## TRIAZINE, PYRIMIDINE AND PYRIDINE ANALOGS AND THEIR USE AS THERAPEUTIC AGENTS AND DIAGNOSTIC PROBES

### FIELD OF THE INVENTION

The invention relates to new therapeutic agents and diagnostic probes, including pharmaceutically acceptable salts, prodrugs and metabolites thereof, which are useful for modulating protein or enzyme activity for modulating cellular activities such as signal transduction, proliferation, differentiation, programmed cell death, migration and cytokine secretion. More specifically the invention provides compounds which inhibit, regulate, detect and/or modulate kinase activity, in particular phosphoinositide 3-kinase (PI3K), mammalian target of rapamycin (mTOR), DNA-PK and ATM kinase inhibitor compounds, their pharmaceutically acceptable salts, and prodrugs thereof; compositions of the new compounds, either alone or in combination with at least one additional therapeutic agent, with a pharmaceutically acceptable carrier; and uses of the new compounds, either alone or in combination with at least one additional therapeutic agent, in the prophylaxis or treatment of a number of diseases, in particular, those characterized by the abnormal activity of serine/threonine kinases, receptor tyrosine kinases and lipid kinases. The invention also relates to methods of using the compounds for *in vitro*, *in situ*, and *in vivo* diagnosis, assay development or treatment of mammalian cells, or associated pathological conditions.

### BACKGROUND OF THE INVENTION

Protein kinases participate in the signaling events which control the activation, growth, differentiation, survival and migration of cells in response to extracellular mediators or stimuli including growth factors, cytokines or chemokines. In general, these kinases are classified in two groups, those that preferentially phosphorylate tyrosine residues and those that preferentially phosphorylate serine and/or threonine residues. The tyrosine kinases include membrane-spanning growth factor receptors, for example the epidermal growth factor receptor (EGFR) and cytosolic non-receptor

kinases including Src family kinases, the Syk family kinases and the Tec family kinases.

Inappropriately high protein kinase activity is involved in many diseases including cancer, metabolic diseases, immunological diseases and inflammatory disorders. This can be caused either directly or indirectly by the failure of control mechanisms due to mutation, overexpression or inappropriate activation of the enzyme.

Protein tyrosine kinases – both receptor tyrosine kinases and non-receptor kinases – are essential for the activation and proliferation of cells of the immune system. Among the earliest detectable events upon the immunoreceptor activation in mast cells, T cells and B cells is the stimulation of non-receptor tyrosine kinases.

Phosphoinositide 3-kinases (PI3Ks) were early on identified as lipid kinases associated with viral oncogens [Whitman et al., *Nature* 315:239–242 (1985); Sugimoto et al., *Proc. Natl. Acad. Sci.* 81:2117–2121 (1984); Macara et al., *Proc. Natl. Acad. Sci.* 81:2728–2732 (1984)], and for the last 20 years, the connection between cancer and PI3K has been further substantiated [Cully et al., *Nat. Rev., Cancer* 6:184–192 (2006); Wymann et al., *Curr. Opin. Cell Biol.* 17:141–149 (2005); Vivanco et al., *Nat. Rev., Cancer* 2:489–501 (2002)]. PI3Ks have since been recognized to modulate a wide range of cellular activities, and to be central to the growth and metabolic control. Genetically modified mice targeting the PI3K pathway, and the elucidation of human hereditary disease like Cowden's syndrome, tuberous sclerosis, ataxia telangiectasia, X-linked myotubular myopathy and Charcot-Marie-Tooth neuropathy, have provided further insight in the cellular and systemic role of phosphoinositide signaling. Deregulation of phosphoinositide levels, and in particular the product of class I PI3Ks, PtdIns (3,4,5)P<sub>3</sub>, is involved in the pathogenesis of cancer, chronic inflammation, allergy, metabolic disease, diabetes and cardiovascular problems.

PI3Ks are a family of enzymes, which phosphorylate the 3'-OH position of the inositol ring of phosphoinositides. They have been divided into three classes on the basis of structural features and in vitro lipid substrate specificity [(Marone et al., *Biochimica et Biophysica Acta* 1784:159-185 (2008)]. Class I PI3Ks form heterodimers, which consist of one of the four closely related ~110 kDa catalytic

subunits, and an associated regulatory subunit belonging to two distinct families. *In vitro* they are capable to convert PtdIns to PtdIns-3-P, PtdIns-4-P to PtdIns(3,4)P<sub>2</sub>, and PtdIns(4,5)P<sub>2</sub> to PtdIns(3,4,5)P<sub>3</sub>, but the *in vivo* substrate is PtdIns(4,5)P<sub>2</sub> [Cantley et al., *Science* 296:1655–1657 (2002)]. Class I PI3Ks are activated by a large variety of cell-surface receptors, comprising growth factor receptors as well as G protein-coupled receptors.

Class II PI3Ks are capable to phosphorylate PtdIns and PtdIns-4-P *in vitro*, but their relevant *in vivo* substrates are still under investigation. This class of large (170–200 kDa) enzymes has three members, all characterized by a C-terminal C2 homology domain. No adaptor molecules for class II PI3Ks have been identified so far. Class III PI3Ks are solely able to phosphorylate PtdIns, and thus generate only PtdIns-3-P. The single member of this class is Vps34, of which the *S. cerevisiae* Vps34p (vacuolar protein sorting mutant 34 protein) is the prototype, and has been shown to play an essential role in trafficking of newly synthesized proteins from the Golgi to the yeast vacuole, an organelle equivalent to lysosomes in mammals [Schu et al., *Science* 260:88–91 (1993)].

Phosphoinositide 4-kinases (PI4Ks) phosphorylate the 4'-OH position of the inositol ring of PtdIns, and thereby generate PtdIns-4-P. This lipid can then be further phosphorylated by PtdIns-4-P 5-kinases to generate PtdIns (4,5)P<sub>2</sub>, which is the main source for phospholipase C and PI3K signaling at the plasma membrane. Four PI4Ks isoforms are known: PI4KII $\alpha$  and  $\beta$ , and PI4KIII $\alpha$  and  $\beta$ . The PI4KIIIs are most closely related to PI3Ks.

The class of PI3K-related proteins, referred to as class IV PI3Ks, consists of high molecular weight enzymes with a catalytic core similar to PI3Ks and PI4Ks and include the target of rapamycin (mTOR, also known as FRAP), DNA-dependent protein kinase (DNA-PKcs), the ataxia telangiectasia mutated gene product (ATM), ataxia telangiectasiarelated (ATR), SMG-1 and transformation/transcription domain-associated protein (TRRAP). The first five members are active protein serine-threonine kinases that are involved in cell growth control and genome/transcriptome surveillance [(Marone et al., *Biochimica et Biophysica Acta* 1784:159-185 (2008)]. DNA-PKcs, ATM, ATR and SMG-1 are involved in DNA-damage responses. The only active kinase not involved in DNA-damage is mTOR, which is regulated by

growth factors and nutrient availability, and coordinates protein synthesis, cell growth and proliferation. *Target of rapamycin (mTOR) complexes 1 and integrate growth factor signaling (via PI3K/PKB and the Ras/MAPK cascade), energy status (LKB1 and AMPK) and nutrient detection.* TOR is positively regulated by PKB/Akt, which phosphorylates the negative regulator TSC2 in the tuberous sclerosis complex (TSC), resulting in activation of the GTPase Rheb and mTOR [(Marone et al., *Biochimica et Biophysica Acta* 1784:159-185 (2008)]. In parallel, mTOR stimulates translation of ribosomal proteins and therefore ribosome biogenesis via the activation of p70<sup>S6K</sup> [Wullschleger et al., *Cell* 124:471 (2006)]. *Rapamycin*, and its derivatives RAD001 and CCI-779, bind to FKBP12, and the complex blocks mTOR complex 1 (mTORC1) activity very selectively. Various clinical trials were initiated using Rapamycin and derivatives, mostly in patients with tumors displaying elevated PI3K signaling and hyperactive mTOR. Promising results were obtained in mantle cell lymphoma, endometrial cancer and renal cell carcinoma [Guertin et al., *Cancer Cell* 12:9 (2007)]. Rapamycin and its derivatives possess anti-angiogenic activity because they counteract VEGF action [Guba et al., *Nat. Med.* 8:128 (2002)]. This opens avenues for combinatorial treatments with conventional chemotherapy [Beuvink et al., *Cell* 120:747 (2005)].

The PI3K pathway is a key signaling transduction cascade controlling the regulation of cell growth, proliferation, survival as well as cell migration. PI3Ks are activated by a wide variety of different stimuli including growth factors, inflammatory mediators, hormones, neurotransmitters, and immunoglobulins and antigens [Wymann et al., *Trends Pharmacol. Sci.* 24:366–376 (2003)]. The class IA PI3K isoforms PI3K $\alpha$ ,  $\beta$  and  $\delta$ , are all bound to one of the p85/p55/p50 regulatory subunits, which all harbor two SH2 domains that bind with high affinity to phosphorylated Tyr-X-X-Met motifs. These motifs are present in activated growth factor receptors, their substrates and numerous adaptor proteins. As described above, activation of the PI3K/PKB signaling cascade has a positive effect on cell growth, survival and proliferation. Constitutive up-regulation of PI3K signaling can have a deleterious effect on cells leading to uncontrolled proliferation, enhanced migration and adhesion-independent growth. These events favor not only the formation of malignant tumors, but also the development of inflammatory and autoimmune

disease.

The PI3 kinase/Akt/PTEN pathway is an attractive target for cancer drug development since such agents would be expected to inhibit proliferation, reverse the repression of apoptosis and surmount resistance to cytotoxic agents in cancer cells. PI3 kinase inhibitors have been reported [see notably Marone et al., *Biochimica et Biophysica Acta* 1784:159-185 (2008); Yaguchi et al. (2006) *Jour. Of the Nat. Cancer Inst.* 98(8):545-556; US7173029; US7037915; US6608056; US6608053; US6838457; US6770641; US6653320; US6403588; US6703414; WO9715658; WO2006046031; WO2006046035; WO2006046040; WO2007042806; WO2007042810; WO2004017950; US2004092561; WO2004007491; WO2004006916; WO2003037886; US2003149074; WO2003035618; WO2003034997; WO2007084786; WO2007095588; WO2008098058; US2003158212; EP1417976; US2004053946; JP2001247477; JP08175990; JP08176070].

1,3,5-triazine and pyrimidine derivatives as pharmaceuticals have been made with respect to antitumor, anti-inflammatory, analgesic and antispasmodic activities. Especially, hexamethylmelamine or altretamin (HMM or  $N^2,N^2,N^4,N^4,N^6,N^6$ -hexamethyl-1,3,5-triazine-2,4,6-triamine) is well-known, which has been developed as analogue of antitumor agent triethylenemelamine (TEM); HMM acts as a prodrug of hydroxymethylpentamethylmelamine (HMPMM: metabolically active type of HMM) [Johnson et al., *Cancer*, 42:2157-2161 (1978)]. HMM has been marketed in Europe under the indications for the treatment of ovarian and small cell lung cancers.

Certain triazine compounds are known to have PI3 kinase inhibitor activity and inhibit the growth of cancer cells [WO02088112 (EP1389617), "HETEROCYCLIC COMPOUNDS AND ANTITUMOR AGENT CONTAINING THE SAME AS ACTIVE INGREDIENT", Kawashima et al., Filing date: 26.04.2002; WO05095389 (EP1741714), "HETEROCYCLIC COMPOUND AND ANTI-MALIGNANT-TUMOR AGENT CONTAINING THE SAME AS ACTIVE INGREDIENT", Kawashima et al., Filing date: 30.03.2005; WO06095906 (EP1864665), "IMMUNOSUPPRESSIVE AGENT AND ANTI-TUMOR AGENT COMPRISING HETEROCYCLIC COMPOUND AS ACTIVE INGREDIENTS", Haruta et al., Filing date: 11.03.2005; WO09905138 (EP1020462), HETEROCYCLIC COMPOUNDS AND ANTITUMOR AGENT

CONTAINING THE SAME AS ACTIVE INGREDIENT, Kawashima et al., Filing date: 24.07.1998; ]. The triazine compound ZSTK474, developed in research laboratories of Zenyaku Kogyo is the first orally administered triazine compound highly active against PI3Ks that displayed potent antitumor activity against human cancer xenografts in mice, without evidence of critical toxicity [Yaguchi et al., Journal of the National Cancer Institute, 98:545-556, (2006)]. ZSTK474 is an ATP-competitive inhibitor of class I phosphatidylinositol 3-kinase isoforms [Kong et al., Cancer Sci, 98:1638-1642 (2007)].

Certain pyrimidine compounds are known to have p110 alpha binding, PI3 kinase inhibitor activity and inhibit the growth of cancer cells [IP of AstraZeneca: WO07066103, WO07080382, WO08023159, WO08023180, WO08032027, WO08032033, WO08032036, WO08032041, WO08032072, WO08032077, WO08032086, WO08032089, WO08032091; IP of Genentech/Piramed/Roche: US2007009880, WO07127183, WO08073785, WO07042810, WO07122410, WO07127175, WO07129161, WO08070740, WO2006046031, WO2006046040, WO2007042806, WO2007122410; IP of Novartis: WO07084786, WO08098058].

In order to expand antitumor spectrum of and increase antitumor activities of such compounds, active against PI3Ks and/or mTOR, the inventors carried out intensive studies on triazine-, pyrimidine- and pyridine-based derivatives. They thus prepared new heterocyclic compounds represented by the formula (I) and formulas (Ia) to (II) which exhibit strong biological activity against lipid kinases.

In comparison with the PI3K inhibitors disclosed by Zenyaku Kogyo [WO02088112 (EP1389617), WO2005095389 (EP1741714), WO2006095906 (EP1864665), WO09905138 (EP1020462)], AstraZeneca (WO07066103, WO07080382, WO08023159, WO08023180, WO08032027, WO08032033, WO08032036, WO08032041, WO08032072, WO08032077, WO08032086, WO08032089, WO08032091), Piramed/Genentech (US2007009880, WO07127183, WO08073785, WO07042810, WO07122410, WO07127175, WO08070740, WO2006046031, WO2006046040, WO2007122410), Yamanouchi/Piramed (WO01083456) and Novartis (WO07084786, WO08098058), the inhibitors of the invention differ in the insertion of a N atom in the basic heterocyclic ring that makes better biological activity to the target enzyme, and/or in

the insertion of a novel molecular fragment making the whole molecule more active or more selective to the appropriate enzyme.

## SUMMARY OF THE INVENTION

The invention relates generally to new triazine-, pyrimidine- and pyridine-based derivatives and their use as therapeutic agents and diagnostic probes.

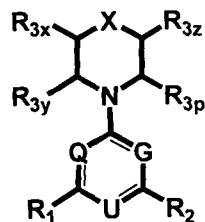

The invention also relates to kinase inhibitors and kinase diagnostic probes.

The invention also relates to phosphoinositide 3-kinase (PI3K) and mammalian target of rapamycin (mTOR) inhibitor compounds with anti-cancer activity, pharmaceutical formulations thereof, which are potentially useful in treatment of disease, conditions and/or disorders modulated by PI3K and mTOR kinases. The compounds may inhibit tumor growth in mammals and may be useful for treating human cancer patients.

The invention also relates to methods of using the compounds for *in vitro*, *in situ*, and *in vivo* diagnosis or treatment of mammalian cells, organisms, or associated pathological conditions.

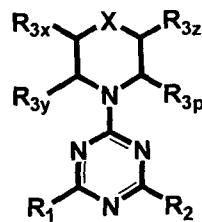

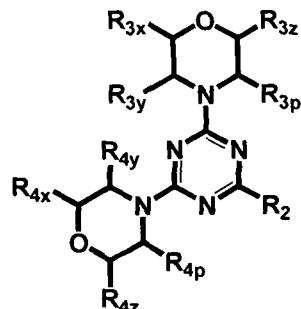

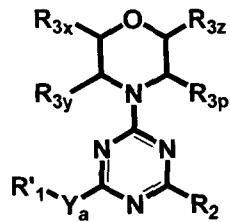

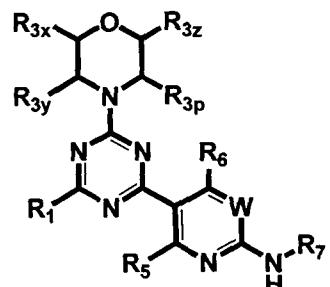

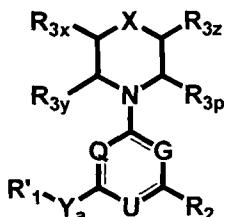

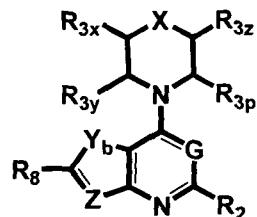

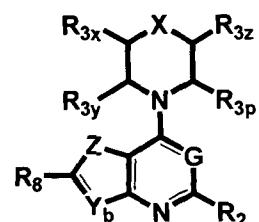

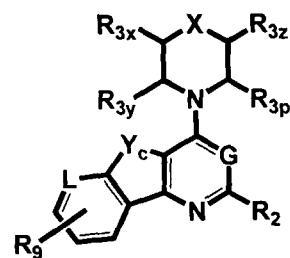

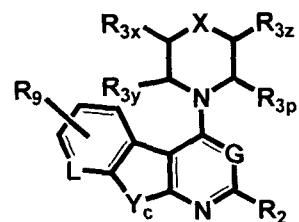

Specifically, one aspect of the invention provides compounds of formula (I).

More specifically, one aspect of the invention provides triazine compounds of formulas (Ia) to (Id), pyrimidine compounds of formulas (Ie) to (Ii) and pyridine compounds of formulas (Ie) and (If) to (Ii):

and stereoisomers, geometric isomers, tautomers, solvates, metabolites, N-oxide derivatives and pharmaceutically acceptable salts thereof.

Another aspect of the invention provides a pharmaceutical composition comprising a triazine or a pyrimidine or a pyridine compound of formula (I) or one of

formulas (Ia) to (Ii) and a pharmaceutically acceptable carrier. The pharmaceutical composition may further comprise one or more additional therapeutic agents selected from anti-proliferative agents, anti-inflammatory agents, immunomodulatory agents, neurotropic factors, agents for treating blood disorders, agents for treating diabetes, and agents for treating immunodeficiency disorders.

Another aspect of the invention provides methods of inhibiting PI3 kinase activity, comprising contacting a PI3 kinase with an effective inhibitory amount of a compound of formula (I) or one of formulas (Ia) to (Ii), or a stereoisomer, geometric isomer, tautomer, solvate, metabolite, N-oxide derivative or pharmaceutically acceptable salt or prodrug thereof.

Another aspect of the invention provides methods of preventing or treating a disease or disorder modulated by PI3 kinases, comprising administering to a mammal in need of such treatment an effective amount of a compound of formula (I) or one of formulas (Ia) to (Ii), or a stereoisomer, geometric isomer, tautomer, solvate, metabolite, N-oxide derivative or pharmaceutically acceptable salt or prodrug thereof. Examples of such diseases, conditions and disorders include, but are not limited to, hyperproliferative disorders (e.g., cancer, including melanoma and other cancers of the skin), neurodegeneration, cardiac hypertrophy, pain, migraine, neurotraumatic diseases, stroke, diabetes, hepatomegaly, cardiovascular disease, Alzheimer's disease, cystic fibrosis, autoimmune diseases, atherosclerosis, restenosis, psoriasis, allergic disorders, inflammation, neurological disorders, hormone-related diseases, conditions associated with organ transplantation, immunodeficiency disorders, destructive bone disorders, hyperproliferative disorders, infectious diseases, conditions associated with cell death, thrombin-induced platelet aggregation, chronic myelogenous leukaemia (CML), liver disease, pathologic immune conditions involving T cell activation, and CNS disorders.

Another aspect of the invention provides methods of preventing or treating a hyperproliferative disorder, comprising administering to a mammal in need of such treatment an effective amount of a compound of formula (I) or one of formulas (Ia) to (Ii), or a stereoisomer, geometric isomer, tautomer, solvate, metabolite, N-oxide derivative or pharmaceutically acceptable salt or prodrug thereof, alone or in combination with one or more additional compounds having anti-hyperproliferative

*properties.*

In a further aspect the present invention provides a method of using a compound of this invention to treat a disease or condition modulated by PI3 kinase and/or mTOR in a mammal.

An additional aspect of the invention is the use of a compound of this invention in the preparation of a medicament for the treatment or prevention of a disease or condition modulated by PI3 kinase in a mammal.

Another aspect of the invention includes kits comprising a compound of formula (I) or one of formulas (Ia) to (Ii), or a stereoisomer, geometric isomer, tautomer, solvate, metabolite, N-oxide derivative or pharmaceutically acceptable salt or prodrug thereof, a container, and optionally a package insert or label indicating a treatment.

Another aspect of the invention includes methods of preparing, methods of separating, and methods of purifying compounds of formula (I) or one of formulas (Ia) to (Ii).

Another aspect of the invention includes novel intermediates useful for preparing formula (I) or one of formulas (Ia) to (Ii).

Additional advantages and novel features of this invention shall be set forth in part in the description that follows, and in part will become apparent to those skilled in the art upon examination of the following specification or may be learned by the practice of the invention. The advantages of the invention may be realized and attained by means of the instrumentalities, combinations, compositions, and methods particularly pointed out in the appended claims.

## **DETAILED DESCRIPTION OF EXEMPLARY EMBODIMENTS**

Reference will now be made in detail to certain embodiments of the invention, examples of which are illustrated in the accompanying structures and formulas. While the invention will be described in conjunction with the enumerated embodiments, it will be understood that they are not intended to limit the invention to those embodiments. On the contrary, the invention is intended to cover all alternatives, modifications, and equivalents which may be included within the scope of the present

invention as defined by the claims. One skilled in the art will recognize many methods and materials similar to equivalent to those described herein, which could be used in the practice of the present invention. The present invention is in no way limited to the methods and materials herein described.

In the event that one or more of the literature, patents, and similar materials referred to differs from or contradicts the present application, as regards including but not limited to defined terms, term usage, described techniques, or the like, only the teaching of the present application will be taken into consideration.

## DEFINITIONS

The term "alkyl" as used herein refers to a saturated linear or branched-chain monovalent hydrocarbon radical of one to twelve carbon atoms (C1-C12), wherein the alkyl radical may be optionally substituted independently with one or more substituents described below. In another embodiment, an alkyl radical is one to eight carbon atoms (C1-C8), or one to six carbon atoms (C1-C6). Examples of alkyl groups include, but are not limited to, methyl (Me, -CH<sub>3</sub>), ethyl (Et, -CH<sub>2</sub>CH<sub>3</sub>), 1-propyl (n-Pr, n-propyl, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 2-propyl (i-Pr, i-propyl, -CH(CH<sub>3</sub>)<sub>2</sub>), 1-butyl (n-Bu, n-butyl, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 2-methyl-1-propyl (i-Bu, i-butyl, -CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>), 2-butyl (s-Bu, s-butyl, -CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>3</sub>), 2-methyl-2-propyl (t-Bu, t-butyl, -C(CH<sub>3</sub>)<sub>3</sub>), 1-pentyl (n-pentyl, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 2-pentyl (-CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3-pentyl (-CH(CH<sub>2</sub>CH<sub>3</sub>)<sub>2</sub>), 2-methyl-2-butyl (-C(CH<sub>3</sub>)<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3-methyl-2-butyl (-CH(CH<sub>3</sub>)CH(CH<sub>3</sub>)<sub>2</sub>), 3-methyl-1-butyl (-CH<sub>2</sub>CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>), 2-methyl-1-butyl (-CH<sub>2</sub>CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>3</sub>), 1-hexyl (-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 2-hexyl (-CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3-hexyl (-CH(CH<sub>2</sub>CH<sub>3</sub>)(CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>)), 2-methyl-2-pentyl (-C(CH<sub>3</sub>)<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3-methyl-2-pentyl (-CH(CH<sub>3</sub>)CH(CH<sub>3</sub>)CH<sub>2</sub>CH<sub>3</sub>), 4-methyl-2-pentyl (-CH(CH<sub>3</sub>)CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>), 3-methyl-2-pentyl (-CH(CH<sub>3</sub>)(CH<sub>2</sub>CH<sub>3</sub>)<sub>2</sub>), 2-methyl-3-pentyl (-CH(CH<sub>2</sub>CH<sub>3</sub>)CH(CH<sub>3</sub>)<sub>2</sub>), 2,3-dimethyl-2-butyl (-C(CH<sub>3</sub>)<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>), 3,3-dimethyl-2-butyl (-CH(CH<sub>3</sub>)C(CH<sub>3</sub>)<sub>3</sub>, 1-heptyl, 1-octyl, and the like.

The term "alkenyl" refers to linear or branched-chain monovalent hydrocarbon radical of two to eight carbon atoms (C2-C8) with at least one site of unsaturation, i.e., a carbon-carbon, sp<sup>2</sup> double bond, wherein the alkenyl radical may be optionally

- 12 -

substituted independently with one or more substituents described herein, and includes radicals having "cis" and "trans" orientations, or alternatively, "E" and "Z" orientations. Examples include, but are not limited to, ethylenyl or vinyl (-CH=CH<sub>2</sub>), allyl (-CH<sub>2</sub>CH=CH<sub>2</sub>), and the like.

The term "alkynyl" refers to a linear or branched monovalent hydrocarbon radical of two to eight carbon atoms (C2-C8) with at least one site of unsaturation, i.e., a carbon-carbon, sp triple bond, wherein the alkynyl radical may be optionally substituted independently with one or more substituents described herein. Examples include, but are not limited to, ethynyl (-C≡CH), propynyl (propargyl, -CH<sub>2</sub>C≡CH), and the like.

The term "halogen" (or halo) preferably represents chloro or fluoro, but may also be bromo or iodo.

The terms "carbocycle", "carbocyclyl", "carbocyclic ring" and "cycloalkyl" refer to a monovalent non-aromatic, saturated or partially unsaturated ring having 3 to 12 carbon atoms (C3-C12) as a monocyclic ring or 7 to 12 carbon atoms as a bicyclic ring. Bicyclic carbocyclated having 7 to 12 atoms can be arranged, for example, as a bicyclo [4,5], [5,5], [5,6] or [6,6] system, and bicyclic carbocycles having 9 or 10 ring atoms can be arranged as a bicyclic [5,6] or [6,6] system, or as bridged systems such as bicyclo[2.2.1]heptane, bicyclo[2.2.2]octane and bicyclo[3.2.2]nonane. Examples of monocyclic carbocycles include, but are not limited to, cyclopropyl, cyclobutyl, cyclopentyl, 1-cyclopent-1-enyl, 1-cyclopent-2-enyl, 1-cyclopent-3-enyl, cyclohexyl, 1-cyclohex-1-enyl, 1-cyclohex-2-enyl, 1-cyclohex-3-enyl, cyclohexadienyl, cycloheptyl, cyclooctyl, cyclononyl, cyclodecyl, cycloundecyl, cyclododecyl, and the like.

"Aryl" means a monovalent aromatic hydrocarbon radical of 6-20 carbon atoms (C6-C20) derived by the removal of one hydrogen atom from a single carbon atom of a parent aromatic ring system. Some aryl groups are represented in the exemplary structures as "Ar". Aryl includes bicyclic radicals comprising an aromatic ring fused to a saturated, partially unsaturated ring, or aromatic carbocyclic ring. Typical aryl groups include, but are not limited to, radicals derived from benzene(phenyl), substituted benzenes, naphthalene, anthracene, biphenyl, indenyl, indanyl, 1,2-dihydronaphthalene, 1,2,3,4-tetrahydronaphthyl, and the like. Aryl groups are optionally substituted independently with one or more substituents described herein.

The terms "heterocycle", "heterocyclyl" and "heterocyclic ring" are used interchangeably herein and refer to a saturated or a partially unsaturated (i.e., having one or more double and/or triple bonds within the ring) carbocyclic radical of 3 to 20 ring atoms in which at least one ring atom is a heteroatom selected from nitrogen, oxygen, phosphorus and sulphur, the remaining ring atoms being C, where one or more ring atoms is optionally substituted independently with one or more substituents described below. A heterocycle may be a monocycle having 3 to 7 ring members (2 to 6 carbon atoms and 1 to 4 heteroatoms selected from N, O, P, and S) or a bicyclic having 7 to 10 ring members (4 to 9 carbon atoms and 1 to 6 heteroatoms selected from N, O, P, and S), for example: a bicyclic [4,5], [5,5], [5,6], or [6,6] system. Heterocycles are described in Paquette, Leo A.; "Principles of Modern Heterocyclic Chemistry" (W. A. Benjamin, New York, 1968), particularly Chapters 1, 3, 4, 6, 7, and 9; "The Chemistry of Heterocyclic Compounds, A series of Monographs" (John Wiley & Sons, New York, 1950 to present), in particular Volumes 13, 14, 16, 19, and 28; and J. Am. Chem. Soc. (1960) 82:5566. "Heterocyclyl" also includes radicals where heterocycle radicals are fused with a saturated, partially unsaturated ring, or aromatic carbocyclic or heterocyclic ring. Examples of heterocyclic rings include, but are not limited to, pyrrolidinyl, tetrahydrofuranyl, dihydrofuranyl, tetrahydrothienyl, tetrahydropyranyl, dihydropyranyl, tetrahydrothiopyranyl, piperidino, morpholino, thiomorpholino, thioxanyl, piperazinyl, homopiperazinyl, azetidinyl, oxetanyl, thietanyl, homopiperidinyl, oxepanyl, thiepanyl, oxazepinyl, diazepinyl, thiazepinyl, 2-pyrrolinyl, 3-pyrrolinyl, indolinyl, 2H-pyranyl, 4H-pyranyl, dioxanyl, 1,3-dioxolanyl, pyrazolinyl, dithianyl, dithiolanyl, dihydropyranyl, dihydrothienyl, dihydrofuranyl, pyrazolidinylimidazolinyl, imidazolidinyl, 3-azabicyclo[3.1.0]hexanyl, 3-azabicyclo[4.1.0]heptanyl, azabicyclo[2.2.2]hexanyl, 3H-indolyl quinolizinyl and N-pyridyl ureas. Spiro moieties are also included within the scope of this definition. Examples of a heterocyclic group wherein 2 ring carbon atoms are substituted with oxo (=O) moieties are pyrimidinonyl and 1,1-dioxo-thiomorpholiny. The heterocycle groups herein are optionally substituted independently with one or more substituents described herein.

The term "heteroaryl" refers to a monovalent aromatic radical of 5-, 6-, or 7-membered rings, and includes fused ring systems (at least one of which is aromatic)

of 5-20 atoms, containing one or more heteroatoms independently selected from nitrogen, oxygen, and sulphur. Examples of heteroaryl groups are pyridinyl (including, for example, 2-hydroxypyridinyl), imidazolyl, imidazopyridinyl, pyrimidinyl (including, for example, 4-hydroxypyrimidinyl), pyrazolyl, triazolyl, pyrazinyl, tetrazolyl, furyl, thienyl, isoxazolyl, thiazolyl, oxadiazolyl, oxazolyl, isothiazolyl, pyrrolyl, quinolinyl, isoquinolinyl, tetrahydroisoquinolinyl, indolyl, benzimidazolyl, benzofuranyl, cinnolinyl, indazolyl, indolizinyl, phthalazinyl, pyridazinyl, triazinyl, isoindolyl, pteridinyl, purinyl, oxadiazolyl, triazolyl, thiadiazolyl, furazanyl, benzofurazanyl, benzothiophenyl, benzothiazolyl, benzooxazolyl, quinazolinyl, quinoxalinyl, naphthyridinyl, and furopyridinyl. Heteroaryl groups are optionally substituted independently with one or more substituents described herein.

The heterocycle or heteroaryl groups may be carbon (carbon-linked), or nitrogen (nitrogen-linked) bonded where such is possible. By way of example and not limitation, carbon bonded heterocycles or heteroaryls are bonded at position 2, 3, 4, 5, or 6 of a pyridine, position 3, 4, 5, or 6 of a pyridazine, position 2, 4, 5, or 6 of a pyrimidine, position 2, 3, 5, or 6 of a pyrazine, position 2, 3, 4, or 5 of a furan, tetrahydrofuran, thifuran, thiophene, pyrrole or tetrahydropyrrole, position 2, 4, or 5 of an oxazole, imidazole or thiazole, position 3, 4, or 5 of an isoxazole, pyrazole, or isothiazole, position 2 or 3 of an aziridine, position 2, 3, or 4 of an azetidine, position 2, 3, 4, 5, 6, 7, or 8 of a quinoline or position 1, 3, 4, 5, 6, 7, or 8 of an isoquinoline.

By way of example and not limitation, nitrogen bonded heterocycles or heteroaryls are bonded at position 1 of an aziridine, azetidine, pyrrole, pyrrolidine, 2-pyrroline, 3-pyrroline, imidazole, imidazolidine, 2-imidazoline, 3-imidazoline, pyrazole, pyrazoline, 2-pyrazoline, 3-pyrazoline, piperidine, piperazine, indole, indoline, 1H-indazole, position 2 of a isoindole, or isoindoline, position 4 of a morpholine, and position 9 of a carbazole, or  $\beta$ -carboline.

The term "monocyclic heteroaryl" refers to a five- or six-membered, unsubstituted or substituted, monocyclic heteroaryl radical which contains 1, 2, 3 or 4 ring heteroatoms independently selected from N, O and S. The monocyclic heteroaryl may be attached to the C-2 position of the pyrimidine ring according to formula Ia-Ii at any carbon (carbon-linked), or nitrogen (nitrogen-linked) atom of the monocyclic heteroaryl R3 group. Monocyclic heteroaryl radicals include, but are not limited to: 2-

pyridyl, 3-pyridyl, 4-pyridyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-imidazolyl, 4-imidazolyl, 3-pyrazolyl, 4-pyrazolyl, 2-pyrrolyl, 3-pyrrolyl, 2-thiazolyl, 4-thiazolyl, 5-thiazolyl, 3-pyridazinyl, 4-pyridazinyl, 5-pyridazinyl, 2-pyrimidinyl, 5-pyrimidinyl, 6-pyrimidinyl, 2-pyrazinyl, 2-oxazolyl, 4-oxazolyl, 5-oxazolyl, 2-furanyl, 3-furanyl, 2-thienyl, 3-thienyl, 3-triazolyl, 1-triazolyl, 5-tetrazolyl, 1-tetrazolyl, and 2-tetrazolyl. Monocyclic heteroaryl are optionally substituted independently with one or more substituents described herein.

The term "treat" and "treatment" refer to both therapeutic treatment and prophylactic or preventative measures, wherein the object is to prevent or slow down (lessen) an undesired pathological change or disorder, such as the development or spread of cancer. For purpose of this invention, beneficial or desired clinical results include, but are not limited to, alleviation of symptoms, diminishment of extent of disease, stabilized (i.e., not worsening) state of disease, delay or slowing of disease progression, amelioration or palliation of the disease state, and remission (whether partial or total), whether detectable or undetectable. "Treatment" can also mean prolonging survival as compared to expected survival if not receiving treatment. Those in need of treatment include those already with the condition or disorder as well as those prone to have the condition or disorder or those in which the condition or disorder is to be prevented.

The phrase "therapeutically effective amount" means an amount of a compound of the present invention that (i) treats or prevents the particular disease, condition, or disorder, (ii) attenuates, ameliorates, or eliminates one or more symptoms of the particular disease, condition, or disorder, or (iii) prevents or delays the onset of one or more symptoms of the particular disease, condition, or disorder described herein. In the case of cancer, the therapeutically effective amount of the drug may be reduce the number of cancer cells; reduce the tumor size; inhibit (i.e., slow to some extent and preferably stop) cancer cell infiltration into peripheral organs; inhibit (i.e., slow to some extent and preferably stop) tumor metastasis; inhibit, to some extent, tumor growth; and/or relieve to some extent one or more of the symptoms associated with the cancer. To the extent the drug may prevent growth and/or kill existing cancer cells, it may be cytostatic and/or cytotoxic. For cancer therapy, efficacy can be measured, for example, by assessing the time to disease

progression (TTP) and/or determining the response rate (RR).

The terms "cancer" and "cancerous" refer to or describe the physiological condition in mammals that is typically characterized by unregulated cell growth. A "tumor" comprises one or more cancerous cells. Examples of cancer include, but are not limited to, carcinoma, lymphoma, blastoma, sarcoma, and leukaemia or lymphoid malignancies. More particular examples of such cancers include squamous cell cancer (e.g., epithelial squamous cell cancer), lung cancer including small-cell lung cancer, non-small cell lung cancer ("NSCLC"), adenocarcinoma of the lung and squamous carcinoma of the lung, cancer of the peritoneum, hepatocellular cancer, gastric or stomach cancer including gastrointestinal cancer, pancreatic cancer, glioblastoma, cervical cancer, ovarian cancer, liver cancer, bladder cancer, hepatome, breast cancer, colon cancer, rectal cancer, colorectal cancer, endometrial or uterine carcinoma, salivary gland carcinoma, kidney or renal cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma, anal carcinoma, penile carcinoma, as well as head and neck cancer.

A "chemotherapeutic agent" is a *chemical compound useful in the treatment of cancer*. Examples of known chemotherapeutic agents include trastuzumab, pertuzumab, erlotinib (TARCEVA®, Genetech/OSI Pharm.), bortezomib (VELCADE®, Millennium Pharm.), fulvestrant (FASLODEX®, AstraZeneca), sunitib (SUTENT®, Pfizer/Sugen), letrozole (FEMARA®, Novartis), imatinib mesylate (GLEEVEC®, Novartis), finasunate (VATALANIB®, Novartis), oxaliplatin (ELOXATIN®, Sanofi), 5-FU (5-fluorouracil), leucovorin, Rapamycin (Sirolimus, RAPAMUNE®, Wyeth), Lapatinib (TYKERB®, GSK572016, Glaxo Smith Kline), Lonafarnib (SCH 66336), sorafenib (NEXAVAR, Bayer Labs), and gefitinib (IRESSA®, AstraZeneca), AG1478, alkylating agents such as thiotepa and CYTOXAN® cyclophosphamide; alkyl sulfonates such as busulfan, improsulfan and piposulfan; aziridines such as benzodopa, carboquone, meturedopa, and uredopa; ethylenimines and methylamelamines including altretamine, triethylenemelamine, triethylenephosphoramide, triethylenethiophosphoramide and trimethylomelamine; acetogenins; a camptothecin (including the synthetic analog topotecan); bryostatin; callystatin; CC-1065 (including its adozelesin, carzelesin and bizelesin synthetic analogs); cryptophycins; dolastatin; duocarmycin (including the synthetic analogs,

KW-2189 and CB1-TM1); eleutherobin; pancratistatin; a sarcodictyin; spongistatin; nitrogen mustards such as chlorambucil, chlornaphazine, chlorophosphamide, estramustine, ifosfamide, mechlorethamine, mechlorethamine oxide hydrochloride, melphalan, novembichin, phenesterine, prednimustine, trofosfamide, uracil mustard; nitrosureas such as carmustine, chlorozotocin, fotemustine, lomustine, nimustine, and ranimustine; antibiotics such as the enediyne antibiotics (e.g., calicheamicin, especially calicheamicin gamma1I and calicheamicin omegal1; dynemicin, including dynemicin A; biphosphonates, such as clodronate; an esperamicin; as well as neocarzinostatin chromophore and related chromoprotein enediyne antibiotic chromophores), aclacinomysins, actinomycin, authramycin, azaserine, bleomycins, cactinomycin, carabacin, carminomycin, carzinophillin, chromomycinis, dactinomycin, daunorubicin, detorubicin, 6-diazol-5-oxo-L-norleucine, ADRIAMYCIN® (doxorubicin), morpholino-doxorubicin, cyanomorpholino-doxorubicin, 2-pyrrolino-doxorubicin and deoxydoxorubicin), epirubicin, esorubicin, idarubicin, marcellomycin, mitomycins such as mitomycin C, mycophenolic acid, nogalamycin, olivomycins, peplomycin, porfiromycin, puromycin, quelamycin, rodoubicin, streptonigrin, streptozocin, tubercidin, ubenimex, zinostatin, zorubicin; anti-metabolites such as methotrexate and 5-fluorouracil (5-FU); folic acid analogs such as denopterin, methotrexate, pterofterin, trimetrexate; purine analogs such as fludarabine, 6-mercaptopurine, thioguanine; pyrimidine analogs such as ancitabine, azacitidine, 6-azauridine, carmofur, cytarabine, dideoxuryidine, doxifluridine, enocitabine, floxuridine; androgens such as calusterone, dromostanolone propionate, epitiostanol, mepitiostane, testolactone; anti-adrenals such as aminoglutethimide, mitotane, trilostane; folic acid replenisher such as folinic acid; aceglatone; aldophosphamide glycoside; aminolevulinic acid; eniluracil; amsacrine; bestabucil; bisantrene; edatraxate; defofamine; demecolcine; diaziquone; el fornithine; elliptinium acetate; an epothilone; etoglucid; gallium nitrate; hydroxyurea; lentinan; lonidainine; maytansinoids such as maytansine and ansamitocins; mitoguazone; mitoxantrone; moidanmol; niraerine; pentostatin; phenacetin; pirarubicin; losoxantrone; podophyllinic acid; 2-ethylhydrazide; procarbazine; PSK® polysaccharide complex; razoxane; rhizoxin; sizofiran; spirogermanium; tenuazonic acid; triaziquone; trichothecenes; urethane; vindesine; dacarbazine; mannomustine; mitobronitol;

mitolactol; pipobroman; gacytosine; arabinoside; taxoids, e.g., TAXOL® (paclitaxel; Bristol-Myers Squibb), ABRAXANE™ (Cremophor-free), albumin-engineered nanoparticle formulations of paclitaxel, and TAXOTERE® (docetaxel, doxetaxel; Sanofi-Aventis); chlorambucil; GEMZAR® (gemcitabine); 6-thioguanine; mercaptopurine; methotrexate; platinum analogs such as cisplatin and carboplatin; vinblastine; etoposide; ifosfamide; mitoxantrone; vincristine; NAVELBINE® (vinorelbine); novantrone; teniposide; edatrexate; daunomycin; aminopterin; capecitabine (XELODA®); ibandronate; CP-11; topoisomerase inhibitor RFS 2000; difluoromethylornithine (DMFO); retinoids such as retinoic acid; and pharmaceutically acceptable salts; acids and derivatives of any of the above.

Also included in the definition of "chemotherapeutic agent" are: (i) anti-hormonal agents that act to regulate or inhibit hormone action on tumors such as anti-estrogens and selective receptor modulators (SERMs), including, for example, tamoxifen (including NOLVADEX®; tamoxifen citrate), raloxifene, droloxifene, and FARESTON® (toremifene citrate); (ii) aromatase inhibitors that inhibit the enzyme aromatase, which regulates estrogen production in the adrenal glands, such as, for example, 4(5)-imidazoles, MEGASE® (megestrol acetate); AROMASIN® (exemestane; Pfizer), formestane, fadrazole, RIVISOR® (vorozole), FEMARA® (letrozole; Novartis), and ARIMIDEX® (anastrozole; AstraZeneca); (iii) anti-androgens such as flutamide, nilutamide; (iv) protein kinase inhibitors; (v) lipid kinase inhibitors; (vi) antisense oligonucleotides, particularly those which inhibit expression of genes in signaling pathways implicated in aberrant cell proliferation, such as, for example, PKC-alpha, Raf1 and H-Ras; (vii) ribozymes such as VEGF expression inhibitors (e.g., ANGIOZYME®) and HER2 expression inhibitors; (viii) vaccines such as gene therapy vaccines, for example, ALLOVECTIN®, LEUVECTIN®, and VAXID®; PROLEUKIN® rIL-2; a topoisomerase 1 inhibitor such as LURTOTECANE®; ABARELIX® rmRH; (ix) anti-angiogenic agents such as bevacizumab (AVASTIN®, Genentech); and (x) pharmaceutically acceptable salts, acids and derivatives of any of the above.

The term "prodrug" as used in this application refers to a precursor or derivative form of a compound of the invention that may be less cytotoxic to cells

compared to the parent compound or drug and is capable of being enzymatically or hydrolytically activated or converted into the more active parent form. The prodrugs of this invention include, but are not limited to, phosphate-containing prodrugs, thiophosphate-containing prodrugs, sulfate-containing prodrugs, peptide-containing prodrugs, D-amino acid-modified prodrugs, glycosylated prodrugs,  $\beta$ -lactam-containing prodrugs, optionally substituted phenoxyacetamide-containing prodrugs, optionally substituted phenylacetamide-containing prodrugs, 5-fluorocytosine and other 5-fluorouridine prodrugs which can be converted into the more active cytotoxic free drug. Examples of cytotoxic drugs that can be derivatized into a prodrug form for use in this invention include, but are not limited to, compounds of the invention and chemotherapeutic agents such as described above.

A "metabolite" is a product produced through metabolism in the body of a specified compound or salt thereof. Metabolites of a compound may be identified using routine techniques known in the art and their activities determined using tests such as those described herein. Such products may result for example from the oxidation, reduction, hydrolysis, amidation, deamidation, esterification, deesterification, enzymatic cleavage, and the like, of the administered compound. Accordingly, the invention includes metabolites of compounds of the invention, including compounds produced by a process comprising contacting a compound of this invention with a mammal for a period of time sufficient to yield a metabolic product thereof.

A "liposome" is a small vesicle composed of various types of lipids, phospholipids and/or surfactant, which is useful for delivery of a drug (such as the PI3K and mTOR kinase inhibitors disclosed herein and, optionally, a chemotherapeutic agent) to a mammal. The components of the liposome are commonly arranged in a bilayer formation, similar to the lipid arrangement of biological membranes.

The term "package insert" is used to refer to instructions customarily included in commercial packages of therapeutic products, that contain information about the indications, usage, dosage, administration, contraindications and/or warnings concerning the use of such therapeutic products.

The term "chiral" refers to molecules, which have the property of non-

superimposability of the mirror image partner, while the term "achiral" refers to molecules, which are superimposable on their mirror image partner.

The term "stereoisomers" refers to compounds, which have identical chemical constitution, but differ with regard to the arrangement of the atoms or groups in space.

"Diastereomer" refers to a stereoisomer with two or more centers of chirality and whose molecules are not mirror images of one another. Diastereomers have different physical properties, e.g. melting points, boiling points, spectral properties, and reactivities. Mixtures of diastereomers may separate under high resolution analytical procedures such as electrophoresis and chromatography.

"Enantiomers" refer to two stereoisomers of a compound which are non-superimposable mirror images of one another.

Stereochemical definitions and conventions used herein generally follow S. P. Parker, Ed., *McRaw-Hill Dictionary of Chemical Terms* (1984) McGraw-Hill Book Company, New York; and Eliel, E. and Wilen, S., "Stereochemistry of Organic Compounds", John Wiley & Sons, Inc., New York, 1994. The compounds of the invention may contain asymmetric or chiral centers, and therefore exist in different stereoisomeric forms. It is intended that all stereoisomeric forms of the compounds of the invention, including but not limited to, diastereomers, enantiomers and atropisomers, as well as mixtures thereof such as racemic mixtures, form part of the present invention. Many organic compounds exist in optically active forms, i.e., they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L, or R and S, are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes d and l or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or l meaning that the compound is levorotatory. A compound prefixed with (+) or d is dextrorotatory. For a given chemical structure, these stereoisomers are identical except that they are mirror images of one another. A specific stereoisomer may also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. A 50:50 mixture of enantiomers is referred to as a racemic mixture or a racemate.

The term "tautomer" or "tautomeric form" refers to structural isomers of

different energies, which are interconvertible via a low energy barrier. For example, proton tautomers include interconversions via migration of a proton, such as keto-enol and imin-enamine isomerizations.

The phrase "pharmaceutically acceptable salt" as used herein, refers to pharmaceutically acceptable organic or inorganic salts of a compound of the invention. Exemplary salts include, but are not limited to, sulfate, citrate, acetate, oxalate, chloride, bromide, iodide, nitrate, bisulfate, phosphate, acid phosphate, isonicotinate, lactate, salicylate, acid citrate, tartrate, oleate, tannate, pantothenate, bitartrate, ascorbate, succinate, maleate, gentisinate, fumarate, gluconate, glucuronate, saccharate, formate, benzoate, glutamate, methanesulfonate "mesylate", ethanesulfonate, benzenesulfonate, p-toluenesulfonate, and pamoate salts. A pharmaceutically acceptable salt may involve the inclusion of another molecule such as an acetate ion, a succinate ion or other counter ion. The counter ion may be any organic or inorganic moiety that stabilizes the charge on the parent compound. Furthermore, a pharmaceutically acceptable salt may have more than one charged atom in its structure. Instances where multiple charged atoms are part of the pharmaceutically acceptable salt can have multiple counter ions. Hence, a pharmaceutically acceptable salt can have one or more charged atoms and/or one or more counter ion.

If the compound of the invention is a base, the desired pharmaceutically acceptable salt may be prepared by any suitable method available in the art, for example, treatment of the free base with an inorganic acid, such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, methanesulfonic acid, phosphoric acid and the like, or with an organic acid, such as acetic acid, trifluoroacetic acid, maleic acid, succinic acid, mandelic acid, fumaric acid, malonic acid, pyruvic acid, oxalic acid, glycolic acid, salicylic acid, a pyranosidyl acid, such as glucuronic acid or galacturonic acid, an alpha hydroxyl acid, such as citric acid or tartaric acid, an amino acid, such as aspartic acid or glutamic acid, an aromatic acid, such as benzoic acid or cinnamic acid, a sulfonic acid, such as p-toluenesulfonic acid or ethanesulfonic acid, or the like.

If the compound of the invention is an acid, the desired pharmaceutically acceptable salt may be prepared by any suitable method, for example, treatment of

the free acid with an inorganic or organic base, such as an amine, an alkali metal hydroxide or alkaline earth metal hydroxide, or the like. Illustrative examples of suitable salts include, but are not limited to, organic salts derived from amino acids, such as glycine and arginine, ammonia, primary, secondary, and tertiary amines, and cyclic amines, such as piperidine, morpholine and piperazine, and inorganic salts derived from sodium, calcium, potassium, magnesium, manganese, iron, copper, zinc, aluminium and lithium.

The phrase "pharmaceutically acceptable" indicates that the substance or composition must be compatible chemically and/or toxicologically, with the other ingredients comprising a formulation, and/or the mammal being treated therewith.

A "solvate" refers to an association or complex of one or more solvent molecules and a compound of the invention. Examples of solvents that form solvates include, but are not limited to, water, isopropanol, ethanol, methanol, DMSO, ethyl acetate, acetic acid, and ethanolamine. The term "hydrate" refers to the complex where the solvent molecule is water.

The term "protecting group" refers to a substituent that is commonly employed to block or protect a particular functionality while reacting other functional groups on the compound. For example, an "amino-protecting group" is a substituent attached to an amino group that blocks or protects the amino functionality in the compound. Suitable amino-protecting groups include acetyl, trifluoroacetyl, t-butoxycarbonyl (BOC), benzyloxycarbonyl and 9-fluorenylmethylenoxycarbonyl (Fmoc). For a general description of protecting groups and their use, see T. W. Greene, *Protective Groups in Organic Synthesis*, John Wiley & Sons, New York, 1991.

The terms "compound of this invention" and "compounds of the present invention" and "compounds of formula (I) or one of formulas (Ia) to (Ii)" include compounds of formula (I) or one of formulas (Ia) to (Ii) and stereoisomers, geometric isomers, tautomers, solvates, metabolites, N-oxide derivatives and pharmaceutically acceptable salts and prodrugs thereof.

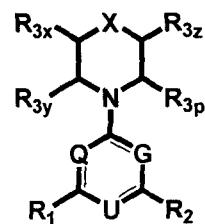

The term "mammal" includes, but is not limited to, humans, mice, rats, guinea, pigs, monkeys, dogs, cats, horses, cows, pigs, and sheep.

## TRIAZINE, PYRIMIDINE AND PYRIDINE ANALOGS AND THEIR USE AS THERAPEUTIC AGENTS AND DIAGNOSTIC PROBES

The present invention provides triazine, pyrimidine and pyridine compounds, and pharmaceutical formulations thereof, which are useful as therapeutic agents and novel diagnostic probes. Moreover, these compounds are potentially useful in the treatment of diseases, conditions and/or disorders modulated by protein kinases and lipid kinases.

More specifically, the present invention provides compounds of formula I,

(I)

and stereoisomers, geometric isomers, tautomers, solvates, metabolites, N-oxide derivatives and pharmaceutically acceptable salts thereof, wherein:

**Q = N, G = N, U = N** (triazine-based compounds of formulas (Ia) to (Id));

**Q = C, G = C, U = N** (pyridine-based compounds of formula (Ie));

**Q = C, U = C, G = N** (pyridine-based compounds of formula (Ie));

**U = C, G = C, Q = N** (pyridine-based compounds of formula (Ie));

**Q = CR<sub>z</sub>, G = N, U = N** (fused-pyrimidine-based compounds of formulas (If) to (Ii)); or

**Q = CR<sub>z</sub>, G = C, U = N** (fused pyridine-based compounds of formulas (If) to (Ii));

wherein **R<sub>z</sub>** is selected from the group consisting of:

- (1) hydrogen, (2) cyano, (3) halogen, (4) methyl, (5) trifluoromethyl, (6) sulfonamido, (7) sulfon, (8) linker moiety (hydrophobic linkers, hydrophilic linkers (pegylated linkers), photo-cleavable linkers, redox reaction-cleavable linkers), (9) linker moiety with covalently bonded TAG-molecules (a TAG could be a fluorophor, biotin, different

polymer beads and different reactive groups), (10) F, Cl, Br, I, -C(C<sub>1</sub>-C<sub>6</sub>-alkyl)<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>t</sub>NR<sub>10</sub>R<sub>11</sub>, -C(R<sub>14</sub>R<sub>15</sub>)<sub>n</sub>NR<sub>12</sub>C(=Y)R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>NR<sub>12</sub>S(O)<sub>2</sub>R<sub>10</sub>, -CH(OR<sub>10</sub>)R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>OR<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>S(O)<sub>2</sub>R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>S(O)<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -C(=Y)R<sub>10</sub>, -C(=Y)OR<sub>10</sub>, -C(=Y)NR<sub>10</sub>R<sub>11</sub>, -C(=Y)NR<sub>12</sub>OR<sub>10</sub>, -C(=O)NR<sub>12</sub>S(O)<sub>2</sub>R<sub>10</sub>, -C(=O)NR<sub>12</sub>(CR<sub>14</sub>R<sub>15</sub>)<sub>m</sub>NR<sub>10</sub>R<sub>11</sub>, -NO<sub>2</sub>, -NHR<sub>12</sub>, -NR<sub>12</sub>C(=Y)R<sub>11</sub>, -NR<sub>12</sub>C(=Y)OR<sub>11</sub>, -NR<sub>12</sub>C(=Y)NR<sub>10</sub>R<sub>11</sub>, -NR<sub>12</sub>S(O)<sub>2</sub>R<sub>10</sub>, -NR<sub>12</sub>SO<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -S(O)<sub>2</sub>R<sub>10</sub>, -S(O)<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -SC(=Y)R<sub>10</sub>, -SC(=Y)OR<sub>10</sub>, C<sub>1</sub>-C<sub>12</sub> alkyl, C<sub>2</sub>-C<sub>8</sub> alkenyl, C<sub>2</sub>-C<sub>8</sub> alkynyl, C<sub>3</sub>-C<sub>12</sub> carbocyclyl, C<sub>2</sub>-C<sub>20</sub> heterocyclyl, C<sub>6</sub>-C<sub>20</sub> aryl, and C<sub>1</sub>-C<sub>20</sub> heteroaryl; or C<sub>3</sub>-C<sub>12</sub> carbocyclyl, C<sub>2</sub>-C<sub>20</sub> heterocyclyl, C<sub>6</sub>-C<sub>20</sub> aryl, or C<sub>1</sub>-C<sub>20</sub> heteroaryl;

where said alkyl, alkenyl, alkynyl, carbocyclyl, heterocyclyl, aryl and heteroaryl are optionally substituted with one or more groups independently selected from F, Cl, Br, I, -CN, CF<sub>3</sub>, -NO<sub>2</sub>, oxo, -C(=Y)R<sub>10</sub>, -C(=Y)OR<sub>10</sub>, -C(=Y)NR<sub>10</sub>R<sub>11</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>NR<sub>10</sub>R<sub>11</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>C(=Y)NR<sub>10</sub>R<sub>11</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>C(=Y)OR<sub>10</sub>, (CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>NR<sub>12</sub>SO<sub>2</sub>R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>OR<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>SO<sub>2</sub>R<sub>10</sub>, -NR<sub>10</sub>R<sub>11</sub>, -NR<sub>12</sub>C(=Y)R<sub>10</sub>, -NR<sub>12</sub>C(=Y)OR<sub>11</sub>, -NR<sub>12</sub>C(=Y)NR<sub>10</sub>R<sub>11</sub>, -NR<sub>12</sub>SO<sub>2</sub>R<sub>10</sub>, =NR<sub>12</sub>, OR<sub>10</sub>, -OC(=Y)R<sub>10</sub>, -OC(=Y)OR<sub>10</sub>, -OC(=Y)NR<sub>10</sub>R<sub>11</sub>, -OS(O)<sub>2</sub>(OR<sub>10</sub>), -OP(=Y)(OR<sub>10</sub>)(OR<sub>11</sub>), -OP(OR<sub>10</sub>)(OR<sub>11</sub>), SR<sub>10</sub>, -S(O)R<sub>10</sub>, -S(O)<sub>2</sub>R<sub>10</sub>, -S(O)<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -S(O)(OR<sub>10</sub>), -S(O)<sub>2</sub>(OR<sub>10</sub>), -SC(=Y)R<sub>10</sub>, -SC(=Y)OR<sub>10</sub>, -SC(=Y)NR<sub>10</sub>R<sub>11</sub>, optionally substituted C<sub>1</sub>-C<sub>12</sub> alkyl, optionally substituted C<sub>2</sub>-C<sub>8</sub> alkenyl, optionally substituted C<sub>2</sub>-C<sub>8</sub> alkynyl, optionally substituted C<sub>3</sub>-C<sub>12</sub> carbocyclyl, optionally substituted C<sub>2</sub>-C<sub>20</sub> heterocyclyl, optionally substituted C<sub>6</sub>-C<sub>20</sub> aryl, and optionally substituted C<sub>1</sub>-C<sub>20</sub> heteroaryl;

X is CR<sub>x</sub> or O, S, NR<sub>y</sub>, wherein R<sub>x</sub> and R<sub>y</sub> are independently selected from the group consisting of:

(1) hydrogen, (2) cyano, (3) halogen, (4) methyl, (5) trifluoromethyl, (6) sulfonamido, (7) sulfon, (8) linker moiety (hydrophobic, hydrophilic, photo-cleavable, redox reaction-cleavable linkers), (9) linker moiety with covalently bonded TAG-molecules (a TAG could be a fluorophor, biotin, different polymer beads and different reactive groups);

the linker moiety being selected from the group consisting of:

optionally substituted C<sub>1</sub>-C<sub>20</sub> alkyl, optionally substituted halo-substituted C<sub>1</sub>-C<sub>20</sub> alkyl, optionally substituted C<sub>1</sub>-C<sub>20</sub> alkoxy, optionally substituted halo-substituted C<sub>1</sub>-C<sub>20</sub> alkoxy, optionally substituted C<sub>1</sub>-C<sub>20</sub> pegylated alkyl;

the tag molecule being selected from the group consisting of:  
 dye molecules, fluorophore dyes (for example bodipy, or rhodamine derivatives), biotine, a polymer resin or a reactive group (for example acrylamid, iodoacetamid, fluoroacetamid, chloroacetamid, bromoacetamid, photo-reactive chemical groups, oxirane carboxamide, redox-reaction reactive chemical groups);

R<sub>3x</sub>, R<sub>3y</sub>, R<sub>3z</sub> and R<sub>3p</sub> are independently selected from the group consisting of:

acetylamino, carboxamide, (4-methylsulfonylpiperazino)-1-methyl, (4-methylpiperazino)-1-methyl, hydroxymethyl, and methoxy.

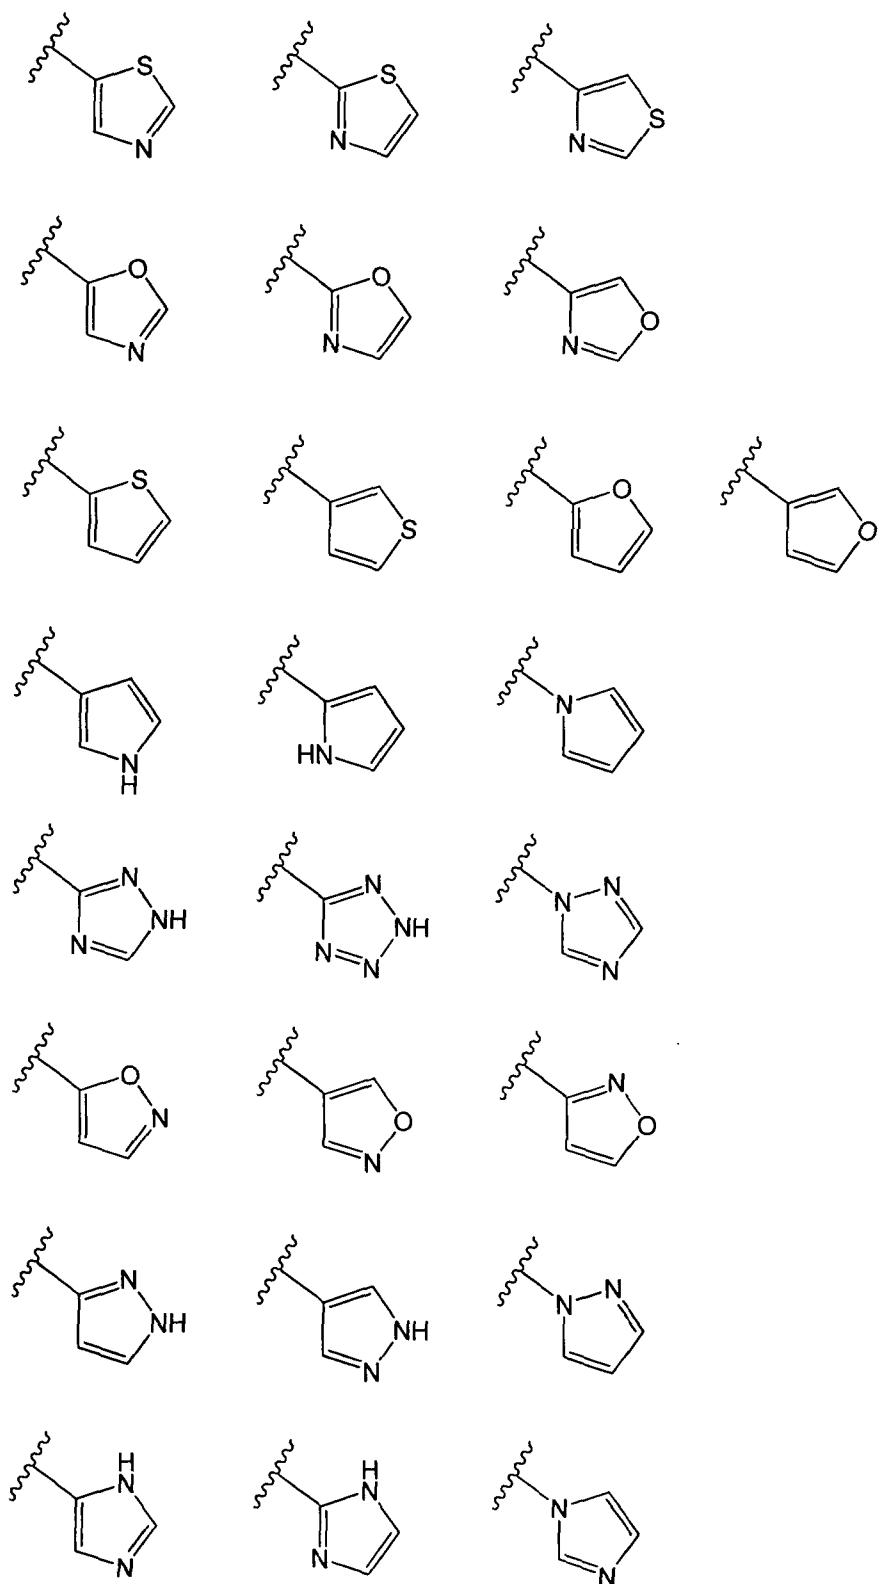

In another aspect of the invention,  $R_2$  is substituted or unsubstituted heterocyclyl, or substituted or unsubstituted  $-O$ -heterocyclyl.

In another aspect,  $R_2$  comprises substituted or unsubstituted heterocyclylalkyl, or substituted or unsubstituted heteroarylalkyl.

In another aspect  $R_2$  is a monocyclic heteroaryl group selected from pyridyl, isoxazolyl, imidazolyl, pyrazolyl, pyrrolyl, thiazolyl, pyridazinyl, pyrimidinyl, pyrazinyl, oxazolyl, furanyl, thienyl, triazolyl, tetrazolyl, where the monocyclic heteroaryl group is optionally substituted with one or more groups selected from F, Cl, Br, I, -CN,  $-NR_{10}R_{11}$ ,  $-OR_{10}$ ,  $-C(O)R_{10}$ ,  $-NR_{10}C(O)R_{11}$ ,  $-N(C(O)R_{11})_2$ ,  $-NR_{10}C(O)NR_{10}R_{11}$ ,  $-C(=O)OR_{10}$ ,  $-C(=O)NR_{10}R_{11}$ , C1-C12 alkyl and (C1-C12 alkyl)- $OR_{10}$ ;

In a particular embodiment,  $R_2$  is selected from the structures:

- 31 -

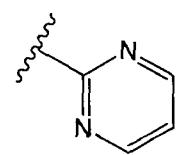

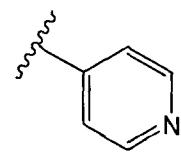

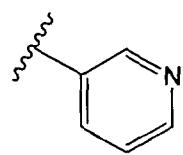

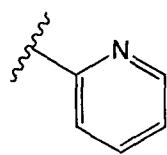

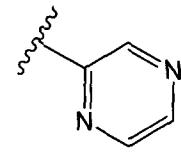

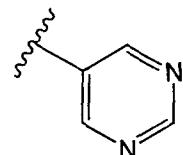

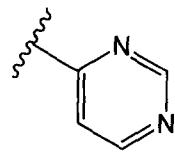

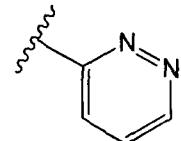

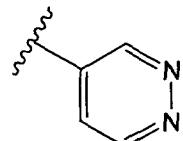

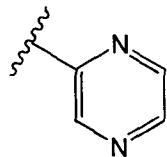

where the wavy line indicates the attachment to the 4-position of the core ring

- 32 -

(triazine or pyrimidine or pyridine ring), and

where the monocyclic heteroaryl group is optionally substituted with one or more groups selected from F, Cl, Br, I, -NR<sub>10</sub>R<sub>11</sub>, -OR<sub>10</sub>, -C(O)R<sub>10</sub>, -NR<sub>10</sub>C(O)R<sub>11</sub>, -N(C(O)R<sub>11</sub>)<sub>2</sub>, -NR<sub>10</sub>C(O)NR<sub>10</sub>R<sub>11</sub>, -C(=O)OR<sub>10</sub>, -C(=O)NR<sub>10</sub>R<sub>11</sub>, and C<sub>1</sub>-C<sub>12</sub> alkyl.

In certain embodiments, R<sub>2</sub> is selected from the structures:

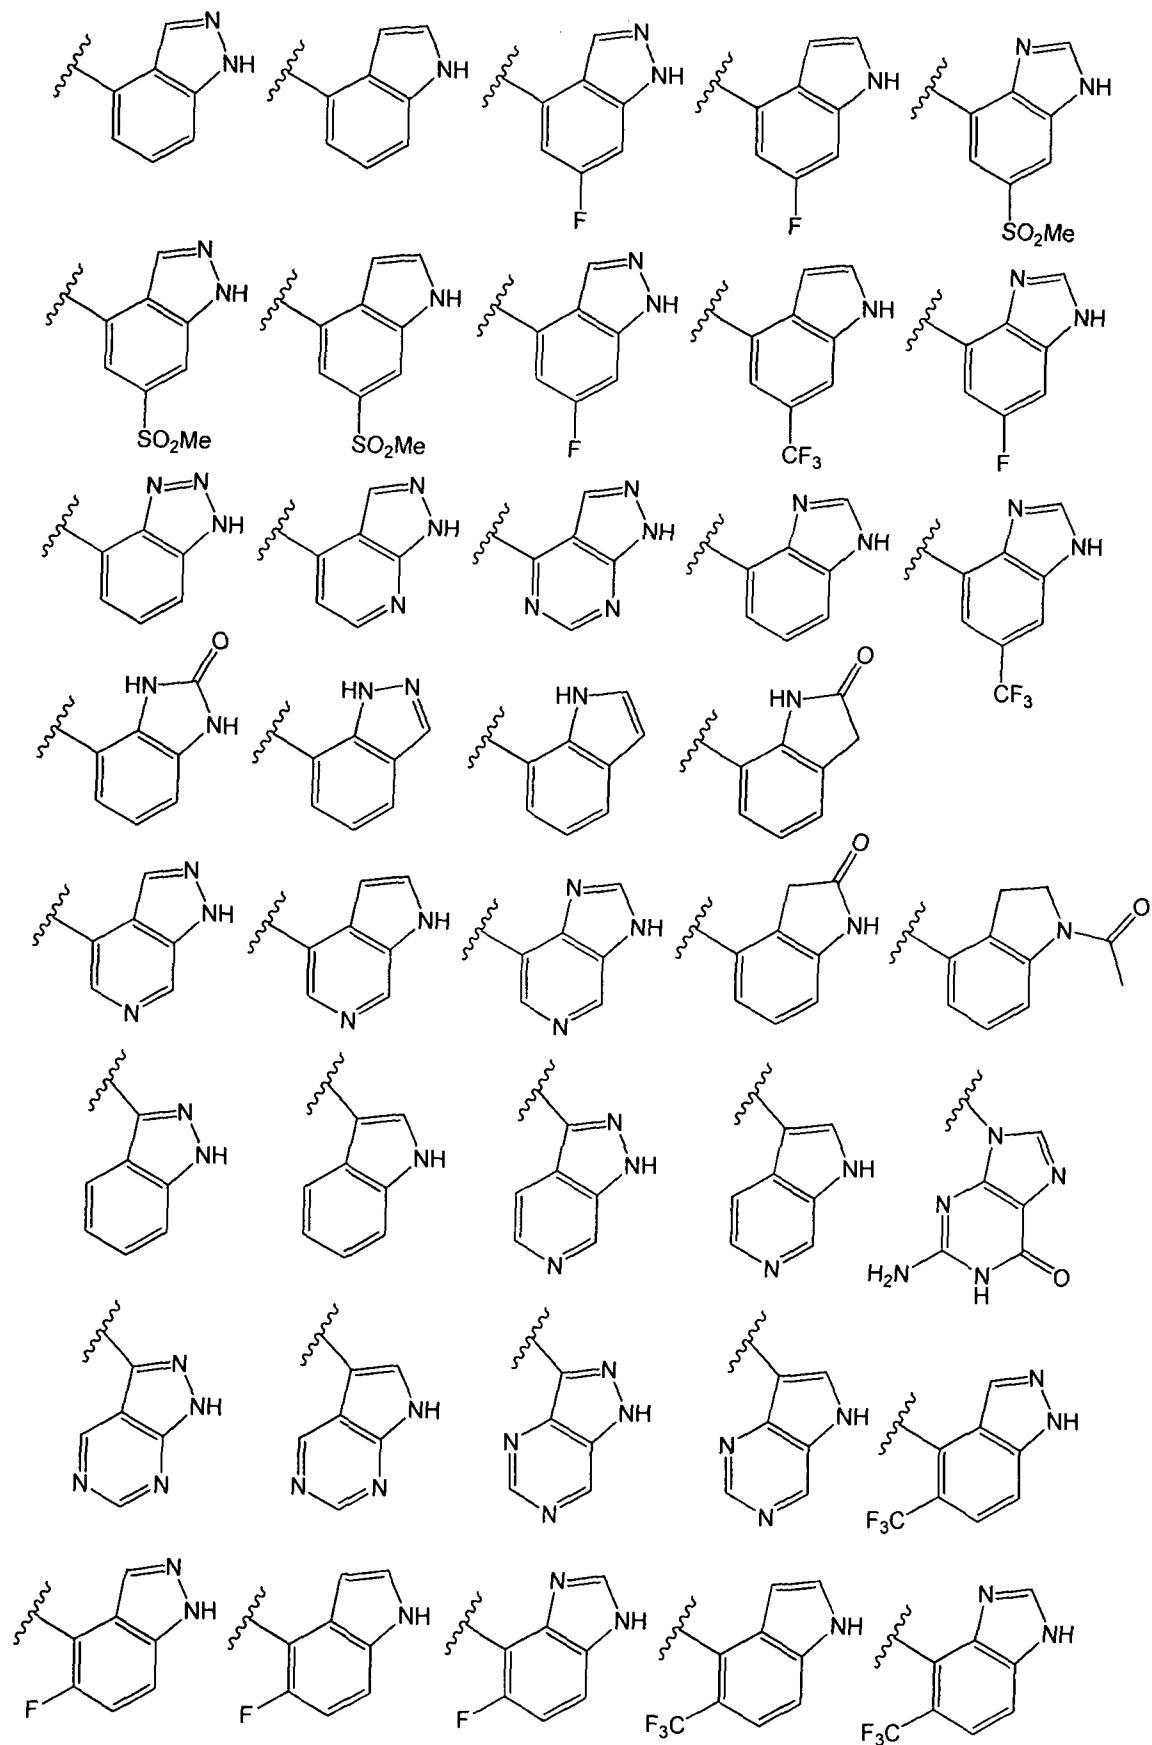

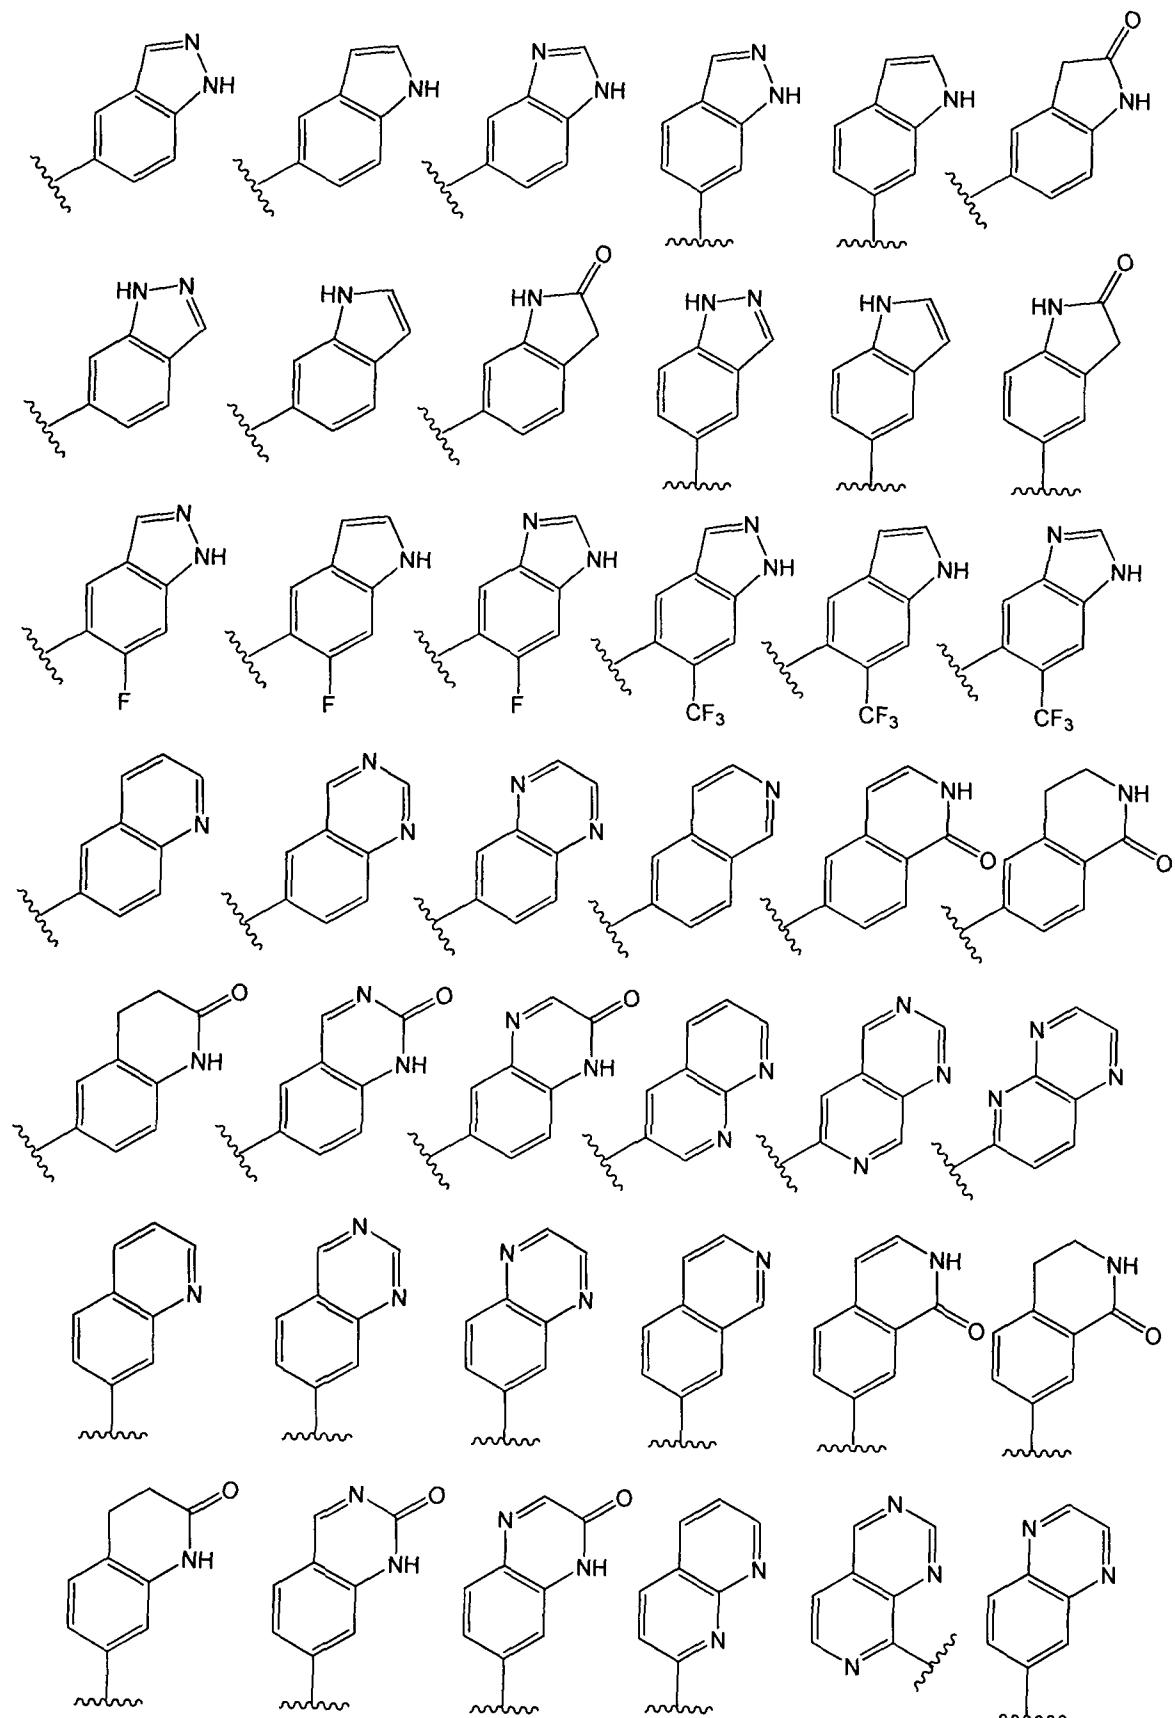

where the wavy line indicates the attachment to the 4-position of the core ring (triazine or pyrimidine or pyridine ring), and

where the monocyclic heteroaryl group is optionally substituted with one or more groups selected from F, Cl, Br, I, -NR<sub>10</sub>R<sub>11</sub>, -OR<sub>10</sub>, -C(O)R<sub>10</sub>, -NR<sub>10</sub>C(O)R<sub>11</sub>, -N(C(O)R<sub>11</sub>)<sub>2</sub>, -NR<sub>10</sub>C(O)NR<sub>10</sub>R<sub>11</sub>, -C(=O)OR<sub>10</sub>, -C(=O)NR<sub>10</sub>R<sub>11</sub>, and C<sub>1</sub>-C<sub>12</sub> alkyl.

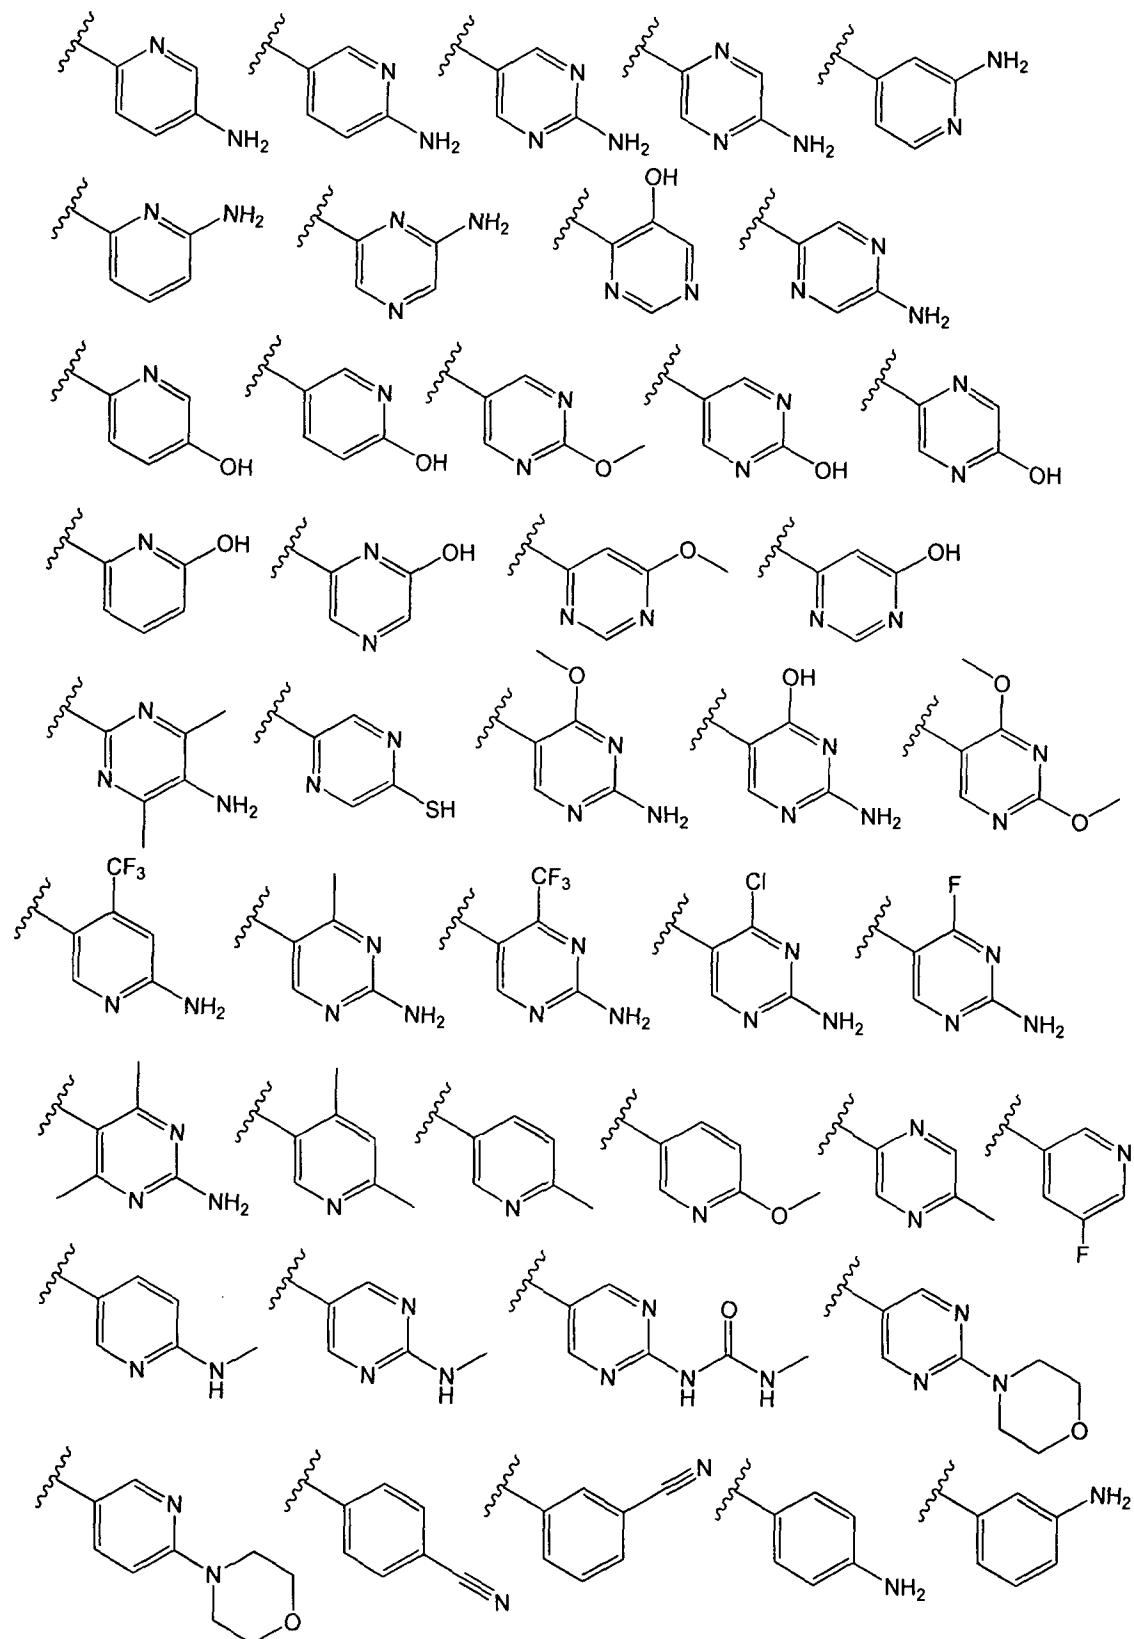

In certain embodiments, R<sub>2</sub> is a monocyclic or bicyclic heteroaryl group selected from the following structures:

- 33 -

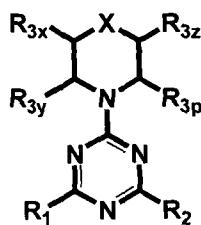

- 35 -

where the wavy line indicates the site of attachment,

In certain embodiments, the monocyclic or bicyclic heteroaryl group is substituted with one or more groups selected from F, -NH<sub>2</sub>, -NHCH<sub>3</sub>, -N(CH<sub>3</sub>)<sub>2</sub>, -OH, -OCH<sub>3</sub>, -C(O)CH<sub>3</sub>, -NHC(O)CH<sub>3</sub>, -N(C(O)CH<sub>3</sub>)<sub>2</sub>, -NHC(O)NH<sub>2</sub>, -CO<sub>2</sub>H, -CHO, -CH<sub>2</sub>OH, -C(=O)NHCH<sub>3</sub>, -C(=O)NH<sub>2</sub>, and -CH<sub>3</sub>.

One aspect of the invention provides compounds having general formula (Ia):

n is 1, 2, 3, 4, 5, or 6; and

t is 2, 3, 4, 5 or 6.

The preferences, particular aspects and embodiments set forth above for  $X$ ,  $R_{3x}$ ,  $R_{3y}$ ,  $R_{3z}$ ,  $R_{3p}$  and  $R_2$  in formula (I) apply to these substituents in formulas (If) and (Ig).

In particular aspect of the invention,  $R_8$  is substituted or unsubstituted heterocyclyl, or substituted or unsubstituted  $-O$ -heterocyclyl. In another aspect,  $R_8$  is substituted or unsubstituted morpholinyl; more particularly,  $R_8$  is unsubstituted N-linked morpholinyl.

In another aspect,  $R_8$  comprises substituted or unsubstituted heterocyclalkyl,

or substituted or unsubstituted heteroarylalkyl.

In another aspect,  $R_8$  is substituted or unsubstituted tetrahydropyran or substituted or unsubstituted tetrahydropyranloxy. More particularly,  $R_8$  is unsubstituted 4-tetrahydropyranloxy.

In another aspect thereof,  $R_8$  comprises substituted or unsubstituted tetrahydropyran. In a more particular aspect, tetrahydropyran comprises 4-tetrahydropyranloxy.

In another aspect,  $R_8$  is substituted or unsubstituted tetrahydrofuran or substituted or unsubstituted tetrahydrofuranloxy. More particularly,  $R_8$  is unsubstituted 3-tetrahydrofuranloxy.

In another aspect,  $R_8$  is optionally substituted phenyl, wherein phenyl is substituted with one or more groups selected from N-methylcarboxamide, isopropylsulfonylamino, methylsulfonyl, 2-hydroxy-2-methylpropanamide, 2-hydroxypropanamide, 2-methoxyacetamide, (propan-2-ol)sulfonyl, 2-amino-2-methylpropanamide, 2-aminoacetamide, 2-hydroxyacetamide, methylsulfonylamino, 2-(dimethylamino)acetamide, amino, acetylamino, carboxamide, (4-methylsulfonylpiperazino)-1-methyl, (4-methylpiperazino)-1-methyl, hydroxymethyl, and methoxy.

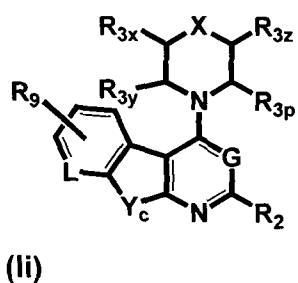

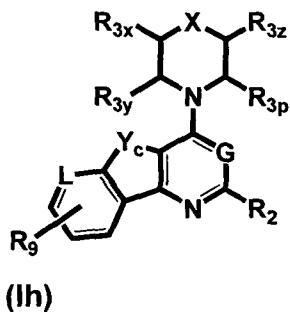

In certain embodiments,  $R_8$  is optionally substituted pyridyl, optionally substituted thiazolyl, optionally substituted isoxazolyl, optionally substituted oxadiazolyl, or optionally substituted pyrimidyl.

In another embodiment,  $R_8$  is selected from the group consisting of: (1) substituted or unsubstituted morpholinyl, (2) substituted or unsubstituted tetrahydropyranyl, and (3) substituted or unsubstituted tetrahydrofuranyl.

In a more particular embodiment thereof,  $R_8$  is N-linked morpholinyl. In another more particular embodiment,  $R_8$  is 4-tetrahydropyranyl; in another embodiment,  $R_8$  is 3-tetrahydrofuranyl.

For the use of  $R_{10}$ , see general reaction scheme 45.

Another aspect of the invention provides compounds having general formulas (Ih) and (li):

and stereoisomers, geometric isomers, tautomers, solvates, metabolites, N-oxide derivatives and pharmaceutically acceptable salts thereof, wherein

**G is N or G is C,**

**X, R<sub>3x</sub>, R<sub>3y</sub>, R<sub>3z</sub>, R<sub>3p</sub> and R<sub>2</sub> are as defined above for formula (I),**

**Y<sub>c</sub> is O, S, SO<sub>2</sub>, NH, or a direct bond,**

**L is C, N or N-oxide,**

**R<sub>9</sub> is selected from the group consisting of:**

- (1) H, F, Cl, Br, I, (2) cyano, (3) nitro, (4) halogen, (5) substituted and unsubstituted alkyl, (6) substituted and unsubstituted alkenyl, (7) substituted and unsubstituted alkynyl, (8) substituted and unsubstituted aryl, (9) substituted and unsubstituted heteroaryl, (10) substituted and unsubstituted heterocyclyl, (11) substituted and unsubstituted cycloalkyl, (12)  $-\text{C}(\text{C}_1\text{-C}_6 \text{ alkyl})_2\text{NR}_{10}\text{R}_{11}$ ,  $-(\text{CR}_{14}\text{R}_{15})_t\text{NR}_{10}\text{R}_{11}$ ,  $-\text{C}(\text{R}_{14}\text{R}_{15})_n\text{NR}_{12}\text{C}(=\text{Y})\text{R}_{10}$ ,  $-(\text{CR}_{14}\text{R}_{15})_n\text{NR}_{12}\text{S}(\text{O})_2\text{R}_{10}$ ,  $-\text{CH}(\text{OR}_{10})\text{R}_{10}$ ,  $-(\text{CR}_{14}\text{R}_{15})_n\text{OR}_{10}$ ,  $-(\text{CR}_{14}\text{R}_{15})_n\text{S}(\text{O})_2\text{R}_{10}$ ,  $-(\text{CR}_{14}\text{R}_{15})_n\text{S}(\text{O})_2\text{NR}_{10}\text{R}_{11}$ ,  $-\text{C}(=\text{Y})\text{R}_{10}$ ,  $-\text{C}(=\text{Y})\text{OR}_{10}$ ,  $-\text{C}(=\text{Y})\text{NR}_{10}\text{R}_{11}$ ,  $-\text{C}(=\text{Y})\text{NR}_{12}\text{OR}_{10}$ ,  $-\text{C}(=\text{O})\text{NR}_{12}\text{S}(\text{O})_2\text{R}_{10}$ ,  $-\text{C}(=\text{O})\text{NR}_{12}(\text{CR}_{14}\text{R}_{15})_m\text{NR}_{10}\text{R}_{11}$ ,  $-\text{NO}_2$ ,  $-\text{NHR}_{12}$ ,  $-\text{NR}_{12}\text{C}(=\text{Y})\text{R}_{11}$ ,  $-\text{NR}_{12}\text{C}(=\text{Y})\text{OR}_{11}$ ,  $-\text{NR}_{12}\text{C}(=\text{Y})\text{NR}_{10}\text{R}_{11}$ ,  $-\text{NR}_{12}\text{S}(\text{O})_2\text{R}_{10}$ ,  $-\text{NR}_{12}\text{SO}_2\text{NR}_{10}\text{R}_{11}$ ,  $-\text{S}(\text{O})_2\text{R}_{10}$ ,  $-\text{S}(\text{O})_2\text{NR}_{10}\text{R}_{11}$ ,  $-\text{SC}(=\text{Y})\text{R}_{10}$ ,  $-\text{SC}(=\text{Y})\text{OR}_{10}$ , C<sub>1</sub>-C<sub>12</sub> alkyl, C<sub>2</sub>-C<sub>8</sub> alkenyl, C<sub>2</sub>-C<sub>8</sub> alkynyl, C<sub>3</sub>-C<sub>12</sub> carbocyclyl, C<sub>2</sub>-C<sub>20</sub> heterocyclyl, C<sub>6</sub>-C<sub>20</sub> aryl or C<sub>1</sub>-C<sub>20</sub> heteroaryl, (13) linker moiety (hydrophobic linkers, hydrophilic linkers, photo-cleavable linkers, redox reaction-cleavable linkers), (14) linker moiety with covalently bonded TAG-molecules (a TAG could be a fluorophor, biotin, different polymer beads and different reactive groups),

wherein  $R_{10}$ ,  $R_{11}$ ,  $R_{12}$ ,  $R_{14}$ ,  $R_{15}$ ,  $Y$ ,  $m$ ,  $n$  and  $t$  are as defined above for formula (I).

In another aspect of the invention,  $R_9$  is substituted or unsubstituted heterocyclyl, or substituted or unsubstituted  $-O$ -heterocyclyl. In another aspect,  $R_9$  is substituted or unsubstituted morpholinyl; more particularly,  $R_9$  is unsubstituted N-linked morpholinyl.

In another aspect,  $R_9$  comprises substituted or unsubstituted heterocyclalkyl, or substituted or unsubstituted heteroarylalkyl.

In another aspect,  $R_9$  is substituted or unsubstituted tetrahydropyran or substituted or unsubstituted tetrahydropyranloxy. More particularly,  $R_9$  is unsubstituted 4-tetrahydropyranloxy.

In another aspect thereof,  $R_9$  comprises substituted or unsubstituted tetrahydropyran. In a more particular aspect, tetrahydropyran comprises 4-tetrahydropyranloxy.

In another aspect,  $R_9$  is substituted or unsubstituted tetrahydrofuran or substituted or unsubstituted tetrahydrofuranyloxy. More particularly,  $R_9$  is unsubstituted 3-tetrahydrofuranyloxy.

In another aspect,  $R_9$  is optionally substituted phenyl, wherein phenyl is substituted with one or more groups selected from N-methylcarboxamide, isopropylsulfonylamino, methylsulfonyl, 2-hydroxy-2-methylpropanamide, 2-hydroxypropanamide, 2-methoxyacetamide, (propan-2-ol)sulfonyl, 2-amino-2-methylpropanamide, 2-aminoacetamide, 2-hydroxyacetamide, methylsulfonylamino, 2-(dimethylamino)acetamide, amino, acetylamino, carboxamide, (4-methylsulfonylpiperazino)-1-methyl, (4-methylpiperazino)-1-methyl, hydroxymethyl, and methoxy.

In certain embodiments,  $R_9$  is optionally substituted pyridyl, optionally substituted thiazolyl, optionally substituted isoxazolyl, optionally substituted oxadiazolyl, or optionally substituted pyrimidyl.

In another embodiment,  $R_9$  is selected from the group consisting of: (1) substituted or unsubstituted morpholinyl, (2) substituted or unsubstituted tetrahydropyranyl, and (3) substituted or unsubstituted tetrahydrofuranyl.

In a more particular embodiment thereof,  $R_9$  is N-linked morpholinyl. In another

- 50 -

more particular embodiment, R<sub>9</sub> is 4-tetrahydropyranyl; in another embodiment, R<sub>9</sub> is 3-tetrahydrofuryl.

The compounds of the invention may contain asymmetric or chiral centers, and therefore exist in different stereoisomeric forms. It is intended that all stereoisomeric forms of the compounds of the invention, including but not limited to, diastereomers, enantiomers and atropisomers, as well as mixtures thereof such as racemic mixtures, form part of the present invention.

In addition, the present invention embraces all geometric and positional isomers. For example, if a compound of the invention incorporates a double bond or a fused ring, the cis- and trans-forms, as well as mixtures thereof, are embraced within the scope of the invention. Both the single positional isomers and mixture of positional isomers are also within the scope of the present invention.

In the structures shown herein, where the stereochemistry of any particular chiral atom is not specified, then all stereoisomers are contemplated and included as the compounds of the invention. Where stereochemistry is specified by a solid wedge or dashed line representing a particular configuration, then that stereoisomer is so specified and defined.

The compounds of the present invention may exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like, and it is intended that the invention embraces both solvated and unsolvated forms.

The compounds of the invention may also exist in different tautomeric forms (tautomers), and all such forms are embraced with the scope of the invention.

The present invention also embraces isotopically-labelled compounds of the present invention which are identical to those recited herein, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. All isotopes of any particular atom or element as specified are contemplated within the scope of the compounds of the invention, and their uses. Exemplary isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, sulphur, fluorine, chlorine and iodine, such as <sup>2</sup>H, <sup>3</sup>H,

- 51 -

<sup>11</sup>C, <sup>13</sup>C, <sup>14</sup>C, <sup>13</sup>N, <sup>15</sup>N, <sup>15</sup>O, <sup>17</sup>O, <sup>18</sup>O, <sup>32</sup>P, <sup>33</sup>P, <sup>35</sup>S, <sup>18</sup>F, <sup>36</sup>Cl, <sup>123</sup>I and <sup>125</sup>I. Certain isotopically-labelled compounds of the present invention (e.g., those labelled with <sup>3</sup>H and <sup>14</sup>C) are useful in compound and/or substrate tissue distribution assays. Tritiated (3H) and carbon-14 (<sup>14</sup>C) isotopes are useful for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium (i.e., <sup>2</sup>H) may afford certain therapeutic advantages resulting from greater metabolic stability (e.g., increased in vivo half-life or reduced dosage requirements) and hence may be preferred in some circumstances. Positron emitting isotopes such as <sup>15</sup>O, <sup>13</sup>N, <sup>11</sup>C and <sup>18</sup>F are useful for positron emission tomography (PET) studies to examine substrate receptor occupancy. Isotopically labelled compounds of the present invention can generally be prepared by following procedures analogous to those disclosed in the Schemes and/or in the Examples herein below, by substituting an isotopically labelled reagent for a non-isotopically labeled reagent.

## PREPARATION OF COMPOUNDS OF THE INVENTION

The compounds of the invention may be synthesized by synthetic routes that include processes analogous to those well known in the chemical arts, particularly in light of the description contained herein. The starting materials are generally available from commercial sources such as Aldrich Chemicals or are readily prepared using methods well known to those skilled in the art (e.g., prepared by methods generally described in Louis F. Fieser and Mary Fieser, *Reagents for Organic Synthesis*, v. 1-19, Wiley, N. Y. (1967-1999 ed.), or Beilsteins *Handbuch der organischen Chemie*, 4, Aufl. ed. Springer- Verlag, Berlin, including supplements (also available via the Beilstein online database).

In certain embodiments, the compounds of the invention may be readily prepared using procedures well-known to prepare triazines and other heterocycles, which are described in: *Comprehensive Heterocyclic Chemistry*, Editors Katritzky and Rees, Pergamon Press, 1984.

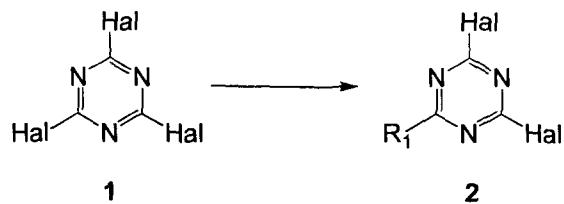

Compounds of the invention may be prepared singly or as compound libraries

comprising at least 2, for example 5 to 1,000 compounds, or 10 to 100 compounds. Libraries of compounds of the invention may be prepared by a combinatorial 'split and mix' approach or by multiple parallel syntheses using either solution phase or solid phase chemistry, by procedures well known to those skilled in the art. Thus according to a further aspect of the invention there is provided a compound library comprising at least 2 compounds, or pharmaceutically acceptable salts thereof.

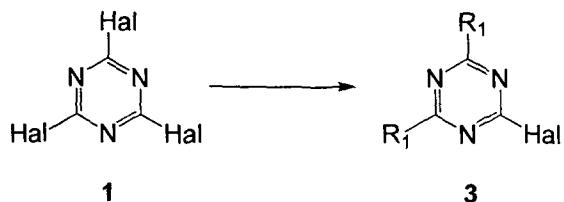

For illustrative purposes, Schemes 1-52 show general methods for preparing the compounds of the present invention as well as key intermediates. For a more detailed description of the individual reaction steps, see the Examples hereinbelow. Those skilled in the art will appreciate that other synthetic routes may be used to synthesize the compounds of the invention. Although specific starting materials and reagents are depicted in the Schemes and discussed below, other starting materials and reagents can be easily substituted to provide a variety of derivatives and/or reaction conditions. In addition, many of the compounds prepared by the methods described below can be further modified in light of this disclosure using conventional chemistry well known to those skilled in the art.

In preparing compounds of the invention, protection of remote functionality (e.g., primary or secondary amine) of intermediates may be necessary. The need for such protection will vary depending on the nature of the remote functionality and the conditions of the preparation methods. Suitable amino-protecting groups include acetyl, trifluoroacetyl, t-butoxycarbonyl (BOC), benzyloxycarbonyl (CBz) and 9-fluorenylmethyleneoxycarbonyl (Fmoc). The need for such protection is readily determined by one skilled in the art. For a general description of protecting groups and their use, see T. W. Greene, *Protective Groups in Organic Synthesis*, John Wiley & Sons, New York, 1991.

## GENERAL PREPARATIVE PROCEDURES

### General Procedure A Triazine substitution:

A solution of 2,4,6-trichloro-1,3,5-triazine (1.00 g, 5.42 mmol, 1.0 eq.) in dioxane (15 ml) at room temperature was treated with diisopropylethylamine (1.03 ml, 5.96 mmol, 1.1 eq.) and dropwise with aminopyridine (1.1 eq.) and stirred for 2 h. The dioxane was evaporated in vacuo, and the residue partitioned between H<sub>2</sub>O (15 ml) and CH<sub>2</sub>Cl<sub>2</sub> (15 ml). The organic layer was separated and the aqueous layer further extracted with CH<sub>2</sub>Cl<sub>2</sub> (2 x 10 ml). The combined extracts were dried (MgSO<sub>4</sub>) and concentrated in vacuo. Purification by column chromatography gave the title compound.

### General Procedure A-1 Triazine substitution:

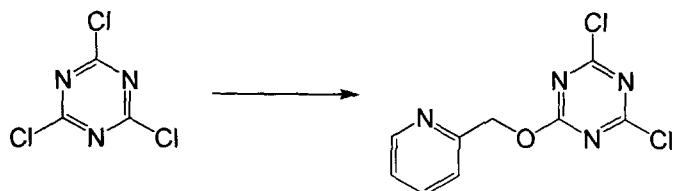

A solution of bis-chloro triazine compound (100 mg, 390 µmol, 1.0 eq.) in dioxane (1 ml) at room temperature was treated with diisopropylethylamine (0.10 ml, 590 µmol, 1.5 eq.) and morpholine (0.05 ml, 590 µmol, 1.5 eq.) and stirred at room temperature for 2 h. The dioxane was evaporated in vacuo, and the residue partitioned between H<sub>2</sub>O (5 ml) and CH<sub>2</sub>Cl<sub>2</sub> (5 ml). The organic layer was separated and the aqueous layer further extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x2 ml). The combined extracts were dried (MgSO<sub>4</sub>) and concentrated in vacuo. Purification by column

- 76 -

chromatography gave the desired compound.

Note: for some of compounds it was necessary to add an additional amount of morpholine (0.3 eq.) after 12 h reaction time and then the reaction mixture was heated 70 °C for 8 h.

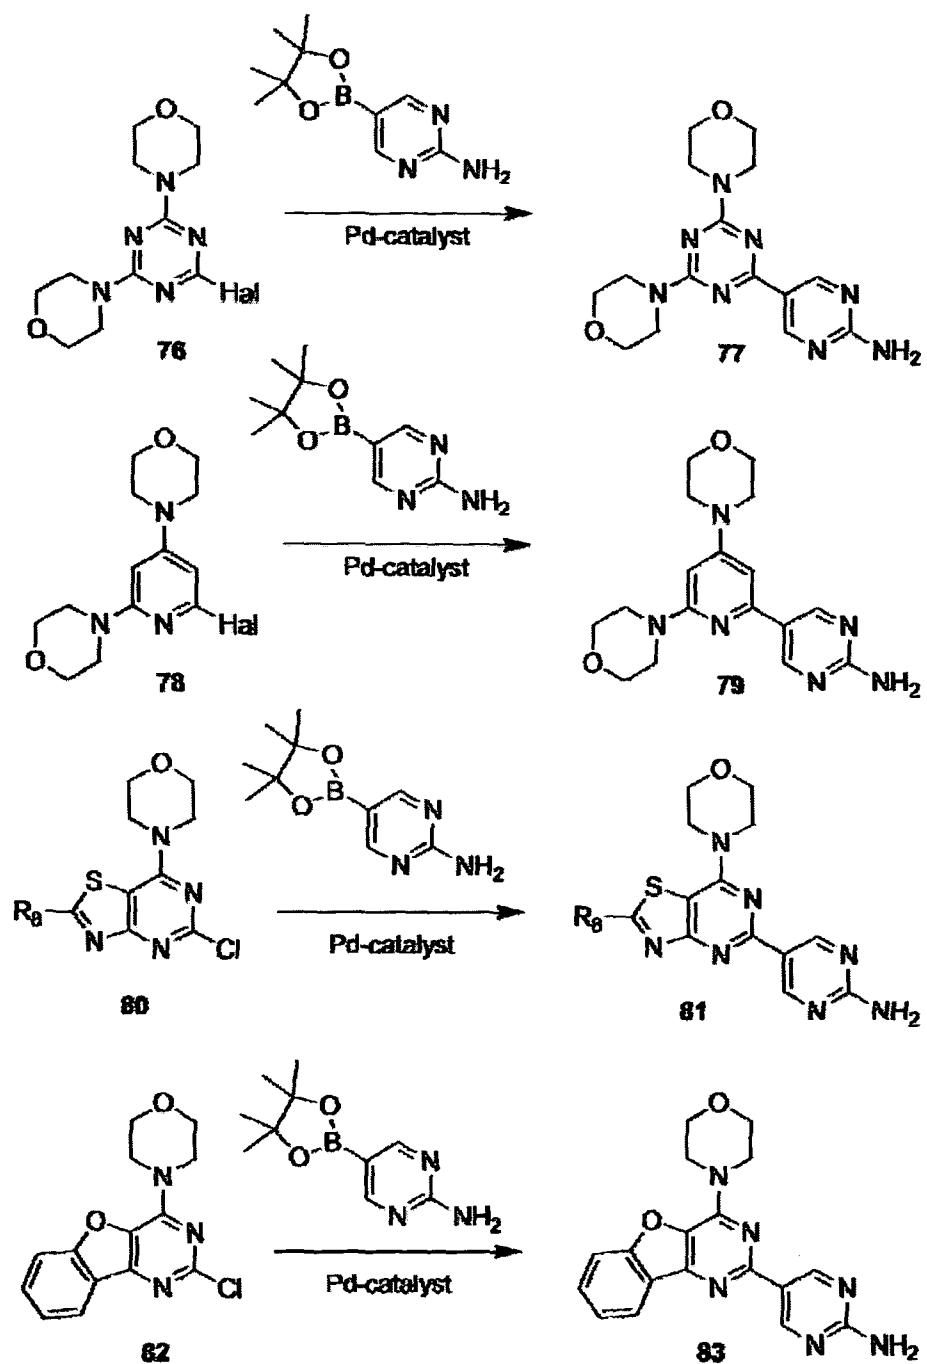

**General Procedure A-2 Triazine substitution:**

247 mg of NaH (60% in mineral oil, 10.3 mmol, 0.95 eq.) was added to a solution of 2-pyridinemethanol (940  $\mu$ l, 9.76 mmol, 0.90 eq.) in THF (20 ml) at room temperature and stirred for 30 minutes. After cooling to -78 °C, 2,4,6-trichloro-1,3,5-triazine (2.00 g, 10.84 mmol, 1.0 eq.) was added dropwise and the reaction allowed to warm to room temperature and stirred for 3 h. Saturated aqueous NH<sub>4</sub>Cl (20 ml) was added and the mixture extracted with EtOAc (20 ml). The organic phase was dried (MgSO<sub>4</sub>) and evaporated in vacuo. Column chromatography gave desired product.

**General Procedure B Suzuki Coupling:**

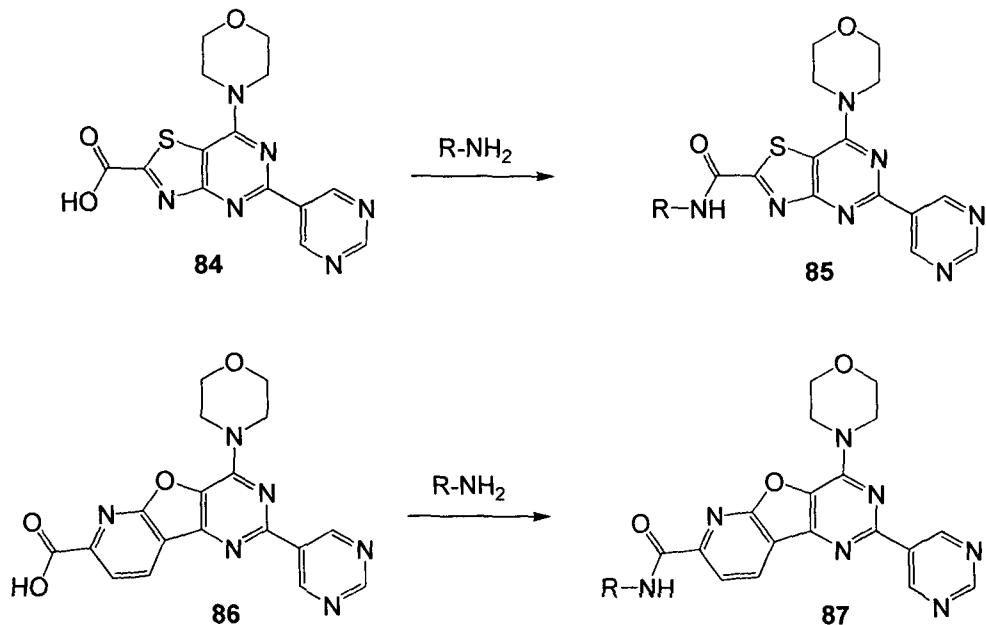

- 77 -

The Suzuki-type coupling reaction is useful to attach a cyclic heteroaryl at the 6-position of the triazine or pyridine ring (see Schemes 7 and 27), 5- or 6-position of the pyrimidine ring (see Schemes 46 and 51). Generally, 4,4'-(6-chloro-1,3,5-triazine-2,4-diyl)dimorpholine (77), 4,4'-(6-chloropyridine-2,4-diyl)dimorpholine (79), 4-(5-chlorothiazolo[4,5-d]pyrimidin-7-yl)morpholine (81) and 2-chloro-4-

morpholinobenzofuro[3,2-d]pyrimidine (83) may be combined with boronic acid pinacol ester (4.0 eq.) in 1,2-dimethoxyethane and 2M Na<sub>2</sub>CO<sub>3</sub> (3:1) for 15 minutes. A catalytic amount, or more, of a palladium reagent, such as dichloro 1,1'-bis(diphenylphosphino)ferrocene palladium (II) (0.025 eq.) was added and the high pressure glass vessel containing the mixture was bubbled with argon gas and sealed. A variety of boronic acids or boronic esters can be used in place of the pinacol boronic ester indicated. Also alternatively, the nitrogen of the pyrimidin-2-amine may be protected, for example with a tetrahydropyranyl group. The reaction mixture was then heated at 90 °C for 15 h or more, cooled down and diluted with ethyl acetate. The organic solution was washed with mixture of water : Na<sub>2</sub>CO<sub>3</sub> : NH<sub>4</sub>OH (NH<sub>4</sub>OH conc. 32% in water) = 5 : 4 : 1, NH<sub>4</sub>Cl (sat.) and brine, dried over MgSO<sub>4</sub>, filtered and concentrated. The residue was purified by silica gel flash column chromatography or if necessary by reverse phase HPLC.

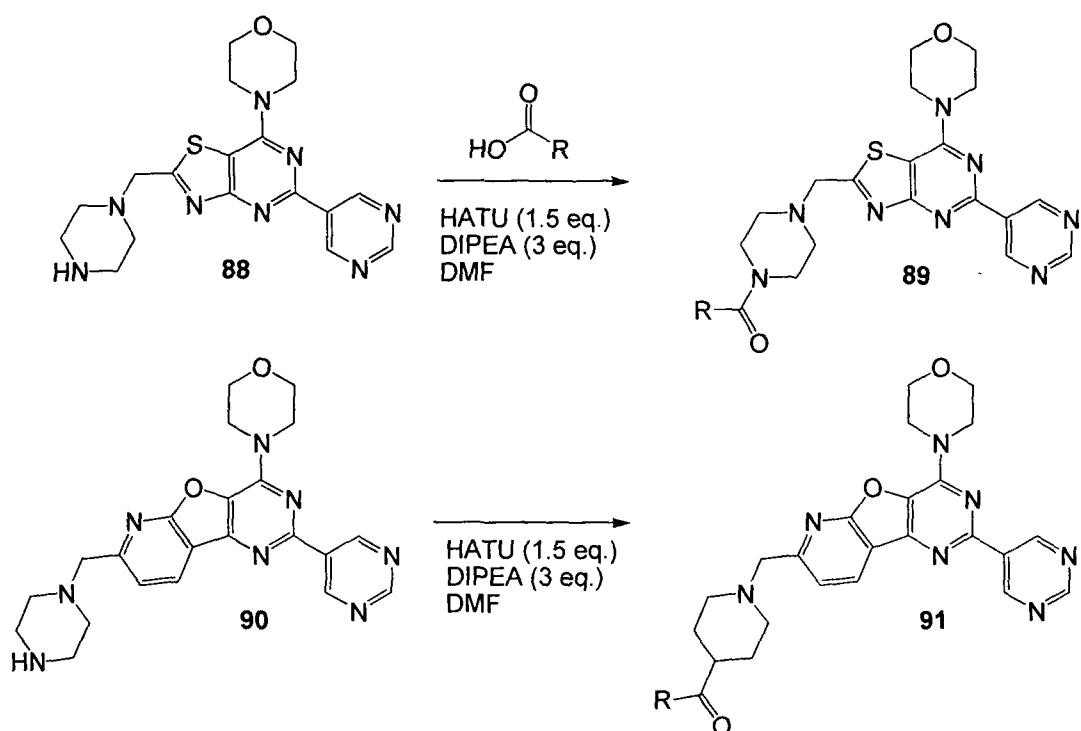

**General Procedure C Amide Coupling:**

7-morpholino-5-(pyrimidin-5-yl)thiazolo[4,5-d]pyrimidine-2-carboxylic acid (84) or pyridinylfuranopyrimidine 86 is treated with 1.5 eq. HATU, 3 eq. of an alkylamine (R-NH<sub>2</sub>) and 3 eq. of DIPEA in DMF to approximately 0.1 M concentration. The

reaction is stirred until complete and extracted in ethylacetate with saturated bicarbonate solution one time. The organic layer is dried, filtered and concentrated to yield the crude intermediate. This intermediate is purified via silica column chromatography or preparative TLC to yield product **85** or **87**.

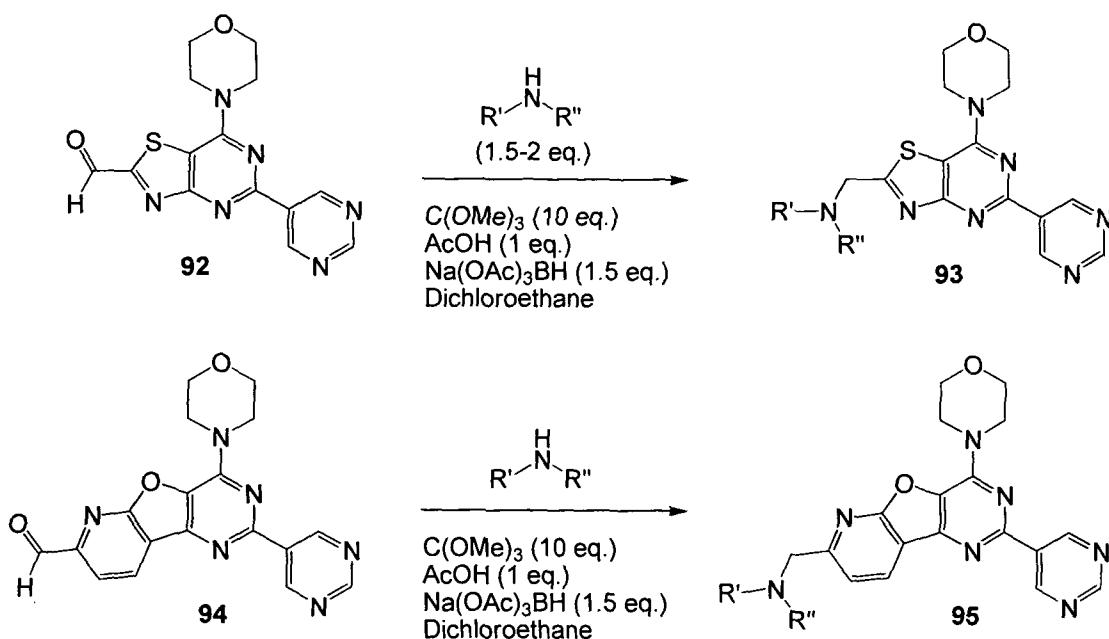

**General Procedure C-1 Amide Coupling:**

**4-(2-(piperazin-1-ylmethyl)-5-(pyrimidin-5-yl)thiazolo[4,5-d]pyrimidin-7-yl)morpholine (88)** or **pyridinylfuropyrimidine 90** is treated with 1.5 eq. HATU, 3 eq. of carboxylic acid ( $\text{RCO}_2\text{H}$ ) and 3 eq. of DIPEA in DMF to approximately 0.1 M concentration. The reaction is stirred until complete and extracted in ethyl acetate with saturated bicarbonate solution one time. The organic layer is dried, filtered and concentrated to yield the crude intermediate that was used without further purification or if necessary that was purified by preparative TLC.

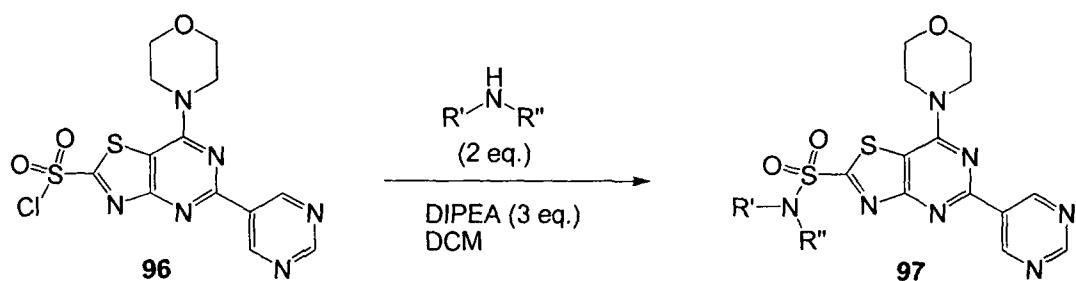

**General procedure D Reductive Amination:**

- 80 -

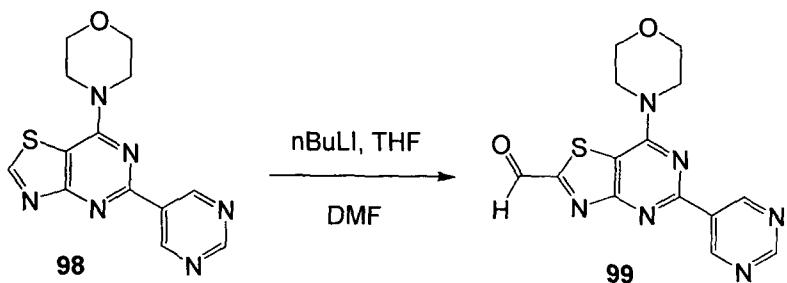

7-morpholino-5-(pyrimidin-5-yl)thiazolo[4,5-d]pyrimidine-2-carbaldehyde (**92**) or pyridinylfuropyrimidine **94** was dissolved to a 0.2 M concentration in dichloroethane. To this solution was added 1.5 to 2.0 equivalents of an amine ( $\text{R}'\text{R}''\text{NH}$ ), 10 equivalents of trimethylorthoformate, and 1 equivalent of acetic acid. The mixture was allowed to stir for 2-6 hours prior to adding 1.5 equivalents of sodium triacetoxyborohydride. Following 12 to 16 hours of stirring the reaction was poured into saturated sodium bicarbonate and extracted several times with ethyl acetate. This intermediate was either purified on silica gel or used crude in the next reaction.

**General procedure E Sulfonamide Formation:**

7-morpholino-5-(pyrimidin-5-yl)thiazolo[4,5-d]pyrimidine-2-sulfonyl chloride (**96**) was suspended in 1 mL of methylene chloride before addition of 2 eq. of amine ( $\text{R}'\text{R}''\text{NH}$ ) and 3 eq. of DIPEA. The reactions were monitored by TLC until complete. The crude reaction mixtures were diluted with ethyl acetate, extracted with saturated ammonium chloride and back-extracted once with ethyl acetate. The organic layers were combined and concentrated to dryness. The crude sulfonamide intermediates **97** were used directly in the subsequent Suzuki couplings

**General procedure F Aldehyde Synthesis:**

To a suspension of 4-(5-(pyrimidin-5-yl)thiazolo[4,5-d]pyrimidin-7-yl)morpholine (6.85 mmol, 1.0 eq.) in dry THF (40 mL) at -78 °C was added a 2.5 M solution of n-butyllithium (nBuLi) in hexane (1.2 eq.). After stirring for 1 h, dry DMF (1.5 eq.) was added. The reaction mixture was stirred for 1 h at -78 °C and then warmed slowly to room temperature. After a further 2 h at room temperature the reaction mixture was poured onto ice/water yielding a precipitate that was collected by filtration and air-dried to yield the title compound.

**METHODS OF SEPARATION**

In the methods of preparing the compounds of this invention, it may be advantageous to separate reaction products from one another and/or from starting materials. The desired products of each step or series of steps are separated and/or purified (hereinafter separated) to the desired degree of homogeneity by the techniques common in the art. Typically such separations involve multiphase

extraction, crystallization from a solvent or solvent mixture, distillation, sublimation, or chromatography. Chromatography can involve any number of methods including, for example: reverse-phase and normal phase; size exclusion; ion exchange; high, medium and low pressure liquid chromatography methods and apparatus; small scale analytical; simulated moving bed (SMB) and preparative thin or thick layer chromatography, as well as techniques of small scale thin layer and flash chromatography.

Another class of separation methods involves treatment of a mixture with a reagent selected to bind to or render otherwise separable a desired product, unreacted starting material, reaction by product, or the like. Such reagents include adsorbents or absorbents such as activated carbon, molecular sieves, ion exchange media, or the like. Alternatively, the reagents can be acids in the case of a basic material, bases in the case of an acidic material, binding reagents such as antibodies, binding proteins, selective chelators such as crown ethers, liquid/liquid ion extraction reagents (LIX), or the like.

*Selection of appropriate methods of separation depends on the nature of the materials involved. For example, boiling point and molecular weight in distillation and sublimation, presence or absence of polar functional groups in chromatography, stability of materials in acidic and basic media in multiphase extraction, and the like. One skilled in the art will apply techniques most likely to achieve the desired separation.*

Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods well known to those skilled in the art, such as by chromatography and/or fractional crystallization. Enantiomers can be separated by converting the enantiomeric mixture into a diastereomeric mixture by reaction with an appropriate optically active compound (e.g., chiral auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the diastereomers and converting (e.g., hydrolyzing) the individual diastereoisomers to the corresponding pure enantiomers. Also, some of the compounds of the present invention may be atropisomers (e.g., substituted biaryls) and are considered as part of this invention. Enantiomers can also be separated by use of a chiral HPLC column.

A single stereoisomer, e.g., an enantiomer, substantially free of its stereoisomer may be obtained by resolution of the racemic mixture using a method such as formation of diastereomers using optically active resolving agents (Eliel, E. and Wilen, S. "Stereochemistry of Organic Compounds," John Wiley & Sons, Inc., New York, 1994; Lochmuller, C. H., (1975) *J. Chromatogr.*, 113(3):283-302). Racemic mixtures of chiral compounds of the invention can be separated and isolated by any suitable method, including: (1) formation of ionic, diastereomeric salts with chiral compounds and separation by fractional crystallization or other methods, (2) formation of diastereomeric compounds with chiral derivatizing reagents, separation of the diastereomers, and conversion to the pure stereoisomers, and (3) separation of the substantially pure or enriched stereoisomers directly under chiral conditions. See: "Drug Stereochemistry, Analytical Methods and Pharmacology," Irving W. Wainer, Ed., Marcel Dekker, Inc., New York (1993).

Under method (1), diastereomeric salts can be formed by reaction of enantiomerically pure chiral bases such as brucine, quinine, ephedrine, strychnine,  $\alpha$ -methyl-  $\beta$ -phenylethylamine (amphetamine), and the like with asymmetric compounds bearing acidic functionality, such as carboxylic acid and sulfonic acid. The diastereomeric salts may be induced to separate by fractional crystallization or ionic chromatography. For separation of the optical isomers of amino compounds, addition of chiral carboxylic or sulfonic acids, such as camphorsulfonic acid, tartaric acid, mandelic acid, or lactic acid can result in formation of the diastereomeric salts.

Alternatively, by method (2), the substrate to be resolved is reacted with one enantiomer of a chiral compound to form a diastereomeric pair (E. and Wilen, S. "Stereochemistry of Organic Compounds", John Wiley & Sons, Inc., 1994, p. 322). Diastereomeric compounds can be formed by reacting asymmetric compounds with enantiomerically pure chiral derivatizing reagents, such as menthyl derivatives, followed by separation of the diastereomers and hydrolysis to yield the pure or enriched enantiomer. A method of determining optical purity involves making chiral esters, such as a menthyl ester, e.g., (-) menthyl chloroformate in the presence of base, or Mosher ester,  $\alpha$ -methoxy- $\alpha$ - (trifluoromethyl)phenyl acetate (Jacob III. *J. Org. Chem.* (1982) 47:4165), of the racemic mixture, and analyzing the  $^1\text{H}$  NMR spectrum for the presence of the two atropisomeric enantiomers or diastereomers.

Stable diastereomers of atropisomeric compounds can be separated and isolated by normal- and reverse-phase chromatography following methods for separation of atropisomeric naphthyl-isoquinolines (WO96/15111). By method (3), a racemic mixture of two enantiomers can be separated by chromatography using a chiral stationary phase ("Chiral Liquid Chromatography" (1989) W. J. Lough, Ed., Chapman and Hall, New York; Okamoto, J. Chromatogr., (1990) 513:375-378). Enriched or purified enantiomers can be distinguished by methods used to distinguish other chiral molecules with asymmetric carbon atoms, such as optical rotation and circular dichroism.

## ADMINISTRATION OF COMPOUNDS OF THE INVENTION

The compounds of the invention may be administered by any route appropriate to the condition to be treated. Suitable routes include oral, parenteral (including subcutaneous, intramuscular, intravenous, intraarterial, intradermal, intrathecal and epidural), transdermal, rectal, nasal, topical (including buccal and sublingual), vaginal, intraperitoneal, intrapulmonary and intranasal. For local immunosuppressive treatment, the compounds may be administered by intralesional administration, including perfusing or otherwise contacting the graft with the inhibitor before transplantation. It will be appreciated that the preferred route may vary with for example the condition of the recipient. Where the compound is administered orally, it may be formulated as a pill, capsule, tablet, etc. with a pharmaceutically acceptable carrier or excipient. Where the compound is administered parenterally, it may be formulated with a pharmaceutically acceptable parenteral vehicle and in a unit dosage injectable form, as detailed below.

A dose to treat human patients may range from about 10 mg to about 1000 mg of formula Ia-d compound. A typical dose may be about 100 mg to about 300 mg of the compound. A dose may be administered once a day (QID), twice per day (BID), or more frequently, depending on the pharmacokinetic and pharmacodynamic properties, including absorption, distribution, metabolism, and excretion of the particular compound. In addition, toxicity factors may influence the dosage and administration regimen. When administered orally, the pill, capsule, or tablet may be

ingested daily or less frequently for a specified period of time. The regimen may be repeated for a number of cycles of therapy.

## **METHODS OF TREATMENT WITH COMPOUNDS OF THE INVENTION**

Compounds of the present invention are useful for treating diseases, conditions and/or disorders including, but not limited to, those characterized by over expression of lipid kinases, e.g. PI3 Kinase. Accordingly, another aspect of this invention includes methods of treating or preventing diseases or conditions that can be treated or prevented by inhibiting lipid kinases, including PI3. In one embodiment, the method comprises administering to a mammal in need thereof a therapeutically effective amount of a compound of formula Ia-d, or a stereoisomer, geometric isomer, tautomer, solvate, metabolite, N-oxide derivative or pharmaceutically acceptable salt or prodrug thereof.

Diseases and conditions treatable according to the methods of this invention include, but are not limited to, cancer, stroke, diabetes, hepatomegaly, cardiovascular disease, Alzheimer's disease, cystic fibrosis, autoimmune diseases, atherosclerosis, restenosis, psoriasis, allergic disorders, inflammation, neurological disorders, a hormone- related disease, conditions associated with organ transplantation, immunodeficiency disorders, destructive bone disorders, proliferative disorders, infectious diseases, conditions associated with cell death, thrombin-induced platelet aggregation, chronic myelogenous leukemia (CML), liver disease, pathologic immune conditions involving T cell activation, and CNS disorders in a patient. In one embodiment, a human patient is treated with a compound of formula Ia-d and a pharmaceutically acceptable carrier, adjuvant, or vehicle, wherein said compound of formula Ia-d is present in an amount to detectably inhibit PB kinase activity.

Cancers which can be treated according to the methods of this invention include, but are not limited to, breast, ovary, cervix, prostate, testis, genitourinary tract, esophagus, larynx, glioblastoma, neuroblastoma, stomach, skin, keratoacanthoma, lung, epidermoid carcinoma, large cell carcinoma, non-small cell lung carcinoma (NSCLC), small cell carcinoma, lung adenocarcinoma, bone, colon,

adenoma, pancreas, adenocarcinoma, thyroid, follicular carcinoma, undifferentiated carcinoma, papillary carcinoma, seminoma, melanoma, sarcoma, bladder carcinoma, liver carcinoma and biliary passages, kidney carcinoma, myeloid disorders, lymphoid disorders, hairy cells, buccal cavity and pharynx (oral), lip, tongue, mouth, pharynx, small intestine, colon-rectum, large intestine, rectum, brain and central nervous system, Hodgkin's and leukemia.

Cardiovascular diseases which can be treated according to the methods of this invention include, but are not limited to, restenosis, cardiomegaly, atherosclerosis, myocardial infarction, and congestive heart failure.

Neurodegenerative disease which can be treated according to the methods of this invention include, but are not limited to, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, Huntington's disease, and cerebral ischemia, and neurodegenerative disease caused by traumatic injury, glutamate neurotoxicity and hypoxia.

Inflammatory diseases which can be treated according to the methods of this invention include, but are not limited to, rheumatoid arthritis, psoriasis, contact dermatitis, and delayed hypersensitivity reactions.

Another aspect of this invention provides a compound of this invention for use in the treatment of the diseases or conditions described herein in a mammal, for example, a human, suffering from such disease or condition. Also provided is the use of a compound of this invention in the preparation of a medicament for the treatment of the diseases and conditions described herein in a warm-blooded animal, such as a mammal, for example a human, suffering from such disorder.

## PHARMACEUTICAL FORMULATIONS

In order to use a compound of this invention for the therapeutic treatment (including prophylactic treatment) of mammals including humans, it is normally formulated in accordance with standard pharmaceutical practice as a pharmaceutical composition. According to this aspect of the invention there is provided a pharmaceutical composition comprising a compound of this invention in association with a pharmaceutically acceptable diluent or carrier.

A typical formulation is prepared by mixing a compound of the present invention and a carrier, diluent or excipient. Suitable carriers, diluents and excipients are well known to those skilled in the art and include materials such as carbohydrates, waxes, water soluble and/or swellable polymers, hydrophilic or hydrophobic materials, gelatin, oils, solvents, water and the like. The particular carrier, diluent or excipient used will depend upon the means and purpose for which the compound of the present invention is being applied. Solvents are generally selected based on solvents recognized by persons skilled in the art as safe (GRAS) to be administered to a mammal. In general, safe solvents are nontoxic aqueous solvents such as water and other non-toxic solvents that are soluble or miscible in water. Suitable aqueous solvents include water, ethanol, propylene glycol, polyethylene glycols (e.g., PEG 400, PEG 300), etc. and mixtures thereof. The formulations may also include one or more buffers, stabilizing agents, surfactants, wetting agents, lubricating agents, emulsifiers, suspending agents, preservatives, antioxidants, opaquing agents, glidants, processing aids, colorants, sweeteners, perfuming agents, flavoring agents and other known additives to provide an elegant presentation of the drug (i.e., a compound of the present invention or pharmaceutical composition thereof) or aid in the manufacturing of the pharmaceutical product (i.e., medicament).

The formulations may be prepared using conventional dissolution and mixing procedures. For example, the bulk drug substance (i.e., compound of the present invention or stabilized form of the compound (e.g., complex with a cyclodextrin derivative or other known complexation agent) is dissolved in a suitable solvent in the presence of one or more of the excipients described above. The compound of the present invention is typically formulated into pharmaceutical dosage forms to provide an easily controllable dosage of the drug and to enable patient compliance with the prescribed regimen.

The pharmaceutical composition (or formulation) for application may be packaged in a variety of ways depending upon the method used for administering the drug. Generally, an article for distribution includes a container having deposited therein the pharmaceutical formulation in an appropriate form. Suitable containers are well known to those skilled in the art and include materials such as bottles

(plastic and glass), sachets, ampoules, plastic bags, metal cylinders, and the like. The container may also include a tamper-proof assemblage to prevent indiscreet access to the contents of the package. In addition, the container has deposited thereon a label that describes the contents of the container. The label may also include appropriate warnings.

Pharmaceutical formulations of the compounds of the present invention may be prepared for various routes and types of administration. For example, a compound of formula Ia-d having the desired degree of purity may optionally be mixed with pharmaceutically acceptable diluents, carriers, excipients or stabilizers (Remington's Pharmaceutical Sciences (1980) 16th edition, Osol, A. Ed.), in the form of a lyophilized formulation, milled powder, or an aqueous solution, formulation may be conducted by mixing at ambient temperature at the appropriate pH, and at the desired degree of purity, with physiologically acceptable carriers, i.e., carriers that are non-toxic to recipients at the dosages and concentrations employed. The pH of the formulation depends mainly on the particular use and the concentration of compound, but *may range from about 3 to about 8*. Formulation in an acetate buffer at pH 5 is a suitable embodiment.

The compound of this invention for use herein is preferably sterile. In particular, formulations to be used for in vivo administration must be sterile. Such sterilization is readily accomplished by filtration through sterile filtration membranes.

The compound ordinarily can be stored as a solid composition, a lyophilized formulation or as an aqueous solution.

The pharmaceutical compositions of the invention will be formulated, dosed and administered in a fashion, i.e., amounts, concentrations, schedules, course, vehicles and route of administration, consistent with good medical practice. Factors for consideration in this context include the particular disorder being treated, the particular mammal being treated, the clinical condition of the individual patient, the cause of the disorder, the site of delivery of the agent, the method of administration, the scheduling of administration, and other factors known to medical practitioners. The "therapeutically effective amount" of the compound to be administered will be governed by such considerations, and is the minimum amount necessary to prevent, ameliorate, or treat the coagulation factor mediated disorder. Such amount is

preferably below the amount that is toxic to the host or renders the host significantly more susceptible to bleeding.

As a general proposition, the initial pharmaceutically effective amount of the inhibitor administered parenterally per dose will be in the range of about 0.01-100 mg/kg, namely about 0.1 to 20 mg/kg of patient body weight per day, with the typical initial range of compound used being 0.3 to 15 mg/kg/day.

Acceptable diluents, carriers, excipients and stabilizers are nontoxic to recipients at the dosages and concentrations employed, and include buffers such as phosphate, citrate and other organic acids; antioxidants including ascorbic acid and methionine; preservatives (such as octadecyldimethylbenzyl ammonium chloride; hexamethonium chloride; benzalkonium chloride, benzethonium chloride; phenol, butyl or benzyl alcohol; alkyl parabens such as methyl or propyl paraben; catechol; resorcinol; cyclohexanol; 3-pentanol; and m-cresol); low molecular weight (less than about 10 residues) polypeptides; proteins, such as serum albumin, gelatin, or immunoglobulins; hydrophilic polymers such as polyvinylpyrrolidone; amino acids such as glycine, glutamine, asparagine, histidine, arginine, or lysine; monosaccharides, disaccharides and other carbohydrates including glucose, mannose, or dextrins; chelating agents such as EDTA; sugars such as sucrose, mannitol, trehalose or sorbitol; salt-forming counter-ions such as sodium; metal complexes (e.g., Zn-protein complexes); and/or non-ionic surfactants such as TWEEN™, PLURONICS™ or polyethylene glycol (PEG). The active pharmaceutical ingredients may also be entrapped in microcapsules prepared, for example, by coacervation techniques or by interfacial polymerization, for example, hydroxymethylcellulose or gelatin-microcapsules and poly-(methylmethacrylate) microcapsules, respectively, in colloidal drug delivery systems (for example, liposomes, albumin microspheres, microemulsions, nano-particles and nanocapsules) or in macroemulsions. Such techniques are disclosed in Remington's Pharmaceutical Sciences 16th edition, Osol, A. Ed. (1980).

Sustained-release preparations of compounds of formula Ia-d may be prepared. Suitable examples of sustained-release preparations include semipermeable matrices of solid hydrophobic polymers containing a compound of formula Ia-d, which matrices are in the form of shaped articles, e.g., films, or

- 90 -

microcapsules. Examples of sustained-release matrices include polyesters, hydrogels (for example, poly(2-hydroxyethyl- methacrylate), or polyvinyl alcohol)), polylactides (U.S. Patent No. 3,773,919), copolymers of L-glutamic acid and gamma-ethyl-L-glutamate, non-degradable ethylene-vinyl acetate, degradable lactic acid-glycolic acid copolymers such as the LUPRON DEPOT™ (injectable microspheres composed of lactic acid-glycolic acid copolymer and leuprolide acetate) and poly-D(-)-3-hydroxybutyric acid.

The formulations include those suitable for the administration routes detailed herein. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. Techniques and formulations generally are found in Remington's Pharmaceutical Sciences (Mack Publishing Co., Easton, PA). Such methods include the step of bringing into association the active ingredient with the carrier which constitutes one or more accessory ingredients. In general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product.

Formulations of a compound of formula Ia-d suitable for oral administration may be prepared as discrete units such as pills, capsules, cachets or tablets each containing a predetermined amount of a compound of formula Ia-d.

Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the powdered active ingredient moistened with an inert liquid diluent. The tablets may optionally be coated or scored and optionally are formulated so as to provide slow or controlled release of the active ingredient therefrom.

Tablets, troches, lozenges, aqueous or oil suspensions, dispersible powders or granules, emulsions, hard or soft capsules, e.g., gelatin capsules, syrups or elixirs may be prepared for oral use. Formulations of compounds of formula Ia-d intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents including sweetening agents, flavoring agents, coloring agents

and preserving agents, in order to provide a palatable preparation. Tablets containing the active ingredient in admixture with non-toxic pharmaceutically acceptable excipient which are suitable for manufacture of tablets are acceptable. These excipients may be, for example, inert diluents, such as calcium or sodium carbonate, lactose, calcium or sodium phosphate; granulating and disintegrating agents, such as maize starch, or alginic acid; binding agents, such as starch, gelatin or acacia; and lubricating agents, such as magnesium stearate, stearic acid or talc. Tablets may be uncoated or may be coated by known techniques including microencapsulation to delay disintegration and adsorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate alone or with a wax may be employed.

For treatment of the eye or other external tissues, e.g., mouth and skin, the formulations are preferably applied as a topical ointment or cream containing the active ingredient(s) in an amount of, for example, 0.075 to 20% w/w. When formulated in an ointment, the active ingredients may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in- water cream base.

If desired, the aqueous phase of the cream base may include a polyhydric alcohol, i.e., an alcohol having two or more hydroxyl groups such as propylene glycol, butane 1,3-diol, mannitol, sorbitol, glycerol and polyethylene glycol (including PEG 400) and mixtures thereof. The topical formulations may desirably include a compound which enhances absorption or penetration of the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethyl sulfoxide and related analogs.

The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an emulsifier, it desirably comprises a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make up the so-called emulsifying wax, and the wax together with the oil and fat make up the so-called emulsifying ointment base which forms the oily dispersed

phase of the cream formulations. Emulsifiers and emulsion stabilizers suitable for use in the formulation of the invention include Tween® 60, Span® 80, cetostearyl alcohol, benzyl alcohol, myristyl alcohol, glyceryl mono-stearate and sodium lauryl sulfate. [00173] Aqueous suspensions of formula Ia-d compounds contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients include a suspending agent, such as sodium carboxymethylcellulose, croscarmellose, povidone, methylcellulose, hydroxypropyl methylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia, and dispersing or wetting agents such as a naturally occurring phosphatide (e.g., lecithin), a condensation product of an alkylene oxide with a fatty acid (e.g., polyoxyethylene stearate), a condensation product of ethylene oxide with a long chain aliphatic alcohol (e.g., heptadecaethyleneoxycetanol), a condensation product of ethylene oxide with a partial ester derived from a fatty acid and a hexitol anhydride (e.g., polyoxyethylene sorbitan monooleate). The aqueous suspension may also contain one or more preservatives such as ethyl or n-propyl p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents and one or more sweetening agents, such as sucrose or saccharin.

The pharmaceutical compositions of compounds of the invention may be in the form of a sterile injectable preparation, such as a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, such as a solution in 1,3- butanediol or prepared as a lyophilized powder. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile fixed oils may conventionally be employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid may likewise be used in the preparation of injectables.

The amount of active ingredient that may be combined with the carrier material to produce a single dosage form will vary depending upon the host treated and the

particular mode of administration. For example, a time-release formulation intended for oral administration to humans may contain approximately 1 to 1000 mg of active material compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95% of the total compositions (weight: weight). The pharmaceutical composition can be prepared to provide easily measurable amounts for administration. For example, an aqueous solution intended for intravenous infusion may contain from about 3 to 500  $\mu$ g of the active ingredient per milliliter of solution in order that infusion of a suitable volume at a rate of about 30 mL/hr can occur.

Formulations suitable for parenteral administration include aqueous and nonaqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents.

Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier, especially an aqueous solvent for the active ingredient. The active ingredient is preferably present in such formulations in a concentration of about 0.5 to 20% w/w, for example about 0.5 to 10% w/w, for example about 1.5% w/w.

Formulations suitable for topical administration in the mouth include lozenges comprising the active ingredient in a flavored basis, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert basis such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active ingredient in a suitable liquid carrier.

Formulations for rectal administration may be presented as a suppository with a suitable base comprising for example cocoa butter or a salicylate. [00180] formulations suitable for intrapulmonary or nasal administration have a particle size for example in the range of 0.1 to 500 microns (including particle sizes in a range between 0.1 and 500 microns in increments microns such as 0.5, 1, 30 microns, 35 microns, etc.), which is administered by rapid inhalation through the nasal passage or by inhalation through the mouth so as to reach the alveolar sacs. Suitable formulations include aqueous or oily solutions of the active ingredient. Formulations

suitable for aerosol or dry powder administration may be prepared according to conventional methods and may be delivered with other therapeutic agents such as compounds heretofore used in the treatment or prophylaxis disorders as described below.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

The formulations may be packaged in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water, for injection immediately prior to use. Extemporaneous injection solutions and suspensions are prepared from sterile powders, granules and tablets of the kind previously described. Preferred unit dosage formulations are those containing a daily dose or unit daily sub-dose, as herein above recited, or an appropriate fraction thereof, of the active ingredient.

The invention further provides veterinary compositions comprising at least one active ingredient as above defined together with a veterinary carrier therefore. Veterinary carriers are materials useful for the purpose of administering the composition and may be solid, liquid or gaseous materials which are otherwise inert or acceptable in the veterinary art and are compatible with the active ingredient. These veterinary compositions may be administered parenterally, orally or by any other desired route.

## COMBINATION THERAPY

The compounds of the invention may be employed alone or in combination with other therapeutic agents for the treatment of a disease or disorder described herein, such as a hyperproliferative disorder (e.g., cancer). In certain embodiments, a compound of formula Ia-d is combined in a pharmaceutical combination formulation, or dosing regimen as combination therapy, with a second compound that has anti-hyperproliferative properties or that is useful for treating a hyperproliferative disorder

(e.g., cancer). The second compound of the pharmaceutical combination formulation or dosing regimen preferably has complementary activities to the compound of formula Ia-d such that they do not adversely affect each other. Such compounds are suitably present in combination in amounts that are effective for the purpose intended. In one embodiment, a composition of this invention comprises a compound of formula Ia-d, or a stereoisomer, geometric isomer, tautomer, solvate, metabolite, a N-oxide derivative or pharmaceutically acceptable salt or prodrug thereof, in combination with a chemotherapeutic agent such as described herein.

The combination therapy may be administered as a simultaneous or sequential regimen. When administered sequentially, the combination may be administered in two or more administrations. The combined administration includes coadministration, using separate formulations or a single pharmaceutical formulation, and consecutive administration in either order, wherein preferably there is a time period while both (or all) active agents simultaneously exert their biological activities. [00187] Suitable dosages for any of the above coadministered agents are those presently used and may be lowered due to the combined action (synergy) of the newly identified agent and other chemotherapeutic agents or treatments.

The combination therapy may provide "synergy" and prove "synergistic", i.e., the effect achieved when the active ingredients used together is greater than the sum of the effects that results from using the compounds separately. A synergistic effect may be attained when the active ingredients are: (1) co-formulated and administered or delivered simultaneously in a combined, unit dosage formulation; (2) delivered by alternation or in parallel as separate formulations; or (3) by some other regimen. When delivered in alternation therapy, a synergistic effect may be attained when the compounds are administered or delivered sequentially, e.g., by different injections in separate syringes, separate pills or capsules, or separate infusions. In general, during alternation therapy, an effective dosage of each active ingredient is administered sequentially, i.e., serially, whereas in combination therapy, effective dosages of two or more active ingredients are administered together.

In a particular embodiment of anti-cancer therapy, a compound of formula Ia-d, or a stereoisomer, geometric isomer, tautomer, solvate, metabolite, N-oxide derivative or pharmaceutically acceptable salt or prodrug thereof, may be combined

with other chemotherapeutic, hormonal or antibody agents such as those described herein, as well as combined with surgical therapy and radiotherapy. Combination therapies according to the present invention thus comprise the administration of at least one compound of formula Ia-d, or a stereoisomer, geometric isomer, tautomer, solvate, metabolite, N-oxide derivative or pharmaceutically acceptable salt or prodrug thereof, and the use of at least one other cancer treatment method. The amounts of the compound(s) of formula Ia-d and the other pharmaceutically active chemotherapeutic agent(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect.

## **METABOLITES OF COMPOUNDS OF THE INVENTION**

Also falling within the scope of this invention are the *in vivo* metabolic products of formulas (I) and (Ia) to (II) described herein. Such products may result for example from the oxidation, reduction, hydrolysis, amidation, deamidation, esterification, deesterification, enzymatic cleavage, and the like, of the administered compound. Accordingly, the invention includes metabolites of compounds of formulas (I) and (Ia) to (II), including compounds produced by a process comprising contacting a compound of this invention with a mammal for a period of time sufficient to yield a metabolic product thereof.

Metabolite products typically are identified by preparing a radiolabeled (e.g., C or H) isotope of a compound of the invention, administering it parenterally in a detectable dose (e.g., greater than about 0.5 mg/kg) to an animal such as rat, mouse, guinea pig, monkey, or to man, allowing sufficient time for metabolism to occur (typically about 30 seconds to 30 hours) and isolating its conversion products from the urine, blood or other biological samples. These products are easily isolated since they are labeled (others are isolated by the use of antibodies capable of binding epitopes surviving in the metabolite). The metabolite structures are determined in conventional fashion, e.g., by MS, LC/MS or NMR analysis. In general, analysis of metabolites is done in the same way as conventional drug metabolism studies well known to those skilled in the art. The metabolite products, so long as they are not otherwise found *in vivo*, are useful in diagnostic assays for therapeutic

dosing of the compounds of the invention.

## PRODRUGS OF THE COMPOUNDS OF THE INVENTION

In addition to compounds of the invention, the invention also includes pharmaceutically acceptable prodrugs of such compounds. Prodrugs include compounds wherein an amino acid residue, or a polypeptide chain of two or more (e.g., two, three or four) amino acid residues, is covalently joined through an amide or ester bond to a free amino, hydroxy or carboxylic acid group of a compound of the present invention. The amino acid residues include but are not limited to the 20 naturally occurring amino acids commonly designated by three letter symbols and also includes phosphoserine, phosphothreonine, phosphotyrosine, 4-hydroxyproline, hydroxylysine, demosine, isodemosine, gamma- carboxyglutamate, hippuric acid, octahydroindole-2-carboxylic acid, statine, 1,2,3,4- tetrahydroisoquinoline-3-carboxylic acid, penicillamine, ornithine, 3-methylhistidine, norvaline, beta-alanine, gamma-aminobutyric acid, citrulline, homocysteine, homoserine, methyl-alanine, para-benzoylphenylalanine, phenylglycine, propargylglycine, sarcosine, methionine sulfone and tert-butylglycine.

Additional types of prodrugs are also encompassed. For instance, a free carboxyl group of a compound of the invention can be derivatized as an amide or alkyl ester. As another example, compounds of this invention comprising free hydroxy groups may be derivatized as prodrugs by converting the hydroxy group into a group such as, but not limited to, a phosphate ester, hemisuccinate, dimethylaminoacetate, or phosphoryloxymethyloxycarbonyl group, as outlined in Advanced Drug Delivery Reviews, (1996) 19:115. Carbamate prodrugs of hydroxy and amino groups are also included, as are carbonate prodrugs, sulfonate esters and sulfate esters of hydroxy groups. Derivatization of hydroxy groups as (acyloxy)methyl and (acyloxy)ethyl ethers, wherein the acyl group may be an alkyl ester optionally substituted with groups including, but not limited to, ether, amine and carboxylic acid functionalities, or where the acyl group is an amino acid ester as described above, are also encompassed. Prodrugs of this type are described in J. Med. Chem., (1996), 39:10. More specific examples include replacement of the hydrogen atom of the

alcohol group with a group such as (C<sub>1</sub>-C<sub>6</sub>)alkanoyloxymethyl, 1-((C<sub>1</sub>-C<sub>6</sub>)alkanoyloxy)ethyl, 1-methyl-1-((C<sub>1</sub>-C<sub>6</sub>)alkanoyloxy)ethyl, (C<sub>1</sub>-C<sub>6</sub>)alkoxycarbonyloxymethyl, N-(C<sub>1</sub>-C<sub>6</sub>)alkoxycarbonylaminomethyl, succinyl, (CrC<sub>6</sub>)alkanoyl,  $\alpha$ -amino(C<sub>1</sub>-C<sub>4</sub>)alkanoyl, arylacyl and  $\alpha$ -aminoacyl, or  $\alpha$ -aminoacyl- $\alpha$ -aminoacyl, where each  $\alpha$ -aminoacyl group is independently selected from the naturally occurring L-amino acids, P(O)(OH)<sub>2</sub>, -P(O)(O(C<sub>1</sub>-C<sub>6</sub>)alkyl)<sub>2</sub> or glycosyl (the radical resulting from the removal of a hydroxyl group of the hemiacetal form of a carbohydrate). ## ARTICLES OF MANUFACTURE

In another embodiment of the invention, an article of manufacture, or "kit", containing materials useful for the treatment of the diseases and disorders described above is provided. In one embodiment, the kit comprises a container comprising a compound of formula Ia-d, or a stereoisomer, geometric isomer, tautomer, solvate, metabolite, N-oxide derivative or pharmaceutically acceptable salt or prodrug thereof. The kit may further comprise a label or package insert on or associated with the container. The term "package insert" is used to refer to instructions customarily included in commercial packages of therapeutic products, that contain information about the indications, usage, dosage, administration, contraindications and/or warnings concerning the use of such therapeutic products. Suitable containers include, for example, bottles, vials, syringes, blister pack, etc. The container may be formed from a variety of materials such as glass or plastic. The container may hold a compound of formula Ia-d or a formulation thereof which is effective for treating the

condition and may have a sterile access port (for example, the container may be an intravenous solution bag or a vial having a stopper pierceable by a hypodermic injection needle). At least one active agent in the composition is a compound of formula Ia-d. The label or package insert indicates that the composition is used for treating the condition of choice, such as cancer. In addition, the label or package insert may indicate that the patient to be treated is one having a disorder such as a hyperproliferative disorder, neurodegeneration, cardiac hypertrophy, pain, migraine or a neurotraumatic disease or event. In one embodiment, the label or package inserts indicates that the composition comprising a compound of formula Ia-d can be used to treat a disorder resulting from abnormal cell growth. The label or package insert may also indicate that the composition can be used to treat other disorders. Alternatively, or additionally, the article of manufacture may further comprise a second container comprising a pharmaceutically acceptable buffer, such as bacteriostatic water for injection (BWFI), phosphate-buffered saline, Ringer's solution and dextrose solution. It may further include other materials desirable from a commercial and user standpoint, including other buffers, diluents, filters, needles, and syringes.

The kit may further comprise directions for the administration of the compound of formula Ia-d and, if present, the second pharmaceutical formulation. For example, if the kit comprises a first composition comprising a compound of formula Ia-d and a second pharmaceutical formulation, the kit may further comprise directions for the simultaneous, sequential or separate administration of the first and second pharmaceutical compositions to a patient in need thereof.

In another embodiment, the kits are suitable for the delivery of solid oral forms of a compound of formula Ia-d, such as tablets or capsules. Such a kit preferably includes a number of unit dosages. Such kits can include a card having the dosages oriented in the order of their intended use. An example of such a kit is a "blister pack". Blister packs are well known in the packaging industry and are widely used for packaging pharmaceutical unit dosage forms. If desired, a memory aid can be provided, for example in the form of numbers, letters, or other markings or with a calendar insert, designating the days in the treatment schedule in which the dosages can be administered.

- 100 -

According to one embodiment, a kit may comprise (a) a first container with a compound of formula Ia-d contained therein; and optionally (b) a second container with a second pharmaceutical formulation contained therein, wherein the second pharmaceutical formulation comprises a second compound with anti-hyperproliferative activity. Alternatively, or additionally, the kit may further comprise a third container comprising a pharmaceutically-acceptable buffer, such as bacteriostatic water for injection (BWF), phosphate-buffered saline, Ringer's solution and dextrose solution. It may further include other materials desirable from a commercial and user standpoint, including other buffers, diluents, filters, needles, and syringes.

In certain other embodiments wherein the kit comprises a composition of formula Ia-d and a second therapeutic agent, the kit may comprise a container for containing the separate compositions such as a divided bottle or a divided foil packet, however, the separate compositions may also be contained within a single, undivided container. Typically, the kit comprises directions for the administration of the separate components. The kit form is particularly advantageous when the separate components are preferably administered in different dosage forms (e.g., oral and parenteral), are administered at different dosage intervals, or when titration of the individual components of the combination is desired by the prescribing physician.

#### EXAMPLE OF BIOLOGICAL EVALUATION

Determination of the potential to target PI3K/PI3K-related kinases (PIKK) of a compound of formula I is possible by a number of direct and indirect detection methods. Certain exemplary compounds described herein were assayed for their phospho PKB blocking activity and their in vitro activity against tumor cells. The range of phospho PKB activities was less than 1 nM (nanomolar) to about 10  $\mu$ M (micromolar). Other exemplary compounds of the invention had phospho PKB blocking activity IC<sub>50</sub> values less than 10 nM. Certain compounds of the invention had tumor cell-based activity IC<sub>50</sub> values less than 100 nM.

The cytotoxic or cytostatic activity of formula I exemplary compounds was measured by: establishing a proliferating mammalian tumor cell lines in a cell culture

medium, adding a formula I compound, culturing the cells for a period from about 6 hours to about 3 days; and measuring cell viability. Cell-based assays were used to measure viability, i.e. proliferation (IC<sub>50</sub>), cytotoxicity (EC<sub>50</sub>), and induction of apoptosis (caspase activation).

The in vitro potency of formula I compounds was measured by the in-cell Western assay designed in laboratories at University of Basel. This assay method was conducted in microtiter plate formats, making it amenable to high-throughput screening (HTS). Inhibitors were added to the medium and incubated. Antibodies diluted in PBS/T against pPKB Ser473 (Cell Signalling) and PKB (gift from E.Hirsch) or pS6 Ser 235/236 (Cell Signalling) were incubated overnight and then secondary fluorescently labelled antibodies (LI-COR) were applied and plates were scanned on an Odyssey reader to detect pPKB/PKB ratios.

#### EXAMPLES OF PREPARATION OF COMPOUNDS OF THE INVENTION

The chemical reactions described in the Examples may be readily adapted to prepare a number of other lipid kinase inhibitors of the invention, and alternative methods for preparing the compounds of this invention are deemed to be within the

scope of this invention. For example, the synthesis of non-exemplified compounds according to the invention may be successfully performed by modifications apparent to those skilled in the art, e.g., by appropriately protecting interfering groups, by utilizing other suitable reagents known in the art other than those described, and/or by making routine modifications of reaction conditions. Alternatively, other reactions disclosed herein or known in the art will be recognized as having applicability for preparing other compounds of the invention.

In the Examples described below, unless otherwise indicated all temperatures are set forth in degrees Celsius. Reagents were purchased from commercial suppliers such as Aldrich Chemical Company, Fluorochem, Acros, Lancaster, TCI or Maybridge, and were used without further purification unless otherwise indicated. The reactions set forth below were done generally under a positive pressure of nitrogen or argon or with a drying tube (unless otherwise stated) in anhydrous solvents, and the reaction flasks were typically fitted with rubber septa for the introduction of substrates and reagents via syringe. Glassware was oven dried and/or heat dried. Column chromatography was conducted by using Merck silica gel. <sup>1</sup>H NMR spectra were recorded on a Bruker instrument operating at 400 MHz, 500 MHz and 600 MHz. <sup>1</sup>H NMR spectra were obtained in deuterated CDCl<sub>3</sub>, CD<sub>3</sub>-DMSO, CH<sub>3</sub>OD or d<sub>6</sub>-acetone solutions (reported in ppm), using chloroform as the reference standard (7.25 ppm) or TMS (0 ppm). When peak multiplicities are reported, the following abbreviations are used: s (singlet), d (doublet), t (triplet), m (multiplet), br (broadened), dd (doublet of doublets), dt (doublet of triplets). Coupling constants, when given, are reported in Hertz (Hz).

Example P1

**4,4'-(6-chloro-1,3,5-triazine-2,4-diyl)dimorpholine:**

Cyanuric chloride (1.00 g, 5.42 mmol, 1.0 eq.) was dissolved in DMF (5 ml) and

- 216 -

morpholine (2.11 ml, 24.4 mmol, 4.5 eq.) was slowly added into reaction mixture at 0 °C, stirred for 20 minutes at the same temperature, poured to water and colorless precipitate was filtered, washed with hexane and diethyl ether and dried to provide the title compound as a colorless solid (860 mg, 56%).

**Analytical data:**

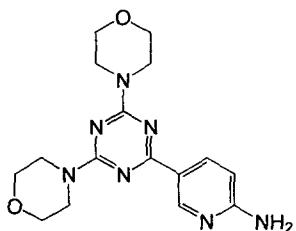

**<sup>1</sup>H-NMR (400 MHz, CDCl<sub>3</sub>):** δ 3.78-3.69 (16H, m).

**<sup>13</sup>C-NMR (100 MHz, CDCl<sub>3</sub>):** δ 170.10, 164.88, 67.28, 66.98, 44.23.

**ESI-MS (70 eV, m/z):** calcd. for C<sub>11</sub>H<sub>16</sub>ClN<sub>5</sub>O<sub>2</sub> [M+H]<sup>+</sup>: 286, found 360.

**X-Ray analysis:** the structure of 4,4'-(6-chloro-1,3,5-triazine-2,4-diyl)dimorpholine was confirmed by x-ray analysis.

**Example P2**

**5-(4,6-dimorpholino-1,3,5-triazin-2-yl)pyridin-2-amine:**

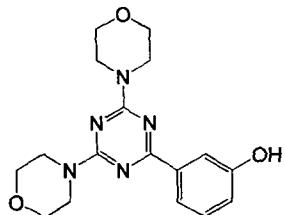

Following the general procedure A, 4,4'-(6-chloro-1,3,5-triazine-2,4-diyl)dimorpholine was coupled with 2-aminopyridine-5-boronic acid pinacol ester with the reaction time of 15 h. Chromatography (methylene chloride/methanol 97:3) gave 69% of the title compound as a light yellow solid.

**Analytical data:**

**<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>):** δ 9.06 (s, 1H), 8.36 (dd, J = 2.28, 8.59 Hz, 1H), 6.50 (d, J = 8.59 Hz, 1H), 4.82 (s, 2H), 3.87- 3.73 (m, 16H), 2.22 (s, 1H), 1.23 (s, 1H).

**<sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):** δ 169.42, 165.37, 160.56, 150.02, 138.31, 123.91, 107.89, 67.27, 44.01, 25.27.

**ESI-MS (70 eV, m/z):** calcd. for C<sub>16</sub>H<sub>21</sub>N<sub>7</sub>O<sub>2</sub> [M+H]<sup>+</sup>: 344.38, found 344.30.

Example P3**3-(4,6-dimorpholino-1,3,5-triazin-2-yl)phenol:**

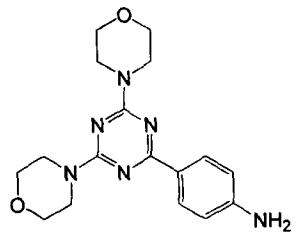

Following the general procedure A, 4,4'-(6-chloro-1,3,5-triazine-2,4-diyl)dimorpholine was coupled with 3-hydroxyphenylboronic acid pinacol ester with reaction time of 15 h. Chromatography (hexane/ethyl acetate 1:1) gave the title compound as a colorless solid.

**Analytical data:**

**<sup>1</sup>H NMR (400 MHz, DMSO):**  $\delta$  9.51 (s, 1H), 7.77-7.74 (m, 2H), 7.23 (t,  $J$  = 8.08 Hz, 1H), 6.90-6.88 (m, 1H), 3.81-3.55 (m, 16H), 1.25 (s, 1H).

**<sup>13</sup>C NMR (100 MHz, DMSO):**  $\delta$  170.27, 165.60, 165.47, 158.12, 138.99, 130.01, 119.73, 119.36, 115.56, 66.86, 44.10.

**ESI-MS (70 eV, m/z):** calcd. for  $C_{17}H_{21}N_5O_3[2M]^+$ : 685.32, found 685.8.

Example P4**4-(4,6-dimorpholino-1,3,5-triazin-2-yl)aniline:**

Following the general procedure A, 4,4'-(6-chloro-1,3,5-triazine-2,4-diyl)dimorpholine was coupled with 4-aminophenylboronic acid pinacol ester with reaction time of 24 h. Chromatography (hexane/ethyl acetate 6:4) gave the title compound as a yellow solid.

**Example P10**

**5-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-4-(trifluoromethyl)pyridin-2-amine:**

To a dry 25 ml flask was added 5-bromo-4-(trifluoromethyl)pyridin-2-amine (300 mg, 1.24 mmol, 1.0 eq.), potassium acetate (366 mg, 3.73 mmol, 3.0 eq.), bis(pinacolato)diboran (348 mg, 1.37 mmol, 1.1 eq.) and dioxane (8 ml). Argon was bubbled through the solution for 15 minutes, at which time 1,1-bis(diphenylphosphino)ferrocene-palladium(II)dichloride dichloromethane complex (50.8 mg, 60 μmol, 0.05 eq.) was added. The reaction was refluxed in a 115 °C oil bath for 8 hours under argon. After cooling to room temperature, the dioxane was removed in vacuo. Ethyl acetate was added and the resulting slurry was sonicated and filtered. Additional ethyl acetate was used to wash the solid. The combined organic extracts were concentrated and the crude material was partially purified by silica gel chromatography (hexane/ethyl acetate 6:4). Upon removal of solvent, hexane was added, decantation was done and resulting colorless solid was dried on a high vacuum for three days.

Example P50

**In cell Western-inhibition assay (protocol for phospho-PKB/PKB detection on A2058 melanoma):**

Inhibitor efficacy of formula 1 compounds were measured by a cell assay employing

the following protocol:

Cells were plated in black 96 well view plates (Packard) 24 hours prior to the experiment. Inhibitor or DMSO as control were added to the medium (each sample as duplicates) and incubated for 3 hours. 4% para-formaldehyde was applied for 20 minutes at room temperature to fix the cells. After washing with PBS/ 0.1% Triton/X-100, blocking with 10% goat serum in PBS was done for 1 hour. On a shaker, antibodies diluted in PBS against pPKB Ser473 (Cell Signalling) and PKB (gift from E.Hirsch) or pS6 Ser 235/236 (Cell Signalling) were incubated overnight at 4°C. After washing with PBS, secondary antibodies (LI-COR) diluted in PBS were applied at room temperature in the dark. Plates were washed with PBS prior to scanning on an Odyssey reader.

#### Day 0

1. Plate 80'000 cells /well in a black Packard 96 well ViewPlate.
2. Pipette with the multi channel pipette 200 µl of cell suspension per well.
3. Check *under the microscope* the homogeneity of the plating.
4. Incubate cells 24 hours.

#### Day 1

1. Carefully throw away the medium and refill the wells with 100 µl of medium. Check *under the microscope* for cell loss.
2. Add 1 µl of 100x concentrated DMSO or Inhibitor.
3. Incubate for 3 hours at 37°.
4. Add 60 µl para-formaldehyde 10% (final 4 %) and incubate at room temperature for 20 minutes.
5. Wash 3 x 5 minutes with (200 µl) PBS/ 0.1 % Triton/X-100.
6. Block 60 minutes with (100 µl) of 10 %FCS in PBS at room temperature.
7. Incubate over night with 50 µl pPKB Ser473 (1:500) and PKB (1:500) or pS6 Ser 235/236 (1:500) in PBS at 4°C on a shaker.

#### Day 2

1. Wash 3 x 5 minutes with PBS.

- 249 -

2. Incubate 60 minutes with 50 µl secondary antibody anti-rabbit IRDye800 (1:800) and anti-mouse IRDye680 (1:500) in PBS at room temperature in the dark on a shaker.
3. Wash 3 x 5 minutes with PBS.
4. Read the plate on an Odyssey reader.

Reagents:

Anti-Phospho PKB Ser 473 (Cell Signaling cat. 4058)  
Anti-PKB (gift from E. Hirsch, Torino)  
Anti-pS6 Ser235/236 (Cell Signaling cat. 4856)  
Goat anti-Rabbit-IRDye 800 CW (LI-COR cat. 926-32211)  
Goat anti Mouse- IRDye 680 (LI-COR cat. 926-32220)

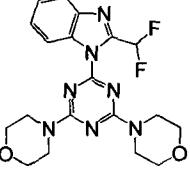

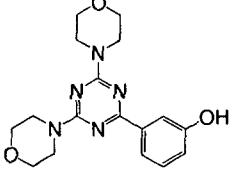

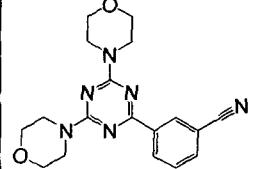

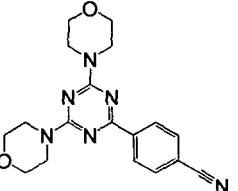

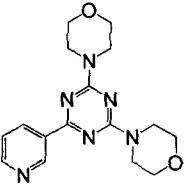

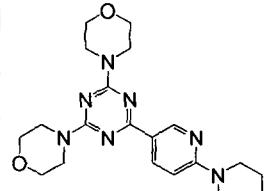

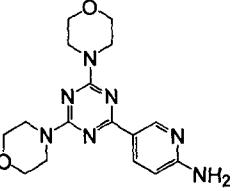

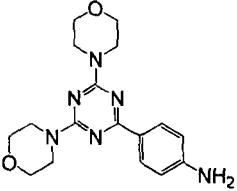

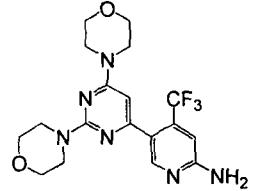

Examples of in cell Western inhibition assay:

The more phosphorylated PKB was measured on the Odyssey scan, the higher the pPKB/PKB values were i.e. the less strong was inhibition of signalling. A summary of the results obtained for some exemplary compounds is depicted in table 7.

Assessment of compound permeability was indirectly interpreted by using this assay. The compounds were applied to the apical surface of cell monolayers and compound permeation into the cellular compartment could be interpreted by measuring the inhibition of PI3Ks.

the invention. Further, since numerous modifications and changes will be readily apparent to those skilled in the art, it is not desired to limit the invention to the exact construction and process shown as described above. Accordingly, all suitable modifications and equivalents may be considered to fall within the scope of the invention as defined by the claims that follow.

The words "comprise," "comprising," "include," "including," and "includes" when used in this specification and in the following claims are intended to specify the presence of stated features, integers, components, or steps, but they do not preclude the presence or addition of one or more other features, integers, components, steps, or groups thereof.

Claims

1. A compound of formula (I),

(I)

and stereoisomers, geometric isomers, tautomers, solvates, metabolites, N-oxide derivatives and pharmaceutically acceptable salts thereof, wherein:

**Q = N, G = N, U = N** (triazine-based compounds of formulas (Ia) to (Id));

**Q = C, G = C, U = N** (pyridine-based compounds of formula (Ie));

**Q = C, U = C, G = N** (pyridine-based compounds of formula (Ie));

**U = C, G = C, Q = N** (pyridine-based compounds of formula (Ie));

**Q = CR<sub>z</sub>, G = N, U = N** (fused-pyrimidine-based compounds of formulas (If) to (Ii)); or

**Q = CR<sub>z</sub>, G = C, U = N** (fused pyridine-based compounds of formulas (If) to (Ii));

wherein **R<sub>z</sub>** is selected from the group consisting of:

- (1) hydrogen, (2) cyano, (3) halogen, (4) methyl, (5) trifluoromethyl, (6) sulfonamido, (7) sulfon, (8) linker moiety (hydrophobic linkers, hydrophilic linkers (pegylated linkers), photo-cleavable linkers, redox reaction-cleavable linkers), (9) linker moiety with covalently bonded TAG-molecules, (10) F, Cl, Br, I, -C(C<sub>1</sub>-C<sub>6</sub>-alkyl)<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>t</sub>NR<sub>10</sub>R<sub>11</sub>, -C(R<sub>14</sub>R<sub>15</sub>)<sub>n</sub>NR<sub>12</sub>C(=Y)R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>NR<sub>12</sub>S(O)<sub>2</sub>R<sub>10</sub>, -CH(OR<sub>10</sub>)R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>OR<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>S(O)<sub>2</sub>R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>S(O)<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -C(=Y)R<sub>10</sub>, -C(=Y)OR<sub>10</sub>, -C(=Y)NR<sub>10</sub>R<sub>11</sub>, -C(=Y)NR<sub>12</sub>OR<sub>10</sub>, -C(=O)NR<sub>12</sub>S(O)<sub>2</sub>R<sub>10</sub>, -C(=O)NR<sub>12</sub>(CR<sub>14</sub>R<sub>15</sub>)<sub>m</sub>NR<sub>10</sub>R<sub>11</sub>, -NO<sub>2</sub>, -NHR<sub>12</sub>, -NR<sub>12</sub>C(=Y)R<sub>11</sub>, -NR<sub>12</sub>C(=Y)OR<sub>11</sub>, -NR<sub>12</sub>C(=Y)NR<sub>10</sub>R<sub>11</sub>, -NR<sub>12</sub>S(O)<sub>2</sub>R<sub>10</sub>, -NR<sub>12</sub>SO<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -S(O)<sub>2</sub>R<sub>10</sub>, -S(O)<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -SC(=Y)R<sub>10</sub>, -SC(=Y)OR<sub>10</sub>, C<sub>1</sub>-C<sub>12</sub> alkyl, C<sub>2</sub>-C<sub>8</sub> alkenyl, C<sub>2</sub>-C<sub>8</sub> alkynyl, C<sub>3</sub>-C<sub>12</sub> carbocycli, C<sub>2</sub>-C<sub>20</sub> heterocycli, C<sub>6</sub>-C<sub>20</sub> aryl, and C<sub>1</sub>-C<sub>20</sub> heteroaryl; or C<sub>3</sub>-C<sub>12</sub>

carbocyclyl, C<sub>2</sub>-C<sub>20</sub> heterocyclyl, C<sub>6</sub>-C<sub>20</sub> aryl, or C<sub>1</sub>-C<sub>20</sub> heteroaryl;

where said alkyl, alkenyl, alkynyl, carbocyclyl, heterocyclyl, aryl and heteroaryl are optionally substituted with one or more groups independently selected from F, Cl, Br, I, -CN, CF<sub>3</sub>, -NO<sub>2</sub>, oxo, -C(=Y)R<sub>10</sub>, -C(=Y)OR<sub>10</sub>, -C(=Y)NR<sub>10</sub>R<sub>11</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>NR<sub>10</sub>R<sub>11</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>C(=Y)NR<sub>10</sub>R<sub>11</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>C(=Y)OR<sub>10</sub>, (CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>NR<sub>12</sub>SO<sub>2</sub>R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>OR<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>R<sub>10</sub>, -(CR<sub>14</sub>R<sub>15</sub>)<sub>n</sub>SO<sub>2</sub>R<sub>10</sub>, -NR<sub>10</sub>R<sub>11</sub>, -NR<sub>12</sub>C(=Y)R<sub>10</sub>, -NR<sub>12</sub>C(=Y)OR<sub>11</sub>, -NR<sub>12</sub>C(=Y)NR<sub>10</sub>R<sub>11</sub>, -NR<sub>12</sub>SO<sub>2</sub>R<sub>10</sub>, =NR<sub>12</sub>, OR<sub>10</sub>, -OC(=Y)R<sub>10</sub>, -OC(=Y)OR<sub>10</sub>, -OC(=Y)NR<sub>10</sub>R<sub>11</sub>, -OS(O)<sub>2</sub>(OR<sub>10</sub>), -OP(=Y)(OR<sub>10</sub>)(OR<sub>11</sub>), -OP(OR<sub>10</sub>)(OR<sub>11</sub>), SR<sub>10</sub>, -S(O)R<sub>10</sub>, -S(O)<sub>2</sub>R<sub>10</sub>, -S(O)<sub>2</sub>NR<sub>10</sub>R<sub>11</sub>, -S(O)(OR<sub>10</sub>), -S(O)<sub>2</sub>(OR<sub>10</sub>), -SC(=Y)R<sub>10</sub>, -SC(=Y)OR<sub>10</sub>, -SC(=Y)NR<sub>10</sub>R<sub>11</sub>, optionally substituted C<sub>1</sub>-C<sub>12</sub> alkyl, optionally substituted C<sub>2</sub>-C<sub>8</sub> alkenyl, optionally substituted C<sub>2</sub>-C<sub>8</sub> alkynyl, optionally substituted C<sub>3</sub>-C<sub>12</sub> carbocyclyl, optionally substituted C<sub>2</sub>-C<sub>20</sub> heterocyclyl, optionally substituted C<sub>6</sub>-C<sub>20</sub> aryl, and optionally substituted C<sub>1</sub>-C<sub>20</sub> heteroaryl;

X is CR<sub>x</sub> or O, S, NR<sub>y</sub>, wherein R<sub>x</sub> and R<sub>y</sub> are independently selected from the group consisting of:

(1) hydrogen, (2) cyano, (3) halogen, (4) methyl, (5) trifluoromethyl, (6) sulfonamido, (7) sulfon, (8) linker moiety (hydrophobic, hydrophilic, photo-cleavable, redox reaction-cleavable linkers), (9) linker moiety with covalently bonded TAG-molecules (a TAG could be a fluorophor, biotin, different polymer beads and different reactive groups);

the linker moiety being selected from the group consisting of:

optionally substituted C<sub>1</sub>-C<sub>20</sub> alkyl, optionally substituted halo-substituted C<sub>1</sub>-C<sub>20</sub> alkyl, optionally substituted C<sub>1</sub>-C<sub>20</sub> alkoxy, optionally substituted halo-substituted C<sub>1</sub>-C<sub>20</sub> alkoxy, optionally substituted C<sub>1</sub>-C<sub>20</sub> pegylated alkyl;

the tag molecules being selected from the group consisting of:

11. A compound of claim 1 selected from 5-(4,6-dimorpholino-1,3,5-triazin-2-yl)-4-(trifluoromethyl)pyridin-2-amine and 5-(4,6-dimorpholino-1,3,5-triazin-2-yl)-4-(trifluoromethyl)pyrimidin-2-amine.
12. A compound of any of claims 1 to 11 for use as a therapeutic agent.
13. A pharmaceutical composition comprising a compound of any of claims 1 to 11 and a pharmaceutically acceptable carrier.
14. A compound of any one of Claims 1 to 11 for use in the treatment of cancer.
15. Use of a compound of any one of Claims 1 to 11 in the manufacture of a medicament for the treatment for hyperproliferative disorders (e.g., cancer, including melanoma and other cancers of the skin), neurodegeneration, cardiac hypertrophy, pain, migraine, neurotraumatic diseases, stroke, diabetes, hepatomegaly, cardiovascular disease, Alzheimer's disease, cystic fibrosis, autoimmune diseases, atherosclerosis, restenosis, psoriasis, allergic disorders, inflammation, neurological disorders, hormone-related diseases, conditions associated with organ transplantation, immunodeficiency disorders, destructive bone disorders, hyperproliferative disorders, infectious diseases, conditions associated with cell death, thrombin-induced platelet aggregation, chronic myelogenous leukaemia (CML), liver disease, pathologic immune conditions involving T cell activation, and CNS disorders.
16. A method for inhibiting phosphorylation of Akt in a human or animal subject, comprising administering to a human or animal subject an effective amount of a compound of any one of Claims 1 to 11.
17. A pharmaceutical composition, comprising a pharmaceutically acceptable carrier and an amount of a compound of any one of Claims 1 to 11 effective to inhibit PI3K activity in a human or animal subject when administered thereto.

18. A pharmaceutical composition, comprising a pharmaceutically acceptable carrier and an amount of a compound of any one of Claims 1 to 11 effective to inhibit mTOR activity in a human or animal subject when administered thereto.
19. The composition of claim 18, effective to inhibit PI3K alpha activity in a human or animal subject when administered thereto.
20. The composition of claim 17, effective to inhibit TORC1 and/or TORC2 activity in a human or animal subject when administered thereto.
21. The composition of Claim 17 further comprising at least one additional agent for the treatment of hyperproliferative disorders (e.g., cancer, including melanoma and other cancers of the skin), neurodegeneration, cardiac hypertrophy, pain, migraine, neurotraumatic diseases, stroke, diabetes, hepatomegaly, cardiovascular disease, Alzheimer's disease, cystic fibrosis, autoimmune diseases, atherosclerosis, restenosis, psoriasis, allergic disorders, inflammation, neurological disorders, hormone-related diseases, conditions associated with organ transplantation, immunodeficiency disorders, destructive bone disorders, hyperproliferative disorders, infectious diseases, conditions associated with cell death, thrombin-induced platelet aggregation, chronic myelogenous leukaemia (CML), liver disease, pathologic immune conditions involving T cell activation, and CNS disorders.
22. The composition of Claim 21, wherein the at least one additional agent for the treatment of cancer is vatalanib, imatinib or gefitinib.
23. A method for treating a condition by modulation of PI3K activity comprising administering to a human or animal subject in need of such treatment an effective amount of a compound of any of Claims 1 to 11.
24. A method for treating a condition by modulation of mTOR activity comprising administering to a human or animal subject in need of such treatment an effective amount of a compound of any one of Claims 1 to 11.

25. The method of Claim 23, wherein the compound has an IC<sub>50</sub> value of less than about 1  $\mu$ M with respect to inhibition of PI3K.
26. The method of Claim 24, wherein the compound has an IC<sub>50</sub> value of less than about 1  $\mu$ M with respect to inhibition of mTOR.
27. The method of Claim 23 or 24, wherein the condition is cancer.
28. A method for inhibiting PI3K activity in a human or animal subject, comprising administering to the human or animal subject a composition comprising an amount of a compound of any of Claims 1 to 11 effective to inhibit PI3K activity the human or animal subject.
29. A method for inhibiting mTOR activity in a human or animal subject, comprising administering to the human or animal subject a composition comprising an amount of a compound of any one of Claims 1 to 11 effective to inhibit mTOR activity the human or animal subject.
30. A method for treating a cancer disorder in a human or animal subject, comprising administering to the human or animal subject a composition comprising an amount of a compound of any one of Claims 1 to 11 effective to inhibit PI3K activity the human or animal subject.
31. A method for treating hyperproliferative disorders (e.g., cancer, including melanoma and other cancers of the skin), neurodegeneration, cardiac hypertrophy, pain, migraine, neurotraumatic diseases, stroke, diabetes, hepatomegaly, cardiovascular disease, Alzheimer's disease, cystic fibrosis, autoimmune diseases, atherosclerosis, restenosis, psoriasis, allergic disorders, inflammation, neurological disorders, hormone-related diseases, conditions associated with organ transplantation, immunodeficiency disorders, destructive bone disorders, hyperproliferative disorders, infectious diseases, conditions associated with cell

death, thrombin-induced platelet aggregation, chronic myelogenous leukaemia (CML), liver disease, pathologic immune conditions involving T cell activation, and CNS disorders, in a human or animal subject, comprising administering to the human or animal subject a composition comprising an amount of a compound of any one of Claims 1 to 11 effective to inhibit mTOR activity the human or animal subject.

32. The method of Claim 30 or 31 further comprising administering to the human or animal subject at least one additional agent for the treatment of cancer.

33. The method of Claim 32, wherein the at least one additional agent for the treatment of cancer is vatalanib, imatinib or gefitinib.

34. The method of Claim 31 or 32, wherein the cancer is breast cancer, bladder cancer, colon cancer, glioma, glioblastoma, lung cancer, hepatocellular cancer, gastric cancer, melanoma, thyroid cancer, endometrial cancer, renal cancer, cervical cancer, pancreatic cancer, esophageal cancer, prostate cancer, brain cancer, or ovarian cancer.

35. A method of modulating activity of PDK, PKB and other PH-domain containing effector proteins comprising contacting a compound of any one of Claims 1 to 11 with a cell.

36. The method of Claim 35, wherein the compound has an EC<sub>50</sub> value of less than about 1  $\mu$ M with respect to inhibition of pAKT.

37. A kit, comprising a compound of any one of Claims 1 to 11 and a package insert or other labelling including directions for treating a cellular proliferative disease by administering a PI3K inhibitory amount of the compound.

38. A method for inhibiting the activity of KSP kinesin which method comprises contacting said kinesin with an effective inhibitory amount of a compound of any of claims 1 to 11.

- 274 -

**39.** A method for inhibiting the activity of KSP kinesin in a cell which method comprises contacting said cell with an effective inhibitory amount of a compound of any of claims 1 to 11.
