Abstract:
The present invention describes combination treatment comprising a PD-1 axis binding antagonist and a MEK inhibitor and methods for use thereof, including methods of treating conditions where enhanced immunogenicity is desired such as increasing tumor immunogenicity for the treatment of cancer.
COMPOSITIONS FOR TREATING CANCER USING PD-1 AXIS BINDING ANTAGONISTS AND MEK INHIBITORS

CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application claims the priority benefit of U.S. provisional application Serial No. 62/024,988, filed July 15, 2014, the contents of which are incorporated herein by reference in its entirety.

SUBMISSION OF SEQUENCE LISTING ON ASCII TEXT FILE

[0002] The content of the following submission on ASCII text file is incorporated herein by reference in its entirety: a computer readable form (CRF) of the Sequence Listing (file name: 146392027540SeqList.txt, date recorded: July 8, 2015, size: 22 KB).

BACKGROUND

[0004] In the two-signal model T-cells receive both positive and negative secondary co-stimulatory signals. The regulation of such positive and negative signals is critical to maximize the host's protective immune responses, while maintaining immune tolerance and preventing autoimmunity. Negative secondary signals seem necessary for induction of T-cell tolerance, while positive signals promote T-cell activation. While the simple two-signal model still
provides a valid explanation for naive lymphocytes, a host's immune response is a dynamic process, and co-stimulatory signals can also be provided to antigen-exposed T-cells. The mechanism of co-stimulation is of therapeutic interest because the manipulation of co-stimulatory signals has shown to provide a means to either enhance or terminate cell-based immune response. Recently, it has been discovered that T cell dysfunction or anergy occurs concurrently with an induced and sustained expression of the inhibitory receptor, programmed death 1 polypeptide (PD-1). As a result, therapeutic targeting of PD-1 and other molecules which signal through interactions with PD-1, such as programmed death ligand 1 (PD-L1) and programmed death ligand 2 (PD-L2) are an area of intense interest.

PD-L1 is overexpressed in many cancers and is often associated with poor prognosis (Okazaki T et al., Intern. Immun. 2007 19(7):813) (Thompson RH et al., Cancer Res 2006, 66(7):3381). Interestingly, the majority of tumor infiltrating T lymphocytes predominantly express PD-1, in contrast to T lymphocytes in normal tissues and peripheral blood T lymphocytes indicating that up-regulation of PD-1 on tumor-reactive T cells can contribute to impaired antitumor immune responses (Blood 2009 114(8): 1537). This may be due to exploitation of PD-L1 signaling mediated by PD-L1 expressing tumor cells interacting with PD-1 expressing T cells to result in attenuation of T cell activation and evasion of immune surveillance (Sharpe et al., Nat Rev 2002) (Keir ME et al., 2008 Annu. Rev. Immunol. 26:677). Therefore, inhibition of the PD-L1/PD-1 interaction may enhance CD8+ T cell-mediated killing of tumors.

The inhibition of PD-1 axis signaling through its direct ligands (e.g., PD-L1, PD-L2) has been proposed as a means to enhance T cell immunity for the treatment of cancer (e.g., tumor immunity). Moreover, similar enhancements to T cell immunity have been observed by inhibiting the binding of PD-L1 to the binding partner B7-1. Furthermore, combining inhibition of PD-1 signaling with other signaling pathways (e.g. MAPK pathway, "MEK") that are deregulated in tumor cells may further enhance treatment efficacy. However, an optimal therapeutic treatment would combine blockade of PD-1 receptor/ligand interaction with an agent that directly inhibited tumor growth, optionally further including unique immune enhancing properties not provided by PD-1 blockade alone. There remains a need for such an optimal therapy for treating, stabilizing, preventing, and/or delaying development of various cancers.

BRIEF SUMMARY

[0008] Provided herein are methods for treating or delaying progression of cancer in an individual comprising administering to the individual an effective amount of a PD-1 axis binding antagonist and a MEK inhibitor, wherein the individual has cancer or is at risk of developing cancer that is resistant to a B-raf antagonist. In some embodiments, the method further comprises diagnosing the individual as having a cancer that is resistant to a B-raf antagonist, wherein the diagnosing occurs prior to administering the effective amount of the PD-1 axis binding antagonist and the MEK inhibitor. In some embodiments, the method further comprises selecting an individual for treatment based on the individual having cancer that is resistant to a B-raf antagonist or assessing that the individual is at risk of developing cancer that is resistant to a B-raf antagonist, wherein the selecting occurs prior to administering the effective amount of the PD-1 axis binding antagonist and the MEK inhibitor. In some embodiments, the individual has not been previously treated with a B-raf antagonist. In some embodiments, the individual has been previously treated with a B-raf antagonist.

[0009] In another aspect, provided herein are methods for treating or delaying progression of cancer in an individual comprising (a) diagnosing the individual as having a cancer that is resistant to a B-raf antagonist; and (b) administering to the individual an effective amount of a PD-1 axis binding antagonist and a MEK inhibitor, wherein the administering occurs after diagnosing the individual. In some embodiments, the individual has not been previously treated with a B-raf antagonist. In some embodiments, the individual has been previously treated with a B-raf antagonist.

[0010] In another aspect, provided herein are methods for treating or delaying progression of cancer in an individual comprising (a) selecting an individual for treatment based on the individual having cancer that is resistant to a B-raf antagonist or assessing that the individual is at risk of developing cancer that is resistant to a B-raf antagonist; and (b) administering to the individual an effective amount of a PD-1 axis binding antagonist and a MEK inhibitor, wherein the administering occurs after selecting the individual. In some embodiments, the individual has not been previously treated with a B-raf antagonist. In some embodiments, the individual has been previously treated with a B-raf antagonist.

[0011] In another aspect, provided herein are methods for treating or delaying progression of cancer in an individual comprising administering to the individual an effective amount of a PD-1
axis binding antagonist and a MEK inhibitor, wherein the individual has been previously treated
with a B-raf antagonist for cancer.

[0012] In some embodiments, the cancer in the individual has progressed within 1 month, 6
months, 1 year, or 5 years after completing a B-raf antagonist-based therapy regimen. In some
embodiments, the B-raf antagonist is a small molecule inhibitor, an antibody, a peptide, a
peptidomimetic, an aptamer or a polynucleotide. In some embodiments, the B-raf antagonist
dabrafenib, vemurafeni, GSK 2118436, RAF265, XL281, ARQ736, BAY73-4506, sorafenib,
PLX4720, PLX-3603, GSK2118436, GDC-0879, or N-(3-(5-(4-chlorophenyl)-IH-pyrrolo[2,3-
b]pyridine-3-carbonyl)-2,4-difluorophenyl)propane-1-sulfonamide. In some embodiments, the
B-raf antagonist is a selective B-raf antagonist of B-raf V600. In some embodiments, the
selective B-raf antagonist of B-raf V600 is a selective antagonist of B-raf V600E. In some
embodiments, the selective B-raf antagonist of B-raf V600 is a selective antagonist of B-raf
V600E, B-raf V600K, and/or V600D. In some embodiments, the selective B-raf antagonist of
B-raf V600 is a selective antagonist of B-raf V600R.

[0013] In some embodiments, the cancer contains a BRAF V600E mutation, a BRAF wildtype,
KRAS wildtype, or an activating KRAS mutation. In some embodiments, the treatment results
in a sustained response in the individual after cessation of the treatment. In some embodiments,
the individual has colorectal cancer, melanoma, lung cancer, ovarian cancer, breast cancer,
pancreatic cancer, hematological malignancy, bladder cancer, and/or renal cell carcinoma. In
some embodiments, the cancer is metastatic.

[0014] In some embodiments, the PD-1 axis binding antagonist is selected from the group
consisting of a PD-1 binding antagonist, a PD-L1 binding antagonist and a PD-L2 binding
antagonist. In some embodiments, the PD-1 axis binding antagonist is a PD-1 binding
antagonist. In some embodiments, the PD-1 binding antagonist inhibits the binding of PD-1 to
its ligand binding partners. In some embodiments, the PD-1 binding antagonist inhibits the
binding of PD-1 to PD-L1, PD-1 to PD-L2, or PD-1 to both PD-L1 and PD-L2. In some
embodiments, the PD-1 binding antagonist is an antibody. In some embodiments, the PD-1
binding antagonist is MDX-1106, Merck 3745, CT-011, MEDI-0680, PDR001, REGN2810,
BGB-108, BGB-A317, or AMP-224. In some embodiments, the PD-1 binding antagonist is
nivolumab, pembrolizumab, pidilizumab, MEDI-0680, PDR001, REGN2810, BGB-108, BGB-
A317, or AMP-224. In some embodiments, the PD-1 axis binding antagonist is a PD-L1
binding antagonist. In some embodiments, the PD-L1 binding antagonist inhibits the binding of
PD-L1 to PD-1, PD-L1 to B7-1, or PD-L1 to both PD-1 and B7-1. In some embodiments, the PD-L1 binding antagonist is an anti-PD-L1 antibody. In some embodiments, the anti-PD-L1 antibody is a monoclonal antibody. In some embodiments, the anti-PD-L1 antibody is an antibody fragment selected from the group consisting of Fab, Fab'-SH, Fv, scFv, and (Fab')\textsubscript{2} fragments. In some embodiments, the anti-PD-L1 antibody is a humanized antibody or a human antibody. In some embodiments, the PD-L1 binding antagonist is selected from the group consisting of: YW243.55.S70, MPDL3280A, MEDI4736, MDX-1105, and MSB0010718C. In some embodiments, the PD-L1 binding antagonist is selected from the group consisting of: YW243.55.S70, atezolizumab, durvalumab, MDX-1105, and avelumab. In some embodiments, the antibody comprises a heavy chain comprising HVR-H1 sequence of SEQ ID NO: 15, HVR-H2 sequence of SEQ ID NO: 16, and HVR-H3 sequence of SEQ ID NO: 3; and a light chain comprising HVR-L1 sequence of SEQ ID NO: 17, HVR-L2 sequence of SEQ ID NO: 18, and HVR-L3 sequence of SEQ ID NO: 19. In some embodiments, the antibody comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 24 or 28 and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 21. In some embodiments, the PD-1 axis binding antagonist is a PD-L2 binding antagonist. In some embodiments, the PD-L2 binding antagonist is an antibody. In some embodiments, the PD-L2 binding antagonist is an immunoadhesin. In some embodiments, the MEK inhibitor is a competitive inhibitor of MEK. In some embodiments, the MEK inhibitor is more selective against an activating KRAS mutation. In some embodiments, the MEK inhibitor is an allosteric inhibitor of MEK. In some embodiments, the MEK inhibitor is more selective against an activating BRAF mutation. In some embodiments, the MEK inhibitor is a compound of the formula (I), (II), (III), (IV), (V), (VI) or (VII), or a pharmaceutically acceptable salt or solvate thereof. In some embodiments, the MEK inhibitor is selected from the group consisting of G02442104, G-38963, G02443714, G00039805 and GDC-0973, or a pharmaceutically acceptable salt or solvate thereof. In some embodiments, the MEK inhibitor is G02443714, G02442104 or G00039805.

[0015] In some embodiments, the MEK inhibitor is administered continuously. In some embodiments, the MEK inhibitor is administered intermittently. In some embodiments, the MEK inhibitor is administered before the PD-1 axis binding antagonist. In some embodiments, the MEK inhibitor is administered simultaneous with the PD-1 axis binding antagonist. In some embodiments, the MEK inhibitor is administered after the PD-1 axis binding antagonist. In
some embodiments, the PD-1 axis binding antagonist and/or the MEK inhibitor is administered intravenously, intramuscularly, subcutaneously, topically, orally, transdermally, intraperitoneally, intraorbitally, by implantation, by inhalation, intrathecally, intraventricularly, or intranasally.

[0016] In another aspect, provided herein are kits comprising a PD-1 axis binding antagonist and a package insert comprising instructions for using the PD-1 axis binding antagonist in combination with a MEK inhibitor to treat or delay progression of cancer in an individual, wherein the individual has cancer or is at risk of developing cancer that is resistant to a B-raf antagonist. In another aspect, provided herein are kits comprising a PD-1 axis binding antagonist and a MEK inhibitor, and a package insert comprising instructions for using the PD-1 axis binding antagonist and the MEK inhibitor to treat or delay progression of cancer in an individual, wherein the individual has cancer or is at risk of developing cancer that is resistant to a B-raf antagonist. In another aspect, provided herein are kits comprising a MEK inhibitor and a package insert comprising instructions for using the MEK inhibitor in combination with a PD-1 axis binding antagonist to treat or delay progression of cancer in an individual, wherein the individual has cancer or is at risk of developing cancer that is resistant to a B-raf antagonist. In another aspect, provided herein are kits comprising a PD-1 axis binding antagonist and a package insert comprising instructions for using the PD-1 axis binding antagonist in combination with a MEK inhibitor to treat or delay progression of cancer in an individual, wherein the individual has been previously treated with a B-raf antagonist for cancer. In another aspect, provided herein are kits comprising a PD-1 axis binding antagonist and a MEK inhibitor, and a package insert comprising instructions for using the PD-1 axis binding antagonist and the MEK inhibitor to treat or delay progression of cancer in an individual, wherein the individual has been previously treated with a B-raf antagonist for cancer. In another aspect, provided herein are kits comprising a MEK inhibitor and a package insert comprising instructions for using the MEK inhibitor in combination with a PD-1 axis binding antagonist to treat or delay progression of cancer in an individual, wherein the individual has been previously treated with a B-raf antagonist for cancer.

[0017] In some embodiments, the individual is a human.

[0018] It is to be understood that one, some, or all of the properties of the various embodiments described herein may be combined to form other embodiments of the present invention. These and other aspects of the invention will become apparent to one of skill in the
art. These and other embodiments of the invention are further described by the detailed description that follows.

BRIEF DESCRIPTION OF THE DRAWINGS

[0019] FIG. 1 shows tumor re-growth upon treatment with anti-PDL1, a MEK inhibitor, or both. The graph shows the percent tumor volume change over time during treatment with the indicated agent(s).

[0020] FIG. 2 shows individual animal responses to treatment with Vemurafenib followed by anti-PDL1, a MEK inhibitor, or both. Each bar depicts the percent change in tumor growth upon crossover from Vemurafenib to the indicated treatment in an individual animal.

DETAILED DESCRIPTION

I. General techniques

II. Definitions

[0022] The term "antagonist" is used in the broadest sense, and includes any molecule that partially or fully blocks, inhibits, or neutralizes a biological activity of a native polypeptide disclosed herein. In a similar manner, the term "agonist" is used in the broadest sense and includes any molecule that mimics a biological activity of a native polypeptide disclosed herein.

Suitable agonist or antagonist molecules specifically include agonist or antagonist antibodies or antibody fragments, fragments or amino acid sequence variants of native polypeptides, peptides, antisense oligonucleotides, small organic molecules, etc. Methods for identifying agonists or antagonists of a polypeptide may comprise contacting a polypeptide with a candidate agonist or antagonist molecule and measuring a detectable change in one or more biological activities normally associated with the polypeptide.

[0023] The term "aptamer" refers to a nucleic acid molecule that is capable of binding to a target molecule, such as a polypeptide. For example, an aptamer of the invention can specifically bind to a B-raf polypeptide, or to a molecule in a signaling pathway that modulates the expression or activity of B-raf. The generation and therapeutic use of aptamers are well established in the art. See, e.g., U.S. Pat. No. 5,475,096, and the therapeutic efficacy of Macugen® (Eyetech, New York) for treating age-related macular degeneration.

[0024] The term "PD-1 axis binding antagonist" is a molecule that inhibits the interaction of a PD-1 axis binding partner with either one or more of its binding partner, so as to remove T-cell dysfunction resulting from signaling on the PD-1 signaling axis - with a result being to restore or enhance T-cell function (e.g., proliferation, cytokine production, target cell killing). As used herein, a PD-1 axis binding antagonist includes a PD-1 binding antagonist, a PD-L1 binding antagonist and a PD-L2 binding antagonist.

[0025] The term "PD-1 binding antagonists" is a molecule that decreases, blocks, inhibits, abrogates or interferes with signal transduction resulting from the interaction of PD-1 with one or more of its binding partners, such as PD-L1, PD-L2. In some embodiments, the PD-1 binding antagonist is a molecule that inhibits the binding of PD-1 to its binding partners. In a specific
aspect, the PD-1 binding antagonist inhibits the binding of PD-1 to PD-L1 and/or PD-L2. For example, PD-1 binding antagonists include anti-PD-1 antibodies, antigen binding fragments thereof, immunoadhesins, fusion proteins, oligopeptides and other molecules that decrease, block, inhibit, abrogate or interfere with signal transduction resulting from the interaction of PD-1 with PD-L1 and/or PD-L2. In one embodiment, a PD-1 binding antagonist reduces the negative co-stimulatory signal mediated by or through cell surface proteins expressed on T lymphocytes mediated signaling through PD-1 so as render a dysfunctional T-cell less dysfunctional (e.g., enhancing effector responses to antigen recognition). In some embodiments, the PD-1 binding antagonist is an anti-PD-1 antibody. In a specific aspect, a PD-1 binding antagonist is MDX-1 106 described herein. In another specific aspect, a PD-1 binding antagonist is Merck 3745 described herein. In another specific aspect, a PD-1 binding antagonist is CT-011 described herein.

[0026] The term "PD-L1 binding antagonists" is a molecule that decreases, blocks, inhibits, abrogates or interferes with signal transduction resulting from the interaction of PD-L1 with either one or more of its binding partners, such as PD-1, B7-1. In some embodiments, a PD-L1 binding antagonist is a molecule that inhibits the binding of PD-L1 to its binding partners. In a specific aspect, the PD-L1 binding antagonist inhibits binding of PD-L1 to PD-1 and/or B7-1. In some embodiments, the PD-L1 binding antagonists include anti-PD-L1 antibodies, antigen binding fragments thereof, immunoadhesins, fusion proteins, oligopeptides and other molecules that decrease, block, inhibit, abrogate or interfere with signal transduction resulting from the interaction of PD-L1 with one or more of its binding partners, such as PD-1, B7-1. In one embodiment, a PD-L1 binding antagonist reduces the negative co-stimulatory signal mediated by or through cell surface proteins expressed on T lymphocytes mediated signaling through PD-L1 so as to render a dysfunctional T-cell less dysfunctional (e.g., enhancing effector responses to antigen recognition). In some embodiments, a PD-L1 binding antagonist is an anti-PD-L1 antibody. In a specific aspect, an anti-PD-L1 antibody is YW243.55.S70 described herein. In another specific aspect, an anti-PD-L1 antibody is MDX-1 105 described herein. In still another specific aspect, an anti-PD-L1 antibody is MPDL3280A (atezolizumab) described herein.

[0027] The term "PD-L2 binding antagonists" is a molecule that decreases, blocks, inhibits, abrogates or interferes with signal transduction resulting from the interaction of PD-L2 with either one or more of its binding partners, such as PD-1. In some embodiments, a PD-L2 binding antagonist is a molecule that inhibits the binding of PD-L2 to its binding partners. In a
specific aspect, the PD-L2 binding antagonist inhibits binding of PD-L2 to PD-1. In some embodiments, the PD-L2 antagonists include anti-PD-L2 antibodies, antigen binding fragments thereof, immunoadhesins, fusion proteins, oligopeptides and other molecules that decrease, block, inhibit, abrogate or interfere with signal transduction resulting from the interaction of PD-L2 with either one or more of its binding partners, such as PD-1. In one embodiment, a PD-L2 binding antagonist reduces the negative co-stimulatory signal mediated by or through cell surface proteins expressed on T lymphocytes mediated signaling through PD-L2 so as render a dysfunctional T-cell less dysfunctional (e.g., enhancing effector responses to antigen recognition). In some embodiments, a PD-L2 binding antagonist is an immunoadhesin.

[0028] The term "dysfunction" in the context of immune dysfunction, refers to a state of reduced immune responsiveness to antigenic stimulation. The term includes the common elements of both exhaustion and/or anergy in which antigen recognition may occur, but the ensuing immune response is ineffective to control infection or tumor growth.

[0029] The term "dysfunctional", as used herein, also includes refractory or unresponsive to antigen recognition, specifically, impaired capacity to translate antigen recognition into downstream T-cell effector functions, such as proliferation, cytokine production (e.g., IL-2) and/or target cell killing.

[0030] The term "anergy" refers to the state of unresponsiveness to antigen stimulation resulting from incomplete or insufficient signals delivered through the T-cell receptor (e.g. increase in intracellular Ca^{2+} in the absence of ras-activation). T cell anergy can also result upon stimulation with antigen in the absence of co-stimulation, resulting in the cell becoming refractory to subsequent activation by the antigen even in the context of costimulation. The unresponsive state can often be overridden by the presence of Interleukin-2. Anergic T-cells do not undergo clonal expansion and/or acquire effector functions.

[0031] The term "exhaustion" refers to T cell exhaustion as a state of T cell dysfunction that arises from sustained TCR signaling that occurs during many chronic infections and cancer. It is distinguished from anergy in that it arises not through incomplete or deficient signaling, but from sustained signaling. It is defined by poor effector function, sustained expression of inhibitory receptors and a transcriptional state distinct from that of functional effector or memory T cells. Exhaustion prevents optimal control of infection and tumors. Exhaustion can result from both extrinsic negative regulatory pathways (e.g., immunoregulatory cytokines) as well as cell intrinsic negative regulatory (costimulatory) pathways (PD-1, B7-H3, B7-H4, etc.).
"Enhancing T-cell function" means to induce, cause or stimulate a T-cell to have a sustained or amplified biological function, or renew or reactivate exhausted or inactive T-cells. Examples of enhancing T-cell function include: increased secretion of $\gamma$-interferon from CD8$^+$ T-cells, increased proliferation, increased antigen responsiveness (e.g., viral, pathogen, or tumor clearance) relative to such levels before the intervention. In one embodiment, the level of enhancement is as least 50%, alternatively 60%, 70%, 80%, 90%, 100%, 120%, 150%, or 200%. The manner of measuring this enhancement is known to one of ordinary skill in the art.

A "T cell dysfunctional disorder" is a disorder or condition of T-cells characterized by decreased responsiveness to antigenic stimulation. In a particular embodiment, a T-cell dysfunctional disorder is a disorder that is specifically associated with inappropriate increased signaling through PD-1. In another embodiment, a T-cell dysfunctional disorder is one in which T-cells are anergic or have decreased ability to secrete cytokines, proliferate, or execute cytolytic activity. In a specific aspect, the decreased responsiveness results in ineffective control of a pathogen or tumor expressing an immunogen. Examples of T cell dysfunctional disorders characterized by T-cell dysfunction include unresolved acute infection, chronic infection and tumor immunity.

"Tumor immunity" refers to the process in which tumors evade immune recognition and clearance. Thus, as a therapeutic concept, tumor immunity is "treated" when such evasion is attenuated, and the tumors are recognized and attacked by the immune system. Examples of tumor recognition include tumor binding, tumor shrinkage and tumor clearance.

"Immunogenicity" refers to the ability of a particular substance to provoke an immune response. Tumors are immunogenic and enhancing tumor immunogenicity aids in the clearance of the tumor cells by the immune response. Examples of enhancing tumor immunogenicity include treatment with anti-PDL antibodies and a MEK inhibitor.

"Sustained response" refers to the sustained effect on reducing tumor growth after cessation of a treatment. For example, the tumor size may remain to be the same or smaller as compared to the size at the beginning of the administration phase. In some embodiments, the sustained response has a duration at least the same as the treatment duration, at least 1.5X, 2.0X, 2.5X, or 3.0X length of the treatment duration.

As used herein, "cancer" and "cancerous" refer to or describe the physiological condition in mammals that is typically characterized by unregulated cell growth. Included in this definition are benign and malignant cancers as well as dormant tumors or micrometastases.
Examples of cancer include but are not limited to, carcinoma, lymphoma, blastoma, sarcoma, and leukemia. More particular examples of such cancers include but are not limited to squamous cell cancer, lung cancer (including small-cell lung cancer, non-small cell lung cancer, adenocarcinoma of the lung, and squamous carcinoma of the lung), cancer of the peritoneum, hepatocellular cancer, gastric or stomach cancer (including gastrointestinal cancer), pancreatic cancer, glioblastoma, cervical cancer, ovarian cancer, liver cancer, bladder cancer, hepatoma, breast cancer, colon cancer, colorectal cancer, endometrial or uterine carcinoma, salivary gland carcinoma, kidney or renal cancer, liver cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma and various types of head and neck cancer, as well as B-cell lymphoma (including low grade/follicular non-Hodgkin's lymphoma (NHL); small lymphocytic (SL) NHL; intermediate grade/follicular NHL; intermediate grade diffuse NHL; high grade immunoblastic NHL; high grade lymphoblastic NHL; high grade small non-cleaved cell NHL; bulky disease NHL; mantle cell lymphoma; AIDS-related lymphoma; and Waldenstrom's Macroglobulinemia); chronic lymphocytic leukemia (CLL); acute lymphoblastic leukemia (ALL); Hairy cell leukemia; chronic myeloblastic leukemia; and post-transplant lymphoproliferative disorder (PTLD), as well as abnormal vascular proliferation associated with phakomatoses, edema (such as that associated with brain tumors), and Meigs' syndrome. Examples of cancer may include primary tumors of any of the above types of cancer or metastatic tumors at a second site derived from any of the above types of cancer.

[0038] The term "antibody" includes monoclonal antibodies (including full length antibodies which have an immunoglobulin Fc region), antibody compositions with polyepitopic specificity, multispecific antibodies (e.g., bispecific antibodies, diabodies, and single-chain molecules, as well as antibody fragments (e.g., Fab, F(ab')2, and Fv). The term "immunoglobulin" (Ig) is used interchangeably with "antibody" herein.

[0039] The basic 4-chain antibody unit is a heterotetrameric glycoprotein composed of two identical light (L) chains and two identical heavy (H) chains. An IgM antibody consists of 5 of the basic heterotetramer units along with an additional polypeptide called a J chain, and contains 10 antigen binding sites, while IgA antibodies comprise from 2-5 of the basic 4-chain units which can polymerize to form polyvalent assemblages in combination with the J chain. In the case of IgGs, the 4-chain unit is generally about 150,000 daltons. Each L chain is linked to an H chain by one covalent disulfide bond, while the two H chains are linked to each other by one or more disulfide bonds depending on the H chain isotype. Each H and L chain also has regularly
spaced intrachain disulfide bridges. Each H chain has at the N-terminus, a variable domain (VH) followed by three constant domains (CH) for each of the a and γ chains and four CH domains for μ and ε isotypes. Each L chain has at the N-terminus, a variable domain (VL) followed by a constant domain at its other end. The VL is aligned with the VH and the CL is aligned with the first constant domain of the heavy chain (CHT). Particular amino acid residues are believed to form an interface between the light chain and heavy chain variable domains. The pairing of a VH and VL together forms a single antigen-binding site. For the structure and properties of the different classes of antibodies, see e.g., *Basic and Clinical Immunology*, 8th Edition, Daniel P. Sties, Abba I. Terr and Tristram G. Parsolw (eds), Appleton & Lange, Norwalk, CT, 1994, page 71 and Chapter 6. The L chain from any vertebrate species can be assigned to one of two clearly distinct types, called kappa and lambda, based on the amino acid sequences of their constant domains. Depending on the amino acid sequence of the constant domain of their heavy chains (CH), immunoglobulins can be assigned to different classes or isotypes. There are five classes of immunoglobulins: IgA, IgD, IgE, IgG and IgM, having heavy chains designated α, δ, ε, yand μ, respectively. The γ and a classes are further divided into subclasses on the basis of relatively minor differences in the CH sequence and function, e.g., humans express the following subclasses: IgGl, IgG2A, IgG2B, IgG3, IgG4, IgAl and IgA2.

[0040] The "variable region" or "variable domain" of an antibody refers to the amino-terminal domains of the heavy or light chain of the antibody. The variable domains of the heavy chain and light chain may be referred to as "VH" and "VL", respectively. These domains are generally the most variable parts of the antibody (relative to other antibodies of the same class) and contain the antigen binding sites.

[0041] The term "variable" refers to the fact that certain segments of the variable domains differ extensively in sequence among antibodies. The V domain mediates antigen binding and defines the specificity of a particular antibody for its particular antigen. However, the variability is not evenly distributed across the entire span of the variable domains. Instead, it is concentrated in three segments called hypervariable regions (HVRs) both in the light-chain and the heavy chain variable domains. The more highly conserved portions of variable domains are called the framework regions (FR). The variable domains of native heavy and light chains each comprise four FR regions, largely adopting a beta-sheet configuration, connected by three HVRs, which form loops connecting, and in some cases forming part of, the beta-sheet structure. The HVRs in each chain are held together in close proximity by the FR regions and, with the
HVRs from the other chain, contribute to the formation of the antigen binding site of antibodies (see Kabat et al, *Sequences of Immunological Interest*, Fifth Edition, National Institute of Health, Bethesda, MD (1991)). The constant domains are not involved directly in the binding of antibody to an antigen, but exhibit various effector functions, such as participation of the antibody in antibody-dependent cellular toxicity.

[0042] The term "monoclonal antibody" as used herein refers to an antibody obtained from a population of substantially homogeneous antibodies, *i.e.*, the individual antibodies comprising the population are identical except for possible naturally occurring mutations and/or post-translation modifications (*e.g.*, isomerizations, amidations) that may be present in minor amounts. Monoclonal antibodies are highly specific, being directed against a single antigenic site. In contrast to polyclonal antibody preparations which typically include different antibodies directed against different determinants (epitopes), each monoclonal antibody is directed against a single determinant on the antigen. In addition to their specificity, the monoclonal antibodies are advantageous in that they are synthesized by the hybridoma culture, uncontaminated by other immunoglobulins. The modifier "monoclonal" indicates the character of the antibody as being obtained from a substantially homogeneous population of antibodies, and is not to be construed as requiring production of the antibody by any particular method. For example, the monoclonal antibodies to be used in accordance with the present invention may be made by a variety of techniques, including, for example, the hybridoma method (*e.g.*, Kohler and Milstein, *Nature*, 256:495-97 (1975); Hongo et al, *Hybridoma*, 14 (3): 253-260 (1995); Harlow et al, *Antibodies: A Laboratory Manual*, (Cold Spring Harbor Laboratory Press, 2nd ed. 1988); Hammerling et al, in: *Monoclonal Antibodies and T-Cell Hybridomas* 563-681 (Elsevier, N.Y., 1981)), recombinant DNA methods (see, *e.g.*, U.S. Patent No. 4,816,567), phage-display technologies (see, *e.g.*, Clackson et al, *Nature*, 352: 624-628 (1991); Marks et al, *J. Mol. Biol.* 222: 581-597 (1992); Sidhu et al, *J. Mol. Biol.* 338(2): 299-310 (2004); Lee et al, *J. Mol. Biol.* 340(5): 1073-1093 (2004); Fellouse, *Proc. Natl. Acad. Set USA* 101(34): 12467-12472 (2004); and Lee et al, *J. Immunol. Methods* 284(1-2): 119-132 (2004), and technologies for producing human or human-like antibodies in animals that have parts or all of the human immunoglobulin loci or genes encoding human immunoglobulin sequences (see, *e.g.*, WO 1998/24893; WO 1996/34096; WO 1996/33735; WO 1991/10741; Jakobovits et al, *Proc. Natl. Acad. Set USA* 90: 2551 (1993); Jakobovits et al, *Nature* 362: 255-258 (1993); Bruggemann et al, *Year in Immunol.* 7:33 (1993); U.S. Patent Nos. 5,545,807; 5,545,806; 5,569,825; 5,625,126; 5,633,425;

[0043] The term "naked antibody" refers to an antibody that is not conjugated to a cytotoxic moiety or radiolabel.

[0044] The terms "full-length antibody," "intact antibody" or "whole antibody" are used interchangeably to refer to an antibody in its substantially intact form, as opposed to an antibody fragment. Specifically whole antibodies include those with heavy and light chains including an Fc region. The constant domains may be native sequence constant domains (e.g., human native sequence constant domains) or amino acid sequence variants thereof. In some cases, the intact antibody may have one or more effector functions.

[0045] An "antibody fragment" comprises a portion of an intact antibody, preferably the antigen binding and/or the variable region of the intact antibody. Examples of antibody fragments include Fab, Fab', F(ab')₂ and Fv fragments; diabodies; linear antibodies (see U.S. Patent 5,641,870, Example 2; Zapata et al., Protein Eng. 8(10): 1057-1062 [1995]); single-chain antibody molecules and multispecific antibodies formed from antibody fragments. Papain digestion of antibodies produced two identical antigen-binding fragments, called "Fab" fragments, and a residual "Fc" fragment, a designation reflecting the ability to crystallize readily. The Fab fragment consists of an entire L chain along with the variable region domain of the H chain (\(V_H\), and the first constant domain of one heavy chain (\(C_H\)). Each Fab fragment is monovalent with respect to antigen binding, i.e., it has a single antigen-binding site. Pepsin treatment of an antibody yields a single large F(ab')₂ fragment which roughly corresponds to two disulfide linked Fab fragments having different antigen-binding activity and is still capable of cross-linking antigen. Fab' fragments differ from Fab fragments by having a few additional residues at the carboxy terminus of the \(C_H\) domain including one or more cysteines from the antibody hinge region. Fab'-SH is the designation herein for Fab' in which the cysteine residue(s) of the constant domains bear a free thiol group. F(ab')₂ antibody fragments originally were produced as pairs of Fab' fragments which have hinge cysteines between them. Other chemical couplings of antibody fragments are also known.

[0046] The Fc fragment comprises the carboxy-terminal portions of both H chains held together by disulfides. The effector functions of antibodies are determined by sequences in the
Fc region, the region which is also recognized by Fc receptors (FcR) found on certain types of cells.

"Fv" is the minimum antibody fragment which contains a complete antigen-recognition and -binding site. This fragment consists of a dimer of one heavy- and one light-chain variable region domain in tight, non-covalent association. From the folding of these two domains emanate six hypervariable loops (3 loops each from the H and L chain) that contribute the amino acid residues for antigen binding and confer antigen binding specificity to the antibody. However, even a single variable domain (or half of an Fv comprising only three HVRs specific for an antigen) has the ability to recognize and bind antigen, although at a lower affinity than the entire binding site.

"Single-chain Fv" also abbreviated as "sFv" or "scFv" are antibody fragments that comprise the VH and VL antibody domains connected into a single polypeptide chain. Preferably, the sFv polypeptide further comprises a polypeptide linker between the VH and VL domains which enables the sFv to form the desired structure for antigen binding. For a review of the sFv, see Pluckthun in The Pharmacology of Monoclonal Antibodies, vol. 113, Rosenberg and Moore eds., Springer-Verlag, New York, pp. 269-315 (1994).

"Functional fragments" of the antibodies of the invention comprise a portion of an intact antibody, generally including the antigen binding or variable region of the intact antibody or the Fc region of an antibody which retains or has modified FcR binding capability. Examples of antibody fragments include linear antibody, single-chain antibody molecules and multispecific antibodies formed from antibody fragments.

The term "diabodies" refers to small antibody fragments prepared by constructing sFv fragments (see preceding paragraph) with short linkers (about 5-10) residues) between the VH and VL domains such that inter-chain but not intra-chain pairing of the V domains is achieved, thereby resulting in a bivalent fragment, i.e., a fragment having two antigen-binding sites. Bispecific diabodies are heterodimers of two "crossover" sFv fragments in which the VH and VL domains of the two antibodies are present on different polypeptide chains. Diabodies are described in greater detail in, for example, EP 404,097; WO 93/1161; Hollinger et al., Proc. Natl. Acad. Sci. USA 90: 6444-6448 (1993).

The monoclonal antibodies herein specifically include "chimeric" antibodies (immunoglobulins) in which a portion of the heavy and/or light chain is identical with or homologous to corresponding sequences in antibodies derived from a particular species or
belonging to a particular antibody class or subclass, while the remainder of the chain(s) is(are) identical with or homologous to corresponding sequences in antibodies derived from another species or belonging to another antibody class or subclass, as well as fragments of such antibodies, so long as they exhibit the desired biological activity (U.S. Patent No. 4,816,567; Morrison et al., Proc. Natl. Acad. Set USA, 81:6851-6855 (1984)). Chimeric antibodies of interest herein include PRIMATIZED® antibodies wherein the antigen-binding region of the antibody is derived from an antibody produced by, e.g., immunizing macaque monkeys with an antigen of interest. As used herein, "humanized antibody" is used a subset of "chimeric antibodies."

[0052] "Humanized" forms of non-human (e.g., murine) antibodies are chimeric antibodies that contain minimal sequence derived from non-human immunoglobulin. In one embodiment, a humanized antibody is a human immunoglobulin (recipient antibody) in which residues from an HVR (hereinafter defined) of the recipient are replaced by residues from an HVR of a non-human species (donor antibody) such as mouse, rat, rabbit or non-human primate having the desired specificity, affinity, and/or capacity. In some instances, framework ("FR") residues of the human immunoglobulin are replaced by corresponding non-human residues. Furthermore, humanized antibodies may comprise residues that are not found in the recipient antibody or in the donor antibody. These modifications may be made to further refine antibody performance, such as binding affinity. In general, a humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the hypervariable loops correspond to those of a non-human immunoglobulin sequence, and all or substantially all of the FR regions are those of a human immunoglobulin sequence, although the FR regions may include one or more individual FR residue substitutions that improve antibody performance, such as binding affinity, isomerization, immunogenicity, etc. The number of these amino acid substitutions in the FR are typically no more than 6 in the H chain, and in the L chain, no more than 3. The humanized antibody optionally will also comprise at least a portion of an immunoglobulin constant region (Fc), typically that of a human immunoglobulin. For further details, see, e.g., Jones et al., Nature 321:522-525 (1986); Riechmann et al., Nature 332:323-329 (1988); and Presta, Curr. Op. Struct. Biol. 2:593-596 (1992). See also, for example, Vaswani and Hamilton, Ann. Allergy, Asthma & Immunol. 1:105-115 (1998); Harris, Biochem. Soc. Transactions 23:1035-1038 (1995); Hurle and Gross, Curr. Op. Biotech. 5:428-433 (1994); and U.S. Pat. Nos. 6,982,321 and 7,087,409.
A "human antibody" is an antibody that possesses an amino-acid sequence corresponding to that of an antibody produced by a human and/or has been made using any of the techniques for making human antibodies as disclosed herein. This definition of a human antibody specifically excludes a humanized antibody comprising non-human antigen-binding residues. Human antibodies can be produced using various techniques known in the art, including phage-display libraries. Hoogenboom and Winter, *J. Mol. Biol.*, 227:381 (1991); Marks *et al.*, *J. Mol. Biol.*, 222:581 (1991). Also available for the preparation of human monoclonal antibodies are methods described in Cole *et al.*, *Monoclonal Antibodies and Cancer Therapy*, Alan R. Liss, p. 77 (1985); Boerner *et al.*, *J. Immunol.*, 147(1):86-95 (1991). See also van Dijk and van de Winkel, *Curr. Opin. Pharmacol.*, 5:368-74 (2001). Human antibodies can be prepared by administering the antigen to a transgenic animal that has been modified to produce such antibodies in response to antigenic challenge, but whose endogenous loci have been disabled, e.g., immunized xenomice (see, e.g., U.S. Pat. Nos. 6,075,181 and 6,150,584 regarding XENOMOUSE™ technology). See also, for example, Li *et al.*, *Proc. Natl. Acad. Set USA*, 103:3557-3562 (2006) regarding human antibodies generated via a human B-cell hybridoma technology.

The term "hypervariable region," "HVR," or "HV," when used herein refers to the regions of an antibody variable domain which are hypervariable in sequence and/or form structurally defined loops. Generally, antibodies comprise six HVRs; three in the VH (HI, H2, H3), and three in the VL (LI, L2, L3). In native antibodies, H3 and L3 display the most diversity of the six HVRs, and H3 in particular is believed to play a unique role in conferring fine specificity to antibodies. See, e.g., Xu *et al.*, *Immunity* 13:37-45 (2000); Johnson and Wu, in *Methods in Molecular Biology* 248:1-25 (Lo, ed., Human Press, Totowa, NJ, 2003). Indeed, naturally occurring camelid antibodies consisting of a heavy chain only are functional and stable in the absence of light chain. See, e.g., Hamers-Casterman *et al.*, *Nature* 363:446-448 (1993); Sheriff *et al.*, *Nature Struct. Biol.* 3:733-736 (1996).

A number of HVR delineations are in use and are encompassed herein. The Kabat Complementarity Determining Regions (CDRs) are based on sequence variability and are the most commonly used (Kabat *et al.*, *Sequences of Proteins of Immunological Interest*, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD. (1991)). Chothia refers instead to the location of the structural loops (Chothia and Lesk, *J. Mol. Biol.* 196:901-917 (1987)). The AbM HVRs represent a compromise between the Kabat HVRs and Chothia.
structural loops, and are used by Oxford Molecular's AbM antibody modeling software. The "contact" HVRs are based on an analysis of the available complex crystal structures. The residues from each of these HVRs are noted below.

[0056] HVRs may comprise "extended HVRs" as follows: 24-36 or 24-34 (L1), 46-56 or 50-56 (L2) and 89-97 or 89-96 (L3) in the VL and 26-35 (H1), 50-65 or 49-65 (H2) and 93-102, 94-102, or 95-102 (H3) in the VH. The variable domain residues are numbered according to Kabat et al., supra, for each of these definitions.

[0057] The expression "variable-domain residue-numbering as in Kabat" or "amino-acid-position numbering as in Kabat," and variations thereof, refers to the numbering system used for heavy-chain variable domains or light-chain variable domains of the compilation of antibodies in Kabat et al., supra. Using this numbering system, the actual linear amino acid sequence may contain fewer or additional amino acids corresponding to a shortening of, or insertion into, a FR or HVR of the variable domain. For example, a heavy-chain variable domain may include a single amino acid insert (residue 52a according to Kabat) after residue 52 of H2 and inserted residues (e.g. residues 82a, 82b, and 82c, etc. according to Kabat) after heavy-chain FR residue 82. The Kabat numbering of residues may be determined for a given antibody by alignment at regions of homology of the sequence of the antibody with a "standard" Kabat numbered sequence.

[0058] "Framework" or "FR" residues are those variable-domain residues other than the HVR residues as herein defined.

[0059] A "human consensus framework" or "acceptor human framework" is a framework that represents the most commonly occurring amino acid residues in a selection of human immunoglobulin VL or VH framework sequences. Generally, the selection of human immunoglobulin VL or VH sequences is from a subgroup of variable domain sequences. Generally, the subgroup of sequences is a subgroup as in Kabat et al., Sequences of Proteins of Immunological Interest, 5th Ed. Public Health Service, National Institutes of Health, Bethesda,
MD (1991). Examples include for the VL, the subgroup may be subgroup kappa I, kappa II, kappa III or kappa IV as in Kabat et al., supra. Additionally, for the VH, the subgroup may be subgroup I, subgroup II, or subgroup III as in Kabat et al., supra. Alternatively, a human consensus framework can be derived from the above in which particular residues, such as when a human framework residue is selected based on its homology to the donor framework by aligning the donor framework sequence with a collection of various human framework sequences. An acceptor human framework “derived from” a human immunoglobulin framework or a human consensus framework may comprise the same amino acid sequence thereof, or it may contain pre-existing amino acid sequence changes. In some embodiments, the number of pre-existing amino acid changes are 10 or less, 9 or less, 8 or less, 7 or less, 6 or less, 5 or less, 4 or less, 3 or less, or 2 or less.

[0060] A "VH subgroup III consensus framework" comprises the consensus sequence obtained from the amino acid sequences in variable heavy subgroup III of Kabat et al., supra. In one embodiment, the VH subgroup III consensus framework amino acid sequence comprises at least a portion or all of each of the following sequences: EVQLVESGGGLVQPGGSLRLS CAAS (HC-FR1XSEQ ID NO:4), WVRQAPGKGLEWV (HC-FR2), (SEQ ID NO:5), RFTISADTSKNTAYLQMNSLRAEDTAVYYCAR (HC-FR3, SEQ ID NO:6), WGGQTLVTVA (HC-FR4), (SEQ ID NO:7).

[0061] A "VL kappa I consensus framework" comprises the consensus sequence obtained from the amino acid sequences in variable light kappa subgroup I of Kabat et al., supra. In one embodiment, the VH subgroup I consensus framework amino acid sequence comprises at least a portion or all of each of the following sequences: DIQMTQSPSSLSASVGDRVTITC (LC-FRI) (SEQ ID NO:11), WYQQKPGKAPKLIY (LC-FR2) (SEQ ID NO:12), GVPSRFSGSGLTDFTLTISLQPQDFATYYC (LC-FR3) (SEQ ID NO:13), FGQGTKVEIKR (LC-FR4) (SEQ ID NO:14).

[0062] An "amino-acid modification" at a specified position, e.g. of the Fc region, refers to the substitution or deletion of the specified residue, or the insertion of at least one amino acid residue adjacent the specified residue. Insertion "adjacent" to a specified residue means insertion within one to two residues thereof. The insertion may be N-terminal or C-terminal to the specified residue. The preferred amino acid modification herein is a substitution.

[0063] An "affinity-matured" antibody is one with one or more alterations in one or more HVRs thereof that result in an improvement in the affinity of the antibody for antigen, compared

[0064] As use herein, the term "specifically binds to" or is "specific for" refers to measurable and reproducible interactions such as binding between a target and an antibody, which is determinative of the presence of the target in the presence of a heterogeneous population of molecules including biological molecules. For example, an antibody that specifically binds to a target (which can be an epitope) is an antibody that binds this target with greater affinity, avidity, more readily, and/or with greater duration than it binds to other targets. In one embodiment, the extent of binding of an antibody to an unrelated target is less than about 10% of the binding of the antibody to the target as measured, e.g., by a radioimmunoassay (RIA). In certain embodiments, an antibody that specifically binds to a target has a dissociation constant (Kd) of \( \leq 1\mu M \), \( \leq 100\ nM \), \( \leq 10\ nM \), \( \leq 1\ nM \), or \( \leq 0.1\ nM \). In certain embodiments, an antibody specifically binds to an epitope on a protein that is conserved among the protein from different species. In another embodiment, specific binding can include, but does not require exclusive binding.

[0065] As used herein, the term "immunoadhesive" designates antibody-like molecules which combine the binding specificity of a heterologous protein (an "adhesive") with the effector functions of immunoglobulin constant domains. Structurally, the immunoadhesins comprise a fusion of an amino acid sequence with the desired binding specificity which is other than the antigen recognition and binding site of an antibody (i.e., is "heterologous"), and an immunoglobulin constant domain sequence. The adhesin part of an immunoadhesive molecule typically is a contiguous amino acid sequence comprising at least the binding site of a receptor or a ligand. The immunoglobulin constant domain sequence in the immunoadhesive may be obtained from any immunoglobulin, such as IgG-1, IgG-2 (including IgG2A and IgG2B), IgG-3, or IgG-4 subtypes, IgA (including IgA-1 and IgA-2), IgE, IgD or IgM. The Ig fusions preferably include the substitution of a domain of a polypeptide or antibody described herein in
the place of at least one variable region within an Ig molecule. In a particularly preferred embodiment, the immunoglobulin fusion includes the hinge, CH2 and CH3, or the hinge, CH1, CH2 and CH3 regions of an IgGl molecule. For the production of immunoglobulin fusions see also US Patent No. 5,428,130 issued June 27, 1995. For example, useful immunoadhesins as second medicaments useful for combination therapy herein include polypeptides that comprise the extracellular or PD-1 binding portions of PD-L1 or PD-L2 or the extracellular or PD-L1 or PD-L2 binding portions of PD-1, fused to a constant domain of an immunoglobulin sequence, such as a PD-L1 ECD - Fc, a PD-L2 ECD - Fc, and a PD-1 ECD - Fc, respectively.

Immunoadhesin combinations of Ig Fc and ECD of cell surface receptors are sometimes termed soluble receptors.

[0066] A "fusion protein" and a "fusion polypeptide" refer to a polypeptide having two portions covalently linked together, where each of the portions is a polypeptide having a different property. The property may be a biological property, such as activity in vitro or in vivo. The property may also be simple chemical or physical property, such as binding to a target molecule, catalysis of a reaction, etc. The two portions may be linked directly by a single peptide bond or through a peptide linker but are in reading frame with each other.

[0067] A "PD-1 oligopeptide," "PD-L1 oligopeptide," or "PD-L2 oligopeptide" is an oligopeptide that binds, preferably specifically, to a PD-1, PD-L1 or PD-L2 negative costimulatory polypeptide, respectively, including a receptor, ligand or signaling component, respectively, as described herein. Such oligopeptides may be chemically synthesized using known oligopeptide synthesis methodology or may be prepared and purified using recombinant technology. Such oligopeptides are usually at least about 5 amino acids in length, alternatively at least about 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, or 100 amino acids in length or more. Such oligopeptides may be identified using well known techniques. In this regard, it is noted that techniques for screening oligopeptide libraries for oligopeptides that are capable of specifically binding to a polypeptide target are well known in the art (see, e.g., U.S. Patent Nos. 5,556,762, 5,750,373, 4,708,871, 4,833,092, 5,223,409, 5,403,484, 5,571,689, 5,663,143; PCT Publication Nos. WO 84/03506 and WO84/03564; Geysen et al., Proc. Natl. Acad. Sci. U.S.A., 81:3998-4002 (1984); Geysen et al., Proc. Natl. Acad. Sci. U.S.A., 82:178-182

[0068] A "blocking" antibody or an "antagonist" antibody is one that inhibits or reduces a biological activity of the antigen it binds. In some embodiments, blocking antibodies or antagonist antibodies substantially or completely inhibit the biological activity of the antigen. The anti-PD-L1 antibodies of the invention block the signaling through PD-1 so as to restore a functional response by T-cells (e.g., proliferation, cytokine production, target cell killing) from a dysfunctional state to antigen stimulation.

[0069] An "agonist" or activating antibody is one that enhances or initiates signaling by the antigen to which it binds. In some embodiments, agonist antibodies cause or activate signaling without the presence of the natural ligand.

[0070] The term "Fc region" herein is used to define a C-terminal region of an immunoglobulin heavy chain, including native-sequence Fc regions and variant Fc regions. Although the boundaries of the Fc region of an immunoglobulin heavy chain might vary, the human IgG heavy-chain Fc region is usually defined to stretch from an amino acid residue at position Cys226, or from Pro230, to the carboxyl-terminus thereof. The C-terminal lysine (residue 447 according to the EU numbering system) of the Fc region may be removed, for example, during production or purification of the antibody, or by recombinantly engineering the nucleic acid encoding a heavy chain of the antibody. Accordingly, a composition of intact antibodies may comprise antibody populations with all K447 residues removed, antibody populations with no K447 residues removed, and antibody populations having a mixture of antibodies with and without the K447 residue. Suitable native-sequence Fc regions for use in the antibodies of the invention include human IgG1, IgG2 (IgG2A, IgG2B), IgG3 and IgG4.

[0071] "Fc receptor" or "FcR" describes a receptor that binds to the Fc region of an antibody. The preferred FcR is a native sequence human FcR. Moreover, a preferred FcR is one which binds an IgG antibody (a gamma receptor) and includes receptors of the FcyRI, FcyRII, and FcyRIII subclasses, including allelic variants and alternatively spliced forms of these receptors, FcyRII receptors include FcyRIIA (an "activating receptor") and FcyRIIB (an "inhibiting

The phrase "substantially reduced," or "substantially different," as used herein, denotes a sufficiently high degree of difference between two numeric values (generally one associated with a molecule and the other associated with a reference/comparator molecule) such that one of skill in the art would consider the difference between the two values to be of statistical significance within the context of the biological characteristic measured by said values (e.g., Kd values). The difference between said two values is, for example, greater than about 10%, greater than about 20%, greater than about 30%, greater than about 40%, and/or greater than about 50% as a function of the value for the reference/comparator molecule.

The term "substantially similar" or "substantially the same," as used herein, denotes a sufficiently high degree of similarity between two numeric values (for example, one associated with an antibody of the invention and the other associated with a reference/comparator antibody), such that one of skill in the art would consider the difference between the two values to be of little or no biological and/or statistical significance within the context of the biological
characteristic measured by said values (e.g., Kd values). The difference between said two values is, for example, less than about 50%, less than about 40%, less than about 30%, less than about 20%, and/or less than about 10% as a function of the reference/comparator value.

"Carriers" as used herein include pharmaceutically acceptable carriers, excipients, or stabilizers that are nontoxic to the cell or mammal being exposed thereto at the dosages and concentrations employed. Often the physiologically acceptable carrier is an aqueous pH buffered solution. Examples of physiologically acceptable carriers include buffers such as phosphate, citrate, and other organic acids; antioxidants including ascorbic acid; low molecular weight (less than about 10 residues) polypeptide; proteins, such as serum albumin, gelatin, or immunoglobulins; hydrophilic polymers such as polyvinylpyrrolidone; amino acids such as glycine, glutamine, asparagine, arginine or lysine; monosaccharides, disaccharides, and other carbohydrates including glucose, mannose, or dextrins; chelating agents such as EDTA; sugar alcohols such as mannitol or sorbitol; salt-forming counterions such as sodium; and/or nonionic surfactants such as TWEEN™, polyethylene glycol (PEG), and PLURONICS™.

A "package insert" refers to instructions customarily included in commercial packages of medicaments that contain information about the indications customarily included in commercial packages of medicaments that contain information about the indications, usage, dosage, administration, contraindications, other medicaments to be combined with the packaged product, and/or warnings concerning the use of such medicaments, etc.

As used herein, the term "treatment" refers to clinical intervention designed to alter the natural course of the individual or cell being treated during the course of clinical pathology. Desirable effects of treatment include decreasing the rate of disease progression, ameliorating or palliating the disease state, and remission or improved prognosis. For example, an individual is successfully "treated" if one or more symptoms associated with cancer are mitigated or eliminated, including, but are not limited to, reducing the proliferation of (or destroying) cancerous cells, decreasing symptoms resulting from the disease, increasing the quality of life of those suffering from the disease, decreasing the dose of other medications required to treat the disease, delaying the progression of the disease, and/or prolonging survival of individuals.

As used herein, "delaying progression of a disease" means to defer, hinder, slow, retard, stabilize, and/or postpone development of the disease (such as cancer). This delay can be of varying lengths of time, depending on the history of the disease and/or individual being treated. As is evident to one skilled in the art, a sufficient or significant delay can, in effect,
encompass prevention, in that the individual does not develop the disease. For example, a late stage cancer, such as development of metastasis, may be delayed.

[0079] As used herein, "reducing or inhibiting cancer relapse" means to reduce or inhibit tumor or cancer relapse or tumor or cancer progression. As disclosed herein, cancer relapse and/or cancer progression include, without limitation, cancer metastasis.

[0080] An "effective amount" is at least the minimum concentration required to effect a measurable improvement or prevention of a particular disorder. An effective amount herein may vary according to factors such as the disease state, age, sex, and weight of the patient, and the ability of the antibody to elicit a desired response in the individual. An effective amount is also one in which any toxic or detrimental effects of the treatment are outweighed by the therapeutically beneficial effects. For prophylactic use, beneficial or desired results include results such as eliminating or reducing the risk, lessening the severity, or delaying the onset of the disease, including biochemical, histological and/or behavioral symptoms of the disease, its complications and intermediate pathological phenotypes presenting during development of the disease. For therapeutic use, beneficial or desired results include clinical results such as decreasing one or more symptoms resulting from the disease, increasing the quality of life of those suffering from the disease, decreasing the dose of other medications required to treat the disease, enhancing effect of another medication such as via targeting, delaying the progression of the disease, and/or prolonging survival. In the case of cancer or tumor, an effective amount of the drug may have the effect in reducing the number of cancer cells; reducing the tumor size; inhibiting (i.e., slow to some extent or desirably stop) cancer cell infiltration into peripheral organs; inhibit (i.e., slow to some extent and desirably stop) tumor metastasis; inhibiting to some extent tumor growth; and/or relieving to some extent one or more of the symptoms associated with the disorder. An effective amount can be administered in one or more administrations. For purposes of this invention, an effective amount of drug, compound, or pharmaceutical composition is an amount sufficient to accomplish prophylactic or therapeutic treatment either directly or indirectly. As is understood in the clinical context, an effective amount of a drug, compound, or pharmaceutical composition may or may not be achieved in conjunction with another drug, compound, or pharmaceutical composition. Thus, an "effective amount" may be considered in the context of administering one or more therapeutic agents, and a single agent may be considered to be given in an effective amount if, in conjunction with one or more other agents, a desirable result may be or is achieved.

-26-
As used herein, "in conjunction with" refers to administration of one treatment modality in addition to another treatment modality. As such, "in conjunction with" refers to administration of one treatment modality before, during, or after administration of the other treatment modality to the individual.

As used herein, "complete response" or "CR" refers to disappearance of all target lesions; "partial response" or "PR" refers to at least a 30% decrease in the sum of the longest diameters (SLD) of target lesions, taking as reference the baseline SLD; and "stable disease" or "SD" refers to neither sufficient shrinkage of target lesions to qualify for PR, nor sufficient increase to qualify for PD, taking as reference the smallest SLD since the treatment started.

As used herein, "progressive disease" or "PD" refers to at least a 20% increase in the SLD of target lesions, taking as reference the smallest SLD recorded since the treatment started or the presence of one or more new lesions.

As used herein, "progression free survival" (PFS) refers to the length of time during and after treatment during which the disease being treated (e.g., cancer) does not get worse. Progression-free survival may include the amount of time patients have experienced a complete response or a partial response, as well as the amount of time patients have experienced stable disease.

As used herein, "overall response rate" (ORR) refers to the sum of complete response (CR) rate and partial response (PR) rate.

As used herein, "overall survival" refers to the percentage of individuals in a group who are likely to be alive after a particular duration of time.

A "chemotherapeutic agent" is a chemical compound useful in the treatment of cancer. Examples of chemotherapeutic agents include alkylating agents such as thiotepa and cyclophosphamide (CYTOXAN®); alkyl sulfonates such as busulfan, improsulfan, and piposulfan; aziridines such as benzodopa, carboquone, meturedopa, and uredopa; ethylenimines and methylamelamines including altretamine, triethylenemelamine, triethylenephosphoramide, triethylenetriphosphoramide and trimethylolomelamine; acetogenins (especially bullatacin and bullatacinone); delta-9-tetrahydrocannabinol (dronabinol, MARINOL®); beta-lapachone; lapachol; colchicines; betulinic acid; a camptothecin (including the synthetic analogue topotecan (HYCAMTIN®), CPT-11 (irinotecan, CAMPTOSAR®), acetylcamptothecin, scopoletin, and 9-aminocamptothecin); bryostatin; pemetrexed; callystatin; CC-1065 (including its adozelesin, carzelesin and bizelesin synthetic analogues); podophyllotoxin; podophyllinic acid; teniposide;
cryptophycins (particularly cryptophycin 1 and cryptophycin 8); dolastatin; duocarmycin (including the synthetic analogues, KW-2189 and CB1-TM1); eleutherobin; pancratistatin; TLK-286; CDP323, an oral alpha-4 integrin inhibitor; a sarcodictyin; spongistatin; TLK-286; CDP323, a n oral alpha-4 integrin inhibitor; a sarcodictyin; spongistatin; nitrogem mustards such as chlorambucil, chlornaphazine, chlophosphamide, estramustine, ifosfamide, mechlorethamine, mechlorethamine oxide hydrochloride, melphalan, novembichin, phengersterine, prednimustine, trofoxamid, uracil mustard; nitrosureas such as carmustine, chlorozotocin, fotemustine, lomustine, nimustine, and ranimustine; antibiotics such as the enediyne antibiotics (e.g., calicheamicin, especially calicheamicin gammall and calicheamicin omegall (see, e.g., Nicolaou et al., Angew. Chem Intl. Ed. Engl., 33: 183-186 (1994)); dynemicin, including dynemicin A; an esperamycin; as well as neocarzinostatin chromophore and related chromoprotein enediyne antibiotic chromophores), aclacinomysins, actinomycin, authramycin, azaserine, bleomycins, cactinomycin, carabicin, carminomycin, carzinophilin, chromomycinis, dactinomycin, daunorubicin, detorubicin, 6-diazo-5-oxo-L-norleucine, doxorubicin (including ADRIAMYCIN®, morpholino-doxorubicin, cyanomorpholino-doxorubicin, 2-pyrrolino-doxorubicin, doxorubicin HC1 liposome injection (DOXIL®) and deoxydoxorubicin), epirubicin, esorubicin, idarubicin, marcellomycin, mitomycins such as mitomycin C, mycophenolic acid, nogalamycin, olivomycins, peplomycin, potfiromycin, puromycin, quelamycin, rodorubicin, streptonigrin, streptozocin, tubercidin, ubenimex, zinostatin, zorubicin; anti-metabolites such as methotrexate, gemcitabine (GEMZAR®), tegafur (UFTORAL®), capecitabine (XELODA®), an epothilone, and 5-fluorouracil (5-FU); folic acid analogues such as denopterin, methotrexate, pteropterin, trimetrexate; purine analogs such as fludarabine, 6-mercaptopurine, thiamiprine, thioguanine; pyrimidine analogs such as ancitabine, azacitidine, 6-azauridine, carmofur, cytarabine, dideoxyuridine, doxifluridine, enocitabine, floxuridine, and imatinib (a 2-phenylaminopyrimidine derivative), as well as other c-Kit inhibitors; anti-adrenals such as aminoglutethimide, mitotane, trilostane; folic acid replenisher such as frolinic acid; aceglatone; aldophosphamide glycoside; aminolevulinic acid; eniluracil; amsacrine; bestrabucil; bisantrene; edatraxate; defofamine; demecolcine; diaziqzone; elfornithine; elliptinium acetae; etoglucid; gallium nitrate; hydroxyurea; lentinan; londainine; maytansinoids such as maytansine and ansamitocins; mitoguazone; mitoxantrone; mopidanmol; nitraerine; pentostatin; phenamet; pirarubicin; losoxantrone; 2-ethylhydrazide; procarbazine; PSK® polysaccharide complex (JHS Natural Products, Eugene, OR); razoxane; rhizoxin; sizofiran; spirogermanium; tenuazonic acid; triaziquone; 2,2',2"-trichloroethylamine;
trichothecenes (especially T-2 toxin, verracurin A, roridin A and anguidine); urethan; vindesine (ELDISINE®, FILDESIN®, dacarbazine; mannomustine; mitobronitol; mitolactol; pipobroman; gacytosine; arabinoside ("Ara-C"); thiopeta; taxoids, e.g., paclitaxel (TAXOL®), albumin-engineered nanoparticle formulation of paclitaxel (ABRAAXANE™), and doxetaxel (TAXOTERE®); chloranbucil; 6-thioguanine; mercaptopurine; methotrexate; platinum analogs such as cisplatin and carboplatin; vinblastine (VELBAN®); platinum; etoposide (VP-16); ifosfamide; mitoantrone; vincristine (ONCOVIN®); oxaliplatin; leucovovin; vinorelbine (NAVELBINE®); novantrone; edatrexate; daunomycin; aminopterin; ibandronate; topoisomerase inhibitor RFS 2000; difluoromethylornithine (DMFO); retinoids such as retinoic acid; pharmaceutically acceptable salts, acids or derivatives of any of the above; as well as combinations of two or more of the above such as CHOP, an abbreviation for a combined therapy of cyclophosphamide, doxorubicin, vincristine, and prednisolone, and FOLFOX, an abbreviation for a treatment regimen with oxaliplatin (ELOXATIN™) combined with 5-FU and leucovovin.

Additional examples of chemotherapeutic agents include anti-hormonal agents that act to regulate, reduce, block, or inhibit the effects of hormones that can promote the growth of cancer, and are often in the form of systemic, or whole-body treatment. They may be hormones themselves. Examples include anti-estrogens and selective estrogen receptor modulators (SERMs), including, for example, tamoxifen (including NOLVADEX® tamoxifen), raloxifene (EVISTA®), droloxifene, 4-hydroxytamoxifen, trioxifene, keoxifene, LY117018, onapristone, and toremifene (FARESTON®); anti-progesterones; estrogen receptor down-regulators (ERDs); estrogen receptor antagonists such as fulvestrant (FASLODEX®); agents that function to suppress or shut down the ovaries, for example, leutinizing hormone-releasing hormone (LHRH) agonists such as leuprolide acetate (LUPRON® and ELIGARD®), goserelin acetate, buserelin acetate and tripterel; anti-androgens such as flutamide, nilutamide and bicalutamide; and aromatase inhibitors that inhibit the enzyme aromatase, which regulates estrogen production in the adrenal glands, such as, for example, 4(5)-imidazoles, aminoglutethimide, megestrol acetate (MEGASE®), exemestane (AROMASIN®), formestanie, fadrozole, vorozole (RIVISOR®), letrozole (FEMARA®), and anastrozole (ARIMIDEX®). In addition, such definition of chemotherapeutic agents includes bisphosphonates such as clodronate (for example, BONEFOS® or OSTAC®), etidronate (DIDROCAL®), NE-58095, zoledronic acid/zoledronate (ZOMETA®), alendronate (FOSAMAX®), pamidronate (AREDIA®), tiludronate (SKELID®),
or risedronate (ACTONEL®); as well as troxacitabine (a 1,3-dioxolane nucleoside cytosine analog); anti-sense oligonucleotides, particularly those that inhibit expression of genes in signaling pathways implicated in abherant cell proliferation, such as, for example, PKC-alpha, Raf, H-Ras, and epidermal growth factor receptor (EGF-R); vaccines such as THERATOPE® vaccine and gene therapy vaccines, for example, ALLOVECTIN® vaccine, LEUVECTIN® vaccine, and VAXID® vaccine; topoisomerase 1 inhibitor (e.g., LURTOTECAN®); an anti-estrogen such as fulvestrant; a Kit inhibitor such as imatinib or EXEL-0862 (a tyrosine kinase inhibitor); EGFR inhibitor such as erlotinib or cetuximab; an anti-VEGF inhibitor such as bevacizumab; arinotecan; rmRH (e.g., ABARELIX®); lapatinib and lapatinib ditosylate (an ErbB-2 and EGFR dual tyrosine kinase small-molecule inhibitor also known as GW572016); 17AAG (geldanamycin derivative that is a heat shock protein (Hsp) 90 poison), and pharmaceutically acceptable salts, acids or derivatives of any of the above.

[0089] As used herein, the term "cytokine" refers generically to proteins released by one cell population that act on another cell as intercellular mediators or have an autocrine effect on the cells producing the proteins. Examples of such cytokines include lymphokines, monokines; interleukins ("ILs") such as IL-1, IL-1α, IL-2, IL-3, IL-4, IL-5, IL-6, IL-7, IL-8, IL-9, IL10, IL-11, IL-12, IL-13, IL-15, IL-17A-F, IL-18 to IL-29 (such as IL-23), IL-31, including PROLEUKIN® rIL-2; a tumor-necrosis factor such as TNF-a or TNF-β, TGF-pi-3; and other polypeptide factors including leukemia inhibitory factor ("LIF"), ciliary neurotrophic factor ("CNTF"), CNTF-like cytokine ("CLC"), cardiotrophin ("CT"), and kit ligand ("KL").

[0090] As used herein, the term "chemokine" refers to soluble factors (e.g., cytokines) that have the ability to selectively induce chemotaxis and activation of leukocytes. They also trigger processes of angiogenesis, inflammation, wound healing, and tumorigenesis. Example chemokines include IL-8, a human homolog of murine keratinocyte chemoattractant (KC).

[0091] As used herein and in the appended claims, the singular forms "a," "or," and "the" include plural referents unless the context clearly dictates otherwise.

[0092] Reference to "about" a value or parameter herein includes (and describes) variations that are directed to that value or parameter per se. For example, description referring to "about X" includes description of "X".

[0093] The term "alkyl" as used herein refers to a saturated linear or branched-chain monovalent hydrocarbon radical of one to twelve carbon atoms. Examples of alkyl groups include, but are not limited to, methyl (Me, -CH₃), ethyl (Et, -CH₂CH₃), 1-propyl (n-Pr, n-propyl,
-CH₂CH₂CH₃, 2-propyl (i-Pr, i-propyl, -CH(CH₃)₂). 1-butyl (n-Bu, n-butyl, -CH₂CH₂CH₂CH₃), 2-methyl-1-propyl (i-Bu, i-butyl, -CH₂CH₂CH(CH₃)₂), 2-butyl (s-Bu, s-butyl, -CH(CH₃)CH₂CH₃), 2-methyl-2-propyl (t-Bu, t-butyl, -C(CH₃)₃), 1-pentyl (n-pentyl, -CH₂CH₂CH₂CH₂CH₃), 2-pentyl (-CH(CH₃)CH₂CH₂CH₃), 3-pentyl (-CH(CH₂)CH₃), 2-methyl-2-butyl (-C(CH₃)₂CH₂CH₃), 3-methyl-2-butyl (-CH(CH₃)CH(CH₃)₂), 3-methyl-1-butyl (-CH₂CH₂CH(CH₃)₂), 2-methyl-1-butyl (-CH₂CH(CH₃)CH₂CH₃), 1-hexyl (-CH₂CH₂CH₂CH₂CH₂CH₃), 2-hexyl (-CH(CH₃)CH₂CH₂CH₂CH₃), 3-hexyl (-CH(CH₂)CH₂CH₂CH₃), 2-methyl-2-pentyl (-C(CH₃)₂CH₂CH₂CH₃), 3-methyl-2-pentyl (-CH(CH₃)CHCH₂CH₂CH₃), 4-methyl-2-pentyl (-CH(CH₃)CH₂CH₂CH₂CH₂CH₃), 3-methyl-3-pentyl (-C(CH₃)₂CH₂CH₂CH₃), 2-methyl-3-pentyl (-CH(CH₂)CH₂CH₂CH₂CH₃), 2,3-dimethyl-2-butyl (-C(CH₃)₂CH(CH₃)₂), 3,3-dimethyl-2-butyl (-CH(CH₃)₂CH(CH₃)₂), 1-heptyl, 1-octyl, and the like.

0094 The term "alkenyl" refers to linear or branched-chain monovalent hydrocarbon radical of two to twelve carbon atoms with at least one site of unsaturation, i.e., a carbon-carbon, sp² double bond, wherein the alkenyl radical includes radicals having "cis" and "trans" orientations, or alternatively, "E" and "Z" orientations. Examples include, but are not limited to, ethenyl or vinyl (-CH=CH₂), allyl (-CH₂CH=CH₂), and the like.

0095 The term "alkynyl" refers to a linear or branched monovalent hydrocarbon radical of two to twelve carbon atoms with at least one site of unsaturation, i.e., a carbon-carbon, sp triple bond. Examples include, but are not limited to, ethynyl (-C≡CH), propynyl (propargyl, -CH₂C≡CH), and the like.

0096 The terms "carbocycle", "carbocyclic", "carbocyclic ring" and "cycloalkyl" refer to a monovalent non-aromatic, saturated or partially unsaturated ring having 3 to 12 carbon atoms as a monocyclic ring or 7 to 12 carbon atoms as a bicyclic ring. Bicyclic carbocycles having 7 to 12 atoms can be arranged, for example, as a bicyclo [4,5], [5,5], [5,6] or [6,6] system, and bicyclic carbocycles having 9 or 10 ring atoms can be arranged as a bicyclo [5,6] or [6,6] system, or as bridged systems such as bicyclo[2.2.1]heptane, bicyclo[2.2.2]octane and bicyclo[3.2.2]nonane. Examples of monocyclic carbocycles include, but are not limited to, cyclopentyl, cyclohexyl, cyclohex-1-enyl, 1-cyclopent-1-enyl, 1-cyclopent-2-enyl, 1-cyclopent-3-enyl, cycloheptyl, cyclohept-1-enyl, 1-cyclohept-1-enyl, 1-cyclohept-2-enyl, 1-cyclohept-3-enyl, cyclohexadienyl, cycloheptyl, cyclooctyl, cycloundecyl, cyclodecy, cyclododecyl, and the like.

0097 "Aryl" means a monovalent aromatic hydrocarbon radical of 6-18 carbon atoms derived by the removal of one hydrogen atom from a single carbon atom of a parent aromatic...
ring system. Some aryl groups are represented in the exemplary structures as "Ar". Aryl includes bicyclic radicals comprising an aromatic ring fused to a saturated, partially unsaturated ring, or aromatic carbocyclic or heterocyclic ring. Typical aryl groups include, but are not limited to, radicals derived from benzene (phenyl), substituted benzenes, naphthalene, anthracene, indenyl, indanyl, 1,2-dihydronaphthalene, 1,2,3,4-tetrahydronaphthyl, and the like.

[0098] The terms "heterocycle," "heterocyclyl" and "heterocyclic ring" are used interchangeably herein and refer to a saturated or a partially unsaturated (i.e., having one or more double and/or triple bonds within the ring) carbocyclic radical of 3 to 18 ring atoms in which at least one ring atom is a heteroatom selected from nitrogen, oxygen and sulfur, the remaining ring atoms being C, where one or more ring atoms is optionally substituted independently with one or more substituents described below. A heterocycle may be a moncycle having 3 to 7 ring members (2 to 6 carbon atoms and 1 to 4 heteroatoms selected from N, O, P, and S) or a bicycle having 7 to 10 ring members (4 to 9 carbon atoms and 1 to 6 heteroatoms selected from N, O, P, and S), for example: a bicyclo [4,5], [5,5], [5,6], or [6,6] system. Heterocycles are described in Paquette, Leo A.; "Principles of Modern Heterocyclic Chemistry" (W.A. Benjamin, New York, 1968), particularly Chapters 1, 3, 4, 6, 7, and 9; "The Chemistry of Heterocyclic Compounds, A series of Monographs" (John Wiley & Sons, New York, 1950 to present), in particular Volumes 13, 14, 16, 19, and 28; and J. Am. Chem. Soc. (1960) 82:5566. "Heterocyclyl" also includes radicals where heterocycle radicals are fused with a saturated, partially unsaturated ring, or aromatic carbocyclic or heterocyclic ring. Examples of heterocyclic rings include, but are not limited to, pyrrolidinyl, tetrahydrofuranyl, dihydrofuranyl, tetrahydrothienyl, tetrahydropyranyl, dihydropyranyl, tetrahydrothiopyranyl, piperidinyl, morpholinyl, thiomorpholinyl, thioxanyl, piperazinyl, azetidinyl, oxetanyl, thietanyl, homopiperidinyl, oxepanyl, thiepanyl, oxazepinyl, diazepinyl, thiazepinyl, 2-pyrrolinyl, 3-pyrrolinyl, indolinyl, 2H-pyranyl, 4H-pyranyl, dioxanyl, 1,3-dioxolanyl, pyrazolyl, dithianyl, dithiolanyl, dihydropyranyl, dihydrothienyl, dihydrofuranyl, pyrazolidinylimidazolinyl, imidazolidinyl, 3-azabicyclo[3.1.0]hexanyl, 3-azabicyclo[4.1.0]heptanyl, and azabicyclo[2.2.2]hexanyl. Spiro moieties are also included within the scope of this definition. Examples of a heterocyclic group wherein ring atoms are substituted with oxo (=0) moieties are pyrimidinonyl and 1,1-dioxo-thiomorpholinyl.

[0099] The term "heteroaryl" refers to a monovalent aromatic radical of 5- or 6-membered rings, and includes fused ring systems (at least one of which is aromatic) of 5-18 atoms,
containing one or more heteroatoms independently selected from nitrogen, oxygen, and sulfur. Examples of heteroaryl groups are pyridinyl (including, for example, 2-hydroxypyridinyl), imidazolyl, imidazopyridinyl, pyrimidinyl (including, for example, 4-hydroxypyrimidinyl), pyrazolyl, triazolyl, pyrazinyl, tetrazolyl, furyl, thiényl, isoxazolyl, thiazolyl, oxazolyl, isothiazolyl, pyrrolyl, quinolinyl, isoquinolinyl, indolyl, benzimidazolyl, benzofuranyl, cinnolinyl, indazolyl, indolizinyi, phthalazinyl, pyridazinyl, triazinyl, isoindolyl, pteridinyl, purinyl, oxadiazolyl, triazolyl, thiazolyl, furazanyl, benzofurazanyl, benzothiophenyl, benzothiazolyl, benzoaxazolyl, quinazolinyl, quinoxalinyi, naphthyridinyl, and furoxantridinyl.

[0100] The heterocycle or heteroaryl groups may be carbon (carbon-linked) or nitrogen (nitrogen-linked) attached where such is possible. By way of example and not limitation, carbon bonded heterocycles or heteroaryls are bonded at position 2, 3, 4, 5, or 6 of a pyridine, position 3, 4, 5, or 6 of a pyridazine, position 2, 4, 5, or 6 of a pyrimidine, position 2, 3, 5, or 6 of a pyrazine, position 2, 3, 4, or 5 of a furan, tetrahydrofuran, thiofuran, thiophene, pyrrole or tetrahydropyrrole, position 2, 4, or 5 of an oxazole, imidazole or thiazole, position 3, 4, or 5 of an isoxazole, pyrazole, or isothiazole, position 2 or 3 of an aziridine, position 2, 3, or 4 of an azetidine, position 2, 3, 4, 5, 6, 7, or 8 of a quinoline or position 1, 3, 4, 5, 6, 7, or 8 of an isoquinoline.

[0101] By way of example and not limitation, nitrogen bonded heterocycles or heteroaryls are bonded at position 1 of an aziridine, azetidine, pyrrole, pyrrolidine, 2-pyrroline, 3-pyrrolinyl, imidazole, imidazolidine, 2-imidazoline, 3-imidazoline, pyrazole, pyrazoline, 2-pyrazolyl, 3-pyrazoline, piperidine, piperazine, indole, indoline, lH-indazole, position 2 of a isoindole, or isoindoline, position 4 of a morpholine, and position 9 of a carbazole, or β-carboline.

[0102] The heteroatoms present in heteroaryl or heterocycleryl include the oxidized forms such as N⁺−O⁻, S(O) and S(O)₂⁻.

[0103] The term "halo" refers to F, Cl, Br or I.

[0104] The phrase "pharmacologically acceptable salt" as used herein, refers to pharmacologically acceptable organic or inorganic salts of a compound of the invention. Exemplary salts include, but are not limited, to sulfate, citrate, acetate, oxalate, chloride, bromide, iodide, nitrate, bisulfate, phosphate, acid phosphate, isonicotinate, lactate, salicylate, acid citrate, tartrate, olate, tannate, pantothenate, bitartrate, ascorbate, succinate, maleate, gentisinate, fumarate, gluconate, glucuronate, saccharate, formate, benzoate, glutamate, methanesulfonate "mesylate", ethanesulfonate, benzenesulfonate, p-toluenesulfonate, pamoate.
(i.e., 1,1′-methylene-bis-(2-hydroxy-3-naphthoate)) salts, alkali metal (e.g., sodium and potassium) salts, alkaline earth metal (e.g., magnesium) salts, and ammonium salts. A pharmaceutically acceptable salt may involve the inclusion of another molecule such as an acetate ion, a succinate ion or other counter ion. The counter ion may be any organic or inorganic moiety that stabilizes the charge on the parent compound. Furthermore, a pharmaceutically acceptable salt may have more than one charged atom in its structure. Instances where multiple charged atoms are part of the pharmaceutically acceptable salt can have multiple counter ions. Hence, a pharmaceutically acceptable salt can have one or more charged atoms and/or one or more counter ion.

[0105] If the compound of the invention is a base, the desired pharmaceutically acceptable salt may be prepared by any suitable method available in the art, for example, treatment of the free base with an inorganic acid, such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, methanesulfonic acid, phosphoric acid and the like, or with an organic acid, such as acetic acid, maleic acid, succinic acid, mandelic acid, fumaric acid, malonic acid, pyruvic acid, oxalic acid, glycolic acid, salicylic acid, a pyranosidyl acid, such as glucuronic acid or galacturonic acid, an alpha hydroxy acid, such as citric acid or tartaric acid, an amino acid, such as aspartic acid or glutamic acid, an aromatic acid, such as benzoic acid or cinnamic acid, a sulfonic acid, such as p-toluenesulfonic acid or ethanesulfonic acid, or the like.

[0106] If the compound of the invention is an acid, the desired pharmaceutically acceptable salt may be prepared by any suitable method, for example, treatment of the free acid with an inorganic or organic base, such as an amine (primary, secondary or tertiary), an alkali metal hydroxide or alkaline earth metal hydroxide, or the like. Illustrative examples of suitable salts include, but are not limited to, organic salts derived from amino acids, such as glycine and arginine, ammonia, primary, secondary, and tertiary amines, and cyclic amines, such as piperidine, morpholine and piperazine, and inorganic salts derived from sodium, calcium, potassium, magnesium, manganese, iron, copper, zinc, aluminum and lithium.

[0107] The phrase "pharmaceutically acceptable" indicates that the substance or composition must be compatible chemically and/or toxicologically, with the other ingredients comprising a formulation, and/or the mammal being treated therewith.

[0108] A "solvate" refers to an association or complex of one or more solvent molecules and a compound of the invention. Examples of solvents that form solvates include, but are not limited
to, water, isopropanol, ethanol, methanol, DMSO, ethyl acetate, acetic acid, and ethanolamine. The term "hydrate" refers to the complex where the solvent molecule is water.

[0109] It is understood that aspects and variations of the invention described herein include "consisting of and/or "consisting essentially of aspects and variations.

III. Methods

[0110] In one aspect, provided herein is a method for treating or delaying progression of cancer in an individual comprising administering to the individual an effective amount of a PD-1 axis binding antagonist and a MEK inhibitor.

[0111] The methods of this invention may find use in treating conditions where enhanced immunogenicity is desired such as increasing tumor immunogenicity for the treatment of cancer. A variety of cancers may be treated, or their progression may be delayed, including but are not limited to a cancer that may contain a B-raf V600E mutation, a cancer that may contain a B-raf wildtype, a cancer that may contain a KRAS wildtype, or a cancer that may contain an activating KRAS mutation.

[0112] In some embodiments, the individual has cancer or is at risk of developing cancer that is resistant to a B-raf antagonist. In some embodiments, the individual has been previously treated with a B-raf antagonist for cancer. In some embodiments, the individual has not been previously treated with a B-raf antagonist. B-raf is a serine-threonine kinase known to be frequently mutated in cancer, e.g., malignant melanoma, colorectal, ovarian, and thyroid cancer. Typically, B-raf mutations observed in cancer include activating mutations, such as the V600E mutation. Without wishing to be bound to theory, it is thought that activating mutations in B-raf promote deregulated MAPK/ERK signaling, leading to tumor cell proliferation and survival.

[0113] While B-raf antagonists (e.g., B-raf inhibitors) are known to produce effective short-term increases in patient survival and tumor regression, resistance to B-raf inhibition is frequently observed (see, e.g., Tentori, L., et al. Trends Pharmacol. Sci. 34(12):656-66 (2013)). Resistance to B-raf inhibition may be characterized by numerous phenomena. In some embodiments, resistance to B-raf inhibition may be characterized by one or more of MAPK pathway reactivation, PI3K activation, CRAF upregulation, NRAS mutation, PDGFR overexpression, COT1 overexpression, IGFR-1 overexpression, MEK1 mutation, HGF expression, PD-L1 overexpression, MEK2 mutation, MITF focal amplification, AKT mutation (e.g., AKT1 or AKT3), B-raf amplification, and the formation of RAF dimers (e.g.,
CRAF/CRAF dimers, CRAF/B-raf dimers, and mutated dimerizing B-raf such as a B-raf variant lacking exons 4-8).

[0114] In some embodiments, resistance to B-raf inhibition may refer to a cancer cell or tumor that is refractory to B-raf inhibition. Resistance to B-raf inhibition is used herein in the broadest sense and may include any cancer cell that was previously or may be expected to be sensitive to B-raf inhibition through any particular mechanism or at any particular dose of a B-raf antagonist of the present disclosure. Resistance to B-raf inhibition may refer to B-raf activity in the presence of a B-raf antagonist. Resistance to B-raf inhibition may refer to a cell that grows in the presence of a B-raf antagonist when it is not expected to grow under such a condition, regardless of the enzymatic activity of B-raf that may be present.

[0115] In some embodiments, the B-raf antagonist is a small molecule inhibitor, an antibody, a peptide, a peptidomimetic, an aptamer or a polynucleotide.

[0116] In some embodiments, the individual has previously been treated with a B-raf antagonist. In some embodiments, a B-raf antagonist may include vemurafenib (also known as ZELBORAF®), dabrafenib (also known as TAFINLAR®), LGX818, GSK 2118436, RAF265, XL281, ARQ736, BAY73-4506, sorafenib, PLX4720, PLX-3603, GSK2118436, GDC-0879, or N-(3-(5-(4-chlorophenyl)-1H-pyrrolo[2,3-b]pyridine-3-carbonyl)-2,4-difluorophenyl)propane-1-sulfonamide. In some embodiments, a B-raf antagonist may include MLN2480, LY3009120, a MEK inhibitor such as trametinib (also known as MEKINIST®), or an EGFR inhibitor such as erlotinib (also known as TARCEVA®). Further descriptions of B-raf inhibitors may be found in Zambon, A. et al. Bioorg. Med. Chem. Lett. 22(2):789-92 (2012); Tentori, L., et al. Trends Pharmacol. Sci. 34(12):656-66 (2013); and Martin-Liberal, J. and Larkin, J. Expert Opin. Pharmacother. 15(9): 1235-45 (2014), WO2007/002325, WO2007/002433, WO20091 11278, WO20091 11279, WO20091 11277, WO20091 11280 and U.S. Pat. No. 7,491,829.

[0117] In some embodiments, the B-raf antagonist is a selective B-raf antagonist of B-raf V600. In some embodiments, the selective B-raf antagonist of B-raf V600 is a selective antagonist of B-raf V600E. In some embodiments, the selective B-raf antagonist of B-raf V600 is a selective antagonist of B-raf V600E, B-raf V600K, and/or V600D. In some embodiments, the selective B-raf antagonist of B-raf V600 is a selective antagonist of B-raf V600R. Techniques for generating and assaying B-raf antagonists that are selective for B-raf V600 have been described in the art; see, e.g., Tsai, J, et al, Proc. Natl. Acad. Sci. 105(8):3041-6 (2008).
[0118] In some embodiments, the cancer contains a BRAF V600E mutation, a BRAF wildtype, a KRAS wildtype, or an activating KRAS mutation. Methods for detecting the presence of such mutations may include, without limitation, PCR, Sanger sequencing, use of a mutation-specific antibody, and the like. Methods for determining whether a cancer expresses a B-raf V600 are known in the art, including without limitation the COBAS® 4800 B-raf V600 Mutation Test kit (Roche).

[0119] In some embodiments, the patient's cancer has been shown to express a B-raf biomarker. In some embodiments, B-raf biomarker is mutant B-raf. In some embodiments, mutant B-raf is B-raf V600. In some embodiments, B-raf V600 is B-raf V600E. In some embodiments, mutant B-raf is constitutively active.

[0120] In some embodiments, the cancer patient has progressed while receiving a B-raf antagonist therapy (i.e., the patient is "B-raf refractory"), or the patient has progressed within 1 month, 2 months, 3 months, 4 months, 5, months, 6 months, 7 months, 8 months, 9 months, 10 months, 11 months, 12 months, or more after completing a B-raf antagonist-based therapy regimen.

[0121] In some embodiments, vemurafenib resistant cancer is meant that the cancer patient has progressed while receiving vemurafenib-based therapy (i.e., the patient is "vemurafenib refractory"). In some embodiments, cancer in the patient has progressed within 1 month, 2 months, 3 months, 4 months, 5, months, 6 months, 7 months, 8 months, 9 months, 10 months, 11 months, 12 months, or more after completing a vemurafenib-based therapy regimen. In some embodiments, the cancer in the individual has progressed within 1 month, 2 months, 3 months, 4 months, 5, months, 6 months, 7 months, 8 months, 9 months, 10 months, 11 months, 1 year, 2 years, 3 years, 4 years, or 5 years after completing a B-raf antagonist-based therapy regimen.

[0122] In some embodiments, the treatment results in a sustained response in the individual after cessation of the treatment.

[0123] In some embodiments, resistance to, e.g., B-raf inhibitor develops (is acquired) after treatment with B-raf antagonist. In other embodiments, the patient (e.g., the patient having B-raf resistant cancer) has not been previously treated with a B-raf antagonist.

[0124] In some embodiments, the patient is currently being treated with B-raf antagonist, such as a B-raf inhibitor. In some embodiments, the patient was previously treated with B-raf antagonist. In some embodiments, the patient was not previously treated with B-raf antagonist.
In some embodiments, the individual has colorectal cancer, melanoma, lung cancer, ovarian cancer, breast cancer, pancreatic cancer, hematological malignancy, bladder cancer, and/or renal cell carcinoma. In some embodiments, the individual has non-small cell lung cancer. The non-small cell lung cancer may be at early stage or at late stage. In some embodiments, the individual has small cell lung cancer. The small cell lung cancer may be at early stage or at late stage. In some embodiments, the individual has renal cell cancer. The renal cell cancer may be at early stage or at late stage. In some embodiments, the individual has merkel cell cancer. The merkel cell cancer may be at early stage or at late stage. In some embodiments, the individual has gastric carcinoma. The gastric carcinoma may be at early stage or at late stage. In some embodiments, the individual has thymic carcinoma. The thymic carcinoma may be at early stage or at late stage. In some embodiments, the individual has thymic lymphoma. The thymic lymphoma may be at early stage or at late stage. In some embodiments, the individual has lymphomas. The lymphomas may be at early stage or at late stage. In some embodiments, the individual has myelomas. The myelomas may be at early stage or at late stage. In some embodiments, the individual has mycosis fungoides. The mycosis fungoides may be at early stage or at late stage. In some embodiments, the individual has small cell lung cancer. The small cell lung cancer may be at early stage or at late stage.
early stage or at late stage. In some embodiments, the individual has hematologic malignancies. The hematological malignancies may be early stage or late stage. In some embodiments, the individual is a human. In some embodiments, the cancer is metastatic.

[0126] In some embodiments, the individual is a mammal, such as domesticated animals (e.g., cows, sheep, cats, dogs, and horses), primates (e.g., humans and non-human primates such as monkeys), rabbits, and rodents (e.g., mice and rats). In some embodiments, the individual treated is a human.

[0127] In another aspect, provided herein is a method of enhancing immune function in an individual having cancer comprising administering an effective amount of a PD-1 axis binding antagonist and a MEK inhibitor.

[0128] In some embodiments, the CD8 T cells in the individual have enhanced priming, activation, proliferation and/or cytolytic activity relative to prior to the administration of the PD-1 pathway antagonist and the MEK inhibitor. In some embodiments, the CD8 T cell priming is characterized by elevated CD44 expression and/or enhanced cytolytic activity in CD8 T cells. In some embodiments, the CD8 T cell activation is characterized by an elevated frequency of $\gamma$-IFN$^+$ CD8 T cells. In some embodiments, the CD8 T cell is an antigen-specific T-cell. In some embodiments, the immune evasion by signaling through PD-L1 surface expression is inhibited.

[0129] In some embodiments, the cancer cells in the individual have elevated expression of MHC class I antigen expression relative to prior to the administration of the PD-1 pathway antagonist and the MEK inhibitor.

[0130] In some embodiments, the antigen presenting cells in the individual have enhanced maturation and activation relative prior to the administration of the PD-1 pathway antagonist and the MEK inhibitor. In some embodiments, wherein the antigen presenting cells are dendritic cells. In some embodiments, the maturation of the antigen presenting cells is characterized by increased frequency of CD83$^+$ dendritic cells. In some embodiments, the activation of the antigen presenting cells is characterized by elevated expression of CD80 and CD86 on dendritic cells.

[0131] In some embodiments, the serum levels of cytokine IL-10 and/or chemokine IL-8, a human homolog of murine KC, in the individual are reduced relative prior to the administration of the anti-PD-L1 antibody and the MEK inhibitor.

[0132] In some embodiments, the cancer has elevated levels of T-cell infiltration.
In some embodiments, the combination therapy of the invention comprises administration of a PD-1 axis binding antagonist and a MEK inhibitor. The PD-1 axis binding antagonist and the MEK inhibitor may be administered in any suitable manner known in the art. For example, The PD-1 axis binding antagonist and the MEK inhibitor may be administered sequentially (at different times) or concurrently (at the same time).

In some embodiments, the MEK inhibitor is administered continuously. In some embodiments, the MEK inhibitor is administered intermittently. In some embodiments, the MEK inhibitor is administered before administration of the PD-1 axis binding antagonist. In some embodiments, the MEK inhibitor is administered simultaneously with administration of the PD-1 axis binding antagonist. In some embodiments, the MEK inhibitor is administered after administration of the PD-1 axis binding antagonist.

In some embodiments, provided is a method for treating or delaying progression of cancer in an individual comprising administering to the individual an effective amount of a PD-1 axis binding antagonist and a MEK inhibitor, further comprising administering an additional therapy. The additional therapy may be radiation therapy, surgery (e.g., lumpectomy and a mastectomy), chemotherapy, gene therapy, DNA therapy, viral therapy, RNA therapy, immunotherapy, bone marrow transplantation, nanotherapy, monoclonal antibody therapy, or a combination of the foregoing. The additional therapy may be in the form of adjuvant or neoadjuvant therapy. In some embodiments, the additional therapy is the administration of small molecule enzymatic inhibitor or anti-metastatic agent. In some embodiments, the additional therapy is the administration of side-effect limiting agents (e.g., agents intended to lessen the occurrence and/or severity of side effects of treatment, such as anti-nausea agents, etc.). In some embodiments, the additional therapy is radiation therapy. In some embodiments, the additional therapy is surgery. In some embodiments, the additional therapy is a combination of radiation therapy and surgery. In some embodiments, the additional therapy is gamma irradiation. In some embodiments, the additional therapy is therapy targeting PI3K/AKT/mTOR pathway, HSP90 inhibitor, tubulin inhibitor, apoptosis inhibitor, and/or chemopreventative agent. The additional therapy may be one or more of the chemotherapeutic agents described hereabove.

The PD-1 axis binding antagonist and the MEK inhibitor may be administered by the same route of administration or by different routes of administration. In some embodiments, the PD-1 axis binding antagonist is administered intravenously, intramuscularly, subcutaneously, topically, orally, transdermally, intraperitoneally, intraorbitally, by implantation, by inhalation,
intrathecally, intraventricularly, or intranasally. In some embodiments, the MEK inhibitor is administered intravenously, intramuscularly, subcutaneously, topically, orally, transdermally, intraperitoneally, intraorbitally, by implantation, by inhalation, intrathecally, intraventricularly, or intranasally. An effective amount of the PD-1 axis binding antagonist and the MEK inhibitor may be administered for prevention or treatment of disease. The appropriate dosage of the PD-1 axis binding antagonist and/or the MEK inhibitor may be determined based on the type of disease to be treated, the type of the PD-1 axis binding antagonist and the MEK inhibitor, the severity and course of the disease, the clinical condition of the individual, the individual's clinical history and response to the treatment, and the discretion of the attending physician.

PD-1 axis binding antagonists

[0138] Provided herein is a method for treating or delaying progression of cancer in an individual comprising administering to the individual an effective amount of a PD-1 axis binding antagonist and a MEK inhibitor. For example, a PD-1 axis binding antagonist includes a PD-1 binding antagonist, a PD-L1 binding antagonist and a PD-L2 binding antagonist. Alternative names for "PD-1" include CD279 and SLEB2. Alternative names for "PD-L1" include B7-H1, B7-4, CD274, and B7-H. Alternative names for "PD-L2" include B7-DC, Btdc, and CD273. In some embodiments, PD-1, PD-L1, and PD-L2 are human PD-1, PD-L1 and PD-L2.

[0139] In some embodiments, the PD-1 binding antagonist is a molecule that inhibits the binding of PD-1 to its ligand binding partners. In a specific aspect the PD-1 ligand binding partners are PD-L1 and/or PD-L2. In another embodiment, a PD-L1 binding antagonist is a molecule that inhibits the binding of PD-L1 to its binding partners. In a specific aspect, PD-L1 binding partners are PD-1 and/or B7-1. In another embodiment, the PD-L2 binding antagonist is a molecule that inhibits the binding of PD-L2 to its binding partners. In a specific aspect, a PD-L2 binding partner is PD-1. The antagonist may be an antibody, an antigen binding fragment thereof, an immunoadhesin, a fusion protein, or oligopeptide.

[0140] In some embodiment, the PD-1 binding antagonist is an anti-PD-1 antibody (e.g., a human antibody, a humanized antibody, or a chimeric antibody). In some embodiments, the anti-PD-1 antibody is selected from the group consisting of MDX-1106 (nivolumab, OPDIVO®), Merck 3745 (MK-3475, pembrolizumab, KEYTRUDA®), CT- 011 (pidilizumab), MEDI-0680
(AMP-514), PDR001, REGN2810, BGB-108, and BGB-A317. In some embodiments, the PD-1 binding antagonist is an immunoadhesin (e.g., an immunoadhesin comprising an extracellular or PD-1 binding portion of PD-L1 or PD-L2 fused to a constant region (e.g., an Fc region of an immunoglobulin sequence). In some embodiments, the PD-1 binding antagonist is AMP-224. In some embodiments, the PD-L1 binding antagonist is anti-PD-L1 antibody. In some embodiments, the anti-PD-L1 binding antagonist is selected from the group consisting of YW243.55.S70, MPDL3280A (atezolizumab), MEDI4736 (durvalumab), MDX-1105, and MSB0010718C (avelumab). MDX-1105, also known as BMS-936559, is an anti-PD-L1 antibody described in WO2007/005874. Antibody YW243.55.S70 (heavy and light chain variable region sequences shown in SEQ ID Nos: 20 and 21, respectively) is an anti-PD-L1 described in WO 2010/077634 Al. MEDI4736 is an anti-PD-L1 antibody described in WO2011/066389 and US2013/034559. MDX-1106, also known as nivolumab, MDX-1106-04, ONO-4538, BMS-936558, or OPDIVO®, is an anti-PD-1 antibody described in WO2006/121168. Merck 3745, also known as MK-3475, pembrolizumab, lambrolizumab, KEYTRUDA®, or SCH-900475, is an anti-PD-1 antibody described in WO2009/14335. CT-011, also known as hBAT or hBAT-1, is an anti-PD-1 antibody described in WO2009/101611. AMP-224, also known as B7-DCIg, is a PD-L2-Fc fusion soluble receptor described in WO2010/027827 and WO2011/066342.

[0141] In some embodiments, the anti-PD-1 antibody is MDX-1106. Alternative names for "MDX-1106" include MDX-1106-04, ONO-4538, BMS-936558 or nivolumab. In some embodiments, the anti-PD-1 antibody is Nivolumab (CAS Registry Number: 946414-94-4). In a still further embodiment, provided is an isolated anti-PD-1 antibody comprising a heavy chain variable region comprising the heavy chain variable region amino acid sequence from SEQ ID NO:22 and/or a light chain variable region comprising the light chain variable region amino acid sequence from SEQ ID NO:23. In a still further embodiment, provided is an isolated anti-PD-1 antibody comprising a heavy chain and/or a light chain sequence, wherein:

(a) the heavy chain sequence has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100% sequence identity to the heavy chain sequence:

QVQLVESGGGVVQPGRRSLRLDCKASIGITFSNSGWMHWVRQAPGKLEGWVAVIYWDGSKRYYADSVKGRFTISRDNSKNTLFLQMNSLRAEDTAVYYCATNDDYWGQGTLVTVSSASTKPSVFPLAPCSRSTSEUSTAASLGCLVKDYFPEPVTVSWNSGALTSGVHTFPAVL
(b) the light chain sequences has at least 85%, at least 90%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100% sequence identity to the light chain sequence:

[0142] Examples of anti-PD-L1 antibodies useful for the methods of this invention, and methods for making thereof are described in PCT patent application WO 2010/077634 A1, which is incorporated herein by reference.

[0143] In some embodiments, the PD-1 axis binding antagonist is an anti-PD-L1 antibody. In some embodiments, the anti-PD-L1 antibody is capable of inhibiting binding between PD-L1 and PD-1 and/or between PD-L1 and B7-1. In some embodiments, the anti-PD-L1 antibody is a monoclonal antibody. In some embodiments, the anti-PD-L1 antibody is an antibody fragment selected from the group consisting of Fab, Fab'-SH, Fv, scFv, and (Fab')2 fragments. In some embodiments, the anti-PD-L1 antibody is a humanized antibody. In some embodiments, the anti-PD-L1 antibody is a human antibody.

[0144] The anti-PD-L1 antibodies useful in this invention, including compositions containing such antibodies, such as those described in WO 2010/077634 A1, may be used in combination with a MEK inhibitor to treat cancer. In some embodiments, the anti-PD-L1 antibody comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO:20 and a light chain variable region comprising the amino acid sequence of SEQ ID NO:21.

[0145] In one embodiment, the anti-PD-L1 antibody contains a heavy chain variable region polypeptide comprising an HVR-H1, HVR-H2 and HVR-H3 sequence, wherein:

(a) the HVR-H1 sequence is GFTFSXiSWIH (SEQ ID NO: 1);
(b) the HVR-H2 sequence is AWIX2PYGGSX3YYADSVKG (SEQ ID NO: 2);
(c) the HVR-H3 sequence is RHWPGGFDPY (SEQ ID NO: 3);
further wherein: \( X_1 \) is D or G; \( X_2 \) is S or L; \( X_3 \) is T or S.

[0146] In one specific aspect, \( X_1 \) is D; \( X_2 \) is S and \( X_3 \) is T. In another aspect, the polypeptide further comprises variable region heavy chain framework sequences juxtaposed between the HVRs according to the formula: (HC-FR1)-(HVR-H1)-(HC-FR2)-(HVR-H2)-(HC-FR3)-(HVR-H3)-(HC-FR4). In yet another aspect, the framework sequences are derived from human consensus framework sequences. In a further aspect, the framework sequences are VH subgroup III consensus framework. In a still further aspect, at least one of the framework sequences is the following:

- HC-FR1 is EVQLVESGGGLVQPGGLRLSCAAS (SEQ ID NO: 4)
- HC-FR2 is WVRQAPGKGLEWV (SEQ ID NO: 5)
- HC-FR3 is RFTISADTSKNTAYLQMNSLRAEDTA VYYCAR (SEQ ID NO: 6)
- HC-FR4 is WGGQGLTVT (SEQ ID NO: 7).

[0147] In a still further aspect, the heavy chain polypeptide is further combined with a variable region light chain comprising an HVR-L1, HVR-L2 and HVR-L3, wherein:

(a) the HVR-L1 sequence is RASQX4X5X6TX7X8X9A (SEQ ID NO: 8);
(b) the HVR-L2 sequence is SASX_{10}\_S (SEQ ID NO: 9);
(c) the HVR-L3 sequence is QQX_{11}_X_{12}_X_{13}_XPX5T (SEQ ID NO: 10);

further wherein: \( X_4 \) is D or V; \( x_5 \) is V or I; \( X_6 \) is S or N; \( X_7 \) is A or F; \( X_8 \) is V or L; \( X_9 \) is F or T; \( X_{10} \) is Y or A; \( X_\_ \) is Y, G, F, or S; \( X_{11} \) is L, Y, F or W; \( X_{12} \) is Y, N, A, T, G, F or I; \( X_{13} \) is A, W, R, P or T.

[0148] In a still further aspect, \( X_4 \) is D; \( X_5 \) is V; \( X_6 \) is S; \( X_7 \) is A; \( X_8 \) is V; \( X_9 \) is F; \( X_{10} \) is Y; \( X_{11} \) is Y; \( X_{12} \) is L; \( X_{13} \) is Y; \( X_{14} \) is H; \( X_{15} \) is A. In a still further aspect, the light chain further comprises variable region light chain framework sequences juxtaposed between the HVRs according to the formula: (LC-FR1)-(HVR-L1)-(LC-FR2)-(HVR-L2)-(LC-FR3)-(HVR-L3)-(LC-FR4). In a still further aspect, the framework sequences are derived from human consensus framework sequences. In a still further aspect, the framework sequences are VL kappa I consensus framework. In a still further aspect, at least one of the framework sequence is the following:

- LC-FR1 is DIQMTQSPSSLASASVGDRVTITC (SEQ ID NO: 11)
- LC-FR2 is WYQQKPGKAPKLIIY (SEQ ID NO: 12)
- LC-FR3 is GVPSRFSGSSTDFTLTISSLQPEFATYYC (SEQ ID NO: 13).
LC-FR4 is FGQGTKVEIKR (SEQ ID NO:14).

In another embodiment, provided is an isolated anti-PD-L1 antibody or antigen binding fragment comprising a heavy chain and a light chain variable region sequence, wherein:

(a) the heavy chain comprises and HVR-H1, HVR-H2 and HVR-H3, wherein further:

(i) the HVR-H1 sequence is GFTFSX₁SWIH; (SEQ ID NO:1)

(ii) the HVR-H2 sequence is AWIX₂PYGGSX₃YYADSVKG (SEQ ID NO:2)

(iii) the HVR-H3 sequence is RHWPQGFDY, and (SEQ ID NO:3)

(b) the light chain comprises and HVR-L1, HVR-L2 and HVR-L3, wherein further:

(i) the HVR-L1 sequence is RASQX₄X₅X₆TX₇X₈A (SEQ ID NO:8)

(ii) the HVR-L2 sequence is SASX₉LX₁₀S; and (SEQ ID NO:9)

(iii) the HVR-L3 sequence is QQXₙX₁₁X₁₂X₁₃PXₐ₅T; (SEQ ID NO:10)

Further wherein: X₁ is D or G; X₂ is S or L; X₃ is T or S; X₄ is D or V; X₅ is V or I; X₆ is S or N; X₇ is A or F; X₈ is V or L; X₉ is F or T; X₁₀ is Y or A; X₁₁ is Y, G, F, or S; X₁₂ is L, Y, F or W; X₁₃ is Y, N, A, T, G, F or I; X₁₄ is H, V, P, T or I; X₁₅ is A, W, R, P or T.

In a specific aspect, X₁ is D; X₂ is S and X₃ is T. In another aspect, X₄ is D; X₅ is V; X₆ is S; X₇ is A; X₈ is V; X₉ is F; X₁₀ is Y; X₁₁ is Y; X₁₂ is L; X₁₃ is Y; X₁₄ is H; X₁₅ is A. In yet another aspect, X₁ is D; X₂ is S and X₃ is T, X₄ is D; X₅ is V; X₆ is S; X₇ is A; X₈ is V; X₉ is F; X₁₀ is Y; X₁₁ is Y; X₁₂ is L; X₁₃ is Y; X₁₄ is H and X₁₅ is A.

In a further aspect, the heavy chain variable region comprises one or more framework sequences juxtaposed between the HVRs as: (HC-FR1)-(HVR-H1)-(HC-FR2)-(HVR-H2)-(HC-FR3)-(HVR-H3)-(HC-FR4), and the light chain variable regions comprises one or more framework sequences juxtaposed between the HVRs as: (LC-FR1)-(HVR-L1)-(LC-FR2)-(HVR-L2)-(LC-FR3)-(HVR-L3)-(LC-FR4). In a still further aspect, the framework sequences are derived from human consensus framework sequences. In a still further aspect, the heavy chain framework sequences are derived from a Kabat subgroup I, II, or III sequence. In a still further aspect, the heavy chain framework sequence is a VH subgroup III consensus framework. In a still further aspect, one or more of the heavy chain framework sequences is the following:

[0153] In a still further specific aspect, the antibody further comprises a human or murine constant region. In a still further aspect, the human constant region is selected from the group consisting of IgG1, IgG2, IgG3, and IgG4. In a still further specific aspect, the human constant region is IgG1. In a still further aspect, the murine constant region is selected from the group consisting of IgG1, IgG2A, IgG2B, and IgG3. In a still further aspect, the murine constant region if IgG2A. In a still further specific aspect, the antibody has reduced or minimal effector function. In a still further specific aspect the minimal effector function results from an "effector-less Fc mutation" or aglycosylation. In still a further embodiment, the effector-less Fc mutation is an N297A or D265A/N297A substitution in the constant region.

[0154] In yet another embodiment, provided is an anti-PD-L1 antibody comprising a heavy chain and a light chain variable region sequence, wherein:

(a) the heavy chain further comprises HVR-H1, HVR-H2 and an HVR-H3 sequence having at least 85% sequence identity to GFTFSDSWIH (SEQ ID NO: 15), AWISPYGGSTYYADSVKGG (SEQ ID NO: 16) and RHWPGGFDY (SEQ ID NO:3), respectively, or

(b) the light chain further comprises an HVR-L1, HVR-L2 and an HVR-L3 sequence having at least 85% sequence identity to RASQDVSTAVA (SEQ ID NO:17), SASFLYS (SEQ ID NO: 18) and QQYLYHPAT (SEQ ID NO: 19), respectively.

[0155] In a specific aspect, the sequence identity is 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or 100%. In another aspect, the heavy chain variable
region comprises one or more framework sequences juxtaposed between the HVRs as: (HC-FR1)-(HVR-H1)-(HC-FR2)-(HVR-H2)-(HC-FR3)-(HVR-H3)-(HC-FR4), and the light chain variable regions comprises one or more framework sequences juxtaposed between the HVRs as: (LC-FR1)-(HVR-L1)-(LC-FR2)-(HVR-L2)-(LC-FR3)-(HVR-L3)-(LC-FR4). In yet another aspect, the framework sequences are derived from human consensus framework sequences. In a still further aspect, the heavy chain framework sequences are derived from a Kabat subgroup I, II, or III sequence. In a still further aspect, the heavy chain framework sequence is a VH subgroup III consensus framework. In a still further aspect, one or more of the heavy chain framework sequences is the following:

[0161] In a still further specific aspect, the antibody further comprises a human or murine
constant region. In a still further aspect, the human constant region is selected from the group
consisting of IgGl, IgG2, IgG3, and IgG4. In a still further specific aspect, the human
constant region is IgGl. In a still further aspect, the murine constant region is selected from
the group consisting of IgGl, IgG2A, IgG2B, and IgG3. In a still further aspect, the murine
constant region if IgG2A. In a still further specific aspect, the antibody has reduced or minimal
effector function. In a still further specific aspect, the minimal effector function results from
production in prokaryotic cells. In a still further specific aspect the minimal effector function
results from an "effector-less Fc mutation" or aglycosylation. In still a further embodiment, the
effector-less Fc mutation is an N297A or D265A/N297A substitution in the constant region.

[0162] In another further embodiment, provided is an isolated anti-PD-L1 antibody
comprising a heavy chain and a light chain variable region sequence, wherein:

(a) the heavy chain sequence has at least 85% sequence identity to the heavy chain
sequence: EVQLVESGGGLVQPGGSLRLSCAASGFTSFSDSWIHVRQAPGKGLEWVAVIS
PYGGSTYYADSVKGRFTISADTSKNTAYLMNSLRAEDTAVYCCARRHWPQGFDYWG
QGTLVTSS (SEQ ID NO:24), or

(b) the light chain sequence has at least 85% sequence identity to the light chain
sequence: DIQMTQSPSSLSAVGDRVTITCRASQDVSTAVAWYQQKPGKAPKLIIY SASF
LYSGVPSRFSGSGTGTTLTISSLQPEDFATYYCQQYLYHPATFGQGTKVEIKR (SEQ
ID NO:21).

[0163] In a still further embodiment, provided is an isolated anti-PD-L1 antibody comprising a
heavy chain and a light chain variable region sequence, wherein:

(a) the heavy chain sequence has at least 85% sequence identity to the heavy chain
sequence: EVQLVESGGGLVQPGGSLRLSCAASGFTSFSDSWIHVRQAPGKGLEWVAVI

-49-
O164] In a specific aspect, the sequence identity is 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or 100%. In another aspect, the heavy chain variable region comprises one or more framework sequences juxtaposed between the HVRs as: (HC-FR1)-(HVR-H1)-(HC-FR2)-(HVR-H2)-(HC-FR3)-(HVR-H3)-(HC-FR4), and the light chain variable regions comprises one or more framework sequences juxtaposed between the HVRs as: (LC-FR1)-(HVR-L1)-(LC-FR2)-(HVR-L2)-(LC-FR3)-(HVR-L3)-(LC-FR4). In yet another aspect, the framework sequences are derived from human consensus framework sequences. In a further aspect, the heavy chain framework sequences are derived from a Kabat subgroup I, II, or III sequence. In a still further aspect, the heavy chain framework sequence is a VH subgroup III consensus framework. In a still further aspect, one or more of the heavy chain framework sequences is the following:

HC-FR1 EVQLVESGGGLVQPGGSLRLSCAAS (SEQ ID NO:4)
HC-FR2 WVRQAPGKGLEWV (SEQ ID NO:5)
HC-FR3 RFTISADTSKNTAYLQMNSLRAEDTAVYYCAR (SEQ ID NO:6)
HC-FR4 WGQGTLVTVSS (SEQ ID NO:25).

O165] In a still further aspect, the light chain framework sequences are derived from a Kabat kappa I, II, or IV subgroup sequence. In a still further aspect, the light chain framework sequences are VL kappa I consensus framework. In a still further aspect, one or more of the light chain framework sequences is the following:

LC-FR1 DIQMTQSPSSLSASVGDRVTITC (SEQ ID NO:11)
LC-FR2 WYQQKPGKAPKLLY (SEQ ID NO:12)
LC-FR3 GVPSRFSGSGTDLTSSLQPEDFATYYC (SEQ ID NO:13)
LC-FR4 FGGGTKVEIKR (SEQ ID NO:14).
In a still further specific aspect, the antibody further comprises a human or murine constant region. In a still further aspect, the human constant region is selected from the group consisting of IgG1, IgG2, IgG3, and IgG4. In a still further specific aspect, the human constant region is IgG1. In a still further aspect, the murine constant region is selected from the group consisting of IgG1, IgG2A, IgG2B, and IgG3. In a still further aspect, the murine constant region if IgG2A. In a still further specific aspect, the antibody has reduced or minimal effector function. In a still further specific aspect, the minimal effector function results from production in prokaryotic cells. In a still further specific aspect the minimal effector function results from an "effector-less Fc mutation" or aglycosylation. In still a further embodiment, the effector-less Fc mutation is an N297A or D265A/N297A substitution in the constant region.

In yet another embodiment, the anti-PD-1 antibody is MPDL3280A (atezolizumab). In a still further embodiment, provided is an isolated anti-PD-1 antibody comprising a heavy chain variable region comprising the heavy chain variable region amino acid sequence from SEQ ID NO:24 and/or a light chain variable region comprising the light chain variable region amino acid sequence from SEQ ID NO:25. In a still further embodiment, provided is an isolated anti-PD-1 antibody comprising a heavy chain and/or a light chain sequence, wherein:

(a) the heavy chain sequence has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100% sequence identity to the heavy chain sequence:

(b) the light chain sequences has at least 85%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99% or 100% sequence identity to the light chain sequence:

DIIQMTQPSSLSASVGDRTITCRASQDVSTAVAWYQQKPGKAPKLISAYASFLYSGVPS
In a still further embodiment, the invention provides for compositions comprising any of the above described anti-PD-L1 antibodies in combination with at least one pharmaceutically-acceptable carrier.

In a still further embodiment, provided is an isolated nucleic acid encoding a light chain or a heavy chain variable region sequence of an anti-PD-L1 antibody, wherein:

(a) the heavy chain further comprises and HVR-H1, HVR-H2 and an HVR-H3 sequence having at least 85% sequence identity to GFTFSDSWIH (SEQ ID NO: 15), AWISPYGGSTYYADSVKG (SEQ ID NO: 16) and RHWPGGFDY (SEQ ID NO: 3), respectively, and

(b) the light chain further comprises an HVR-L1, HVR-L2 and an HVR-L3 sequence having at least 85% sequence identity to RASQDVSTAVA (SEQ ID NO: 17), SASFLYS (SEQ ID NO: 18) and QQYLYHPAT (SEQ ID NO: 19), respectively.

In a specific aspect, the sequence identity is 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or 100%. In aspect, the heavy chain variable region comprises one or more framework sequences juxtaposed between the HVRs as: (HC-FR1)-(HVR-H1)-(HC-FR2)-(HVR-H2)-(HC-FR3)-(HVR-H3)-(HC-FR4), and the light chain variable regions comprises one or more framework sequences juxtaposed between the HVRs as: (LC-FR1)-(HVR-L1)-(LC-FR2)-(HVR-L2)-(LC-FR3)-(HVR-L3)-(LC-FR4). In yet another aspect, the framework sequences are derived from human consensus framework sequences. In a further aspect, the heavy chain framework sequences are derived from a Kabat subgroup I, II, or III sequence. In a still further aspect, the heavy chain framework sequence is a VH subgroup III consensus framework. In a still further aspect, one or more of the heavy chain framework sequences is the following:

[0172] In a still further specific aspect, the antibody described herein (such as an anti-PD-1 antibody, an anti-PD-L1 antibody, or an anti-PD-L2 antibody) further comprises a human or murine constant region. In a still further aspect, the human constant region is selected from the group consisting of IgGl, IgG2, IgG3, and IgG4. In a still further specific aspect, the human constant region is IgGl. In a still further aspect, the murine constant region is selected from the group consisting of IgGl, IgG2A, IgG2B, and IgG3. In a still further aspect, the murine constant region if IgG2A. In a still further specific aspect, the antibody has reduced or minimal effector function. In a still further specific aspect, the minimal effector function results from production in prokaryotic cells. In a still further specific aspect the minimal effector function results from an "effector-less Fc mutation" or aglycosylation. In still a further aspect, the effector-less Fc mutation is an N297A or D265A/N297A substitution in the constant region.

[0173] In a still further aspect, provided herein are nucleic acids encoding any of the antibodies described herein. In some embodiments, the nucleic acid further comprises a vector suitable for expression of the nucleic acid encoding any of the previously described anti-PD-L1, anti-PD-1, or anti-PD-L2 antibodies. In a still further specific aspect, the vector further comprises a host cell suitable for expression of the nucleic acid. In a still further specific aspect, the host cell is a eukaryotic cell or a prokaryotic cell. In a still further specific aspect, the eukaryotic cell is a mammalian cell, such as Chinese Hamster Ovary (CHO).

[0174] The antibody or antigen binding fragment thereof, may be made using methods known in the art, for example, by a process comprising culturing a host cell containing nucleic acid encoding any of the previously described anti-PD-L1, anti-PD-1, or anti-PD-L2 antibodies or
antigen-binding fragment in a form suitable for expression, under conditions suitable to produce such antibody or fragment, and recovering the antibody or fragment.

[0175] In a still further embodiment, the invention provides for a composition comprising an anti-PD-L1, an anti-PD-1, or an anti-PD-L2 antibody or antigen binding fragment thereof as provided herein and at least one pharmaceutically acceptable carrier. In some embodiments, the anti-PD-L1, anti-PD-1, or anti-PD-L2 antibody or antigen binding fragment thereof administered to the individual is a composition comprising one or more pharmaceutically acceptable carrier. Any of the pharmaceutically acceptable carrier described herein or known in the art may be used.

**MEK inhibitors**

[0176] The invention provides methods for treating cancer or slowing progression of cancer in an individual comprising administering an effective amount of a PD-1 pathway antagonist and a MEK inhibitor. Any known MEK inhibitors are intended, such as the MEK inhibitor compounds described in PCT patent applications WO 03/077914 Al, WO 2005/121142 Al, WO 2007/044515 Al, WO 2008/024725 Al and WO 2009/085983 Al, the content of which are incorporated herein by reference. The MEK inhibitor administered may be in a pharmaceutical composition or formulation. In some embodiments, the pharmaceutical composition or formulation comprises one or more MEK inhibitors described herein and a pharmaceutically acceptable carrier or excipient.

[0177] In some embodiments, the MEK inhibitor is a competitive inhibitor of MEK. In some embodiments, the MEK inhibitor is more selective against an activating KRAS mutation. In some embodiments, the MEK inhibitor is an allosteric inhibitor of MEK. In some embodiments, the MEK inhibitor is more selective against an activating B-raf mutation (e.g., B-raf V600E mutation). In some embodiments, the MEK inhibitor binds and inhibits the activity of MEK1 and/or MEK2 (such as human MEK1 and/or human MEK2).

[0178] In some embodiments, the MEK inhibitor is a compound selected from the group consisting of GDC-0973 (also known as "Cobimetinib" or "XL518"), G-38963, G02443714 (also known as "AS703206"), G02442104 (also known as "GSK-1120212"), and G00039805 (also known as "AZD-6244"), or a pharmaceutically acceptable salt or solvate thereof.

[0179] In some embodiments, the MEK inhibitor is a compound of formula (I),

-54-
or a pharmaceutically acceptable salt or solvate thereof, wherein A, X, R, R₂, R₃, R⁴, R⁵, R⁶, and R⁷ are as defined in Group A, Group B, Group C, or Group D:

**Group A:**
A is arylene optionally substituted with one, two, three or four groups selected from R¹⁰, R¹², R¹⁴, R¹⁶, and R¹⁹ where R¹⁰, R¹², R¹⁴ and R¹⁶ are independently hydrogen, alkyl, alkenyl, alkynyl, halo, haloalkoxy, hydroxy, alkoxy, amino, alkyamino, dialkylamino, haloalkyl, -NHS(0)₂R⁸, -CN, -C(0)R⁸, -C(0)OR⁸, -C(0)NR³⁵R⁸⁸ and -NR⁸C(0)R⁸⁸ and where R¹⁹ is hydrogen, alkyl, or alkenyl;

X is alkyl, halo, haloalkyl, or haloalkoxy;

R¹, R², R³, R⁴, R⁵ and R⁶ are independently hydrogen, halo, nitro, -NR⁸R⁸⁸, -OR⁸, -NHS(0)₂R⁸, -CN, -S(0)ₘR⁸, -S(0)₂NR³⁵R⁸⁸, -C(0)R⁸, -C(0)OR⁸, -C(0)NR³⁵R⁸⁸, -NR⁸C(0)OR⁸, -NR⁸C(0)R⁸, -CH₂N(R²⁵)(NR²⁵aR²⁵b), -CH₂NR²⁵C(=NH)(NR²⁵aR²⁵b), -CH₂NR²⁵C(=NH)(N(R²⁵a)(N0₂)), -CH₂NR²⁵C(=NH)(N(R²⁵a)(CN)), -CH₂NR²⁵C(=NH)(R²⁵), -CH₂NR²⁵C(NR²⁵aR²⁵b)=CH(N0₂), alkyl, alkenyl, alkynyl, cycloalkyl, heteroaryl, or heterocycloalkyl; where the alkyl, alkenyl, alkynyl, cycloalkyl, heteroaryl, and heterocycloalkyl are independently optionally substituted with one, two, three, four, five, six or seven groups independently selected from halo, alkyl, haloalkyl, nitro, optionally substituted cycloalkyl, optionally substituted heterocycloalkyl, optionally substituted aryl, optionally substituted aralkyl, optionally substituted heteroaryl, -OR⁸, -NR⁸R⁸⁸, -NR⁸S(0)₂R⁹, -CN, -S(0)ₘR⁹, -C(0)R⁸, -C(0)OR⁸, -C(0)NR³⁵R⁸⁸, -NR⁸C(0)NR³⁵R⁸⁸ and -NR⁸C(0)OR⁸ and -NR⁸C(0)R⁸; or one of R¹ and R² together with the carbon to which they are attached, R³ and R⁴ together with the carbon to which they are attached, and R⁵ and R⁶ together with the carbon to which they are attached form C(O) or C(=NOH);

m is 0, 1, or 2;

R⁷ is hydrogen, halo or alkyl;
each $R^8$, $R^8$ and $R^8$ is independently selected from hydrogen, hydroxy, optionally substituted alkoxy, alkyl, alkenyl, alkynyl, aryl, cycloalkyl, heteroaryl, and heterocycloalkyl; where the alkyl, alkenyl, alkynyl, aryl, cycloalkyl, heteroaryl, and heterocycloalkyl are independently optionally substituted with one, two, three, four, or five groups independently selected from alkyl, halo, hydroxy, hydroxyalkyl, optionally substituted alkoxy, alkoxyalkyl, haloalkyl, carboxy, alkoxy carbonyl, alkenyl, optionally substituted cycloalkyl, optionally substituted aryloxy, optionally substituted aryloxycarbonyl, optionally substituted aryalkyl, optionally substituted arylalkyl, optionally substituted arylalkoxy, optionally substituted arylhydroxymethyl, nitro, cyano, optionally substituted heterocycloalkyl, optionally substituted heteroaryl, $-S(0)R^{31}$ (where $n$ is 0, 1, or 2 and $R^{31}$ is optionally substituted alkyl, optionally substituted aryl, optionally substituted heterocycloalkyl, or optionally substituted heteroaryl), $-NR^{34}SO_2R^{34a}$ (where $R^{34}$ is hydrogen or alkyl and $R^{34a}$ is alkyl, alkenyl, cycloalkyl, aryl, heteroaryl, or heterocycloalkyl), $-SO_2NR^3S^5$ (where $R^3$ is hydrogen or alkyl and $R^5$ is alkyl, alkenyl, cycloalkyl, aryl, heteroaryl, or heterocycloalkyl), $-NR^3C(0)R^{32a}$ (where $R^{32}$ is hydrogen or alkyl and $R^{32a}$ is alkyl, alkenyl, alkoxy, or cycloalkyl), $-NR^30R^{33a}$ (where $R^{30}$ and $R^{33}$ are independently hydrogen, alkyl, or hydroxyalkyl), and $-C(0)NR^33S^3$ (where $R^{13}$ is hydrogen or alkyl and $R^{13a}$ is alkyl, alkenyl, alkynyl, or cycloalkyl); and

each $R^9$ is independently selected from alkyl, alkenyl, alkynyl, aryl, cycloalkyl, heteroaryl, and heterocycloalkyl; where the alkyl, alkenyl, alkynyl, aryl, cycloalkyl, heteroaryl, and heterocycloalkyl are independently optionally substituted with one, two, three, four, or five groups selected from halo, hydroxy, alkyl, haloalkyl, haloalkoxy, amino, alkylamino, and dialkylamino;

Group B:

A is heteroarylene optionally substituted with one, two, three, or four groups selected from $R^{10}$, $R^{12}$, $R^{14}$, $R^{16}$ and $R^{19}$ where $R^{10}$, $R^{12}$, $R^{14}$ and $R^{16}$ are independently hydrogen, alkyl, alkenyl, alkynyl, halo, haloalkoxy, hydroxy, alkoxy, cyano, amino, alkylamino, dialkylamino, haloalkyl, alkylsulfonyl amino, alkylcarbonyl, alkenylcarbonyl, alkoxy carbonyl, alkenyloxy carbonyl, aminocarbonyl, alkylaminocarbonyl, dialkylaminocarbonyl, or alkylcarbonylamino; where $R^{19}$ is hydrogen, alkyl, or alkenyl;
and where each alkyl and alkenyl, either alone or as part of another group within \( R^0 \), \( R^{12} \),
\( R^4 \), \( R^6 \) and \( R^{18} \), is independently optionally substituted with halo, hydroxy, or alkoxy;
X is alkyl, halo, haloalkyl, or haloalkoxy;
\( R^1 \), \( R^2 \), \( R^3 \), \( R^4 \), \( R^5 \) and \( R^6 \) are independently hydrogen, halo, nitro, -\( NR^8 R^{18} \), -OR\(^8 \), -N\( HS(0)_2 R^8 \),
-CN, -\( S(0)_m R^8 \), -\( S(0)_2 NR^8 R^{18} \), -\( C(0)R^8 \), -\( C(0)OR^8 \), -\( C(0)NR^8 R^{18} \), -\( NR^8 C(0)OR^8 \),
-\( NR^8 C(0)NR^8 R^{18} \), -\( NR^8 C(0)OR^8 \), -\( NR^8 C(0)R^8 \), -\( CH_2 N(R^{25})(N(R^{25a}R^{25b})) \),
-\( CH_2 NR^{25} C(=NH)(NR^{25a}R^{25b}) \), -\( CH_2 NR^{25} C(=NH)(N(R^{25a})(N(0 \_2)) \),
-\( CH_2 NR^{25} C(=NH)(N(R^{25a})(CN)) \), -\( CH_2 NR^{25} C(=NH)(R^{25}) \),
-\( CH_2 NR^{25} C(N(R^{25a}R^{25b})=CH(N(0 \_2)) \), alkyl, alkenyl, alkynyl, cycloalkyl, heteroaryl, or
heterocycloalkyl, where the alkyl, alkenyl, alkynyl, cycloalkyl, heteroaryl, and
heterocycloalkyl are independently optionally substituted with one, two, three, four, five,
six or seven groups independently selected from halo, alkyl, haloalkyl, nitro, optionally
substituted cycloalkyl, optionally substituted heterocycloalkyl, optionally substituted aryl,
only substituted arylalkyl, optionally substituted heteroaryl, -OR\(^8 \),

[0180] In some variations, the MEK inhibitor compound of the formula (I) is a compound of the Group A, having the formula 1(a) or 1(b):

or a pharmaceutically acceptable salt or solvate thereof, wherein the variables are as defined for the formula (I), Group A, or as defined in WO 2007/044515 Al, incorporated herein by reference.

[0181] In some variations, the MEK inhibitor compound of the formula (I) is a compound of the Group B, having the formula 1(c), 1(d), 1(e), 1(f), 1(g), 1(h), 1(i), 1(j), 1(k), 1(m), 1(n), 1(o), 1(p), 1(q), 1(r), 1(s), 1(u), 1(v), 1(w), 1(x), 1(cc) or 1(dd):
or a pharmaceutically acceptable salt or solvate thereof, wherein the variables are as defined for
the formula (I), Group B, or as defined in WO 2007/044515 Al, incorporated herein by
reference.

[0182] In some variations, the MEK inhibitor compound of the formula (I) is a compound of
the Group C, having the formula I(y) or I(z):

or a pharmaceutically acceptable salt or solvate thereof, wherein the variables are as defined for
the formula (I), Group C, or as defined in WO 2007/044515 Al, incorporated herein by
reference.
In some variations, the MEK inhibitor compound of the formula (I) is a compound of the Group D, having the formula I(aa) or I(bb):

![Chemical structures of I(aa) and I(bb)]

or a pharmaceutically acceptable salt or solvate thereof, wherein the variables are as defined for the formula (I), Group D, or as defined in WO 2007/044515 Al, incorporated herein by reference.

In some embodiments, the MEK inhibitor compound of the formula (I) is a compound selected from the compound Nos. 1-362 as listed in WO 2007/044515 Al, Table 1 on pages 71-144 (herein collectively referred to as the Formula I Species), or a pharmaceutically acceptable salt or solvate thereof.

Also embraced are any variations of formula (I) as described in WO 2007/044515 Al, which is incorporated herein by reference. Compounds of the formula (I) or any variations thereof can be synthesized using methods known in the art, for example, the synthetic methods described in WO 2007/044515 Al, incorporated herein by reference.

Unless defined otherwise herein, the terms used in describing compounds of the formula (I) should be understood to have the same meaning as defined in WO 2007/044515 Al.

In some embodiments, the MEK inhibitor is a compound of formula (II):

![Chemical structure of (II)]

or a pharmaceutically acceptable salt or solvate thereof, wherein:

- $Z^1$ is CR\(^1\) or N;
- $Z^2$ is CR\(^2\) or N;
- $Z^3$ is CR\(^3\) or N;
where one or two of $Z^1, Z^2, Z^3$, and $Z^4$ are $N$;

$R^1, R^2, R^3$ and $R^4$ are independently selected from $H$, halo, $CN$, $CF_3$, $-OCF_3$, $-NO_2$,

SC(=Y)R$_{16}$, -(CR$_{19}$R$_{20}$)$_n$SC(=Y)OR$_{16}$, -(CR$_{19}$R$_{20}$)$_n$SC(=Y)NR$_{16}$R$_{17}$, and $R^{21}$,

each $R^{16}$, $R^{17}$ and $R^{18}$ is independently H, C$_1$- C$_{12}$ alkyl, C$_2$- C$_8$ alkenyl, C$_2$- C$_8$ alkynyl, carbocyclyl, heterocyclyl, aryl, or heteroaryl, wherein said alkyl, alkenyl, alkynyl, carboyclyl, heterocyclyl, aryl, or heteroaryl,
heterocyclyl, aryl, or heteroaryl is optionally substituted with one or more groups selected from halo, oxo, CN, -OCF₃, CF₃, -NO₂, C₁-C₆ alkyl, -OH, -SH, -O(C₁-C₆ alkyl), -S(C₁-C₆ alkyl), -NH₂, -NH(C₁-C₆ alkyl), -N(C₁-C₆ alkyl)₂, -S0₂ (C₁-C₆ alkyl), -C0₂H, -C0₂ (C₁-C₆ alkyl), -C(0)NH₂, -C(0)NH(C₁-C₆ alkyl), -C(0)N(C₁-C₆ alkyl)₂, -N(C₁-C₆ alkyl)C(0)(C₁-C₆ alkyl), -NHC(0)(C₁-C₆ alkyl), -NHSO₂ (C₁-C₆ alkyl), -N(C₁-C₆ alkyl)SO₂ (C₁-C₆ alkyl), -S0₂N₂, -S0₂N(C₁-C₆ alkyl), -S0₂N(C₁-C₆ alkyl)₂, -OC(0)NH₂, -OC(0)NH(C₁-C₆ alkyl), -OC(0)N(C₁-C₆ alkyl)₂, -OC(0)O (C₁-C₆ alkyl), -NHC(0)NH(C₁-C₆ alkyl), -NHC(0)N(C₁-C₆ alkyl)₂, -NH(C₁-C₆ alkyl)₂, -NH(C₁-C₆ alkyl)C(0)(C₁-C₆ alkyl), and -N(C₁-C₆ alkyl)C(0)(C₁-C₆ alkyl);

or R¹⁶ and R¹⁷ together with the nitrogen to which they are attached form a 3-8
membered saturated, unsaturated or aromatic ring having 0-2 heteroatoms selected from O, S
and N, wherein said ring is optionally substituted with one or more groups selected from halo,
CN, -OCF₃, CF₃, -NO₂, C₁-C₆ alkyl, -OH, -SH, -O(C₁-C₆ alkyl), -S(C₁-C₆ alkyl), -NH₂,
-NH(C₁-C₆ alkyl), -N(C₁-C₆ alkyl)₂, -S0₂ (C₁-C₆ alkyl), -C0₂H, -C0₂ (C₁-C₆ alkyl),
-C(0)NH₂, -C(0)NH(C₁-C₆ alkyl), -C(0)N(C₁-C₆ alkyl)₂, -N(C₁-C₆ alkyl)C(0)(C₁-C₆ alkyl),
-NHC(0)(C₁-C₆ alkyl), -NHSO₂ (C₁-C₆ alkyl), -N(C₁-C₆ alkyl)SO₂ (C₁-C₆ alkyl), -S0₂N₂,
-S0₂N(C₁-C₆ alkyl), -S0₂N(C₁-C₆ alkyl)₂, -OC(0)NH₂, -OC(0)NH(C₁-C₆ alkyl),
-OC(0)N(C₁-C₆ alkyl)₂, -OC(0)O (C₁-C₆ alkyl), -NHC(0)NH(C₁-C₆ alkyl), -NHC(0)N(C₁-C₆ alkyl)₂,
-NHC(0)(C₁-C₆ alkyl), -NH(C₁-C₆ alkyl)₂, -NH(C₁-C₆ alkyl)C(0)(C₁-C₆ alkyl), and -N(C₁-C₆ alkyl)C(0)(C₁-C₆ alkyl);

R¹⁹ and R²⁰ are independently selected from H, C₁-C₁₂ alkyl, -(CH₂)ₙ-aryl, -(CH₂)ₙ-carbocyclyl, -(CH₂)ₙ-heterocyclyl, and -(CH₂)ₙ-heteroaryl;

R²¹ is C₁-C₁₂ alkyl, C₂-C₆ alkendiyl, C₂-C₆ alkynyl, carbocyclyl, heterocyclyl, aryl, or
heteroaryl, wherein each member of R²¹ is optionally substituted with one or more groups
selected from halo, CN, -OCF₃, CF₃, -NO₂, C₁-C₆ alkyl, -OH, -SH, -O(C₁-C₆ alkyl), -S(C₁-C₆ alkyl), -NH₂, -NH(C₁-C₆ alkyl), -N(C₁-C₆ alkyl)₂, -S0₂ (C₁-C₆ alkyl), -C0₂H, -C0₂ (C₁-C₆ alkyl),
-C(0)NH₂, -C(0)NH(C₁-C₆ alkyl), -C(0)N(C₁-C₆ alkyl)₂, -N(C₁-C₆ alkyl)C(0)(C₁-C₆ alkyl),
-NHC(0)(C₁-C₆ alkyl), -NHSO₂ (C₁-C₆ alkyl), -N(C₁-C₆ alkyl)SO₂ (C₁-C₆ alkyl), -S0₂N₂,
-S0₂N(C₁-C₆ alkyl), -S0₂N(C₁-C₆ alkyl)₂, -OC(0)NH₂, -OC(0)NH(C₁-C₆ alkyl),
-OC(0)N(C₁-C₆ alkyl)₂, -OC(0)O (C₁-C₆ alkyl), -NHC(0)NH(C₁-C₆ alkyl), -NHC(0)N(C₁-C₆ alkyl)₂,
-NHC(0)(C₁-C₆ alkyl), -NH(C₁-C₆ alkyl)₂, -NH(C₁-C₆ alkyl)C(0)(C₁-C₆ alkyl), and -N(C₁-C₆ alkyl)C(0)(C₁-C₆ alkyl);
-OC(0)N(C$_1$-C$_6$ alkyl)$_2$, -OC(0)O(C$_1$-C$_6$ alkyl), -NHC(0)NH(C$_1$-C$_6$ alkyl), -NHC(0)N(C$_1$-C$_6$ alkyl)$_2$,
-N(C$_1$-C$_6$ alkyl)C(0)NH(C$_1$-C$_6$ alkyl), -N(C$_1$-C$_6$ alkyl)C(0)N(C$_1$-C$_6$ alkyl)$_2$,
-NHC(0)NH(C$_1$-C$_6$ alkyl), -NHC(0)N(C$_1$-C$_6$ alkyl)$_2$, -NH(0)(C$_1$-C$_6$ alkyl), and -N(C$_1$-C$_6$
alkyl)C(0)(Cl-C$_6$ alkyl);

each Y' is independently O, NR$^{22}$, or S; and

R$^{22}$ is H or C$_1$-C$_{12}$ alkyl.

[0188] In some variations, the MEK inhibitor compound of the formula (II) is a compound of
the formula (II-1-a), (II-1-b), (II-1-c), (II-1-d), (II-1-e), (II-1-f), (II-1-g), (II-1-h),
(II-1-i), (II-2-a), (II-2-b), (II-2-c), (II-2-d), (II-2-e), (II-2-f), (II-2-g), (II-2-h),
(II-2-i), (II-3-a), (II-3-b), (II-3-c), (II-3-d), (II-3-e), (II-3-f), (II-3-g),
(II-3-h), or (II-3-i):
or a pharmaceutically acceptable salt or solvate thereof, wherein the variables are as defined for the formula (II) or as defined in WO 2008/024725 A1, incorporated herein by reference.

[0189] In some embodiments, the MEK inhibitor compound of the formula (II) is a compound selected from the compounds of Examples 5-18, 20-102, 105-109, 111-118, 120-133, 136-149 and 151-160 in WO 2008/024725 A1 (herein collectively referred to as the Formula II Species), or a pharmaceutically acceptable salt or solvate thereof. These compounds exhibited an IC₅₀ of
less than 10 µM in the assay described either in Example 8a or 8b (MEK activity assays). Most of these compounds exhibited an IC_{50} of less than 5 µM. See page 62 in WO 2008/024725 Al.

Also embraced are MEK inhibitor compounds (and/or solvates and salts thereof) described in WO 2008/024725 Al, which is incorporated herein by reference, for example, aza-benzofuran compounds of the formula (II) (designated as formula I in WO 2008/024725 Al, e.g., on page 3) and variations thereof as described in WO 2008/024725 Al. Compounds of formula (II) can be synthesized using methods known in the art, for example, the synthetic methods described in WO 2008/024725 Al, incorporated herein by reference.

In some embodiments, the MEK inhibitor is a compound of formula (III):

membered saturated, unsaturated or aromatic ring having 0-2 heteroatoms selected from O, S

and N, wherein said ring is optionally substituted with one or more groups selected from halo,

CN, -OCF\(_3\), CF\(_3\), -N0\(_2\), C\(_1\)-C\(_6\) alkyl, -OH, -SH, -0(C\(_1\)-C\(_6\) alkyl), -S(C\(_1\)-C\(_6\) alkyl), -NH\(_2\),

-NH(C\(_1\)-C\(_6\) alkyl), -N(C\(_1\)-C\(_6\) alkyl), -S0\(_2\)(C\(_1\)-C\(_6\) alkyl), -C0\(_2\)H, -C0\(_2\)(C\(_1\)-C\(_6\) alkyl),

-C(0)NH\(_2\), -C(0)NH(Ci-C\(_6\) alkyl), -C(0)N(C\(_1\)-C\(_6\) alkyl), -N(C\(_1\)-C\(_6\) alkyl)(C\(_0\))(C\(_1\)-C\(_6\) alkyl),

-NHC(0)(Ci-C\(_6\) alkyl), -NHS0\(_2\)(C\(_1\)-C\(_6\) alkyl), -N(C\(_1\)-C\(_6\) alkyl)S0\(_2\)(C\(_1\)-C\(_6\) alkyl), -S0\(_2\)NH\(_2\),

-S0\(_2\)NH(C\(_1\)-C\(_6\) alkyl), -S0\(_2\)N(C\(_1\)-C\(_6\) alkyl), -OC(0)NH\(_2\), -OC(0)NH(C\(_1\)-C\(_6\) alkyl),

-OC(0)(C\(_1\)-C\(_6\) alkyl), -OC(0)0(C\(_1\)-C\(_6\) alkyl), -NHC(0)NH(C\(_1\)-C\(_6\) alkyl), -NHC(0)N(C\(_1\)-C\(_6\) alkyl),

-N(C\(_1\)-C\(_6\) alkyl)C(O)NH(C\(_1\)-C\(_6\) alkyl), -N(C\(_1\)-C\(_6\) alkyl)(C\(_0\))(C\(_1\)-C\(_6\) alkyl),

-NHC(0)(Ci-C\(_6\) alkyl), -NHC(0)N(C\(_1\)-C\(_6\) alkyl), -NHC(0)0(C\(_1\)-C\(_6\) alkyl), and -N(C\(_1\)-C\(_6\) alkyl)(C\(_0\))(C\(_1\)-C\(_6\) alkyl);

R\(^{19}\) and R\(^{20}\) are independently selected from H, C\(_1\)-C\(_12\) alkyl, -(CH\(_2\))\(_n\)-aryl, -(CH\(_2\))\(_n\)-
carbocyclyl, -(CH\(_2\))\(_n\)-heterocyclyl, and -(CH\(_2\))\(_n\)-heteroaryl;

R\(^{21}\) is C\(_1\)-C\(_12\) alkyl, C\(_2\)-Cs alkenyl, C\(_2\)-Cs alkynyl, carbocyclyl, heterocyclyl, aryl, or

heteroaryl, wherein each member of R\(^{21}\) is optionally substituted with one or more groups
selected from halo, oxo, CN, -OCF₃, CF₃, -N0₂, C₁-C₆ alkyl, -OH, -SH, -O(C₁-C₆ alkyl), 
-S(C₁-C₆ alkyl), -NH₂, -NH(C₁-C₆ alkyl), -N(C₁-C₆ alkyl)₂, -S0₂(C₁-C₆ alkyl), -C0₂H, 
-C0₂(C₁-C₆ alkyl), -C(0)NH₂, -C(0)NH(C₁-C₆ alkyl), -C(0)N(C₁-C₆ alkyl)₂, -N(C₁-C₆ 
alkyl)C(0)(C₁-C₆ alkyl), -NHC(0)(C₁-C₆ alkyl), -NHS0₂(C₁-C₆ alkyl), -N(C₁-C₆ alkyl)S0₂(C₁-C₆ alkyl), 
-S0₂NH₂, -S0₂NH(C₁-C₆ alkyl), -S0₂N(C₁-C₆ alkyl)₂, -OC(0)NH₂, 
-OC(0)NH(C₁-C₆ alkyl), -OC(0)N(C₁-C₆ alkyl)₂, -OC(0)O(C₁-C₆ alkyl), 
-NHC(0)NH(C₁-C₆ alkyl), -NHC(0)N(C₁-C₆ alkyl)₂, -N(C₁-C₆ alkyl)C(0)N(C₁-C₆ alkyl), 
-NHC(0)N(C₁-C₆ alkyl), -NHC(0)NHC(0)(C₁-C₆ alkyl), 
-NHC(0)(C₁-C₆ alkyl)₂, and -N(C₁-C₆ alkyl)C(0)O(C₁-C₆ alkyl);
each Y' is independently O, NR₂, or S; and
R₂² is H or C₁-C₁₂ alkyl.

[0192] In some variations, the MEK inhibitor compound of the formula (III) has the formula 
(III-a) or (III-b):

III-a

III-b

or a pharmaceutically acceptable salt or solvate thereof, wherein the variables are as defined for 
the formula (III) or as defined in WO 2009/085983 Al, incorporated herein by reference.

[0193] In some embodiments, the MEK inhibitor compound of the formula (III) is a 
compound selected from the compounds listed in Table 1, or a pharmaceutically acceptable salt 
or solvate thereof.

Compounds in Table 1 correspond to Examples 5-25 in WO 2009/085983 Al.

Compounds (III)-5 - (III)-20 and (III)-22 - (III)-24 exhibited an IC₅₀ of less than 0.5 µM in the assay described in Example 8b (MEK activity assay). Some of these compounds exhibited an IC₅₀ of less than 0.1 µM. Compounds (III)-21 and (III)-25 exhibited an IC₅₀ of less than 10 µM. See page 49 in WO 2009/085983 Al.
Also embraced are MEK inhibitor compounds (and/or solvates and salts thereof) described in WO 2009/085983 Al, which is incorporated herein by reference, for example, imidazopyridine compounds of the formula (III) (designated as formula I in WO 2009/085983 Al, e.g., on page 3) and variations thereof as described in WO 2009/085983 Al. Compounds of formula (III) can be synthesized using methods known in the art, for example, the synthetic methods described in WO 2009/085983 Al, incorporated herein by reference.

In some embodiments, the MEK inhibitor is a compound of formula (IV),

![Formula IV](image)

or a pharmaceutically acceptable salt or solvate thereof, wherein the variables are as defined in WO 03/077914 Al for the formula I on pages 4-9 or any applicable variations described in WO 03/077914 Al, incorporated herein by reference.

In some variations, the MEK inhibitor compound of the formula (IV) is a compound of the formula (IV-a), (IV-b), (IV-c), or (IV-d):

![Formula IV-a and IV-b](image)
or a pharmaceutically acceptable salt or solvate thereof, wherein the variables are as defined in WO 03/077914 A1 for the formulae II, III, Ila and Illb, respectively on pages 10-13 or any applicable variations described in WO 03/077914 A1, incorporated herein by reference.

In some embodiments, the MEK inhibitor compound of the formula (IV) is a compound selected from the group consisting of:

- 7-Fluoro-6-(4-bromo-2-methyl-phenylamino)-3H-benzoimidazole-5-carboxylic acid cyclopropylmethoxyamide;
- 6-(4-Bromo-2-chloro-phenylamino)-7-fluoro-3H-benzoimidazole-5-carboxylic acid cyclopropylmethoxyamide;
- 6-(4-Bromo-2-chloro-phenylamino)-7-fluoro-3-methyl-3H-benzoimidazole-5-carboxylic acid (2-hydroxy-ethoxy)-amide;
- 6-(4-Bromo-2-chloro-phenylamino)-7-fluoro-3-methyl-3H-benzoimidazole-5-carboxylic acid (2,3-dihydroxy-propoxy)-amide;
- 6-(4-Bromo-2-chloro-phenylamino)-7-fluoro-3-(tetrahydro-pyran-2-ylmethyl)-3H-benzoimidazole-5-carboxylic acid (2-hydroxy-ethoxy)-amide;
- [6-(5-Amino-[1,3,4]oxadiazol-2-yl)-4-fluoro-1H-benzoimidazol-5-yl]-(4-bromo-2-methyl-phenyl)-amine;
- 1-[6-(4-Bromo-2-chloro-phenylamino)-7-fluoro-3-methyl-3H-benzoimidazol-5-yl]-2-hydroxy-ethanone;
- 1-[6-(4-Bromo-2-chloro-phenylamino)-7-fluoro-3H-benzoimidazol-5-yl]-2-methoxy ethanone;
- 6-(4-Bromo-2-chloro-phenylamino)-7-fluoro-3-methyl-3H-benzoimidazole-5-carboxylic acid (2-hydroxy-1,1-dimethyl-ethoxy)-amide;
- 6-(4-Bromo-2-chloro-phenylamino)-7-fluoro-3-(tetrahydro-furan-2-ylmethyl)-3H-benzoimidazole-5-carboxylic acid (2-hydroxy-ethoxy)-amide;
6-(4-Bromo-2-chloro-phenylamino)-7-fluoro-3H-benzoimidazole-5-carboxylic acid (2-hydroxy-ethoxy)-amide;
6-(-Bromo-2-fluoro-phenylamino)-7-fluoro-3-methyl-3H-benzoimidazole-5-carboxylic acid (2-hydroxy-ethoxy)-amide; and
6-(2,4-Dichloro-phenylamino)-7-fluoro-3-methyl-3H-benzoimidazole-5-carboxylic acid (2-hydroxy-ethoxy)-amide;
or a pharmaceutically acceptable salt or solvate thereof.

[0199] Also embraced are any variations of formula (IV) as described in WO 03/077914 Al, which is incorporated herein by reference. Compounds of the formula (IV) or any variations thereof can be synthesized using methods known in the art, for example, the synthetic methods described in WO 03/077914 Al, incorporated herein by reference.

[0200] In some embodiments, the MEK inhibitor is a compound of formula (V),

or a pharmaceutically acceptable salt or solvate thereof, wherein the variables are as defined in WO 2005/121142 Al for the formula [I] on pages 6-10 or any applicable variations described in WO 2005/121 142 Al, incorporated herein by reference.

[0201] Also embraced are any variations of formula (V) as described in WO 2005/121142 Al, such as the individual MEK inhibitor compounds described in WO 2005/121142 Al, e.g., Examples 1-1 to 1-343 in Table 1, Examples 2-1 and 2-2 in Table 2, Examples 3-1 to 3-9 in Table 3, Examples 4-1 to 4-148 in Table 4. Compounds of the formula (V) or any variations thereof can be synthesized using methods known in the art, for example, the synthetic methods described in WO 2005/121142 Al, incorporated herein by reference.

[0202] In some embodiments, the MEK inhibitor is a compound of formula (VI),
or a pharmaceutically acceptable salt or ester thereof, wherein:

R1 is selected from the group consisting of bromo, iodo, ethynyl, cycloalkyl, alkoxy, azetidinyl, acetyl, heterocycyl, cyano, straight-chained alkyl and branched-chain alkyl;

R2 is selected from the group consisting of hydrogen, chlorine, fluorine, and alkyl;

R3 is selected from the group consisting of hydrogen, chlorine, and fluorine;

R4 is selected from the group consisting of hydrogen, optionally substituted aryl, alkyl, and cycloalkyl;

\[ R_6 \longrightarrow C \longrightarrow R_8 \]

R5 is selected from the group consisting of hydrogen and \[ R_7 \]

wherein R6 is selected from the group consisting of hydroxyl, alkoxy, cycloalkyl, optionally substituted alkyl, optionally substituted aryl, and optionally substituted heteroaryl;

R7 and R8 are independently selected from the group consisting of hydrogen and optionally substituted alkyl;

or R6 and R7 can together form a cycloalkyl group and R8 is hydrogen.

[0203] In some variations, the MEK inhibitor compound is of the formula (VI), or a pharmaceutically acceptable salt or ester thereof, wherein the variables are as defined in WO 2007/096259 A1 for the formula I or any applicable variations described on pages 4-10 in WO 2007/096259 A1, incorporated herein by reference. Further embraced MEK inhibitors are compounds described in Examples 1-182 in WO 2007/096259 A1, incorporated herein by reference.

[0204] In some embodiments, the MEK inhibitor compound of the formula (VI) is a compound selected from the group consisting of:

(2S,3S)-N-(4-Bromo-phenyl)-2-[(R)-4-(4-methoxy-phenyl)-2,5-dioxo-imidazolidin-1-yl]-3-phenyl-butyramide;

(2S,3S)-N-(4-Iodo-phenyl)-2-[(R)-4-(4-methoxy-phenyl)-2,5-dioxo-imidazolidin-1-yl]-3-phenyl-butyramide.
(2S,3S)-N-(2-Fluoro-4-iodo-phenyl)-2-{(R)-4-[4-(2-hydroxy-ethoxy)-phenyl]-2,5-dioxo-imidazolidin-1-yl}-3-phenyl-butyramide;

(2S,3S)-N-(4-Ethynyl-2-fluoro-phenyl)-2-{(R)-4-[4-(2-hydroxy-ethoxy)-phenyl]-2,5-dioxo-imidazolidin-1-yl}-3-phenyl-butyramide;

(2R,3S)-N-(4-Ethynyl-2-fluoro-phenyl)-2-{(R)-4-[4-(2-hydroxy-ethoxy)-phenyl]-2,5-dioxo-imidazolidin-1-yl}-3-phenyl-butyramide;

(2S,3S)-N-(2-Chloro-4-iodo-phenyl)-2-{(R)-4-[4-(2-hydroxy-ethoxy)-phenyl]-2,5-dioxo-imidazolidin-1-yl}-3-phenyl-butyramide;

(2S,3S)-2-{(R)-4-[4-(2-Hydroxy-ethoxy)-phenyl]-2,5-dioxo-imidazolidin-1-yl}-N-(4-iodo-2-methyl-phenyl)-3-phenyl-butyramide;

(2S,3S)-N-(2-Chloro-4-iodo-phenyl)-2-{(R)-4-[4-((R)-2,3-dihydroxy-propoxy)-phenyl]-2,5-dioxo-imidazolidin-1-yl}-3-phenyl-butyramide;

(2S,3S)-N-(2-Chloro-4-iodo-phenyl)-2-{(R)-4-[4-((S)-2,3-dihydroxy-propoxy)-phenyl]-2,5-dioxo-imidazolidin-1-yl}-3-phenyl-butyramide;

(2S,3S)-2-{(R)-2,5-Dioxo-4-[4-(2-oxo-2-pyrrolidin-l-yl-ethoxy)-phenyl]-imidazolidin-1-yl}-N-(2-fluoro-4-iodo-phenyl)-3-phenyl-butyramide;

(2S,3S)-2-((R)-2,5-Dioxo-4-thiophen-3-yl-imidazolidin-1-yl)-N-(4-iodo-phenyl)-3-phenyl-butyramide;

(S)-2-[(R)-4-(2,3-Dihydro-benzo[l,4]dioxin-6-yl)-2,5-dioxo-imidazolidin-1-yl]-N-(2-fluoro-4-iodo-phenyl)-3-phenyl-propionamide;

(S)-2-[((R)-4-(4-Acetylamino-phenyl)-2,5-dioxo-imidazolidin-1-yl]-N-(2-fluoro-4-iodo-phenyl)-3-phenyl-propionamide;

(4-{(R)-1-[(1S,2S)-1-(2-Fluoro-4-iodo-phenylcarbamoyl)-2-phenyl-propyl]-2,5-dioxo-imidazolidin-4-yl}-phenoxy-methyl)-phosphonic acid dimethyl ester;

(2S,3S)-N-(2-Fluoro-4-iodo-phenyl)-2-((R)-4-isopropyl-2,5-dioxo-imidazolidin-1-yl)-3-phenyl-butyramide;

(2S,3S)-N-(2-Fluoro-4-iodo-phenyl)-2-{(R)-4-[4-(2-hydroxy-ethoxy)-phenyl]-2,5-dioxo-imidazolidin-1-yl}-3-methyl-butyramide;

(S)-N-(2-Fluoro-4-iodo-phenyl)-2-{(R)-4-[4-(2-hydroxy-ethoxy)-phenyl]-2,5-dioxo-imidazolidin-1-yl}-3-m-tolyl-propionamide;

(S)-N-(2-Fluoro-4-iodo-phenyl)-2-{(R)-4-[4-(methoxy-phenyl)-2,5-dioxo-imidazolidin-1-yl]-3-o-tolyl-propionamide;

(S)-N-(2-Fluoro-4-iodo-phenyl)-2-[(R)-4-(4-methoxy-phenyl)-2,5-dioxo-imidazolidin-1-yl]-3-m-tolyl-propionamide;

(S)-N-(2-Fluoro-4-iodo-phenyl)-2-[(R)-4-(methoxy-phenyl)-2,5-dioxo-imidazolidin-1-yl]-3-m-tolyl-propionamide;
(S)-N-(2-Fluoro-4-iodo-phenyl)-2-[(R)-4-(4-methoxy-phenyl)-2,5-dioxo-imidazolidin-1-yl]-3-p-tolyl-propionamide; and
(S)-N-(4-Cyclopropyl-2-fluoro-phenyl)-3-(4-fluoro-phenyl)-2-[(R)-4-[2-hydroxy-1-hydroxymethyl-ethoxy]-phenyl]-2,5-dioxo-imidazolidin-1-yl]-propionamide;
or a pharmaceutically acceptable salt or ester thereof.

[0205] In some embodiments, the MEK inhibitor is a compound of formula (VII),

![VII](image)

or a pharmaceutically acceptable salt or ester thereof, wherein:
- R1 is selected from the group consisting of halogen, ethynyl, and cycloalkyl;
- R2 is selected from the group consisting of hydrogen and CH(R3)(R4);
- R3 is selected from the group consisting of lower alkyl, lower alkoxy, optionally substituted aryl, and optionally substituted heteroaryl;
- R4 is selected from the group consisting of hydrogen and lower alkyl;
- R5 is hydrogen or, taken together with R2 and the carbon to which R2 and R5 are attached, forms lower cycloalkyl; and
- R6 is selected from the group consisting of hydrogen, lower alkyl, lower cycloalkyl, optionally substituted aryl, and optionally substituted heteroaryl.

[0206] In some variations, the MEK inhibitor compound is of the formula (VI), or a pharmaceutically acceptable salt or ester thereof, wherein the variables are as defined in WO 2009/021887 Al for the formula I or any applicable variations described on pages 4-5 in WO 2009/021887 Al, incorporated herein by reference. Further embraced MEK inhibitors are compounds described in Examples 1-21 in 2009/021887 Al, incorporated herein by reference.

[0207] In some embodiments, the MEK inhibitor compound of the formula (VI) is a compound selected from the group consisting of:
- (R)-5-[4-(2-Hydroxy-ethoxy)-phenyl]-3-[(S)-l-(6-iodo-1H-benzoimidazol-2-yl)-2-phenyl-ethyl]-imidazolidine-2,4-dione;
- (R)-5-[4-(2-Hydroxy-ethoxy)-phenyl]-3-(5-iodo-iH-benzoimidazol-2-ylmethyl)-imidazolidine-2,4-dione;

-85-
(R)-5-[4-(2-Hydroxy-ethoxy)-phenyl]-3-[((S)-l-(5-iodo-1H-benzoimidazol-2-yl)-2-methyl-propyl]-imidazolidine-2,4-dione;
(R)-5-[4-(2-Hydroxy-ethoxy)-phenyl]-3-[(lR,2R)-l-(5-iodo-1H-benzoimidazol-2-yl)-2-methoxy-propyl]-imidazolidine-2,4-dione;
3-[(S)-l-(5-iodo-1H-benzoimidazol-2-yl)-2-phenyl-ethyl]-imidazolidine-2,4-dione; compound with trifluoro-acetic acid;
(R)-3-[(S)-2-(4-Fluoro-phenyl)-l-(5-iodo-1H-benzoimidazol-2-yl)-ethyl]-5-[4-(2-hydroxy-ethoxy)-phenyl]-imidazolidine-2,4-dione;
(R)-5-[4-(2-Hydroxy-ethoxy)-phenyl]-3-[(S)-l-(5-iodo-1H-benzoimidazol-2-yl)-2-(4-methoxy-phenyl)-ethyl]-imidazolidine-2,4-dione;
(R)-5-[4-(2-Hydroxy-ethoxy)-phenyl]-3-[(S)-l-(5-iodo-1H-benzoimidazol-2-yl)-2-thiophen-2-yl-ethyl]-imidazolidine-2,4-dione;
(R)-3-[(1S,2S)-1-(6-iodo-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-5-phenyl-imidazolidine-2,4-dione;
(R)-3-[(1S,2S)-1-(6-iodo-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-5-(4-methoxy-phenyl)-imidazolidine-2,4-dione;
(R)-5-[4-(2-Hydroxy-ethoxy)-phenyl]-3-[(1S,2S)-l-(6-iodo-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-imidazolidine-2,4-dione;
(R)-3-[(1S,2S)-1-(6-iodo-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-5-[4-(2-methoxy-ethoxy)-phenyl]-imidazolidine-2,4-dione;
2-(4-[(R)-l-[(1S,2S)-l-(6-iodo-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-2,5-dioxo-imidazolidin-4-yl]-phenoxy)-N,N-dimethyl-acetamide;
N,N-5is-(2-hydroxy-ethyl)-2-(4-[(R)-l-[(1S,2S)-l-(6-iodo-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-2,5-dioxo-imidazolidin-4-yl]-phenoxy)-acetamide;
(R)-3-[(1S,2S)-l-(5-iodo-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-5-isopropyl-imidazolidine-2,4-dione;
(R)-5-Cyclohexyl-3-[(1S,2S)-l-(5-iodo-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-imidazolidine-2,4-dione;
(R)-5-[4-(2-Hydroxy-ethoxy)-phenyl]-3-[(l-5-iodo-1H-benzoimidazol-2-yl)-cyclopropyl]-imidazolidine-2,4-dione;
(R)-3-[(1S,2S)-l-(6-Bromo-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-5-[4-(2-hydroxy-ethoxy)-phenyl]-imidazolidine-2,4-dione;
(R)-3-[[S]-1-(5-Cyclopropyl-1H-benzoimidazol-2-yl)-2-phenyl-ethyl]-5-[4-(2-hydroxy-ethoxy)-phenyl]imidazolidine-2,4-dione;

(R)-3-[[S]-1-(5-Ethynyl-1H-benzoimidazol-2-yl)-2-phenyl-ethyl]-5-[4-(2-hydroxy-ethoxy)-phenyl]imidazolidine-2,4-dione; and

(R)-3-[[1S,2S]-1-(5-Ethynyl-1H-benzoimidazol-2-yl)-2-phenyl-propyl]-5-[4-(2-hydroxy-ethoxy)-phenyl]imidazolidine-2,4-dione;

or a pharmaceutically acceptable salt or solvate thereof.

[0208] In some embodiments, the MEK inhibitor is a compound selected from the group consisting of GDC-0973 (Methanone, [3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl] [3-hydroxy-3-(2S)-2-piperidinyl-1-azetidinyl]-), G-38963, G02443714, G02442104, and G00039805, or a pharmaceutically acceptable salt or solvate thereof.

### IV Kits

[0209] In another aspect, provided herein is a kit comprising a PD-L1 axis binding antagonist and/or a MEK inhibitor for treating or delaying progression of a cancer in an individual or for enhancing immune function of an individual having cancer. In some embodiments, the kit comprises a PD-1 axis binding antagonist and a package insert comprising instructions for using
the PD-1 axis binding antagonist in combination with a MEK inhibitor to treat or delay progression of cancer in an individual or to enhance immune function of an individual having cancer. In some embodiments, the kit comprises a MEK inhibitor and a package insert comprising instructions for using the MEK inhibitor in combination with a PD-1 axis binding antagonist to treat or delay progression of cancer in an individual or to enhance immune function of an individual having cancer. In some embodiments, the kit comprises a PD-1 axis binding antagonist and a MEK inhibitor, and a package insert comprising instructions for using the PD-1 axis binding antagonist and the MEK inhibitor to treat or delay progression of cancer in an individual or to enhance immune function of an individual having cancer. Any of the PD-1 axis binding antagonists and/or MEK inhibitors described herein may be included in the kits.

[0210] In some embodiments, the kit comprises a container containing one or more of the PD-1 axis binding antagonists and MEK inhibitors described herein. Suitable containers include, for example, bottles, vials (e.g., dual chamber vials), syringes (such as single or dual chamber syringes) and test tubes. The container may be formed from a variety of materials such as glass or plastic. In some embodiments, the kit may comprise a label (e.g., on or associated with the container) or a package insert. The label or the package insert may indicate that the compound contained therein may be useful or intended for treating or delaying progression of cancer in an individual or for enhancing immune function of an individual having cancer. The kit may further comprise other materials desirable from a commercial and user standpoint, including other buffers, diluents, filters, needles, and syringes.

EXAMPLES

[0211] The invention can be further understood by reference to the following examples, which are provided by way of illustration and are not meant to be limiting.

Example 1: Combination treatment with an anti-PD1 antibody and a MEK inhibitor causes sustained tumor regression in Vemurafenib-progressing tumors

[0212] While B-raf inhibition (such as by treatment with Vemurafenib) is effective in eliciting short-term tumor regression, resistance is frequently observed. This Example describes the finding that treatment with a combination of a PD-1 axis binding antagonist and a MEK inhibitor induces sustained tumor regression and increased progression-free survival in animals with Vemurafenib-progressing tumors. Moreover, treatment with a combination of a PD-1 axis
binding antagonist and a MEK inhibitor was surprisingly superior to treatment with either agent individually.

**Materials and Methods**

**Mouse model**

[0213] A melanoma GEM model \( B-raf^{600E} \); \( PTEN^{+/0} \); \( TyCreER \) was used. \( B-raf^{600E} \) and \( TyCreER \) alleles were as described in Dankort, D., et al. Nat. Genet. 41(5):544-52 (2009). The \( PTEN \) conditional allele was as described in Lesche, R. et al. genesis 32:148-9 (2002).

**Tumor initiation**

[0214] Tumors were initiated by application of tamoxifen as described in Dankort, D., et al. Nat. Genet. 41(5):544-52 (2009). Animals were enrolled into the study once their tumors reached a size greater than or equal to 400 mm\(^3\).

**Treatments**

[0215] Prior to beginning treatment, each mouse received a biopsy of a melanoma tumor. After the biopsy, mice were allowed to recover for up to one week prior to receiving treatment. Mice were assigned into initial treatment groups (n=20), and treatment commenced at day 0.

[0216] For Vemurafenib treatment, mice were given either MCT, 200\(\mu\)E, PO, qd; or PLX-4032 (Vemurafenib), 50 mg/kg PO, BID (volume not to exceed 300\(\mu\)E). When animals in any group reached ~2000\(\mu\)m\(^3\), the tumors were biopsied a second time. After the biopsy procedure, mice recovered for up to one week prior to receiving further therapeutic treatment. The animals were then re-assigned to the following treatment groups: GDC-0973 (Cobimetinib), 7.5 mg/kg PO, qd (volume not to exceed 300\(\mu\)E) + Ragweed Control (IgG2a), 10mg/kg IP, three times weekly; GDC-0973, 7.5 mg/kg PO, qd (volume not to exceed 300\(\mu\)E) + anti-PDL\(\alpha\) (IgGl-WT), 10mg/kg IP, three times weekly; or MCT, 200\(\mu\)L, PO, qd + anti-PDL\(\alpha\) (IgGl-WT), 10mg/kg IP, three times weekly. IP dose volume did not exceed 300 \(\mu\)L.

[0217] Mice were weighed and tumors measured at least once a week until study termination. Mice received treatment each day until a mean tumor volume of 2500 mm\(^3\) was achieved. Mice were then euthanized, and melanoma tumors were collected for histology and assessing molecular changes. Mice were perfused under anesthesia at euthanasia.

[0218] Throughout the study, mice were monitored for clinical appearance (body condition, coat appearance, posture, labored breathing, etc.) at least 2 times a week, with increasing frequency, up to daily, depending on severity of adverse clinical signs observed. Moribund animals were euthanized. Mice with a body condition score < 2 were euthanized.
Results

Upon tumor induction, the melanoma GEM model B-raf<sup>600E;PTEN<sup>Δf</sup>;TyCreER causes tumors that show an initial regression in size upon treatment with the B-raf inhibitor Vemurafenib. After this initial regression, the tumors display steady re-growth, thereby modeling resistance to B-raf inhibition in Vemurafenib-progressing tumors.

This model was used to test the efficacy of PD-1 axis binding antagonists and MEK inhibitors as a 2<sup>nd</sup> line therapy for Vemurafenib-progressing tumors. As shown in FIG. 1, after first line treatment with Vemurafenib, animals were treated with an antibody against PD-L1, a MEK inhibitor (Cobimetinib), or both. Treatment with anti-PD-L1 alone showed no effect on tumor growth. Treatment with Cobimetinib caused an initial tumor regression, but this response was not sustained and tumor re-growth was observed. Combination treatment with anti-PD-L1 and Cobimetinib, however, caused regression in every tumor, and this regression was sustained. In addition, intratumoral GR1 levels were significantly reduced, and a signature of T cell activation was observed (e.g., increased CD8, PRF1, and MHC I). Importantly, treatment with anti-PD-L1 and Cobimetinib led to increased progression-free survival (PFS).

FIG. 2 shows individual animal responses following crossover from Vemurafenib to anti-PD-L1, Cobimetinib, or combination treatment.

These results demonstrate that combined treatment with a PD-1 axis binding antagonist and a MEK inhibitor leads to dramatic, sustained tumor regression in Vemurafenib-progressing tumors, as compared to treatment with each agent alone. Moreover, these results demonstrate the superior efficacy of combined PD-1 axis/MEK inhibition as a 2<sup>nd</sup> line treatment for tumors resistant to B-raf inhibition.

All patents, patent applications, documents, and articles cited herein are herein incorporated by reference in their entireties.
CLAIMS

What is claimed is:

1. A method for treating or delaying progression of cancer in an individual comprising administering to the individual an effective amount of a PD-1 axis binding antagonist and a MEK inhibitor, wherein the individual has cancer or is at risk of developing cancer that is resistant to a B-raf antagonist.
2. The method of claim 1, further comprising diagnosing the individual as having a cancer that is resistant to a B-raf antagonist, wherein the diagnosing occurs prior to administering the effective amount of the PD-1 axis binding antagonist and the MEK inhibitor.
3. The method of claim 1 or claim 2, wherein the individual has not been previously treated with a B-raf antagonist.
4. The method of claim 1 or claim 2, wherein the individual has been previously treated with a B-raf antagonist.
5. A method for treating or delaying progression of cancer in an individual comprising administering to the individual an effective amount of a PD-1 axis binding antagonist and a MEK inhibitor, wherein the individual has been previously treated with a B-raf antagonist for cancer.
6. The method of claim 4 or 5, wherein the cancer in the individual has progressed within 1 month, 6 months, 1 year, or 5 years after completing a B-raf antagonist-based therapy regimen.
7. The method of any one of claims 1-6, wherein the B-raf antagonist is a small molecule inhibitor, an antibody, a peptide, a peptidomimetic, an aptamer or a polynucleotide.
8. The method of claim 7, wherein the B-raf antagonist is dabrafenib, vemurafenib, GSK 2118436, RAF265, XL281, ARQ736, BAY73-4506, sorafenib, PLX4720, PLX-3603, GSK21 18436, GDC-0879, or N-(3-(5-(4-chlorophenyl)-lH-pyrrolo[2,3-b]pyridine-3-carbonyl)-2,4-difluorophenyl)propane-l-sulfonamide.
9. The method of claim 7, wherein the B-raf antagonist is a selective B-raf antagonist of B-raf V600.
10. The method of claim 7, wherein the selective B-raf antagonist of B-raf V600 is a selective antagonist of B-raf V600E.
11. The method of claim 7, wherein the selective B-raf antagonist of B-raf V600 is a selective antagonist of B-raf V600E, B-raf V600K, and/or V600D.
12. The method of claim 7, wherein the selective B-raf antagonist of B-raf V600 is a selective antagonist of B-raf V600R.
13. The method of any one of claims 1-12, wherein the cancer contains a BRAF V600E mutation, a BRAF wildtype, a KRAS wildtype, or an activating KRAS mutation.
14. The method of any one of claims 1-13, wherein the treatment results in a sustained response in the individual after cessation of the treatment.
15. The method of any one of claims 1-14, wherein the individual has colorectal cancer, melanoma, lung cancer, ovarian cancer, breast cancer, pancreatic cancer, hematological malignancy, bladder cancer, and/or renal cell carcinoma.
16. The method of claim 15, wherein the cancer is metastatic.
17. The method of any one of the preceding claims, wherein the PD-1 axis binding antagonist is selected from the group consisting of a PD-1 binding antagonist, a PD-L1 binding antagonist and a PD-L2 binding antagonist.
18. The method of claim 17, wherein the PD-1 axis binding antagonist is a PD-1 binding antagonist.
19. The method of claim 18, wherein the PD-1 binding antagonist inhibits the binding of PD-1 to its ligand binding partners.
20. The method of claim 19, wherein the PD-1 binding antagonist inhibits the binding of PD-1 to PD-L1, PD-1 to PD-L2, or PD-1 to both PD-L1 and PD-L2.
21. The method of any one of claims 18-20, wherein the PD-1 binding antagonist is an antibody.
22. The method of any one of claims 18-20, wherein the PD-1 binding antagonist is nivolumab, pembrolizumab, pidilizumab, MEDI-0680, PDROOl, REGN2810, BGB-108, BGB-A317, or AMP-224.
23. The method of claim 17, wherein the PD-1 axis binding antagonist is a PD-L1 binding antagonist.
24. The method of claim 23, wherein the PD-L1 binding antagonist inhibits the binding of PD-L1 to PD-1, PD-L1 to B7-1, or PD-L1 to both PD-1 and B7-1.
25. The method of claim 23 or claim 24, wherein the PD-L1 binding antagonist is an anti-PD-L1 antibody.
26. The method of claim 25, wherein the anti-PD-L1 antibody is a monoclonal antibody.
27. The method of claim 25, wherein the anti-PD-L1 antibody is an antibody fragment.
selected from the group consisting of Fab, Fab'-SH, Fv, scFv, and (Fab')_2 fragments.

28. The method of any one of claims 25-27, wherein the anti-PD-L1 antibody is a humanized antibody or a human antibody.

29. The method of any one of claim 25, wherein the PD-L1 binding antagonist is selected from the group consisting of: YW243.55.S70, atezolizumab, durvalumab, MDX-1105, and avelumab.

30. The method of any one of claims 25-28, wherein the antibody comprises a heavy chain comprising HVR-H1 sequence of SEQ ID NO: 15, HVR-H2 sequence of SEQ ID NO: 16, and HVR-H3 sequence of SEQ ID NO: 3; and a light chain comprising HVR-L1 sequence of SEQ ID NO: 17, HVR-L2 sequence of SEQ ID NO: 18, and HVR-L3 sequence of SEQ ID NO: 19.

31. The method of any one of claims 25-28, wherein the antibody comprises a heavy chain variable region comprising the amino acid sequence of SEQ ID NO: 24 or SEQ ID NO: 28 and a light chain variable region comprising the amino acid sequence of SEQ ID NO: 21.

32. The method of claim 17, wherein the PD-L2 axis binding antagonist is a PD-L2 binding antagonist.

33. The method of claim 32, wherein the PD-L2 binding antagonist is an antibody.

34. The method of claim 32, wherein the PD-L2 binding antagonist is an immunoadhesin.

35. The method of any one of claims 1-34, wherein the MEK inhibitor is a competitive inhibitor of MEK.

36. The method of any one of claims 1-34, wherein the MEK inhibitor is more selective against an activating KRAS mutation.

37. The method of any one of claims 1-34, wherein the MEK inhibitor is an allosteric inhibitor of MEK.

38. The method of any one of claims 1-34, wherein the MEK inhibitor is more selective against an activating BRAF mutation.

39. The method of any one of claims 1-34, wherein the MEK inhibitor is a compound of the formula (I), (II), (III), (IV), (V), (VI) or (VII), or a pharmaceutically acceptable salt or solvate thereof.

40. The method of any one of claims 1-34, wherein the MEK inhibitor is selected from the group consisting of G02442104, G-38963, G02443714, G00039805 and GDC-0973, or a pharmaceutically acceptable salt or solvate thereof.

41. The method of claim 40, wherein the MEK inhibitor is G02443714, G02442104 or
42. The method of any one of claims 1-41, wherein the MEK inhibitor is administered continuously.
43. The method of any one of claims 1-41, wherein the MEK inhibitor is administered intermittently.
44. The method of any one of claims 1-41, wherein the MEK inhibitor is administered before the PD-1 axis binding antagonist.
45. The method of any one of claims 1-41, wherein the MEK inhibitor is administered simultaneous with the PD-1 axis binding antagonist.
46. The method of any one of claims 1-41, wherein the MEK inhibitor is administered after the PD-1 axis binding antagonist.
47. The method of any one of claims 1-46, wherein the PD-1 axis binding antagonist and/or the MEK inhibitor is administered intravenously, intramuscularly, subcutaneously, topically, orally, transdermally, intraperitoneally, intraorbitally, by implantation, by inhalation, intrathecally, intraventricularly, or intranasally.
48. A kit comprising a PD-1 axis binding antagonist and a package insert comprising instructions for using the PD-1 axis binding antagonist in combination with a MEK inhibitor to treat or delay progression of cancer in an individual, wherein the individual has cancer or is at risk of developing cancer that is resistant to a B-raf antagonist.
49. A kit comprising a PD-1 axis binding antagonist and a MEK inhibitor, and a package insert comprising instructions for using the PD-1 axis binding antagonist and the MEK inhibitor to treat or delay progression of cancer in an individual, wherein the individual has cancer or is at risk of developing cancer that is resistant to a B-raf antagonist.
50. A kit comprising a MEK inhibitor and a package insert comprising instructions for using the MEK inhibitor in combination with a PD-1 axis binding antagonist to treat or delay progression of cancer in an individual, wherein the individual has cancer or is at risk of developing cancer that is resistant to a B-raf antagonist.
51. A kit comprising a PD-1 axis binding antagonist and a package insert comprising instructions for using the PD-1 axis binding antagonist in combination with a MEK inhibitor to treat or delay progression of cancer in an individual, wherein the individual has been previously treated with a B-raf antagonist for cancer.
52. A kit comprising a PD-1 axis binding antagonist and a MEK inhibitor, and a package
insert comprising instructions for using the PD-1 axis binding antagonist and the MEK inhibitor
to treat or delay progression of cancer in an individual, wherein the individual has been
previously treated with a B-raf antagonist for cancer.

53. A kit comprising a MEK inhibitor and a package insert comprising instructions for using
the MEK inhibitor in combination with a PD-1 axis binding antagonist to treat or delay
progression of cancer in an individual, wherein the individual has been previously treated with a
B-raf antagonist for cancer.
