed on user interface **12000**. A user interface object **12002** is, optionally, for example, an application shortcut or launch icon.

Cursor **12004** is also displayed on user interface **12000**. In some embodiments, cursor **12004** is a mouse pointer. Cursor **12004** is an example of a focus selector. In FIG. **8**A, cursor **12004** is displayed over user interface object **12002-2**.

The device includes one or more sensors that detect the intensity of contacts with touch-sensitive surface **451** (e.g., touchpad **355**) of the device. In FIG. **8**A, the intensity of contact **12006** is detected to be below a first activation threshold (e.g., "IT_L").

The intensity of a contact (e.g., contact **12006**) on touch-sensitive surface **451** is, optionally, increased or decreased by, for example, the user increasing or decreasing, respectively, the pressure on touch-sensitive surface **451** with the contact. The change in intensity of the contact is, optionally, detected by the sensors in the device.

In FIG. **8**B, the device detects an increase in intensity of contact **12006** above the first activation threshold. In some situations, after detecting the increase in intensity of contact **12006**, a decrease in the intensity of contact **12006** (e.g., a liftoff of contact **12006** from touch-sensitive surface **451**) below a second activation threshold (e.g., "IT_1") is be detected by the intensity sensors in the device. In some embodiments, the first activation threshold and the second activation threshold are different and the second activation threshold is lower than the first activation threshold (e.g., the first activation threshold is "IT_L" and the second activation threshold is "IT_1" or, alternatively, "IT_0"). In some other embodiments, the first activation threshold and the second activation threshold are the same (e.g., the first activation threshold is "IT_L" and the second activation threshold is also "IT_L").

In response to the detection of the decrease in intensity of contact **12006** below the second activation threshold (e.g., "IT_1"), after detection of the increase in the intensity of contact **12006** above the first activation threshold (e.g., "IT_L"), one or more operations associated with user interface object **12002-2**, over which cursor **12004** is positioned, are, optionally, performed. In some embodiments, the operation(s) include displaying a new application window associated with user interface object **12002-2**. For example, if user interface object **12002-2** is an icon (e.g., an application launch or shortcut icon) corresponding to an application, window **12008** for the corresponding application is, optionally, displayed on user interface **12000**, as shown in FIG. **8**C.

In some embodiments, user interface object **12002-2** is visually highlighted in response to the detection of the increase then decrease in intensity, or in response to the detection of the increase in intensity. Examples of visual highlighting include a different color or thicker borders (as shown in FIG. **8**C).

Additionally, in response to detection of the decrease in the intensity of contact **12006** below the second activation threshold, after detection of the increase in the intensity of contact **12006** above the first activation threshold, a tactile output is generated on touch-sensitive surface **451**. The tactile output is, optionally, generated in accordance with a movement profile (e.g., movement profiles illustrated in FIGS. **8**P-**8**Q) and/or an amplitude.

Returning to FIG. **8**A, the intensity of contact **12006** is, optionally, increased above the first activation threshold concurrently with the detection of a modifier input. An example of a modifier input is a key press of a key (e.g., on a keyboard) assigned to be a modifier key. A key on keyboard **12011** (e.g., keyboard **350**) is, optionally, pre-assigned to be a modifier key (e.g., as a default) or assigned by a user. FIG. **8**D shows key press **12012** on key **12010** of keyboard **12011** concurrent with detection of an increase in the intensity of contact **12006** above the first activation threshold. After concurrent detection of the increase in the intensity of contact **12006** above the first activation threshold (e.g., "IT_L") and of key press **12012** on key **12010**, the intensity of contact **12006** is decreased below a second activation threshold (e.g., "IT_1"), as shown in FIG. **8**E (at which point continued pressing of key **12010** is optional). In response to detecting the decrease in the intensity of contact **12006** below the second activation threshold, after concurrent detection of the increase in the intensity of contact **12006** above the first activation threshold and key press **12012** of key **12010**, an operation different from that performed when no modifier input is detected is performed. For example, FIG. **8**E shows context menu **12014** displayed on user interface **12000** near cursor **12004** in response to the detection of the decrease in the intensity of contact **12006** below the second activation threshold, after concurrent detection of the increase in the intensity of contact **12006** above the first activation threshold and press **12012** of key **12010**. The operation of displaying context menu **12014** is different from the operation of displaying application window **12008** (FIG. **8**C) that was performed in response to detection of the decrease in the intensity of contact **12006** below the second activation threshold, after detection of the increase in the intensity of contact **12006** above the first

activation threshold without concurrent detection of a press of key **12010**. Context menu **12014** includes menu options associated with user interface object **12002-2**, over which cursor **12004** is positioned, such as "rename," "properties," and so on. The menu options include options for performing operations on or with respect to user interface object **12002-2**.

Another example of a modifier input is an additional contact that is detected on touch-sensitive surface **451** concurrently with contact **12006**. FIG. **8**F shows contact **12016** detected on touch-sensitive surface **451** concurrently with the detection of an increase in the intensity of contact **12006** above the first activation threshold (e.g., "IT_L") and a subsequent decrease in the intensity of contact **12006** below the second activation threshold (e.g., "IT_1"), as shown in FIG. **8**G. In response to detection of the decrease in the intensity of contact **12006** below the second activation threshold, after concurrent detection of the increase in the intensity of contact **12006** above the first activation threshold and contact **12016**, context menu **12014** is displayed on user interface **12000**, as shown in FIG. **8**G.

A further example of a modifier input is detection of the contact **12006** at a specific area on touch-sensitive surface **451**, as opposed to an arbitrary location on touch-sensitive surface **451** outside of the specific area on the touch-sensitive surface. FIG. **8**H shows contact **12006** detected in area **12018** on touch-sensitive surface **451**, at an intensity below the first activation threshold. An increase in the intensity of contact **12006** in area **12018** above the first activation threshold (e.g., "IT_L") is detected, as shown in FIG. **8**I. Then, a decrease in the intensity of contact **12006** in area **12018** below the second activation threshold (e.g., "IT_L") is detected, as shown in FIG. **8**J. In response to detection of the decrease in the intensity of contact **12006** in area **12018** below the second activation threshold, after detection of the increase in the intensity of contact **12006** in area **12018** above the first activation threshold, context menu **12014** is displayed on user interface **12000**, as shown in FIG. **8**J. Here, intensity of contact **12006** in a defined area (e.g., area **12018**) on touch-sensitive surface **451** modified the input of contact **12006**.

In some embodiments, the defined area (e.g., area **12018**) on touch-sensitive surface **451** for modifying the input is predefined, or it is, optionally, defined by the user (e.g., from a predefined set of choices). Further, it should be appreciated that the size and location of area **12018** as shown in FIGS. **8**H-**8**J are merely an illustrative example, and other sizes and/or locations for area **12018** are possible.

Additionally, in response to detection of the decrease in the intensity of contact **12006** below the second activation threshold (e.g., "IT_1"), after concurrent detection of the increase in the intensity of contact **12006** above the first activation threshold (e.g., "IT_L") and a modifier input (e.g., press **12012** of modifier key **12010**, contact **12016**, detecting contact **12006** in area **12018** on touch-sensitive surface **451**), a tactile output (e.g., a "modifier-active tactile output") is generated on touch-sensitive surface **451**. This tactile output (e.g., a "modifier-active tactile output") corresponds to a different tactile sensation from the tactile sensation corresponding to a tactile output (e.g., a "no-modifier tactile output") generated in response to detection of the decrease in intensity of contact **12006** below the second activation threshold without detection of a modifier input when the increase in intensity of contact **12006** above the first activation threshold is detected, as illustrated in FIGS. **8**A-**8**C.

Thus, when an increase in the intensity of contact **12006** above the first activation threshold and a subsequent decrease in the intensity of contact **12006** below the second activation threshold are detected, the operation that is performed depends on whether a modifier input is detected while the increase in intensity above the first activation threshold is detected. In some embodiments, the operation(s) performed in response to detection of the intensity decrease, after detection of the intensity increase without a modifier input, correspond to operations associated with a left-click of a mouse (or similar input device), and the operation(s) performed in response to detection of the intensity decrease, after detection of the intensity increase with a modifier input, correspond to operations associated with a right-click of a mouse (or similar input device). Left-click operations include, for example, activating an application launch or shortcut icon, displaying an application window corresponding to an application associated with an icon, selecting an icon or other user interface object, and so on. Right-click operations include, for example, displaying a context menu (e.g., context menu **12014** or **12024**).

In some other embodiments, the association is, optionally, reversed; the operation(s) performed in response to detection of the intensity decrease, after detection of the intensity increase without a modifier input, correspond to operations associated with a right-click of a mouse (or similar input device), and the operation(s) performed in response to detection of the intensity decrease, after detection of the intensity increase with a modifier input, correspond to operations associated with a left-click of a mouse (or similar input device).

Further, the tactile output that is generated in response to the detection of the decrease in the intensity of contact **12006**, after detection of the increase in the intensity of contact **12006**, depends on the detection of, or lack of, a modifier input along with the detection of the intensity increase. In some embodiments, the tactile output generated when a modifier input is detected (e.g., a "modifier-active tactile output") is different from the tactile output generated when no modifier input is detected (e.g., a "no-modifier tactile output") in amplitude, movement profile, or both.

In some embodiments, the operation that is performed, if any, in response to detection of the decrease in intensity of a contact after detection of the increase in intensity of the contact depends on the position of the focus selector (e.g., cursor **12004**) when the increase in intensity is detected, as well as whether a modifier input was detected. In the examples described above with reference to FIGS. **8**A-**8**J, cursor **12004** is positioned over user interface object **12002-2**. FIG. **8**K shows cursor **12004** positioned over "empty space" on user interface **12000**, away from user interface objects **12002**. Contact **12020** is detected on touch-sensitive surface **451** at an intensity less than the first activation threshold (e.g., "IT_L"). In FIG. **8**L, the device detects an increase in intensity of contact **12020** above the first activation threshold (e.g., "IT_L"). Then, the device detects a decrease in intensity of contact **12020** below the second activation threshold (e.g., "IT_1"), as shown in FIG. **8**M. In response to the decrease of the intensity below the second activation threshold, no operation is performed. In some embodiments, left-clicks that occur when the focus selector is over empty space are ignored, and thus contact **12020** that increases and decreases in intensity with no modifier input while cursor **12004** is over empty space does not cause the device to perform an operation.

On the other hand, FIG. **8**N shows a modifier input (e.g., contact **12022**) detected concurrently with detection of an increase of the intensity of contact **12020** above the first activation threshold. Subsequently, the device detects a

decrease in intensity of contact **12020** below the second activation threshold (e.g., "IT_1"), as shown in FIG. **8**O. In response to the decrease of the intensity below the second activation threshold, context menu **12024** is displayed on user interface **12000**. Context menu **12024** optionally includes different options than context menu **12014** (FIG. **8**E, **8**G, or **8**J), as the context is changed by the positioning of cursor **12004** over empty space on user interface **12000** instead of user interface object **12002-2**. In some embodiments, right-clicks that occur when the focus selector is over empty space activate displaying of a context menu, and thus contact **12020** that increases and decreases in intensity with a modifier input while cursor **12004** is over empty space cause the device to display a context menu (e.g., context menu **12024**).

As described above, different tactile outputs are, optionally, generated depending on whether a modifier input was detected. FIGS. **8**P-**8**Q illustrate example waveforms of movement profiles for generating these tactile outputs. FIG. **8**P illustrates dominant movement components of two different tactile outputs with two different movement profiles (e.g., a sawtooth waveform on the left and a square waveform on the right). In some embodiments, one of the movement profiles (e.g., the sawtooth waveform) corresponds to a tactile output (e.g., a "modifier-active tactile output") for an increase and subsequent decrease in intensity detected while a modifier input is detected; and the other movement profile (e.g., the square waveform) corresponds to a tactile output (e.g., a "no-modifier tactile output") for an increase and subsequent decrease in intensity detected without detecting a modifier input. FIG. **8**Q illustrates dominant movement components of two different tactile outputs with two different amplitudes (e.g., a high amplitude square waveform on the left and a low amplitude square waveform on the right). In some embodiments, one of the amplitudes (e.g., the high amplitude square waveform) corresponds to a tactile output (e.g., a "modifier-active tactile output") for an increase and subsequent decrease in intensity detected while a modifier input is detected; and the other amplitude (e.g., the low amplitude square waveform) corresponds to a tactile output (e.g., a "no-modifier tactile output") for an increase and subsequent decrease in intensity detected without detecting a modifier input. In some embodiments both the amplitude and the movement profile of the tactile output are selected in accordance with a determination as to on whether or not the modifier input was detected when the device detected the increase prior to detecting the subsequent decrease in intensity of the contact.

FIGS. **8**R-**8**V illustrate an example of the user interfaces described above, with reference to FIGS. **8**A-**8**Q, implemented on a device (e.g., device **100**) with a touch-sensitive display **112**. FIG. **8**R shows user interface **12054** and user interface objects **12052** displayed in user interface **12054**, on touch-sensitive display **112** of a device. User interface objects **12052** are similar to user interface objects **12002** described above; the details are not repeated here.

FIG. **8**R also shows contact **12056** detected on user interface object **12052-2**. Contact **12056** as shown in FIG. **8**R has an intensity that is below the first activation threshold (e.g., "IT_L"). An increase of the intensity of contact **12056** above the first activation threshold is detected, as shown in FIG. **8**S. After the detection of the increase, a decrease in the intensity of contact **12056** below the second activation threshold (e.g., "IT_1") is detected, as shown in FIG. **8**T.

In response to the detection of the decrease in intensity of contact **12056** below the second activation threshold, after detection of the increase in the intensity of contact **12056** above the first activation threshold, one or more operations associated with user interface object **12052-2**, over which contact **12056** is detected, are, optionally, performed. For example, if user interface object **12052-2** is an icon (e.g., an application launch or shortcut icon) corresponding to an application, window **12058** for the corresponding application is displayed in user interface **12054**, as shown in FIG. **8**T.

Additionally, in response to detection of the decrease in the intensity of contact **12056** below the second activation threshold, after detection of the increase in the intensity of contact **12056** above the first activation threshold, a tactile output (e.g., a "no-modifier tactile output") is generated on touch-sensitive display **112**. The tactile output is, optionally, generated in accordance with a movement profile (e.g., movement profiles illustrated in FIGS. **8**P-**8**Q).

Returning to FIG. **8**R, the intensity of contact **12056** is, optionally, increased above the first activation threshold concurrently with the detection of a modifier input. An example of a modifier input is an additional contact that is detected on touch-sensitive display **112** concurrently with contact **12056**. FIG. **8**U shows contact **12060** detected on touch-sensitive display **112** concurrently with the detection of an increase in the intensity of contact **12056** above the first activation threshold (e.g., "IT_L"). Then, a decrease in the intensity of contact **12056** below the second activation threshold (e.g., "IT_1") is detected, as shown in FIG. **8**V. In response to detection of the decrease in the intensity of contact **12056** below the second activation threshold, after concurrent detection of the increase in the intensity of contact **12056** above the first activation threshold and contact **12060**, context menu **12062**, which is similar to context menu **12014**) is displayed in user interface **12054**, as shown in FIG. **8**V. In some embodiments, additional contact **12060** is determined to be a modifier input when contact **12060** is detected in a predefined region (e.g., a region in the top right, top left, bottom right, or bottom left corner) of touch-sensitive display **112**.

Additionally, in response to detecting the decrease in the intensity of contact **12056** below the second activation threshold, after concurrent detection of the increase in the intensity of contact **12056** above the first activation threshold and a modifier input (e.g., contact **12060**), the device generates a tactile output (e.g., a "modifier-active tactile output") on touch-sensitive display **112**. In some embodiments, this tactile output (e.g., a "modifier-active tactile output") corresponds to a different tactile sensation from the tactile sensation corresponding to a tactile output (e.g., a "no-modifier tactile output") generated in response to detection of the decrease in intensity of contact **12056** below the second activation threshold without detection of a modifier input when the increase in intensity of contact **12056** above the first activation threshold is detected.

FIGS. **9**A-**9**B are flow diagrams illustrating a method **12100** of providing feedback corresponding to modifier inputs in accordance with some embodiments. The method **12100** is performed at an electronic device (e.g., device **300**, FIG. **3**, or portable multifunction device **100**, FIG. **1**A) with a display and a touch-sensitive surface. In some embodiments, the display is a touch screen display and the touch-sensitive surface is on the display. In some embodiments, the display is separate from the touch-sensitive surface. Some operations in method **12100** are, optionally, combined and/or the order of some operations is, optionally, changed.

As described below, the method **12100** provides an intuitive way to perform operations based on modified inputs. The method reduces the cognitive burden on a user when

providing feedback corresponding to modifier inputs, thereby creating a more efficient human-machine interface. For battery-operated electronic devices, enabling a user to perform operations based on modified inputs faster and more efficiently conserves power and increases the time between battery charges.

The device detects (**12102**) a contact (e.g., a finger contact) on the touch-sensitive surface. For example, contact **12006** (FIG. **8**A or **8**H) or **12020** (FIG. **8**K) is, optionally, detected on touch-sensitive surface **451**. As another example, contact **12056** is, optionally, detected on touch-sensitive display **112**.

The device detects (**12104**) an increase in intensity of the contact above a first activation threshold (e.g., "IT_L"). In some embodiments, the first activation threshold is an "increasing-intensity" activation threshold that indicates a threshold at which a tactile output is generated when the intensity of the contact is increasing. The intensity of contact **12006**, for example, is, optionally, increased from a level below the first activation threshold (e.g., FIGS. **8**A and **8**H) to a level above the first activation threshold (e.g., FIG. **8**B, **8**D, **8**F, or **8**I), and the increase is detected. Similarly, the intensity of contact **12020** is, optionally, increased from a level below the first activation threshold to a level above the first activation threshold (FIGS. **8**K-**8**L, **8**N). As another example, the intensity of contact **12056** is, optionally, increased from a level below the first activation threshold to a level above the first activation threshold (FIGS. **8**R-**8**S, **8**U).

After detecting the increase in intensity of the contact above the first activation threshold, the device detects (**12106**) a reduction in intensity of the contact below a second activation threshold (e.g., "IT_1"). In some embodiments, the second activation threshold is a "decreasing-intensity" activation threshold that indicates a threshold at which a tactile output is generated when the intensity of the contact is decreasing. The intensity of contact **12006**, for example, is, optionally, decreased to a level below the second activation threshold (e.g., FIG. **8**C, **8**E, **8**G, or **8**J), and the increase is detected. Similarly, the intensity of contact **12020** is, optionally, decreased to a level below the second activation threshold (FIGS. **8**M, and **8**O). As another example, the intensity of contact **12056** is, optionally, decreased to a level below the second activation threshold (FIGS. **8**T, and **8**V).

In some embodiments, the second activation threshold is (**12108**) different from the first activation threshold (e.g., the first activation threshold is "IT_L" and the second activation threshold is "IT_1"). In some embodiments, the second activation threshold is (**12110**) the same as the first activation threshold (e.g., the first activation threshold is "IT_L" and the second activation threshold is also "IT_L").

In response to detecting the reduction in intensity of the contact below the second activation threshold (**12112**), in accordance with a determination that a modifier input was detected while detecting the increase in intensity of the contact above the first activation threshold (**12114**), the device performs a first operation (**12116**) and generates (**12118**) a first tactile output on the touch-sensitive surface. For example, in FIG. **8**D, modifier key **12010** is pressed when the increase in intensity of contact **12006** is detected. When the decrease in the intensity of contact **12006** is detected (FIG. **8**E), context menu **12014** is displayed and a first tactile output (e.g., a "modifier-active tactile output") is generated in response. Similar results occur with other examples of modifier inputs (for example, contact **12016**, FIG. **8**G; contact **12006** in area **12018**, FIG. **8**J; contact **12022**, FIG. **8**O). As another example, in FIG. **8**U, additional contact **12060** is detected when the increase in intensity of contact **12056** is detected. When the decrease in the intensity of contact **12056** is detected (FIG. **8**V), context menu **12062** is displayed and a first tactile output (e.g., a "modifier-active tactile output") is generated in response. In some embodiments, the combination of the intensity increase-decrease and the modifier input is associated with a right-click of a mouse or similar input device; the combination activates operations associated with the right-click.

In some embodiments, the modifier input is (**12120**) an input selected from the set consisting of: a key press of a modifier key, an additional contact on the touch-sensitive surface, and detecting the contact on a predefined portion of the touch-sensitive surface designated to modify inputs (e.g., a predefined "right click" region on a touchpad or a predefined region of a touch-sensitive mouse that corresponds to a "right mouse button"). The modifier input is, optionally, for example, press **12012** of modifier key **12010** (FIG. **8**D), additional contact **12016** (FIG. **8**F) or **12022** (FIG. **8**N) or **12060** (FIG. **8**U), or intensity of contact **12006** in area **12018** on touch-sensitive surface **451**.

In response to detecting (**12112**) the reduction in intensity of the contact below the second activation threshold (e.g., "IT_1"), in accordance with a determination that the modifier input was not detected (**12122**) while detecting the increase in intensity of the contact above the first activation threshold (e.g., "IT_L"), the device performs (**12124**) second operation different from the first operation and generates (**12126**) a second tactile output (e.g., a "no-modifier tactile output") on the touch-sensitive surface, where the second tactile output is different from the first tactile output. For example, in FIG. **8**B, there is no modifier input when the increase in intensity of contact **12006** is detected, and thus when the decrease in the intensity of contact **12006** is detected (FIG. **8**C), window **12008** is displayed and a second tactile output (e.g., a "no-modifier tactile output") is generated in response. As another example, in FIG. **8**S, there is no modifier input when the increase in intensity of contact **12056** is detected, and thus when the decrease in the intensity of contact **12056** is detected (FIG. **8**T), window **12058** is displayed and a second tactile output (e.g., a "no-modifier tactile output") is generated in response. In some embodiments, the combination of the intensity increase-decrease and the lack of a modifier input is associated with a left-click of a mouse or similar input device; the combination activates operations associated with the left-click.

In some embodiments, the first operation corresponds (**12128**) to a right-click operation (e.g., an operation corresponding to clicking on the rightmost button of a two or three button mouse or trackpad, sometimes called a "right-click mouse operation"), and the second operation corresponds to a left-click operation (e.g., an operation corresponding to clicking on the leftmost button of a two or three button mouse or trackpad, sometimes called a "left-click mouse operation"). For example, the displaying of context menu **12014** or **12024** or **12062** is a right-click operation, and the displaying of window **12008** (FIG. **8**C) is a left-click operation.

In some embodiments, the contact is detected on the touch-sensitive surface while a focus selector is over an icon on the display, the first operation includes (**12130**) displaying a context menu that includes selectable options to perform operations associated with the icon, and the second operation includes displaying a new application window associated with the icon (e.g., launching an application or, if the application has already been launched, opening a new

window of the application that includes a document associated with the icon). For example, in FIGS. **8**A-**8**J, contact **12006** is detected on touch-sensitive surface **451** while cursor **12004** is displayed over user interface object **12002-2**. When there is no modifier input detected, window **12008** of an application associated with user interface object **12002-2** is displayed, as shown in FIG. **8**C. When a modifier input is detected, context menu **12014** is displayed, as shown in FIGS. **8**E, **8**G, and **8**J. Context menu **12014** includes selectable options to perform operations associated with user interface object **12002-2**. Analogously, in FIGS. **8**R-**8**V, contact **12056** is detected over user interface object **12052-2** on touch-sensitive display **112**. When there is no modifier input detected, window **12058** of an application associated with user interface object **12052-2** is displayed, as shown in FIG. **8**T. When a modifier input is detected, context menu **12062** is displayed, as shown in FIG. **8**V. Context menu **12062** includes selectable options to perform operations associated with user interface object **12052-2**.

In some embodiments, the first tactile output is (**12132**) generated by movement of the touch-sensitive surface that includes a first dominant movement component (e.g., movement corresponding to the initial impulse, ignoring any unintended resonance), the second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component, and the first dominant movement component and the second dominant movement component have a same movement profile (e.g., same waveform shape such as square, sine, squine, sawtooth, triangle, or approximately the same width/period) and different amplitudes, as shown in FIG. **8**Q. Thus, in some embodiments, the tactile outputs with and without the modifier input optionally differs in amplitude rather than in the movement profile, so that one tactile sensation is a stronger version of the other tactile sensation. In contrast, in some embodiments, the tactile output (e.g., a "modifier-active tactile output") generated when a modifier input was detected and the tactile output (e.g., a "no-modifier tactile output") generated when a modifier input was not detected both have respective dominant movement components that have different respective movement profiles (for example, the movement profiles depicted in FIG. **8**P) with either the same maximum amplitude or different maximum amplitudes.

It should be understood that the particular order in which the operations in FIGS. **9**A-**9**B have been described is merely exemplary and is not intended to indicate that the described order is the only order in which the operations could be performed. One of ordinary skill in the art would recognize various ways to reorder the operations described herein. Additionally, it should be noted that details of other processes described herein with respect to other methods described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments) are also applicable in an analogous manner to method **12100** described above with respect to FIGS. **9**A-**9**B. For example, the contacts, gestures, user interface objects, tactile outputs, intensity thresholds, and focus selectors described above with reference to method **12100** optionally has one or more of the characteristics of the contacts, gestures, user interface objects, tactile outputs, intensity thresholds, and focus selectors described herein with reference to other methods described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments). For brevity, these details are not repeated here.

In accordance with some embodiments, FIG. **10** shows a functional block diagram of an electronic device **12200** configured in accordance with the principles of the various described embodiments. The functional blocks of the device are, optionally, implemented by hardware, software, or a combination of hardware and software to carry out the principles of the various described embodiments. It is understood by persons of skill in the art that the functional blocks described in FIG. **10** are, optionally, combined or separated into sub-blocks to implement the principles of the various described embodiments. Therefore, the description herein optionally supports any possible combination or separation or further definition of the functional blocks described herein.

As shown in FIG. **10**, an electronic device **12200** includes a display unit **12202**, a touch-sensitive surface unit **12204** configured to receive contacts, one or more sensor units **12205** configured to detect intensity of contacts with the touch-sensitive surface unit **12204**, and a processing unit **12206** coupled to the display unit **12202**, the touch-sensitive surface unit **12204** and the sensor units **12205**. In some embodiments, the processing unit **12206** includes a detecting unit **12208**, a performing unit **12210**, and a generating unit **12212**.

The processing unit **12206** is configured to: detect a contact on the touch-sensitive surface unit **12204** (e.g., with the detecting unit **12208**); detect an increase in intensity of the contact above a first activation threshold (e.g., with the detecting unit **12208**); after detecting the increase in intensity of the contact above the first activation threshold, detect a reduction in intensity of the contact below a second activation threshold (e.g., with the detecting unit **12208**); and in response to detecting the reduction in intensity of the contact below the second activation threshold: in accordance with a determination that a modifier input was detected while detecting the increase in intensity of the contact above the first activation threshold: perform a first operation (e.g., with the performing unit **12210**) and generate a first tactile output on the touch-sensitive surface unit **12204** (e.g., with the generating unit **12212**); and in accordance with a determination that the modifier input was not detected while detecting the increase in intensity of the contact above the first activation threshold: perform a second operation different from the first operation (e.g., with the performing unit **12210**) and generate a second tactile output on the touch-sensitive surface unit **12204**, wherein the second tactile output is different from the first tactile output (e.g., with the generating unit **12212**).

In some embodiments, the modifier input is an input selected from the set consisting of: a key press of a modifier key, an additional contact on the touch-sensitive surface unit **12204**, and detection of the contact on a predefined portion of the touch-sensitive surface unit **12204** designated to modify inputs.

In some embodiments, the first operation corresponds to a right-click operation, and the second operation corresponds to a left-click operation.

In some embodiments, the contact is detected on the touch-sensitive surface unit **12204** while a focus selector is over an icon on the display unit **12202**, the first operation includes displaying a context menu that includes selectable options to perform operations associated with the icon, and the second operation includes displaying a new application window associated with the icon.

In some embodiments, the second activation threshold is different from the first activation threshold.

In some embodiments, the second activation threshold is the same as the first activation threshold.

In some embodiments, the first tactile output is generated by movement of the touch-sensitive surface unit **12204** that includes a first dominant movement component, the second tactile output is generated by movement of the touch-sensitive surface unit **12204** that includes a second dominant movement component, and the first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes.

The operations in the information processing methods described above are, optionally implemented by running one or more functional modules in information processing apparatus such as general purpose processors (e.g., as described above with respect to FIGS. **1**A and **3**) or application specific chips.

The operations described above with reference to FIGS. **9**A-**9**B are, optionally, implemented by components depicted in FIGS. **1**A-**1**B or FIG. **10**. For example, detection operations **12102**, **12104**, and **12106**, performing operations **12116** and **12124**, and generating operations **12118** and **12126** are, optionally, implemented by event sorter **170**, event recognizer **180**, and event handler **190**. Event monitor **171** in event sorter **170** detects a contact on touch-sensitive display **112**, and event dispatcher module **174** delivers the event information to application **136-1**. A respective event recognizer **180** of application **136-1** compares the event information to respective event definitions **186**, and determines whether a first contact at a first location on the touch-sensitive surface corresponds to a predefined event or sub-event, such as selection of an object on a user interface. When a respective predefined event or sub-event is detected, event recognizer **180** activates an event handler **190** associated with the detection of the event or sub-event. Event handler **190** optionally utilizes or calls data updater **176** or object updater **177** to update the application internal state **192**. In some embodiments, event handler **190** accesses a respective GUI updater **178** to update what is displayed by the application. Similarly, it would be clear to a person having ordinary skill in the art how other processes can be implemented based on the components depicted in FIGS. **1**A-**1**B.

Providing Feedback for Changing Activation States of a User Interface

Many electronic devices have graphical user interfaces that include user interface objects, such as virtual buttons and switches. In some circumstances, a user activates a user interface object to perform an operation or adjust a parameter or property. To make a virtual button or switch easier to use, the virtual object optionally mimics the behavior of the corresponding physical object. For example, haptic sensations are, in some circumstances, felt when a virtual switch is operated, with the haptic sensations mimicking the sensations of the corresponding physical switch, such as mimicking the clicks of a physical actuator mechanism (e.g., a mouse button) that activates the switch. But physical objects, such as real buttons and switches, will, in some circumstances provide excessive tactile feedback in some circumstances, and too little feedback in others. In such situations, a virtual object that just mimicked sensations of the corresponding physical object would also provide too much (or too little) feedback. But a virtual object does not have to be provided with haptic feedback that just mimics tactile sensations from the corresponding physical object. The embodiments described below provide tactile feedback that corresponds to changes in activation states of a virtual button, switch or other user interface object, rather than tactile feedback that corresponds 1:1 to tactile sensations that would be felt by a user when using a physical control to perform similar operations. When tactile sensations are provided for activation state changes of the virtual button or switch, the user can better discern the activation state of the virtual button without being distracted or confused by too much or too little tactile feedback. This improved haptic feedback for virtual objects enables the user to operate the device more quickly and efficiently, thereby creating a more efficient human-machine interface.

FIGS. **11**A-**11**N illustrate exemplary user interfaces for providing feedback for changing activation states of a user interface object in accordance with some embodiments. The user interfaces in these figures are used to illustrate the processes described below, including the processes in FIGS. **12**A-**12**B. FIGS. **11**A-**11**N include intensity diagrams that show the current intensity of the contact on the touch-sensitive surface relative to a plurality of intensity thresholds including a light press intensity threshold (e.g., "IT_L") and a deep press intensity threshold (e.g., "IT_D"). In some embodiments, operations similar to those described below with reference to "IT_L" and "IT_D" are performed with reference to different intensity thresholds.

FIG. **11**A illustrates an example of a user interface that includes one or more user interface objects. Image editor user interface **12300** is displayed on display **450** (e.g., display **340**) of a device (e.g., device **300**). Image **12302** is displayed in image editor user interface **12300** for editing in accordance with user commands. One or more user interface objects (for example, buttons, sliders, rocker switches) optionally include control user interface objects such as rocker switches **12304** and status user interface objects such as value indicators **12306** displayed in image editor user interface **12300**. The user interface objects in FIG. **11**A-**11**G are configured to enable a user to issue commands for editing image **12302** and the user interface objects in FIG. **11**H-**11**N are configured to enable a user to issue commands for editing image **12322**. For example, one or more rocker switches **12304**, for modifying respective parameters of image **12302**, are displayed in image editor user interface **12300**. Values representing respective parameters are, optionally, displayed in respective value indicators **12306**. Rocker switch **12304-1** enables a user to modify the brightness of image **12302**, for example, and the brightness value (for example, represented by integers, with 0 as the middle value between the upper and lower bounds) is displayed in value indicator **12306-1**. Clearly, a middle value of 0 is merely exemplary. For example, an upper bound of 100 and a lower bound of 0 would have a middle value of 50 (not shown), etc. Cursor **12308** is also displayed in user interface **12300**. In some embodiments, cursor **12308** is a mouse pointer. Cursor **12308** is an example of a focus selector.

A respective rocker switch **12304** optionally has a "minus" portion for reducing the value of a parameter associated with the rocker switch, indicated by the minus sign, and a "plus" portion for increasing the value of a parameter associated with the rocker switch, indicated by a plus sign. A rocker switch **12304** is, optionally, activated when a focus selector (e.g., cursor **12308**) is positioned over a portion of the rocker switch and an intensity of a contact associated with the focus selector changes. In some embodiments, the corresponding value decreases or increases depending on the portion over which the focus selector is positioned. When the focus selector is positioned over the "minus" portion, the corresponding value decreases when the rocker switch is activated. When the focus selector is positioned over the "plus" portion, the corresponding value

increases when the rocker switch is activated. In FIG. **11**A, cursor **12308** is positioned over the "minus" portion of rocker switch **12304-1**.

While rocker switch **12304-1** is not activated, rocker switch **12304-1** is displayed in a neutral position, as shown FIG. **11**A. When rocker switch **12304-1** is activated, rocker switch **12304-1** is displayed as if either the "minus" portion (if cursor **12308** is positioned over the "minus" portion when rocker switch **12304-1** is activated, thus rocker switch **12304-1** is activated to decrease the value) or the "plus" portion (if cursor **12308** is positioned over the "plus" portion when rocker switch **12304-1** is activated, thus rocker switch **12304-1** is activated to increase the value) is depressed, as shown in FIG. **11**B (for the "minus" portion being depressed) and FIG. **11**E (for the "plus" portion being depressed), respectively. In some embodiments, when rocker switch **12304-1** is activated, an animation showing a transition of rocker switch **12304-1** from the neutral position to either depressed position is displayed; and when rocker switch **12304-1** is deactivated, an animation showing a transition of rocker switch **12304-1** from either depressed position to the neutral position is displayed.

FIG. **11**A shows contact **12310** detected on touch-sensitive surface **451** (e.g., touchpad **355**) of the device at an intensity that is above a contact detection threshold (e.g., "IT_0") and below a light press intensity threshold (e.g., "IT_L") for activating rocker switch **12304-1**. While contact **12310** continues to be detected on touch-sensitive surface **451** and cursor **12308** is positioned over the "minus" portion of rocker switch **12304-1**, the intensity of contact **12310** is, in some circumstances, increased to a first intensity that is above the light press intensity threshold (e.g., "IT_L") for activating rocker switch **12304-1**, and the increase in intensity is detected, as shown in FIG. **11**B. In response to the detection of the increase in intensity, rocker switch **12304-1** is activated and the brightness value in value indicator **12306-1** decreases. The brightness of image **12302** changes in accordance with the change in the brightness value. In some embodiments, the brightness value decreases at a relatively slow rate (e.g., −1 in value per second). In some embodiments, rocker switch **12304-1** is animated to show the "minus" portion being depressed. In some embodiments, the brightness value continues to decrease as long as the intensity of contact **12310** does not decrease below the light press intensity threshold (e.g., "IT_L").

The intensity of contact **12310** is, in some circumstances, increased further. While contact **12310** continues to be detected on touch-sensitive surface **451** and cursor **12308** is still positioned over the "minus" portion of rocker switch **12304-1**, the device detects an increase in intensity of contact **12310** from the first intensity (e.g., an intensity between IT_L and IT_D) to a second, higher intensity that is above a deep press intensity threshold (e.g., "IT_D"). In response to this increase in intensity, rocker switch **12304-1** changes to a further activation state, as shown in FIG. **11**C where the portion of the rocker switch under focus selector **12308** is pushed "into" the display, and the brightness value of image **12302** decreases at a rate that is faster (e.g., −10 per second) than the rate of decrease at the first intensity, and the brightness of image **12302** changes in accordance with the change in the brightness value, as shown in FIG. **11**C.

The intensity of contact **12310** is, in some circumstances, then decreased below the light press intensity threshold (e.g., "IT_L") quickly (e.g., from the second intensity above IT_D to an intensity below IT_L in 0.05 seconds or less). In response to the detection of the decrease in intensity below the light press intensity threshold (e.g., "IT_L"), the brightness value stops changing, and the brightness of image **12302** stops changing, as shown in FIG. **11**D. Depending on the rate at which the intensity decreased from the second intensity to an intensity below the light press intensity threshold (e.g., "IT_L"), the brightness value optionally stops changing immediately in response to the detection of the intensity decrease, or the rate of change in the brightness value optionally first decreases to a slower rate (e.g., the rate at the first intensity) before the brightness values stops changing.

Rocker switch **12304-1** includes multiple activation states. In some embodiments, the activation states for rocker switch **12304-1** are different brightness levels as the brightness value changes. In some embodiments, when the brightness value is decreasing at the "slow" rate (e.g., −1 per second), each brightness value increment based on the rate of decrease (e.g., −1, −2, −3, so forth) is considered to be an activation state, and when the brightness value is decreasing at the "fast" rate (e.g., −10 per second), each brightness value increment based on the rate of decrease (e.g., each −10th increment) is considered to be an activation state. In some of these embodiments, at each activation state, a tactile output is, optionally, generated on touch-sensitive surface **451**. For example, when the value decreases from −1 to −2, then to −3 and then to −13, tactile outputs are, optionally, generated at −2, −3, and −13.

In some other embodiments, the activation states are the different rates at which the brightness value changes. For example, the "slow" rate is one activation state, the "fast" rate is another activation state, and cessation of activation of rocker switch **12304-1** (e.g., a rate of 0 per second) is another activation state of the rocker switch. A tactile output is, optionally, generated whenever the rate of decrease or increase for the brightness value changes or when rocker switch **12304-1** is activated or ceases to be activated. For example, when the brightness value is not changing, rocker switch **12304-1** is in a first ("neutral") activation state; when the brightness value is decreasing at the "slow" rate (e.g., −1 per second), rocker switch **12304-1** is in a second ("light press") activation state; and when the brightness value is decreasing at the "fast" rate (e.g., −10 per second), rocker switch **12304-1** is in a third ("deep press") activation state. At each activation state, a tactile output is, optionally, generated on touch-sensitive surface **451**. For example, when the activation state changes from the first ("neutral") activation state shown in FIG. **11**A to the second ("light press") activation state shown in FIG. **11**B, the device generates a tactile output corresponding to the change in activation state. As another example, when the activation state changes from the second ("light press") activation state shown in FIG. **11**B to the third ("deep press") activation state shown in FIG. **11**C, the device generates a tactile output corresponding to the change in activation state.

In some embodiments, the tactile output generated in response to a change in activation state optionally varies depending on whether the change in activation state was in response to an increase or a decrease in the intensity of contact **12310**. A tactile output generated for an activation state change in response to an increase in intensity is, optionally, different from a tactile output generated for an activation state change in response to a decrease in intensity. The tactile outputs are, optionally, different in movement profile, amplitude, or both. In some embodiments, a tactile output generated for an activation state change in response to an increase in intensity corresponds to a tactile sensation that simulates a down-click (e.g., press-and-hold) of a physical button (e.g., a mouse button), and a tactile output

generated for an activation state change in response to a decrease in intensity corresponds to a tactile sensation that simulates an up-click (e.g., release from a press-and-hold) of a physical button.

Returning to FIG. **11**D, cursor **12308** has been moved (e.g., from location **12308**-*a* to location **12308**-*b*) to the "plus" portion of rocker switch **12304-1** (e.g., in accordance with movement of contact **12310** across touch-sensitive surface **451** while contact **12310** has an intensity between IT_0 and IT_L from location **12310**-*a* to location **12310**-*b* in FIG. **11**D). The intensity of contact **12310** is increased to the second intensity quickly (e.g., the intensity of contact **12310**-*b* increases from an intensity below the IT_L in FIG. **11**D to the second intensity that is above IT_D in FIG. **11**E in 0.05 seconds or less), as shown in FIG. **11**E. In response to the increase in intensity, the brightness value increases at the "fast" rate (e.g., +10 per second). As shown in FIG. **11**D, rocker switch **12304-1** is in the neutral activation state and transitions directly to the deep press activation state in FIG. **11**E in response to a rapid increase in intensity of contact **12310** to an intensity above IT_D.

As shown in FIG. **11**F, the intensity of contact **12310** is subsequently decreased from the second intensity (e.g., an intensity above IT_D) to the first intensity (e.g., an intensity between IT_L and IT_D). In response to detecting the intensity decrease to the first intensity, the brightness value increases at the "slow" rate (e.g., +1 per second), as shown in FIG. **11**F and rocker switch **12304-1** is shown in the light press activation state.

As shown in FIG. **11**G, the intensity of contact **12310** is subsequently decreased further, from the first intensity (e.g., an intensity between IT_L and IT_D) to an intensity below the light press intensity threshold (e.g., "IT_L"). In response to the further decrease in intensity of contact **12310**, the brightness value stops increasing (e.g., the rate of change becomes 0 per second), as shown in FIG. **11**G and rocker switch **12304-1** is shown in the neutral activation state.

As described above, the activation states of rocker switch **12304-1** optionally correspond to the increments of change in the value, in accordance with the rate of change, or the different rates of change. A tactile output is, optionally, generated whenever one activation state changes to another (e.g., one increment to the next or one rate of change to the next).

FIGS. **11**H-**11**N illustrate an example of the user interfaces described above, with reference to FIGS. **11**A-**11**G, implemented on a device (e.g., device **100**) with a touch-sensitive display **112**. FIG. **11**H illustrates image editor user interface **12328** displayed on touch-sensitive display **112** of a device. Image **12322** is displayed in image editor user interface **12328** for editing in accordance with user commands. One or more user interface objects (for example, buttons, sliders, rocker switches) optionally include control user interface objects such as rocker switches **12324** and status user interface objects such as value indicators **12326** displayed in image editor user interface **12328**. The user interface objects in FIGS. **11**H-**11**N are configured to enable a user to issue commands for editing image **12322**. For example, one or more rocker switches **12324**, for modifying respective parameters of image **12322**, are displayed in image editor user interface **12328**. Values representing respective parameters are, optionally, displayed in respective value indicators **12326**. Rocker switch **12324-1** enables a user to modify the brightness of image **12322** in accordance with changes in intensity of contact **12330** while a focus selector is over rocker switch **12324-1**, for example, and the brightness value (for example, represented by integers, with 0 as the middle value between the upper and lower bounds) is displayed in value indicator **12326-1**. Contact **12330** is an example of a focus selector.

A respective rocker switch **12324** optionally has a "minus" portion for reducing the value of a parameter associated with the rocker switch, indicated by the minus sign, and a "plus" portion for increasing the value of a parameter associated with the rocker switch, indicated by a plus sign. A rocker switch **12324** is, optionally activated when a contact is positioned over a portion of the rocker switch and an intensity of a contact associated with the focus selector changes. In some embodiments, the corresponding value decreases or increases depending on the portion over which the contact is positioned. When the contact is positioned over the "minus" portion, the corresponding value decreases when the rocker switch is activated. When the contact is positioned over the "plus" portion, the corresponding value increases when the rocker switch is activated. In FIG. **11**H, contact **12330** is positioned over the "minus" portion of rocker switch **12324-1**.

While rocker switch **12324-1** is not activated, rocker switch **12324-1** is displayed in a neutral position, as shown FIG. **11**H. When rocker switch **12324-1** is activated, rocker switch **12324-1** is displayed as if either the "minus" portion (if contact **12330** is positioned over the "minus" portion when rocker switch **12324-1** is activated, thus rocker switch **12324-1** is activated to decrease the value) or the "plus" portion (if contact **12330** is positioned over the "plus" portion when rocker switch **12324-1** is activated, thus rocker switch **12324-1** is activated to increase the value) is depressed, as shown in FIG. **11**I (for the "minus" portion being depressed) and FIG. **11**L (for the "plus" portion being depressed), respectively. In some embodiments, when rocker switch **12324-1** is activated, an animation showing a transition of rocker switch **12324-1** from the neutral position to either depressed position is displayed; and when rocker switch **12324-1** is deactivated, an animation showing a transition of rocker switch **12324-1** from either depressed position to the neutral position is displayed.

FIG. **11**H shows contact **12330** detected on touch-sensitive display **112** at an intensity that is above a contact detection threshold (e.g., "IT_0") and below a light press intensity threshold (e.g., "IT_L") for activating rocker switch **12324-1**. While contact **12330** continues to be detected on touch-sensitive display **112** over the "minus" portion of rocker switch **12324-1**, the intensity of contact **12330** is, in some circumstances, increased to a first intensity that is above the light press intensity threshold (e.g., "IT_L") for activating rocker switch **12324-1**, and the increase in intensity is detected, as shown in FIG. **11**I. In response to the detection of the increase in intensity, rocker switch **12324-1** is activated and the brightness value in value indicator **12326-1** decreases. The brightness of image **12322** changes in accordance with the change in the brightness value. In some embodiments, the brightness value decreases at a relatively slow rate (e.g., −1 in value per second). In some embodiments, rocker switch **12324-1** is animated to show the "minus" portion being depressed. In some embodiments, the brightness value continues to decrease as long as the intensity of contact **12330** does not decrease below the light press intensity threshold (e.g., "IT_L").

The intensity of contact **12330** is, in some circumstances, increased further. While contact **12330** continues to be detected on touch-sensitive display **112** over the "minus" portion of rocker switch **12324-1**, the device detects an increase in intensity of contact **12330** from the first intensity (e.g., an intensity between IT_L and IT_D) to a second, higher

intensity that is above a deep press intensity threshold (e.g., "IT_D"). In response to this increase in intensity, rocker switch **12324-1** changes to a further activation state, as shown in FIG. **11**J where the portion of the rocker switch under contact **12330** is pushed "into" the display, and the brightness value of image **12322** decreases at a rate that is faster (e.g., −10 per second) than the rate of decrease at the first intensity, and the brightness of image **12322** changes in accordance with the change in the brightness value, as shown in FIG. **11**J.

The intensity of contact **12330** is, in some circumstances, then decreased below the light press intensity threshold (e.g., "IT_L") quickly (e.g., from the second intensity above IT_D to an intensity below IT_L in 0.05 seconds or less). In response to the detection of the decrease in intensity below the light press intensity threshold (e.g., "IT_L"), the brightness value stops changing, and the brightness of image **12322** stops changing, as shown in FIG. **11**K. Depending on the rate at which the intensity decreased from the second intensity to an intensity below the light press intensity threshold (e.g., "IT_L"), the brightness value optionally stops changing immediately in response to the detection of the intensity decrease, or the rate of change in the brightness value optionally first decreases to a slower rate (e.g., the rate at the first intensity) before the brightness values stops changing.

Rocker switch **12324-1** includes multiple activation states. In some embodiments, the activation states for rocker switch **12324-1** are different brightness levels as the brightness value changes. In some embodiments, when the brightness value is decreasing at the "slow" rate (e.g., −1 per second), each brightness value increment based on the rate of decrease (e.g., **−1**, **−2**, −3, so forth) is considered to be an activation state, and when the brightness value is decreasing at the "fast" rate (e.g., −10 per second), each brightness value increment based on the rate of decrease (e.g., each −10th increment) is considered to be an activation state. In some of these embodiments, at each activation state, a tactile output is, optionally, generated on touch-sensitive display **112**. For example, when the value decreases from −1 to −2, then to −3 and then to −13, tactile outputs are, optionally, generated at −2, −3, and −13.

In some other embodiments, the activation states are the different rates at which the brightness value changes. For example, the "slow" rate is one activation state, the "fast" rate is another activation state, and cessation of activation of rocker switch **12324-1** (e.g., a rate of 0 per second) is another activation state. A tactile output is, optionally, generated whenever the rate of decrease or increase for the brightness value changes or when rocker switch **12324-1** is activated or ceases to be activated. For example, when the brightness value is not changing, rocker switch **12324-1** is in a first ("neutral") activation state; when the brightness value is decreasing at the "slow" rate (e.g., −1 per second), rocker switch **12324-1** is in a second ("light press") activation state; and when the brightness value is decreasing at the "fast" rate (e.g., −10 per second), rocker switch **12324-1** is in a third ("deep press") activation state. At each activation state, a tactile output is, optionally, generated on touch-sensitive display **112**. For example, when the activation state changes from the first ("neutral") activation state shown in FIG. **11**H to the second ("light press") activation state shown in FIG. **11**I, the device generates a tactile output corresponding to the change in activation state. As another example, when the activation state changes from the second ("light press") activation state shown in FIG. **11**I to the third ("deep press") activation state shown in FIG. **11**J, the device generates a tactile output corresponding to the change in activation state.

In some embodiments, the tactile output generated in response to a change in activation state optionally varies depending on whether the change in activation state was in response to an increase or a decrease in the intensity of contact **12330**. A tactile output generated for an activation state change in response to an increase in intensity is, optionally, different from a tactile output generated for an activation state change in response to a decrease in intensity. The tactile outputs is, optionally, different in movement profile, amplitude, or both. In some embodiments, a tactile output generated for an activation state change in response to an increase in intensity corresponds to a tactile sensation that simulates a down-click (e.g., press-and-hold) of a physical button (e.g., a mouse button), and a tactile output generated for an activation state change in response to a decrease in intensity corresponds to a tactile sensation that simulates an up-click (e.g., release from a press-and-hold) of a physical button.

Returning to FIG. **11**K, contact **12330** has been moved (e.g., from location **12330**-*a* to location **12330**-*b* while contact **12330** has an intensity between IT_0 and IT_L) to the "plus" portion of rocker switch **12324-1**. The intensity of contact **12330** is increased to the second intensity quickly (e.g., the intensity of contact **12330** increases from an intensity below IT_L of contact **12330**-*b* in FIG. **11**K to the second intensity that is above IT_D in FIG. **11**L in 0.05 seconds or less), as shown in FIG. **11**L. In response to the increase in intensity, the brightness value increases at the "fast" rate (e.g., +10 per second). As shown in FIG. **11**K, rocker switch **12324-1** is in the neutral activation state and transitions directly to the deep press activation state in FIG. **11**L in response to a rapid increase in intensity of contact **12330** to an intensity above IT_D.

As shown in FIG. **11**M, the intensity of contact **12330** is subsequently decreased from the second intensity (e.g., an intensity above IT_D) to the first intensity (e.g., an intensity between IT_L and IT_D). In response to detecting the intensity decrease to the first intensity, the brightness value increases at the "slow" rate (e.g., +1 per second), as shown in FIG. **11**M and rocker switch **12324-1** is shown in the light press activation state.

As shown in FIG. **11**N, the intensity of contact **12330** is subsequently decreased further, from the first intensity (e.g., an intensity between IT_L and IT_D) to an intensity below the light press intensity threshold (e.g., "IT_L"). In response to the further decrease in intensity of contact **12330**, the brightness value stops increasing (e.g., the rate of change becomes 0 per second), as shown in FIG. **11**N, and rocker switch **12324-1** is shown in the neutral activation state.

As described above, the activation states of rocker switch **12324-1** optionally correspond to the increments of change in the value, in accordance with the rate of change, or the different rates of change. A tactile output is, optionally, generated whenever one activation state changes to another (e.g., one increment to the next or one rate of change to the next).

FIGS. **12**A-**12**B are flow diagrams illustrating a method **12400** of providing feedback for changing activation states of a user interface object in accordance with some embodiments. The method **12400** is performed at an electronic device (e.g., device **300**, FIG. **3**, or portable multifunction device **100**, FIG. **1**A) with a display and a touch-sensitive surface. In some embodiments, the display is a touch screen display and the touch-sensitive surface is on the display. In some embodiments, the display is separate from the touch-

sensitive surface. Some operations in method **12400** are, optionally, combined and/or the order of some operations is, optionally, changed.

As described below, the method **12400** provides a more efficient way to provide feedback when changing activation states of a user interface object. The method reduces the cognitive burden on a user when changing activation states of a user interface object, thereby creating a more efficient human-machine interface. For battery-operated electronic devices, enabling a user to change activation states of a user interface object faster and more efficiently conserves power and increases the time between battery charges.

The device displays (**12402**) a user interface object on the display, where the user interface object has a plurality of activation states. FIG. **11**A, for example, shows rocker switches **12304**, for adjusting parameters of an image, displayed in image editor user interface **12300** on a display **450** that is separate from a touch-sensitive surface **451** on which contacts are detected. As another example, FIG. **11**H shows rocker switches **12324**, for adjusting parameters of an image, displayed in image editor user interface **12328** on a touch-sensitive display **112** on which contacts are detected. A respective rocker switch **12304** or **12324** has multiple activation states, which are, optionally, the increments of change in the corresponding parameter value or the rates of change in the parameter value (e.g., a neutral activation state, a light press activation state and a deep press activation state).

The device detects (**12404**) a contact (e.g., a finger contact) on the touch-sensitive surface. As shown in FIG. **11**A, for example, contact **12310** is detected on touch-sensitive surface **451**. As another example, FIG. **11**H shows contact **12330** detected on touch-sensitive display **112**.

The device detects (**12406**) an increase of intensity of the contact on the touch-sensitive surface from a first intensity (e.g., an intensity between IT_L and IT_D) to a second intensity (e.g., an intensity above IT_D). FIGS. **11**A-**11**C shows an increase in the intensity of contact **12310** from an intensity below a light press intensity threshold (e.g., "IT_L") for activating rocker switch **12304-1**, to a first intensity that is higher than the light press intensity threshold (e.g., "IT_L"), and then to a second intensity that is higher than the first intensity. As another example, in FIGS. **11**D-**11**E, the device detects an increase in the intensity of contact **12310**, from an intensity below the light press intensity threshold (e.g., "IT_L"), quickly (e.g., intensity increases from the below-threshold intensity to the second intensity in 0.05 seconds or less) to a second intensity that is higher than the first intensity. In FIGS. **11**H-**11**J, the device detects an increase in the intensity of contact **12330** from an intensity below a light press intensity threshold (e.g., "IT_L") for activating rocker switch **12324-1**, to a first intensity that is higher than the light press intensity threshold (e.g., "IT_L"), and then to a second intensity that is higher than the first intensity. As another example, in FIGS. **11**K-**11**L, the device detects an increase in the intensity of contact **12330**, from an intensity below the light press intensity threshold (e.g., "IT_L"), quickly (e.g., intensity increases from the below-threshold intensity to the second intensity in 0.05 seconds or less) to a second intensity that is higher than the first intensity.

In response to detecting the increase in intensity (**12408**), the device changes (**12410**) activation states of the user interface object M times, where M is a positive integer, and generates (**12412**) a tactile output on the touch-sensitive surface corresponding to each change in activation state of the user interface object. For example, in FIG. **11**A-**11**C or **11**H-**11**J, in response to the detection of the increase in intensity from below the light press intensity threshold (e.g., "IT_L") to the first intensity (e.g., an intensity between IT_L and IT_D) and then to the second intensity (e.g., an intensity above IT_D), the rocker switch changes from a neutral activation state (corresponding to no change in brightness of the image) to a light press activation state (corresponding to a slow rate of change in brightness of the image) and then to a deep press activation state (corresponding to a fast rate of change in brightness of the image). Here, the activation state (in this case, the rate of change) changes two times, and two tactile outputs are generated.

As another example, in FIG. **11**D-**11**E or **11**K-**11**L, in response to the detection of the rapid increase in intensity from below the light press intensity threshold (e.g., "IT_L") to the second intensity (e.g., an intensity above IT_D), the rocker switch changes from the neutral activation state (corresponding to no change in brightness of the image) to the deep press activation state (corresponding to a fast rate of change in brightness of the image), skipping the light press activation state (corresponding to a slow rate of change in brightness of the image). Here, the activation state (in this case, the rate of change) changes once, and one tactile output is generated, even though the device has detected a change in intensity of the contact that has the same magnitude as the change in intensity of contact **12310** between FIGS. **11**A and **11**C.

In some embodiments, the user interface object has a first appearance in a first activation state; the user interface object has a second appearance, different from the first appearance, in a second activation state; and in response to detecting the increase in intensity, the device displays (**12414**) an animation of the user interface object transitioning from the first appearance to the second appearance. Rocker switch **12304-1** appears in a plurality of activation states in FIGS. **11**A-**11**G, for example, rocker switch **12304-1** appears in a neutral position when the rate of change is 0 (e.g., rocker switch **12304-1** is in a neutral activation state as shown in FIGS. **11**A, **11**D and **11**G) and appears with either the "minus" portion or the "plus" portion depressed when the rate is non-zero (e.g., rocker switch **12304-1** is in a light press activation state as shown in FIGS. **11**B and **11**F or in a deep press activation state as shown in FIGS. **11**C and **11**E). When rocker switch **12304-1** is activated or deactivated (e.g., the rate of change changes), an animation showing a transition from the neutral position to a depressed position, or vice versa, respectively, is, optionally, displayed. Rocker switch **12324-1** appears in a plurality of activation states in FIGS. **11**H-**11**N, for example, rocker switch **12324-1** appears in a neutral position when the rate of change is 0 (e.g., rocker switch **12324-1** is in a neutral activation state as shown in FIGS. **11**H, **11**K and **11**N) and appears with either the "minus" portion or the "plus" portion depressed when the rate is non-zero (e.g., rocker switch **12324-1** is in a light press activation state as shown in FIGS. **11**I and **11**M or in a deep press activation state as shown in FIGS. **11**J and **11**L). When rocker switch **12324-1** is activated or deactivated (e.g., the rate of change changes), an animation showing a transition from the neutral position to a depressed position, or vice versa, respectively, is, optionally, displayed.

The device detects (**12416**) a decrease of intensity of the contact from the second intensity to the first intensity. As shown in FIGS. **11**C-**11**D, for example, a quick decrease in the intensity of contact **12310** from the second intensity to below the light press intensity threshold (e.g., "IT_L") is detected. As another example, in FIGS. **11**E-**11**G, a decrease in the intensity of contact **12310** from the second intensity

to the first intensity and then to below the light press intensity threshold (e.g., "IT_L") is detected. As further examples, in FIGS. **11**J-**11**K, for example, a quick decrease in the intensity of contact **12330** from the second intensity to below the light press intensity threshold (e.g., "IT_L") is detected. In FIGS. **11**L-**11**N, a decrease in the intensity of contact **12330** from the second intensity to the first intensity and then to below the light press intensity threshold (e.g., "IT_L") is detected.

In response to the detection of the decrease in intensity (**12418**), the device changes (**12420**) activation states of the user interface object N times, where N is a positive integer, and generates (**12424**) a tactile output on the touch-sensitive surface corresponding to each change in activation state of the user interface object, where N is different from M. For example, in FIGS. **11**C-**11**D or FIGS. **11**J-**11**K, in response to the detection of the decrease in intensity, the rate of change in the brightness value changes from the "fast" rate (e.g., the deep press activation state of rocker switch **12324-1**) to 0 (e.g., the neutral activation state of rocker switch **12324-1**), and one tactile output is generated, whereas two tactile outputs were generated in response to detecting the increase in intensity in FIGS. **11**A-**11**C and **11**H-**11**J, respectively. As another example, in FIG. **11**E-**11**G or **11**L-**11**N, in response to the detection of the decrease in intensity, the rate of change in the brightness value changes from 0 (e.g., the neutral activation state of rocker switch **12324-1**) to the "slow" rate (e.g., the light press activation state of rocker switch **12324-1**) and then the "fast" rate (e.g., the deep press activation state of rocker switch **12324-1**), and two tactile outputs are generated, whereas just one tactile output was generated in response to detecting the increase in intensity in FIGS. **11**D-**11**E and **11**K-**11**L, respectively.

In some embodiments, a distinct tactile output is a tactile output that was generated to provide feedback corresponding to a user interface event (e.g., a change in the activation state of the user interface object, such as activation of a button or other control). In some embodiments, the touch-sensitive surface is moved by an actuator in accordance with a separate waveform for each user interface event. The waveforms for different user interface events optionally overlap, but a waveform that was generated to provide a tactile feedback for a particular user interface event (e.g., activation of a button or change in activation state of a control such as a rocker switch) will still generate a distinct tactile output. In some embodiments, an activation state of a user interface object corresponds to an operational state of an application on the electronic device, and changing activation states of the user interface object changes operational states of the application. If the user interface object is an adjustable control interface such as a multi-state button, rocker-switch or slider, the activation states of the button/switch/slider are typically displayed by changing the visual appearance of the adjustable control interface (e.g., as a change in shading of a button, a change in rotation of a rocker switch or a change in position of a slider). Additionally, when the activation state of the button/switch/slider is changed, operation of an application associated with the button/switch/slider is changed accordingly. For example, if a rocker switch controls the brightness of an image, the activation states of the rocker switch correspond to different brightness levels of the image, and when the rocker switch changes from a first activation state to a second activation state, the brightness of the image changes from a first brightness level corresponding to the first activation state of the rocker switch to a second brightness level corresponding to the second activation state of the rocker switch. In some embodiments, activation states correspond to image property levels (e.g., hue, saturation, exposure, brightness, contrast), content navigation states (e.g., channel selection, forward navigation, backward navigation, frame-by-frame navigation), system property adjustments (e.g., volume control, screen brightness, date/time settings), rates of change (e.g., the rate at which an adjustable parameter value increases or decreases, speed of forward or backward seeking through video or audio), or other adjustable properties.

In some embodiments, M is (**12424**) greater than N. In FIG. **11**A-**11**D or **11**H-**11**K, for example, the number of changes in activation state in response to the detection of the increase in intensity of the contact (e.g., a change from the neutral activation state to the light press activation state and a change from the light press activation state to the deep press activation state shown in FIGS. **11**A-**11**C and **11**H-**11**J) is greater than the number of changes in activation state in response to the detection of the decrease in intensity of the contact (e.g., a change from the deep press activation state to the neutral activation state shown in FIGS. **11**C-**11**D and FIGS. **11**J-**11**K).

In some embodiments, M is (**12426**) less than N. In FIG. **11**D-**11**G or **11**K-**11**N, for example, the number of changes in activation state in response to the detection of the increase in intensity of the contact (e.g., a change from the neutral activation state to the deep press activation state shown in FIGS. **11**D-**11**E and **11**K-**11**L) is less than the number of changes in activation state in response to the detection of the decrease in intensity of the contact (e.g., a change from the deep press activation state to the light press activation state and a change from the light press activation state to the neutral activation state shown in FIGS. **11**E-**11**G and **11**L-**11**N).

In some embodiments, M is (**12428**) equal to 1 and N is equal to 2. In FIG. **11**D-**11**G or **11**K-**11**N, for example, there is one change in activation state in response to the detection of the increase in intensity and two changes in activation state in response to the detection of the decrease in intensity.

In some embodiments, M is equal to 2 and N is (**12430**) equal to 1. In FIG. **11**A-**11**D or **11**H-**11**K, for example, there are two changes in activation state in response to the detection of the increase in intensity and one change in activation state in response to the detection of the decrease in intensity.

In some embodiments, at least one tactile output generated in response to detecting the increase in intensity corresponds (**12432**) to a tactile sensation that simulates a down-click of a physical actuator mechanism (e.g., a simulation of the physical "down-click sensation" generated by the mechanical button apparatus of a physical button when a user activates the physical button), and at least one tactile output generated in response to detecting the decrease in intensity corresponds to a tactile sensation that simulates an up-click of a physical actuator mechanism (e.g., a simulation of the physical "up-click sensation" generated by the mechanical button apparatus of a physical button when a user activates the physical button). For example, the tactile outputs generated for the activation state changes in response to the detection of the increase in intensity of contact **12310** or **12330** correspond to tactile sensations that simulate a down-click, and the tactile outputs generated for the activation state changes in response to the detection of the decrease in intensity of contact **12310** or **12330** correspond to tactile sensations that simulate an up-click.

While M and N have been discussed herein as positive integers, in some circumstances M is zero (e.g., no activation states of the user interface object are changed in

response to detecting the increase in intensity of the contact) and/or N is zero (e.g., no activation states of the user interface object are changed in response to detecting the decrease in intensity of the contact). Additionally, while M has been described as being different from N, in some circumstances M is equal to N (e.g., the number of activation states that are changed in response to detecting the increase in intensity of the contact is the same as the number of activation states that are changed in response to detecting the decrease in intensity of the contact).

It should be understood that the particular order in which the operations in FIGS. **12A-12B** have been described is merely exemplary and is not intended to indicate that the described order is the only order in which the operations could be performed. One of ordinary skill in the art would recognize various ways to reorder the operations described herein. Additionally, it should be noted that details of other processes described herein with respect to other methods described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments) are also applicable in an analogous manner to method **12400** described above with respect to FIGS. **12A-12B**. For example, the contacts, user interface objects, tactile outputs, intensity thresholds, focus selectors, and animations described above with reference to method **12400** optionally has one or more of the characteristics of the contacts, user interface objects, tactile outputs, intensity thresholds, focus selectors, and animations described herein with reference to other methods described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments). For brevity, these details are not repeated here.

In accordance with some embodiments, FIG. **13** shows a functional block diagram of an electronic device **12500** configured in accordance with the principles of the various described embodiments. The functional blocks of the device are, optionally, implemented by hardware, software, or a combination of hardware and software to carry out the principles of the various described embodiments. It is understood by persons of skill in the art that the functional blocks described in FIG. **13** are, optionally, combined or separated into sub-blocks to implement the principles of the various described embodiments. Therefore, the description herein optionally supports any possible combination or separation or further definition of the functional blocks described herein.

As shown in FIG. **13**, an electronic device **12500** includes a display unit **12502** configured to display a user interface object, where the user interface object has a plurality of activation states; a touch-sensitive surface unit **12504** configured to receive contacts; one or more sensor units **12505** configured to detect intensity of contacts with the touch-sensitive surface unit **12504**; and a processing unit **12506** coupled to the display unit **12502**, the touch-sensitive surface unit **12504**, and the sensor units **12505**. In some embodiments, the processing unit **12506** includes a detecting unit **12508**, a changing unit **12510**, a generating unit **12512**, and a display enabling unit **12514**.

The processing unit **12506** is configured to: detect a contact on the touch-sensitive surface unit **12504** (e.g., with the detecting unit **12508**); detect an increase of intensity of the contact on the touch-sensitive surface unit **12504** from a first intensity to a second intensity (e.g., with the detecting unit **12508**); in response to detecting the increase in intensity: change activation states of the user interface object M times, where M is a positive integer (e.g., with the changing unit **12510**), and generate a tactile output on the touch-sensitive surface unit **12504** corresponding to each change in activation state of the user interface object (e.g., with the generating unit **12512**); detect a decrease of intensity of the contact from the second intensity to the first intensity (e.g., with the detecting unit **12508**); and in response to detecting the decrease in intensity: change activation states of the user interface object N times, where N is a positive integer (e.g., with the changing unit **12510**), and generate a tactile output on the touch-sensitive surface unit **12504** corresponding to each change in activation state of the user interface object, where N is different from M (e.g., with the generating unit **12512**).

In some embodiments, the user interface object has a first appearance in a first activation state, the user interface object has a second appearance, different from the first appearance, in a second activation state, and the processing unit **12506** is configured to: in response to detecting the increase in intensity, enable display of an animation of the user interface object transitioning from the first appearance to the second appearance (e.g., with the display enabling unit **12514**).

In some embodiments, M is greater than N.

In some embodiments, M is less than N.

In some embodiments, M is equal to 1 and N is equal to 2.

In some embodiments, M is equal to 2 and N is equal to 1.

In some embodiments, at least one tactile output generated (e.g., with the generating unit **12512**) in response to detecting the increase in intensity corresponds to a tactile sensation that simulates a down-click of a physical actuator mechanism, and at least one tactile output generated (e.g., with the generating unit **12512**) in response to detecting the decrease in intensity corresponds to a tactile sensation that simulates an up-click of a physical actuator mechanism.

The operations in the information processing methods described above are, optionally implemented by running one or more functional modules in information processing apparatus such as general purpose processors (e.g., as described above with respect to FIGS. **1A** and **3**) or application specific chips.

The operations described above with reference to FIGS. **12A-12B** are, optionally, implemented by components depicted in FIGS. **1A-1B** or FIG. **13**. For example, detection operations **12404**, **12406**, **12416**, changing operations **12410**, **12420**, and generating operations **12412**, **12422** are, optionally, implemented by event sorter **170**, event recognizer **180**, and event handler **190**. Event monitor **171** in event sorter **170** detects a contact on touch-sensitive display **112**, and event dispatcher module **174** delivers the event information to application **136-1**. A respective event recognizer **180** of application **136-1** compares the event information to respective event definitions **186**, and determines whether a first contact at a first location on the touch-sensitive surface corresponds to a predefined event or sub-event, such as selection of an object on a user interface. When a respective predefined event or sub-event is detected, event recognizer **180** activates an event handler **190** associated with the detection of the event or sub-event. Event handler **190** optionally utilizes or calls data updater **176** or object updater **177** to update the application internal state **192**. In some embodiments, event handler **190** accesses a respective GUI updater **178** to update what is displayed by the application. Similarly, it would be clear to a person having ordinary skill in the art how other processes can be implemented based on the components depicted in FIGS. **1A-1B**.

Providing Feedback for Changing Activation States of a User Interface Object

Many electronic devices have graphical user interfaces that include user interface objects, such as buttons and switches. In some circumstances, a user activates a user interface object to perform an operation or adjust a parameter or property. In some devices, a tactile sensation is, in some circumstances, perceived by the user for corresponding physical inputs, such as clicks of a physical actuator mechanism (e.g., a mouse button) that activate a switch. To make a virtual button or switch easier to use, the virtual object optionally mimics the behavior of the corresponding physical object. For example, haptic sensations is, in some circumstances, felt when a virtual switch is operated, with the haptic sensations mimicking the sensations of the corresponding physical switch, such as mimicking the clicks of a physical actuator mechanism (e.g., a mouse button) that activates the switch. But physical objects, such as real buttons and switches, provide, in some circumstances, excessive tactile feedback in some situations, and too little feedback in others. In such situations, a virtual object that just mimicked sensations of the corresponding physical object would also provide too much (or too little) feedback. But a virtual object does not have to be provided with haptic feedback that just mimics tactile sensations from the corresponding physical object. The embodiments described below provide tactile feedback that is not tied to actuations of a physical actuator mechanism. For example, tactile sensations related to activation state changes are, optionally, provided. When tactile sensations not tied to physical actuations are provided for, the user can better discern the activation state of the virtual button without being distracted by too much or too little tactile feedback. If a user interface object goes through two or more activation state changes in rapid succession, haptic feedback does not need to be provided for each change in activation state, whereas the corresponding physical object would provide more tactile feedback. Also, the number of times that haptic feedback is provided as a contact increases in intensity does not have to be the same as the number of times that haptic feedback is provided as the contact decreases in intensity. This asymmetry in the number of times that haptic feedback is provided as a contact increases in intensity or decreases in intensity is, in some embodiments, dependent on how rapidly the contact intensity changes, and, in other embodiments, independent of how rapidly the contact intensity changes. This additional (or alternative) feedback enables the user to operate the device more quickly and efficiently, thereby creating a more efficient human-machine interface.

FIGS. **14**A-**14**N illustrate exemplary user interfaces for providing feedback for changing activation states of a user interface object in accordance with some embodiments. The user interfaces in these figures are used to illustrate the processes described below, including the processes in FIGS. **15**A-**15**C. FIGS. **14**A-**14**N include intensity diagrams that show the current intensity of the contact on the touch-sensitive surface relative to a plurality of intensity thresholds including a light press intensity threshold (e.g., "IT_L") and a deep press intensity threshold (e.g., "IT_D"). In some embodiments, operations similar to those described below with reference to "IT_L" and "IT_D" are performed with reference to different intensity thresholds.

FIG. **14**A illustrates an example of a user interface that includes one or more user interface objects. Image editor user interface **12600** is displayed on display **450** (e.g., display **340**) of a device (e.g., device **300**). Image **12602** is displayed in image editor user interface **12600** for editing in accordance with user commands. One or more user interface objects (for example, buttons, sliders, rocker switches) optionally include control user interface objects such as rocker switches **12604** and status user interface objects such as value indicators **12606** displayed in image editor user interface **12600**. The user interface objects in FIGS. **14**A-**14**G are configured to enable a user to issue commands for editing image **12602**. For example, one or more rocker switches **12604**, for modifying respective parameters of image **12602**, are displayed in image editor user interface **12600**. Values representing respective parameters are, optionally displayed in respective value indicators **12606**. Rocker switch **12604-1** is, optionally, used to modify the brightness of image **12602**, for example, and the brightness level (for example, represented by integers, with 0 as the middle value between the upper and lower bounds) is displayed in value indicator **12606-1**. Cursor **12608** is also displayed on user interface **12600**. In some embodiments, cursor **12608** is a mouse pointer. Cursor **12608** is an example of a focus selector.

A respective rocker switch **12604** optionally has a "minus" portion for reducing the value of a parameter associated with the rocker switch, indicated by the minus sign, and a "plus" portion for increasing the value of a parameter associated with the rocker switch, indicated by a plus sign. A rocker switch **12604** is, optionally, activated when a focus selector (e.g., cursor **12608**) is positioned over either portion of the rocker switch and an intensity of a contact associated with the focus selector changes. In some embodiments, the corresponding value decreases or increases depending on the portion over which the focus selector is positioned. When the focus selector is positioned over the "minus" portion, the corresponding value decreases when the rocker switch is activated. When the focus selector is positioned over the "plus" portion, the corresponding value increases when the rocker switch is activated. In FIG. **14**A, cursor **12608** is positioned over the "minus" portion of rocker switch **12604-1**.

When rocker switch **12604-1** is not activated, rocker switch **12604-1** is displayed in a neutral position, as shown FIG. **14**A. When rocker switch **12604-1** is activated, rocker switch **12604-1** is displayed as if either the "minus" portion (if cursor **12608** is positioned over the "minus" portion when rocker switch **12604-1** is activated, thus rocker switch **12604-1** is activated to decrease the value) or the "plus" portion (if cursor **12608** is positioned over the "plus" portion when rocker switch **12604-1** is activated, thus rocker switch **12604-1** is activated to increase the value) is depressed. For example, FIG. **14**B shows the "minus" portion of rocker switch **12604-1** being depressed. In some embodiments, when rocker switch **12604-1** is activated, an animation showing a transition of rocker switch **12604-1** from the neutral position to either depressed position is, optionally, displayed; and when rocker switch **12604-1** is deactivated, an animation showing a transition of rocker switch **12604-1** from either depressed position to the neutral position is, optionally, displayed.

FIG. **14**A shows contact **12610** detected on touch-sensitive surface **451** (e.g., touchpad **355**) of the device at an intensity that is above a contact detection threshold (e.g., "IT_0") and below a light press intensity threshold (e.g., "IT_L") for activating rocker switch **12604-1**. While contact **12610** continues to be detected on touch-sensitive surface **451** and cursor **12608** is positioned over the "minus" portion of rocker switch **12604-1**, the intensity of contact **12610** is, in some circumstances, increased to a light press intensity

that is above the light press intensity threshold (e.g., "IT_L") for activating rocker switch **12604-1**, and the increase in intensity is detected, as shown in FIG. **14**B. In response to the detection of the increase in intensity, rocker switch **12604-1** is activated and the brightness level in value indicator **12606-1** decreases. The brightness of image **12602** changes in accordance with the change in the brightness level. In some embodiments, the rate of change in the brightness level is a relatively slow rate (e.g., 1 brightness level per time step). In some embodiments, rocker switch **12604-1** is animated to show the "minus" portion being depressed. The brightness level continues to decrease as long as the intensity of contact **12610** does not decrease below the light press intensity threshold (e.g., "IT_L").

The intensity of contact **12610** is, in some circumstances, increased further. While contact **12610** continues to be detected on touch-sensitive surface **451** and cursor **12608** is still positioned over the "minus" portion of rocker switch **12604-1**, the device detects an increase in intensity of contact **12610** from the light press intensity (e.g., an intensity between IT_L and IT_D) to a second, higher intensity that is above a deep press intensity threshold (e.g., "IT_D"). In response to this increase in intensity, rocker switch **12604-1** changes to a further activation state, as shown in FIG. **14**C where the portion of the rocker switch under focus selector **12608** is pushed "into" the display, and brightness level decreases at a "medium" rate that is faster (e.g., 5 brightness levels per time step) than the rate of change at the light press intensity, and the brightness of image **12602** changes in accordance with the change in the brightness level, as shown in FIG. **14**C.

The intensity of contact **12610** is, in some circumstances, increased even further. While contact **12610** continues to be detected on touch-sensitive surface **451** and cursor **12608** is still positioned over the "minus" portion of rocker switch **12604-1**, the intensity of contact **12610** is increased from the first deep press intensity (e.g., an intensity above IT_D shown in FIG. **14**C) to a second deep press intensity (e.g., an intensity above IT_D shown in FIG. **14**D) that is higher than the first deep press intensity. In response to this increase in intensity, rocker switch **12604-1** changes to a further activation state, as shown in FIG. **14**D where the portion of the rocker switch under focus selector **12608** is pushed even further "into" the display than shown in FIG. **14**C, and brightness level decreases at a "fast" rate that is faster (e.g., 10 brightness levels per time step) than the rate of change at the first deep press intensity, and the brightness of image **12602** changes in accordance with the change in the brightness level, as shown in FIG. **14**D.

From the second deep press intensity, the intensity of contact **12610** is, in some circumstances, increased even further. Depending on the implementation, the rate at which the brightness level changes optionally does or does not change further in response to the detection of the increase in intensity, as the rate of change at the second deep press intensity is, optionally, a predefined lower-bound (or upper-bound, for a rate of change where the brightness level increases) rate of change.

The intensity of contact **12610** is, optionally, decreased from the second deep press intensity to the first deep press intensity (e.g., an intensity above IT_D but below the second deep press intensity). While contact **12610** continues to be detected on touch-sensitive surface **451** and cursor **12608** is still positioned over the "minus" portion of rocker switch **12604-1**, the device detects a decrease in intensity of contact **12610** from the second deep press intensity to the first deep press intensity, as shown in FIG. **14**E. In response to this decrease in intensity, rocker switch **12604-1** continues to be activated, and brightness level decreases at the rate that corresponds to the first deep press intensity (e.g., 5 brightness levels per time unit), and the brightness of image **12602** changes in accordance with the change in the brightness level, as shown in FIG. **14**E.

The intensity of contact **12610** is, optionally, further decreased from the first deep press intensity to the light press intensity (e.g., an intensity between IT_L and IT_D). While contact **12610** continues to be detected on touch-sensitive surface **451** and cursor **12608** is still positioned over the "minus" portion of rocker switch **12604-1**, the device detects a decrease in the intensity of contact **12610** from the first deep press intensity to the light press intensity, as shown in FIG. **14**F. In response to this decrease in intensity, rocker switch **12604-1** continues to be activated, and brightness level decreases at the rate corresponding to the light press intensity (e.g., 1 brightness level per time unit), and the brightness of image **12602** changes in accordance with the change in the brightness level, as shown in FIG. **14**F.

The intensity of contact **12610** is, optionally, further decreased from the light press intensity (e.g., an intensity between IT_L and IT_D) to an intensity below the light press intensity threshold (e.g., "IT_L"). While contact **12610** continues to be detected on touch-sensitive surface **451** and cursor **12608** is still positioned over the "minus" portion of rocker switch **12604-1**, the device detects a decrease in intensity of contact **12610** from the light press intensity to an intensity below the light press intensity threshold (e.g., "IT_L"), as shown in FIG. **14**G. In response to detecting this decrease in intensity, rocker switch **12604-1** is deactivated, and the brightness level stops decreasing, as shown in FIG. **14**G. The brightness of image **12602** stops changing in accordance with the brightness level ceasing to decrease.

A user interface object, such as rocker switch **12604-1**, optionally has multiple activation states. For example, the activation states for rocker switch **12604-1** are the different rates at which the brightness level changes. For example, when rocker switch **12604-1** is in a "neutral activation state," while the contact has an intensity below a light press intensity threshold (e.g., an intensity below IT_L), the brightness level is not changing, as shown in FIG. **14**A; when rocker switch **12604-1** is in a "light press activation state," while the contact has the light press intensity (e.g., an intensity between IT_L and IT_D), the brightness level is changing at a slow rate, as shown in FIG. **14**B; when rocker switch **12604-1** is in a "first deep press activation state," while the contact has the first deep press intensity (e.g., an intensity above IT_D), the brightness level is changing at a medium rate, as shown in FIG. **14**C; and when rocker switch **12604-1** is in a "second deep press activation state," while the contact has the second deep press intensity (e.g., an intensity above IT_D that is above the first deep press intensity), the brightness level is changing at a fast rate, as shown in FIG. **14**D. Alternatively, the activation states of a rocker switch correspond to values of a parameter (e.g., a first activation state corresponds to 0, a second activation state corresponds to 1, a third activation state corresponds to 2, and so on).

When the intensity of contact **12610** changes, rocker switch **12604-1** optionally changes from the activation state at the starting intensity (e.g., a neutral activation state, as shown in FIG. **14**A) to the activation state at the destination intensity (e.g., a second deep press activation state, as shown in FIG. **14**D). For example, when the intensity of contact **12610** changes from an intensity below the light press intensity threshold (e.g., "IT_L") to the second deep press

intensity (e.g., an intensity above IT_D that is above the first deep press intensity), the activation state of rocker switch **12604-1** changes from a rate of 0 brightness levels per time step to a rate of 10 brightness levels per time step. As another example, when the intensity of contact **12610** changes from the second deep press intensity to the first deep press intensity (e.g., as illustrated in FIGS. **14**D-**14**E), the activation state of rocker switch **12604-1** changes from a rate of 10 brightness levels per time step to 5 brightness levels per time step. Thus, the changes in the rate of change for the brightness level, described above with reference to FIGS. **14**A-**14**G, are changes in the activation state of rocker switch **12604-1**.

In some embodiments, from the activation state at the starting intensity, rocker switch **12604-1** optionally changes to zero or more intermediate activation states on the way to changing to the activation state at the destination intensity. For example, when the intensity of contact **12610** increases from below the light press intensity threshold (e.g., "IT_L") to the second deep press intensity, from the activation state at the intensity below the light press intensity threshold (e.g., "IT_L"), rocker switch **12604-1** changes to the activation state at the light press intensity (e.g., corresponding to the light press activation state) and then to the activation state at the first deep press intensity (e.g., corresponding to the first deep press activation state), on the way to changing to the activation state at the second deep press intensity (e.g., the second deep press activation state). The activation states at the first and second intensities (e.g., the light press activation state and the first deep press activation state) are the intermediate activation states between the activation state at the intensity below the light press intensity threshold (e.g., "IT_L") and the activation state at the second deep press intensity.

In some embodiments, the number of intermediate activation states between a starting activation state and a destination activation state for an increase in intensity is different than the number of intermediate activation states between a starting activation state and a destination activation state for a decrease in intensity. For example, referring back to FIGS. **14**A-**14**G described above, on the decrease in intensity of contact **12610** shown in FIGS. **14**D-**14**G, on the way to changing from the rate of change at the second deep press intensity to the rate at the neutral activation state, rocker switch **12604-1** optionally skips either or both of the rates at the light press intensity (e.g., corresponding to the light press activation state) and at the first deep press intensity (e.g., corresponding to the first deep press activation state), while those rates are not skipped on the increase in intensity shown in FIGS. **14**A-**14**D. In some other embodiments, the intermediate activation states are not skipped, but the transitions to these states is, in some circumstances, not be noticeable to the user because of the speed of the increase or decrease in intensity leads to transitions between activation states in such quick succession that the user will, in some circumstances, perceive the entire activation state sequence as merely a transition from the starting activation state to the destination activation state. In some embodiments, the device is pre-configured to skip intermediate activations states on the increase or decrease in intensity. In some other embodiments, intermediate activation states are skipped if the intensity increases or decreases at a rate that exceeds a threshold (e.g., a rate corresponding to transitioning between the intensity below IT_L and the intensity above IT_D in less than 0.5, 0.25, 0.1, 0.05 seconds or some other reasonable amount of time). In the latter case, the user has some control over whether intermediate activations states are skipped, as the user controls how fast the intensity increases or decreases.

In response to the increase in the intensity of contact **12610**, one or more distinct tactile outputs are, optionally, generated on touch-sensitive surface **451**. For example, as the intensity increases from below the light press intensity threshold (e.g., "IT_L") to the second deep press intensity, as described above with reference to FIGS. **14**A-**14**D, one or more distinct tactile outputs are, optionally, generated on touch-sensitive surface **451**. For convenience, the number of tactile outputs generated in response to the detection of the increase in intensity is referred to below as the variable "M."

In response to the decrease in the intensity of contact **12610**, one or more distinct tactile outputs are, optionally, generated on touch-sensitive surface **451**. For example, as the intensity decreases from the second deep press intensity to an intensity below the light press intensity threshold (e.g., "IT_L"), as described above with reference to FIGS. **14**D-**14**G, one or more distinct tactile outputs are, optionally, generated on touch-sensitive surface **451**. For convenience, the number of distinct tactile outputs generated in response to the detection of the decrease in intensity is referred to below as the variable "N." In some circumstances, M and N are the same and in some circumstances, M and N are different—for example, the number of tactile outputs generated in response to the detection of the decrease in intensity is, in some circumstances, the same as or different than the number of tactile outputs generated in response to the detection of the increase in intensity.

For example, the M tactile outputs are, optionally, tactile outputs generated at increments of the brightness level or increments of the change in brightness level as the brightness level changes in response to the detection of the increase in the intensity of contact **12610**. For example, a tactile output is, optionally, generated at each of the 10's in the brightness level or at each 10th level from the starting level. Similarly, the N tactile outputs are, optionally, tactile outputs generated at increments of the brightness level or increments of the change in brightness level as the brightness level changes in response to the detection of the decrease in intensity of contact **12610**. In this example, the tactile outputs are not necessarily generated in response to transitions in activation state.

In some embodiments, the M or N tactile outputs are generated for changes or transitions in activation state; the tactile outputs mark the changes or transitions in activation state. For example, a tactile output is, optionally, generated at each change in the rate of change in the brightness level as the intensity of contact **12610** increases (e.g., each of the M tactile outputs correspond to respective changes in activation state), and a tactile output is, optionally, generated at each change in the rate of change in the brightness level as the intensity of contact **12610** decreases (e.g., each of the N tactile outputs correspond to respective changes in activation state). In some embodiments, when a change or transition in activation state is skipped or not noticeable to the user (e.g., because the rate of increase or decrease in the intensity of contact **12610** occurs faster than a rate of change threshold), generation of one or more corresponding tactile sensations is, optionally forgone (e.g., the one or more corresponding tactile sensations associated with corresponding changes in activation state are not generated by the device even though the changes in activation state occur).

In some embodiments, a tactile output varies depending on whether the tactile output was generated in response to an increase or a decrease in the intensity of contact **12610**. A tactile output generated in response to detection of an

increase in the intensity of contact **12610** is, optionally, different from a tactile output generated in response to detection of a decrease in the intensity of contact **12610**. The tactile outputs are, optionally, different in movement profile, amplitude, or both. In some embodiments, a tactile output generated in response to detection of an increase in the intensity of contact **12610** corresponds to a tactile sensation that simulates a down-click (e.g., press-and-hold) of a physical button (e.g., a mouse button), and a tactile output generated in response to detection of a decrease in the intensity of contact **12610** corresponds to a tactile sensation that simulates an up-click (e.g., release from a press-and-hold) of the physical button.

FIG. **14**H-**14**N illustrate an example of the user interfaces described above, with reference to FIGS. **14**A-**14**G, implemented on a device (e.g., device **100**) with a touch-sensitive display **112**. FIG. **14**H illustrates image editor user interface **12628** displayed on touch-sensitive display **112** of a device. Image **12622** is displayed in image editor user interface **12628** for editing in accordance with user commands. One or more user interface objects (for example, buttons, sliders, rocker switches) optionally include control user interface objects such as rocker switches **12604** and status user interface objects such as value indicators **12606** displayed in image editor user interface **12628**. The user interface objects in FIG. **14**H-**14**N are configured to enable a user to issue commands for editing image **12622**. For example, one or more rocker switches **12624**, for modifying respective parameters of image **12622**, are displayed in image editor user interface **12628**. Values representing respective parameters are, optionally, displayed in respective value indicators **12626**. Rocker switch **12624-1** is, optionally, used to modify the brightness of image **12622**, for example, and the brightness value (for example, represented by integers, with 0 as the middle value between the upper and lower bounds) is displayed in value indicator **12626-1**.

A respective rocker switch **12624** optionally has a "minus" portion, for reducing the value of a parameter associated with the rocker switch indicated by the minus sign, and a "plus" portion for increasing the value of a parameter associated with the rocker switch, indicated by a plus sign. A rocker switch **12624** is, optionally, activated when a contact is positioned over either portion of the rocker switch and an intensity of a contact associated with the focus selector changes. In some embodiments, the corresponding value decreases or increases depending on the portion over which the contact is positioned. When the contact is positioned over the "minus" portion, the corresponding value decreases when the rocker switch is activated. When the contact is positioned over the "plus" portion, the corresponding value increases when the rocker switch is activated. In FIG. **14**H, contact **12630** is positioned over the "minus" portion of rocker switch **12624-1**.

When rocker switch **12624-1** is not activated, rocker switch **12624-1** is displayed in a neutral position, as shown FIG. **14**H. When rocker switch **12624-1** is activated, rocker switch **12624-1** is displayed as if either the "minus" portion (if contact **12630** is positioned over the "minus" portion when rocker switch **12624-1** is activated, thus rocker switch **12624-1** is activated to decrease the value) or the "plus" portion (if contact **12630** is positioned over the "plus" portion when rocker switch **12624-1** is activated, thus rocker switch **12624-1** is activated to increase the value) is depressed. For example, FIG. **14**I shows the "minus" portion of rocker switch **12624-1** being depressed. In some embodiments, when rocker switch **12624-1** is activated, an animation showing a transition of rocker switch **12624-1** from the neutral position to either depressed position is, optionally, displayed; and when rocker switch **12624-1** is deactivated, an animation showing a transition of rocker switch **12624-1** from either depressed position to the neutral position is, optionally, displayed.

FIG. **14**H shows contact **12630** detected on touch-sensitive display **112** at an intensity that is above a contact detection threshold (e.g., "IT_0") and below a light press intensity threshold (e.g., "IT_L") for activating rocker switch **12624-1**. While contact **12630** continues to be detected on touch-sensitive display **112** over the "minus" portion of rocker switch **12624-1**, the intensity of contact **12630** is, in some circumstances, increased to a light press intensity that is above the light press intensity threshold (e.g., "IT_L") for activating rocker switch **12624-1**, and the increase in intensity is detected, as shown in FIG. **14**I. In response to the detection of the increase in intensity, rocker switch **12624-1** is activated and the brightness level in value indicator **12626-1** decreases. The brightness of image **12622** changes in accordance with the change in the brightness level. In some embodiments, the rate of change in the brightness level is a relatively slow rate (e.g., 1 brightness level per time step). In some embodiments, rocker switch **12624-1** is animated to show the "minus" portion being depressed. The brightness level continues to decrease as long as the intensity of contact **12630** does not decrease below the light press intensity threshold (e.g., "IT_L").

The intensity of contact **12630** is, in some circumstances, increased further. While contact **12630** continues to be detected on touch-sensitive display **112** over the "minus" portion of rocker switch **12624-1**, the device detects an increase in intensity of contact **12630** from the light press intensity (e.g., an intensity between IT_L and IT_D) to a second, higher intensity that is above a deep press intensity threshold (e.g., "IT_D"). In response to this increase in intensity, rocker switch **12624-1** changes to a further activation state, as shown in FIG. **14**J where the portion of the rocker switch under the focus selector (e.g., contact **12630**) is pushed "into" the display, and brightness level decreases at a "medium" rate that is faster (e.g., 5 brightness levels per time step) than the rate of change at the light press intensity, and the brightness of image **12622** changes in accordance with the change in the brightness level, as shown in FIG. **14**J.

The intensity of contact **12630** is, in some circumstances, increased even further. While contact **12630** continues to be detected on touch-sensitive display **112** over the "minus" portion of rocker switch **12624-1**, the intensity of contact **12630** is increased from the first deep press intensity (e.g., an intensity above IT_D) shown in FIG. **14**J) to a second deep press intensity (e.g., an intensity above IT_D) shown in FIG. **14**K) that is higher than the first deep press intensity. In response to this increase in intensity, rocker switch **12624-1** changes to a further activation state, as shown in FIG. **14**K where the portion of the rocker switch under contact **12630** is pushed even further "into" the display than shown in FIG. **14**J, and brightness level decreases at a "fast" rate that is faster (e.g., 10 brightness levels per time step) than the rate of change at the first deep press intensity, and the brightness of image **12622** changes in accordance with the change in the brightness level, as shown in FIG. **14**K.

From the second deep press intensity, the intensity of contact **12630** is, in some circumstances, increased even further. Depending on the implementation, the rate at which the brightness level changes optionally do or do not change further in response to the detection of the increase in intensity, as the rate of change at the second deep press

intensity is, optionally, a predefined lower-bound (or upper-bound, for a rate of change where the value increases) rate of change.

The intensity of contact **12630** is, optionally, decreased from the second deep press intensity to the first deep press intensity (e.g., an intensity above IT_D) but below the second deep press intensity). While contact **12630** continues to be detected on touch-sensitive display **112** over the "minus" portion of rocker switch **12624-1**, the device detects a decrease in intensity of contact **12630** from the second deep press intensity to the first deep press intensity, as shown in FIG. **14**L. In response to this decrease in intensity, rocker switch **12624-1** continues to be activated, and brightness level decreases at the rate that corresponds to the first deep press intensity (e.g., 5 brightness levels per time unit), and the brightness of image **12622** changes in accordance with the change in the brightness level, as shown in FIG. **14**L.

The intensity of contact **12630** is, optionally, further decreased from the first deep press intensity to the light press intensity (e.g., an intensity between IT_L and IT_D). While contact **12630** continues to be detected on touch-sensitive display **112** over the "minus" portion of rocker switch **12624-1**, the device detects a decrease in the intensity of contact **12630** from the first deep press intensity to the light press intensity, as shown in FIG. **14**M. In response to this decrease in intensity, rocker switch **12624-1** continues to be activated, and brightness level decreases at the rate corresponding to at the light press intensity (e.g., 1 brightness level per time unit), and the brightness of image **12622** changes in accordance with the change in the brightness level, as shown in FIG. **14**M.

The intensity of contact **12630** is, optionally, further decreased from the light press intensity (e.g., an intensity between IT_L and IT_D) to an intensity below the light press intensity threshold (e.g., "IT_L"). While contact **12630** continues to be detected on touch-sensitive display **112** over the "minus" portion of rocker switch **12624-1**, the device detects a decrease in intensity of contact **12630** from the light press intensity to an intensity below the light press intensity threshold (e.g., "IT_L"), as shown in FIG. **14**N. In response to detecting this decrease in intensity, rocker switch **12624-1** is deactivated, and the brightness level stops decreasing, as shown in FIG. **14**N. The brightness of image **12622** stops changing in accordance with the brightness level ceasing to decrease.

A user interface object, such as rocker switch **12624-1**, optionally has multiple activation states. For example, the activation states for rocker switch **12624-1** are the different rates at which the brightness level changes. For example, when rocker switch **12624-1** is in a "neutral activation state," while the contact has an intensity below a light press intensity threshold (e.g., an intensity below IT_L), the brightness level is not changing, as shown in FIG. **14**H; when rocker switch **12624-1** is in a "light press activation state," while the contact has the light press intensity (e.g., an intensity between IT_L and IT_D), the brightness level is changing at a slow rate, as shown in FIG. **14**I; when rocker switch **12624-1** is in a "first deep press activation state," while the contact has the first deep press intensity (e.g., an intensity above IT_D), the brightness level is changing at a medium rate, as shown in FIG. **14**J; and when rocker switch **12624-1** is in a "second deep press activation state," while the contact has the second deep press intensity (e.g., an intensity above IT_D that is above the first deep press intensity), the brightness level is changing at a fast rate, as shown in FIG. **14**K. Alternatively, the activation states of a rocker switch correspond to values of a parameter (e.g., a first activation state corresponds to 0, a second activation state corresponds to 1, a third activation state corresponds to 2, and so on).

When the intensity of contact **12630** changes, rocker switch **12624-1** optionally changes from the activation state at the starting intensity (e.g., a neutral activation state, as shown in FIG. **14**H) to the activation state at the destination intensity (e.g., a second deep press activation state, as shown in FIG. **14**K). For example, when the intensity of contact **12630** changes from an intensity below the light press intensity threshold (e.g., "IT_L") to the second deep press intensity (e.g., an intensity above IT_D that is above the first deep press intensity), the activation state of rocker switch **12624-1** changes from a rate of 0 brightness levels per time step to a rate of 10 brightness levels per time step. As another example, when the intensity of contact **12630** changes from the second deep press intensity to the first deep press intensity (e.g., as illustrated in FIGS. **14**K-**14**L), the activation state of rocker switch **12624-1** changes from a rate of 10 brightness levels per time step to a rate of 5 brightness levels per time step. Thus, the changes in the rate of change for the brightness level, described above with reference to FIGS. **14**H-**14**N, are changes in the activation state of rocker switch **12624-1**.

In some embodiments, from the activation state at the starting intensity, rocker switch **12624-1** optionally changes to zero or more intermediate activation states on the way to changing to the activation state at the destination intensity. For example, when the intensity of contact **12630** increases from below the light press intensity threshold (e.g., "IT_L") to the second deep press intensity, from the activation state at the intensity below the light press intensity threshold (e.g., "IT_L"), rocker switch **12624-1** changes to the activation state at the light press intensity (e.g., corresponding to the light press activation state) and then to the activation state at the first deep press intensity (e.g., corresponding to the first deep press activation state), on the way to changing to the activation state at the second deep press intensity (e.g., the second deep press activation state). The activation states at the first and second intensities (e.g., the light press activation state and the first deep press activation state) are the intermediate activation states between the activation state at the intensity below the light press intensity threshold (e.g., "IT_L") and the activation state at the second deep press intensity.

In some embodiments, the number of intermediate activation states between a starting activation state and a destination activation state for an increase in intensity is different than the number of intermediate activation states between a starting activation state and a destination activation state for a decrease in intensity. For example, referring back to FIGS. **14**H-**14**N described above, on the decrease in intensity of contact **12630** shown in FIGS. **14**K-**14**N, on the way to changing from the rate of change at the second deep press intensity to the rate at the neutral activation state, rocker switch **12624-1** optionally skips either or both of the rates at the light press intensity (e.g., corresponding to the light press activation state) and at the first deep press intensity (e.g., corresponding to the first deep press activation state), while those rates are not skipped on the increase in intensity shown in FIGS. **14**H-**14**K. In some other embodiments, the intermediate activation states are not skipped, but the transitions to these states are, in some circumstances, not be noticeable to the user because of the speed of the increase or decrease in intensity leads to transitions between activation states in such quick succession that the user perceives, in some circumstances, the

entire activation state sequence as merely a transition from the starting activation state to the destination activation state. In some embodiments, the device is pre-configured to skip intermediate activations states on the increase or decrease in intensity. In some other embodiments, intermediate activation states are skipped if the intensity increases or decreases at a rate that exceeds a threshold (e.g., the intensity changes from below the light press intensity threshold to the second deep press intensity in less than a predefined amount of time such as 0.05 seconds). In the latter case, the user has some control over whether intermediate activations states are skipped, as the user controls how fast the intensity increases or decreases.

In response to the increase in the intensity of contact **12630**, one or more distinct tactile outputs are, optionally, generated on touch-sensitive display **112**. For example, as the intensity increases from below the light press intensity threshold (e.g., "IT_L") to the second deep press intensity, as described above with reference to FIGS. **14**H-**14**K, one or more distinct tactile outputs are, optionally, generated on touch-sensitive display **112**. For convenience, the number of tactile outputs generated in response to the detection of the increase in intensity is referred to below as the variable "M."

In response to the decrease in the intensity of contact **12630**, one or more distinct tactile outputs are, optionally, generated on touch-sensitive display **112**. For example, as the intensity decreases from the second deep press intensity to an intensity below the light press intensity threshold (e.g., "IT_L"), as described above with reference to FIGS. **14**K-**14**N, one or more distinct tactile outputs are, optionally, generated on touch-sensitive display **112**. For convenience, the number of distinct tactile outputs generated in response to the detection of the decrease in intensity is referred to below as the variable "N." In some circumstances, M and N are the same and in some circumstances, M and N are different—for example, the number of tactile outputs generated in response to the detection of the decrease in intensity is, optionally, the same as or different than the number of tactile outputs generated in response to the detection of the increase in intensity.

For example, the M tactile outputs are, optionally, tactile outputs generated at increments of the brightness level or increments of the change in brightness level as the brightness level changes in response to the detection of the increase in the intensity of contact **12630**. For example, a tactile output is, optionally, generated at each of the 10's in the brightness level or at each 10th level from the starting level. Similarly, the N tactile outputs are, optionally, tactile outputs generated at increments of the brightness level or increments of the change in brightness level as the brightness level changes in response to the detection of the decrease in intensity of contact **12630**. In this example, the tactile outputs are not necessarily generated in response to transitions in activation state.

In some embodiments, the M or N tactile outputs are generated for changes or transitions in activation state; the tactile outputs mark the changes or transitions in activation state. For example, a tactile output is, optionally, generated at each change in the rate of change in the brightness level as the intensity of contact **12630** increases (e.g., each of the M tactile outputs correspond to respective changes in activation state), and a tactile output is, optionally, generated at each change in the rate of change in the brightness level as the intensity of contact **12630** decreases (e.g., each of the N tactile outputs correspond to respective changes in activation state). In some embodiments, when a change or transition in activation state is skipped or not noticeable to the user (e.g., because the rate of increase or decrease in the intensity of contact **12630** occurs faster than a rate of change threshold), generation of one or more corresponding tactile sensations is, optionally, forgone (e.g., the one or more corresponding tactile sensations associated with corresponding changes in activation state are not generated by the device even though the changes in activation state occur).

In some embodiments, a tactile output varies depending on whether the tactile output was generated in response to an increase or a decrease in the intensity of contact **12630**. A tactile output generated in response to detection of an increase in the intensity of contact **12630** is, optionally, different from a tactile output generated in response to detection of a decrease in the intensity of contact **12630**. The tactile outputs are, optionally, different in movement profile, amplitude, or both. In some embodiments, a tactile output generated in response to detection of an increase in the intensity of contact **12630** corresponds to a tactile sensation that simulates a down-click (e.g., press-and-hold) of a physical button (e.g., a mouse button), and a tactile output generated in response to detection of a decrease in the intensity of contact **12630** corresponds to a tactile sensation that simulates an up-click (e.g., release from a press-and-hold) of the physical button.

FIGS. **15**A-**15**C are flow diagrams illustrating a method **12700** of providing feedback for changing activation states of a user interface object in accordance with some embodiments. The method **12700** is performed at an electronic device (e.g., device **300**, FIG. **3**, or portable multifunction device **100**, FIG. **1**A) with a display and a touch-sensitive surface. In some embodiments, the display is a touch screen display and the touch-sensitive surface is on the display. In some embodiments, the display is separate from the touch-sensitive surface. Some operations in method **12700** are, optionally, combined and/or the order of some operations is, optionally, changed.

As described below, the method **12700** provides an intuitive way to provide feedback for change activation states of a user interface object. The method reduces the cognitive burden on a user when changing activation states of a user interface object, thereby creating a more efficient human-machine interface. For battery-operated electronic devices, enabling a user to change activation states of a user interface object faster and more efficiently conserves power and increases the time between battery charges.

The device displays (**12702**) a user interface object on the display, where the user interface object has a first activation state and a second activation state. FIG. **14**A, for example, shows rocker switches **12604**, for adjusting parameters of an image, displayed in image editor user interface **12600**. A respective rocker switch **12604** has at least two activation states (e.g., a neutral activation state, a light press activation state, a first deep press activation state and/or a second deep press activation state), which optionally include various rates of change in the parameter value. As another example, FIG. **14**H shows rocker switches **12624** displayed in image editor user interface **12628**. A respective rocker switch **12624** has at least two activation states, which optionally include various rates of change in the parameter value. A respective rocker switch **12624** has at least two activation states (e.g., a neutral activation state, a light press activation state, a first deep press activation state and/or a second deep press activation state).

The device detects (**12704**) a contact (e.g., a finger contact) on the touch-sensitive surface. As shown in FIG. **14**A, for example, contact **12610** is detected on touch-

sensitive surface **451**. Also, as shown in FIG. **14**H, contact **12630** is detected on touch-sensitive display **112**.

The device detects (**12706**) an increase of intensity of the contact on the touch-sensitive surface from a first intensity to a second intensity. FIGS. **14**A-**14**D show an increase in the intensity of contact **12610** from an intensity below a light press intensity threshold (e.g., "IT_L") for activating rocker switch **12604-1**, to an intensity above a deep press intensity threshold (e.g., "IT_D") and higher than additional intensities (e.g., a light press intensity that is between IT_L and IT_D) that are also above the threshold. FIGS. **14**H-**14**K shows an increase in the intensity of contact **12630** from an intensity below a light press intensity threshold (e.g., "IT_L") for activating rocker switch **12624-1**, to an intensity above a deep press intensity threshold (e.g., "IT_D") and higher than additional intensities that are also above the threshold (e.g., a light press intensity that is between IT_L and IT_D).

In response to detecting the increase in intensity (**12708**), the device changes (**12710**) activation states of the user interface from the first activation state to the second activation state, and generates (**12712**) M distinct tactile outputs on the touch-sensitive surface, where M is a positive integer. For example, in FIG. **14**A-**14**D or **14**H-**14**K, in response to the detection of the increase in intensity from below the light press intensity threshold (e.g., "IT_L") to an intensity above a deep press intensity threshold (e.g., "IT_D"), the rate of change in brightness level changes from zero, to a "fast" rate (e.g., 10 brightness levels per time step). The activation state for rocker switch **12604-1** or **12624-1** changes from the activation state corresponding to the zero rate (e.g., the neutral activation state), through zero or more intermediate activation states (e.g., the light press activation state and/or the first deep press activation state), to the activation state corresponding to the "fast" rate (e.g., the second deep press activation state). In response to the detection of the increase in intensity, M tactile outputs are, optionally, generated. The M tactile outputs are, optionally, generated at predefined increments of the brightness level (e.g., whenever the ones digit in the brightness level is 0) or at predefined increments of the change in the brightness level (e.g., every 10th increment from the starting brightness level), as the brightness of the image (e.g., **12602** or **12622**) changes in accordance with the rate of change of brightness level corresponding to the current activation state of rocker switch **12604-1** or **12624-1**.

In some embodiments, the M distinct tactile outputs correspond to changes in activation state of the user interface object (**12714**). The M tactile sensations are, optionally, generated whenever the activation state of rocker switch **12604-1** or **12624-1** (e.g., the rate of change for the brightness level) changes.

In some embodiments, while detecting the increase in intensity of the contact, the device determines (**12716**) a rate at which the intensity of the contact is increasing. In accordance with a determination that the rate at which the intensity of the contact is increasing remains below a predefined threshold (e.g., a rate corresponding to transitioning between the first intensity and the second intensity in less than 0.5, 0.25, 0.1, 0.05 seconds or some other reasonable amount of time), the device generates (**12718**) a distinct tactile output for each transition between activation states that occurs in response to detecting the increase in intensity of the contact. In accordance with a determination that the rate at which the intensity of the contact is increasing exceeds the predefined threshold (e.g., a rate corresponding to transitioning between the first intensity and the second intensity in less than 0.5, 0.25, 0.1, 0.05 seconds or some other reasonable amount of time), the device forgoes (**12720**) generation of at least one distinct tactile output for a respective transition between activation states that occurs in response to detecting the increase in intensity of the contact. For example, as the intensity of contact **12610** increases from below the light press intensity threshold (e.g., "IT_L") to an intensity above a deep press intensity threshold (e.g., "IT_D"), as depicted in FIGS. **14**A-**14**D, a speed of the intensity increase is, optionally, determined. As another example, as the intensity of contact **12630** increases from below the light press intensity threshold (e.g., "IT_L") to an intensity above a deep press intensity threshold (e.g., "IT_D"), as depicted in FIGS. **14**H-**14**K, a speed of the intensity increase is, optionally, determined. If the speed of the intensity increase is below the predefined threshold, a tactile output is generated for each transition between activation states along the way. If the speed of the intensity increase is above the predefined threshold, generation of one or more of the tactile outputs is, optionally, forgone, for example the tactile outputs corresponding to transitions between intermediate activation states (e.g., a transitions between the light press activation state and the first deep press activation state).

The device detects (**12722**) a decrease of intensity of the contact from the second intensity to the first intensity. As shown in FIGS. **14**D-**14**G, for example, a decrease in the intensity of contact **12610** from an intensity above a deep press intensity threshold (e.g., "IT_D") to an intensity below the light press intensity threshold (e.g., "IT_L") is detected. As shown in FIGS. **14**K-**14**N, for example, a decrease in the intensity of contact **12630** from an intensity above a deep press intensity threshold (e.g., "IT_D") to an intensity below the light press intensity threshold (e.g., "IT_L") is detected.

In response to detecting the decrease in intensity (**12724**), the device changes (**12726**) activation states of the user interface object from the second activation state (e.g., the second deep press activation state) to the first activation state (e.g., the neutral activation state), and generates (**12732**) N distinct tactile outputs on the touch-sensitive surface, where N is a positive integer and N is different from M. For example, in FIG. **14**D-**14**G or **14**K-**14**N, in response to the detection of the decrease in intensity from an intensity above a deep press intensity threshold (e.g., "IT_D") to an intensity below the light press intensity threshold (e.g., "IT_L"), the rate of change in brightness level changes from the "fast" rate (e.g., 10 per time step) to zero. The activation state for rocker switch **12604-1** or **12624-1** changes from the activation state corresponding to the "fast" rate, through zero or more intermediate activation states (e.g., a first deep press activation state and/or a light press activation state), to the activation state corresponding to the zero rate. In response to the detection of the decrease in intensity, N tactile outputs are, optionally, generated. The N tactile outputs are, optionally, generated at predefined increments of the brightness level (e.g., whenever the ones digit in the brightness level is 0), at predefined increments of the change in the brightness level (e.g., every 10th increment from the starting level), or when the brightness start level starts changing and stops changing, as the brightness level changes in accordance with the rate of change corresponding to the current activation state of rocker switch **12604-1** or **12624-1**. In some circumstances N is different from M (e.g., as the brightness level has optionally changed less on the decrease in intensity, or the tactile outputs are, optionally, predefined to be generated at different points than the increments in the level or in the change in level). For example, when the increase in intensity of the contact is below the predefined threshold and the

decrease in intensity of the contact is above the predefined threshold (e.g., a rate corresponding to transitioning between the first intensity and the second intensity in less than 0.5, 0.25, 0.1, 0.05 seconds or some other reasonable amount of time), the device generates tactile outputs corresponding to each the transitions between the neutral activation state, the light press activation state, the first deep press activation state and the second deep press activation state when the intensity of the contact is increasing, but the device generates tactile outputs for only a subset of these transitions (e.g., only the transition between the second deep press activation state and the neutral activation state).

In some embodiments, changing activation states of the user interface object from the first activation state to the second activation state includes transitioning through a first number of intermediate activation states between the first activation state and the second activation state; and changing activation states of the user interface object from the second activation state to the first activation state includes transitioning through a second number of intermediate activation states between the second activation state and the first activation state (**12728**). For example, in FIG. **14**A-**14**D or **14**H-**14**K, the transition from the neutral activation state to the second deep press activation state includes intermediate transitions to the light press activation state and the first deep press activation state. In FIG. **14**D-**14**G or **14**K-**14**N, the transition from the second deep press activation state to the neutral activation state includes intermediate transitions to the first deep press activation state and the light press activation state.

In some embodiments, the first number of intermediate activation states between the first activation state and the second activation state is different from the second number of intermediate activation states between the second activation state and the first activation state (**12730**). For example, the increase in intensity of contact **12610** or **12630** is, in some circumstances, at a speed below the predefined threshold, and the decrease in intensity of contact **12610** or **12630** is, in some circumstances, above the predefined threshold, and as a result the intermediate activations states on the decrease in intensity are skipped (e.g., processing the transition between the first deep press activation state and the second deep press activation state shown in FIGS. **14**C-**14**D and skipping the transition between the second deep press activation threshold to the first deep press activation shown in FIGS. **14**D-**14**E).

In some embodiments, the N distinct tactile outputs correspond to changes in activation state of the user interface object (**12734**). The N tactile sensations are, optionally, generated whenever the activation state of rocker switch **12604-1** or **12624-1** (e.g., the rate of change for the brightness level) changes.

In some embodiments, while detecting the decrease in intensity of the contact, the device determines (**12736**) a rate at which intensity of the contact is decreasing. In accordance with a determination that the rate at which the intensity of the contact is decreasing remains below a predefined threshold (e.g., a rate corresponding to transitioning between the first intensity and the second intensity in less than 0.5, 0.25, 0.1, 0.05 seconds or some other reasonable amount of time), the device generates (**12738**) a distinct tactile output for each transition between activation states that occurs in response to detecting the decrease in intensity of the contact. In accordance with a determination that the rate at which the intensity of the contact is decreasing exceeds the predefined threshold, the device forgoes (**12740**) generation of at least one distinct tactile output for a respective transition between activation states that occurs in response to detecting the decrease in intensity of the contact. For example, as the intensity of contact **12610** or **12630** decreases from an intensity above a deep press intensity threshold (e.g., "IT_D") to an intensity below the light press intensity threshold (e.g., "IT_L"), as depicted in FIG. **14**D-**14**G or **14**K-**14**N, respectively, a speed of the intensity decrease is, optionally, determined. In some embodiments, if the speed of the intensity decrease is below the predefined threshold, a tactile output is generated for each transition between activation states along the way. If the speed of the intensity decrease is above the predefined threshold, generation of one or more of the tactile outputs is, optionally, forgone, for example the tactile outputs corresponding to transitions between intermediate activation states, such as the light press activation state and the first deep press activation state illustrated in FIGS. **14**B-**14**C.

In some embodiments, at least one tactile output generated in response to detecting the increase in intensity of the contact (e.g., **12610** or **12630**) corresponds to a tactile sensation that simulates a down-click of a physical actuator mechanism (e.g., a tactile sensation that simulates the physical "down-click sensation" generated by the mechanical button apparatus of a physical button when a user activates the physical button), and at least one tactile output generated in response to detecting the decrease in intensity of the contact (e.g., **12610** or **12630**) corresponds to a tactile sensation that simulates an up-click of a physical actuator mechanism (e.g., a tactile sensation that simulates the physical "up-click sensation" generated by the mechanical button apparatus of a physical button when a user activates the physical button).

As used herein, a distinct tactile output is a tactile output that was generated to provide feedback corresponding to a user interface event (e.g., a change in the activation state of the user interface object, such as activation of a button or other control). In some embodiments, the touch-sensitive surface is moved by an actuator in accordance with a separate waveform for each user interface event. The waveforms for different user interface events optionally overlap, but a waveform that was generated to provide a tactile feedback for a particular user interface event (e.g., activation of a button or change in activation state of a control such as a rocker switch) will still generate a distinct tactile output. As used herein, an activation state of a user interface object corresponds to an operational state of an application on the electronic device, and changing activation states of the user interface object changes operational states of the application. If the user interface object is an adjustable control interface such as a multi-state button, rocker-switch or slider, the activation states of the button/switch/slider are typically displayed by changing the visual appearance of the adjustable control interface (e.g., as a change in shading of a button, a change in rotation of a rocker switch or a change in position of a slider). Additionally, when the activation state of the button/switch/slider is changed, operation of an application associated with the button/switch/slider is changed accordingly. For example, if a rocker switch controls the brightness of an image, the activation states of the rocker switch correspond to different brightness levels of the image, and when the rocker switch changes from a first activation state to a second activation state, the brightness of the image changes from a first brightness level corresponding to the first activation state of the rocker switch to a second brightness level corresponding to the second activation state of the rocker switch. In some embodiments, activation states correspond to image property levels (e.g.,

hue, saturation, exposure, brightness, contrast), content navigation states (e.g., channel selection, forward navigation, backward navigation, frame-by-frame navigation), system property adjustments (e.g., volume control, screen brightness, date/time settings), rates of change, and other adjustable properties.

While M and N have been discussed herein as positive integers, in some circumstances M is zero (e.g., tactile outputs are generated in response to detecting the increase in intensity of the contact) and/or N is zero (e.g., no tactile outputs are generated in response to detecting the decrease in intensity of the contact). Additionally, while M has been described as being different from N, in some circumstances M is equal to N (e.g., the number of tactile outputs that are generated in response to detecting the increase in intensity of the contact is the same as the number of tactile outputs that are generated in response to detecting the decrease in intensity of the contact).

It should be understood that the particular order in which the operations in FIGS. **15A-15C** have been described is merely exemplary and is not intended to indicate that the described order is the only order in which the operations could be performed. One of ordinary skill in the art would recognize various ways to reorder the operations described herein. Additionally, it should be noted that details of other processes described herein with respect to other methods described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments) are also applicable in an analogous manner to method **12700** described above with respect to FIGS. **15A-15C**. For example, the contacts, user interface objects, tactile outputs, intensity thresholds, focus selectors, animations described above with reference to method **12700** optionally have one or more of the characteristics of the contacts, user interface objects, tactile outputs, intensity thresholds, focus selectors, animations described herein with reference to other methods described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments). For brevity, these details are not repeated here.

In accordance with some embodiments, FIG. **16** shows a functional block diagram of an electronic device **12800** configured in accordance with the principles of the various described embodiments. The functional blocks of the device are, optionally, implemented by hardware, software, or a combination of hardware and software to carry out the principles of the various described embodiments. It is understood by persons of skill in the art that the functional blocks described in FIG. **16** are, optionally, combined or separated into sub-blocks to implement the principles of the various described embodiments. Therefore, the description herein optionally supports any possible combination or separation or further definition of the functional blocks described herein.

As shown in FIG. **16**, an electronic device **12800** includes a display unit **12802** configured to display a user interface object, wherein the user interface object has a first activation state and a second activation state; a touch-sensitive surface unit **12804** configured to receive contacts; one or more sensor units **12805** configured to detect intensity of contacts with the touch-sensitive surface unit **12804**; and a processing unit **12806** coupled to the display unit **12802**, the touch-sensitive surface unit **12804** and the sensor units **12805**. In some embodiments, the processing unit **12806** includes a detecting unit **12808**, a changing unit **12810**, a generating unit **12812**, and a determining unit **12814**.

The processing unit **12806** is configured to: detect a contact on the touch-sensitive surface unit **12804** (e.g., with the detecting unit **12808**); detect an increase of intensity of the contact on the touch-sensitive surface unit **12804** from a first intensity to a second intensity (e.g., with the detecting unit **12808**); in response to detecting the increase in intensity: change activation states of the user interface object from the first activation state to the second activation state (e.g., with the changing unit **12810**); and generate M distinct tactile outputs on the touch-sensitive surface unit **12804**, where M is a positive integer (e.g., with the generating unit **12812**); detect a decrease of intensity of the contact from the second intensity to the first intensity (e.g., with the detecting unit **12808**); and in response to detecting the decrease in intensity: change activation states of the user interface object from the second activation state to the first activation state (e.g., with the changing unit **12810**); and generate N distinct tactile outputs on the touch-sensitive surface unit **12804** (e.g., with the generating unit **12812**), where N is a positive integer and N is different from M.

In some embodiments, changing activation states of the user interface object from the first activation state to the second activation state includes transitioning through a first number of intermediate activation states between the first activation state and the second activation state; and changing activation states of the user interface object from the second activation state to the first activation state includes transitioning through a second number of intermediate activation states between the second activation state and the first activation state.

In some embodiments, the first number of intermediate activation states between the first activation state and the second activation state is different from the second number of intermediate activation states between the second activation state and the first activation state.

In some embodiments, the processing unit **12806** is configured to: while detecting the increase in intensity of the contact, determine a rate at which the intensity of the contact is increasing (e.g., with the determining unit **12814**); in accordance with a determination that the rate at which the intensity of the contact is increasing remains below a predefined threshold, generate a distinct tactile output for each transition between activation states that occurs in response to detecting the increase in intensity of the contact (e.g., with the generating unit **12812**); and in accordance with a determination that the rate at which the intensity of the contact is increasing exceeds the predefined threshold, forgo generation of at least one distinct tactile output for a respective transition between activation states that occurs in response to detecting the increase in intensity of the contact (e.g., with the generating unit **12812**).

In some embodiments, the processing unit **12806** is configured to: while detecting the decrease in intensity of the contact, determine a rate at which intensity of the contact is decreasing (e.g., with the determining unit **12814**); in accordance with a determination that the rate at which the intensity of the contact is decreasing remains below a predefined threshold, generate a distinct tactile output for each transition between activation states that occurs in response to detecting the decrease in intensity of the contact (e.g., with the generating unit **12812**); and in accordance with a determination that the rate at which the intensity of the contact is decreasing exceeds the predefined threshold, forgo generation of at least one distinct tactile output for a respective transition between activation states that occurs in response to detecting the decrease in intensity of the contact (e.g., with the generating unit **12812**).

In some embodiments, the M distinct tactile outputs correspond to changes in activation state of the user interface object.

In some embodiments, the N distinct tactile outputs correspond to changes in activation state of the user interface object.

In some embodiments, at least one tactile output generated in response to detecting the increase in intensity corresponds to a tactile sensation that simulates a down-click of a physical actuator mechanism; and at least one tactile output generated in response to detecting the decrease in intensity corresponds to a tactile sensation that simulates an up-click of a physical actuator mechanism.

The operations in the information processing methods described above are, optionally implemented by running one or more functional modules in information processing apparatus such as general purpose processors (e.g., as described above with respect to FIGS. **1**A and **3**) or application specific chips.

The operations described above with reference to FIGS. **15**A-**15**C are, optionally, implemented by components depicted in FIGS. **1**A-**1**B or FIG. **16**. For example, detection operations **12704**, **12706**, and **12722**, changing operations **12710** and **12726**, and generating operations **12712** and **12732** are, optionally, implemented by event sorter **170**, event recognizer **180**, and event handler **190**. Event monitor **171** in event sorter **170** detects a contact on touch-sensitive display **112**, and event dispatcher module **174** delivers the event information to application **136-1**. A respective event recognizer **180** of application **136-1** compares the event information to respective event definitions **186**, and determines whether a first contact at a first location on the touch-sensitive surface corresponds to a predefined event or sub-event, such as selection of an object on a user interface. When a respective predefined event or sub-event is detected, event recognizer **180** activates an event handler **190** associated with the detection of the event or sub-event. Event handler **190** optionally utilizes or calls data updater **176** or object updater **177** to update the application internal state **192**. In some embodiments, event handler **190** accesses a respective GUI updater **178** to update what is displayed by the application. Similarly, it would be clear to a person having ordinary skill in the art how other processes can be implemented based on the components depicted in FIGS. **1**A-**1**B.

It should be understood that the particular order in which the operations have been described above is merely exemplary and is not intended to indicate that the described order is the only order in which the operations could be performed. One of ordinary skill in the art would recognize various ways to reorder the operations described herein. Additionally, it should be noted that the various processes separately described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments) can be combined with each other in different arrangements. For example, the contacts, user interface objects, tactile sensations, intensity thresholds, and/or focus selectors described above with reference to any one of the various processes separately described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments) optionally have one or more of the characteristics of the contacts, gestures, user interface objects, tactile sensations, intensity thresholds, and focus selectors described herein with reference to one or more of the other methods described herein (e.g., those listed in the fifth paragraph of the Description of Embodiments). For brevity, all of the various possible combinations are not specifically enumerated here, but it should be understood that the claims described above may be combined in any way that is not precluded by mutually exclusive claim features.

The foregoing description, for purpose of explanation, has been described with reference to specific embodiments. However, the illustrative discussions above are not intended to be exhaustive or to limit the various described embodiments to the precise forms disclosed. Many modifications and variations are possible in view of the above teachings. The embodiments were chosen and described in order to best explain the principles of the various described embodiments and their practical applications, to thereby enable others skilled in the art to best utilize the various described embodiments with various modifications as are suited to the particular use contemplated.

What is claimed is:

1. A method, comprising:

at an electronic device with a touch-sensitive surface and a display:

detecting a contact on the touch-sensitive surface of the electronic device, including a first portion of a gesture made with the contact, a second portion of the gesture that follows the first portion, and lift-off of the contact from the touch-sensitive surface during or after the second portion of the gesture;

in response to detecting the second portion of the gesture made with the contact:

in accordance with a determination that a modifier input was detected while detecting the first portion of the gesture made with the contact, wherein the modifier input includes an additional input that is detected concurrently with the first portion of the gesture made with the contact:

performing a first operation; and

generating a first tactile output on the touch-sensitive surface; and

in accordance with a determination that the modifier input was not detected while detecting the first portion of the gesture made with the contact:

performing a second operation that includes an activation operation different from the first operation; and

generating a second tactile output on the touch-sensitive surface, wherein the second tactile output is different from the first tactile output.

2. The method of claim **1**, wherein the modifier input is an input selected from the set consisting of: a key press of a modifier key, and an additional contact on the touch-sensitive surface.

3. The method of claim **2**, wherein:

the first operation corresponds to a right-click operation and includes displaying a menu listing a plurality of distinct operations; and

the second operation corresponds to a left-click operation.

4. The method of claim **1**, wherein:

detecting the first portion of the gesture made with the contact includes detecting an increase in intensity of the contact above a first activation threshold; and

detecting the second portion of the gesture made with the contact includes, after detecting the increase in intensity of the contact above the first activation threshold, detecting a reduction in intensity of the contact below a second activation threshold.

5. The method of claim 4, including:

in response to detecting the reduction in intensity of the contact below the second activation threshold:

in accordance with a determination that the modifier input was detected while detecting the increase in intensity of the contact above the first activation threshold:

performing the first operation; and

generating the first tactile output on the touch-sensitive surface; and

in accordance with a determination that the modifier input was not detected while detecting the increase in intensity of the contact above the first activation threshold:

performing the second operation different from the first operation; and

generating the second tactile output on the touch-sensitive surface,

wherein the second tactile output is different from the first tactile output.

6. The method of claim 5, wherein the second activation threshold is different from the first activation threshold.

7. The method of claim 5, wherein the second activation threshold is the same as the first activation threshold.

8. The method of claim 5, wherein:

the contact is detected on the touch-sensitive surface while a focus selector is over an icon on the display;

the first operation includes displaying a context menu that includes selectable options to perform operations associated with the icon; and

the second operation includes displaying a new application window associated with the icon.

9. The method of claim 5, wherein:

the first tactile output is generated by movement of the touch-sensitive surface that includes a first dominant movement component;

the second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component; and

the first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes.

10. The method of claim 1, wherein:

the first operation corresponds to a right-click operation; and

the second operation corresponds to a left-click operation.

11. The method of claim 1, wherein:

the contact is detected on the touch-sensitive surface while a focus selector is over an icon on the display;

the first operation includes displaying a context menu that includes selectable options to perform operations associated with the icon; and

the second operation includes displaying a new application window associated with the icon.

12. The method of claim 1, wherein:

the first tactile output is generated by movement of the touch-sensitive surface that includes a first dominant movement component;

the second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component; and

the first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes.

13. The method of claim 1, wherein:

the first operation corresponds to an operation associated with a right-click of a mouse or other input device; and

the second operation corresponds to an operation associated with a left-click of a mouse or other input device.

14. An electronic device, comprising:

a display;

a touch-sensitive surface;

one or more processors;

memory; and

one or more programs, wherein the one or more programs are stored in the memory and configured to be executed by the one or more processors, the one or more programs including instructions for:

detecting a contact on the touch-sensitive surface of the electronic device, including a first portion of a gesture made with the contact, a second portion of the gesture that follows the first portion, and lift-off of the contact from the touch-sensitive surface during or after the second portion of the gesture;

in response to detecting the second portion of the gesture made with the contact:

in accordance with a determination that a modifier input was detected while detecting the first portion of the gesture made with the contact, wherein the modifier input includes an additional input that is detected concurrently with the first portion of the gesture made with the contact:

performing a first operation; and

generating a first tactile output on the touch-sensitive surface; and

in accordance with a determination that the modifier input was not detected while detecting the first portion of the gesture made with the contact:

performing a second operation that includes an activation operation different from the first operation; and

generating a second tactile output on the touch-sensitive surface, wherein the second tactile output is different from the first tactile output.

15. The electronic device of claim 14, wherein the modifier input is an input selected from the set consisting of: a key press of a modifier key, and an additional contact on the touch-sensitive surface.

16. The electronic device of claim 15, wherein:

the first operation corresponds to a right-click operation and includes displaying a menu listing a plurality of distinct operations; and

the second operation corresponds to a left-click operation.

17. The electronic device of claim 14, wherein:

detecting the first portion of the gesture made with the contact includes detecting an increase in intensity of the contact above a first activation threshold; and

detecting the second portion of the gesture made with the contact includes, after detecting the increase in intensity of the contact above the first activation threshold, detecting a reduction in intensity of the contact below a second activation threshold.

18. The electronic device of claim 17, wherein the one or more programs include instructions for:

in response to detecting the reduction in intensity of the contact below the second activation threshold:

in accordance with a determination that the modifier input was detected while detecting the increase in intensity of the contact above the first activation threshold:

performing the first operation; and

generating the first tactile output on the touch-sensitive surface; and

in accordance with a determination that the modifier input was not detected while detecting the increase in intensity of the contact above the first activation threshold:

performing the second operation different from the first operation; and

generating the second tactile output on the touch-sensitive surface,

wherein the second tactile output is different from the first tactile output.

19. The electronic device of claim **18**, wherein the second activation threshold is different from the first activation threshold.

20. The electronic device of claim **18**, wherein the second activation threshold is the same as the first activation threshold.

21. The electronic device of claim **18**, wherein:

the contact is detected on the touch-sensitive surface while a focus selector is over an icon on the display;

the first operation includes displaying a context menu that includes selectable options to perform operations associated with the icon; and

the second operation includes displaying a new application window associated with the icon.

22. The electronic device of claim **18**, wherein:

the first tactile output is generated by movement of the touch-sensitive surface that includes a first dominant movement component;

the second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component; and

the first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes.

23. The electronic device of claim **14**, wherein:

the first operation corresponds to a right-click operation; and

the second operation corresponds to a left-click operation.

24. The electronic device of claim **14**, wherein:

the contact is detected on the touch-sensitive surface while a focus selector is over an icon on the display;

the first operation includes displaying a context menu that includes selectable options to perform operations associated with the icon; and

the second operation includes displaying a new application window associated with the icon.

25. The electronic device of claim **14**, wherein:

the first tactile output is generated by movement of the touch-sensitive surface that includes a first dominant movement component;

the second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component; and

the first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes.

26. The electronic device of claim **14**, wherein:

the first operation corresponds to an operation associated with a right-click of a mouse or other input device; and

the second operation corresponds to an operation associated with a left-click of a mouse or other input device.

27. A non-transitory computer readable storage medium storing one or more programs, the one or more programs comprising instructions, which when executed by an electronic device with a display, and a touch-sensitive surface, cause the electronic device to:

detect a contact on the touch-sensitive surface of the electronic device, including a first portion of a gesture made with the contact, a second portion of the gesture that follows the first portion, and lift-off of the contact from the touch-sensitive surface during or after the second portion of the gesture;

in response to detecting the second portion of the gesture made with the contact:

in accordance with a determination that a modifier input was detected while detecting the first portion of the gesture made with the contact, wherein the modifier input includes an additional input that is detected concurrently with the first portion of the gesture made with the contact:

perform a first operation; and

generate a first tactile output on the touch-sensitive surface; and

in accordance with a determination that the modifier input was not detected while detecting the first portion of the gesture made with the contact:

perform a second operation that includes an activation operation different from the first operation; and

generate a second tactile output on the touch-sensitive surface, wherein the second tactile output is different from the first tactile output.

28. The non-transitory computer readable storage medium of claim **27**, wherein the modifier input is an input selected from the set consisting of: a key press of a modifier key, and an additional contact on the touch-sensitive surface.

29. The non-transitory computer readable storage medium of claim **28**, wherein:

the first operation corresponds to a right-click operation and includes displaying a menu listing a plurality of distinct operations; and

the second operation corresponds to a left-click operation.

30. The non-transitory computer readable storage medium of claim **27**, wherein:

detecting the first portion of the gesture made with the contact includes detecting an increase in intensity of the contact above a first activation threshold; and

detecting the second portion of the gesture made with the contact includes, after detecting the increase in intensity of the contact above the first activation threshold, detecting a reduction in intensity of the contact below a second activation threshold.

31. The non-transitory computer readable storage medium of claim **30**, wherein the one or more programs include instructions for:

in response to detecting the reduction in intensity of the contact below the second activation threshold:

in accordance with a determination that the modifier input was detected while detecting the increase in intensity of the contact above the first activation threshold:

performing the first operation; and

generating the first tactile output on the touch-sensitive surface; and

in accordance with a determination that the modifier input was not detected while detecting the increase in intensity of the contact above the first activation threshold:

performing the second operation different from the first operation; and

generating the second tactile output on the touch-sensitive surface,

wherein the second tactile output is different from the first tactile output.

32. The non-transitory computer readable storage medium of claim **31**, wherein the second activation threshold is different from the first activation threshold.

33. The non-transitory computer readable storage medium of claim **31**, wherein the second activation threshold is the same as the first activation threshold.

34. The non-transitory computer readable storage medium of claim **28**, wherein:

the contact is detected on the touch-sensitive surface while a focus selector is over an icon on the display;

the first operation includes displaying a context menu that includes selectable options to perform operations associated with the icon; and

the second operation includes displaying a new application window associated with the icon.

35. The non-transitory computer readable storage medium of claim **31**, wherein:

the first tactile output is generated by movement of the touch-sensitive surface that includes a first dominant movement component;

the second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component; and

the first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes.

36. The non-transitory computer readable storage medium of claim **27**, wherein:

the first operation corresponds to a right-click operation; and

the second operation corresponds to a left-click operation.

37. The non-transitory computer readable storage medium of claim **27**, wherein:

the contact is detected on the touch-sensitive surface while a focus selector is over an icon on the display;

the first operation includes displaying a context menu that includes selectable options to perform operations associated with the icon; and

the second operation includes displaying a new application window associated with the icon.

38. The non-transitory computer readable storage medium of claim **27**, wherein:

the first tactile output is generated by movement of the touch-sensitive surface that includes a first dominant movement component;

the second tactile output is generated by movement of the touch-sensitive surface that includes a second dominant movement component; and

the first dominant movement component and the second dominant movement component have a same movement profile and different amplitudes.

39. The non-transitory computer readable storage medium of claim **27**, wherein:

the first operation corresponds to an operation associated with a right-click of a mouse or other input device; and

the second operation corresponds to an operation associated with a left-click of a mouse or other input device.

* * * * *
