Description

Field of the Invention

The present invention relates to a bleaching composition that is non-irritative and demonstrates superior bleaching strength and, more particularly, to a bleaching composition that is suited to the removal of hard, surface soiling.

Soiling in locations that are difficult to clean such as lavatories, bathrooms, bathtubs and drain pipes is removed with considerable difficulty with ordinary detergents or bleaching cleaners used primarily for the purpose of cleaning.

The bleaching action or foaming action of compositions having chlorine-based or oxygen-based bleaching agents as the main soiling removal ingredients are used in the removal of such soiling.

The blackening of bathroom ceilings, bathroom tile joints, plastic walls and triangular corners in kitchens is caused by the pigment produced by the mold, Cladosporium. In addition, when flush toilets are used for an extended period of time, although there is accumulation of colored soiling on the inner surfaces, surfaces in contact with standing water and especially in water-sealed areas, this soiling is mainly inorganic substances such as calcium phosphate and iron oxide, organic waste products such as crude protein and bile degradation products, microorganisms or their metabolites.

Since it is difficult to remove these types of hard surface soiling with cleansers and surface activators alone, liquid or spray type bleaching compositions are presently used which use chlorine-based bleaching agents such as sodium hypochlorite.

However, although bleaches for hard surface soiling which use hypochlorous acid demonstrate superior performance, there is a large risk to the eyes and skin. Sprays in particular are not suited for mold growing on bathroom ceilings. Moreover, such bleaches have their own peculiar chlorine smell. As such, not only is there resistance to using such bleaches in confined areas such as in bathrooms and lavatories, when these are mistakenly used in combination with acidic cleaners, a toxic gas is produced.

In recent years, studies have been conducted on bleaches for hard surface soiling that use chlorine-based bleaching agents that do not have the above risks. For example, Japanese Patent Laid-Open No. 1299/1985 discloses a bleach suitable for mold removal containing hydrogen peroxysulfate and inorganic peroxide, Japanese Patent Laid-Open No. 4794/1987 discloses a mold remover composition that uses a combination of hydrogen peroxide or sodium percarbonate, bleaching activator and hydrogen peroxydisulfate, Japanese Patent Laid-Open Publication No. 100598/1987 discloses a mold remover containing peroxide and colloidal silica, and Japanese Patent Laid Open Publications Nos. 197697/1986 and 133964/1987 disclose a bleach for lavatory use which uses an oxygen-based bleaching agent.

In addition, although soiling similar to that found in lavatories such as protein, fats, slime and scaling adhere to the drain pipes of kitchens and bathrooms as well as in the pipes of bathtubs, oxygen-based bleaches are also used for the removal of these types of soiling (such as in Japanese Patent Laid-Open Nos. 78695/1981 and 166899/1986).

Oxygen-based bleaches have the fault of having weaker bleaching strength in comparison to chlorine-based bleaches. Examples of superior bleaching activators for increasing the bleaching strength of oxygen-based bleaches include tetraacetyldiamine, tetraacetylglycoluryl, and pentaerythritol tetraacetate. However, since these bleaching activators produce peracetic acid as the source of bleaching activation, they have a strong irritating odor making their practical application as bleaches for hard surface soiling difficult.

US-A-4606838 and EP 0241137A disclose the use of bleaching compositions comprising the use of aromatic organic acid peroxide precursors, and EP 0267046A discloses bleaching compositions comprising organic peracid precursors which contain oxynitrogen leaving groups.

EP-A-0359087 discloses a proteolytic perhydrolysis bleaching system which uses a protease enzyme and an ester substrate to produce a peracid.

EP-A-0283252 discloses the use of antioxidants in compositions containing organic peroxyacid precursors to increase their stability.

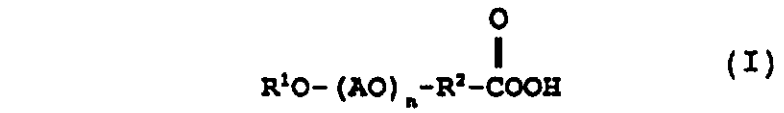

[Summary of the Invention]

Conditions such as a high degree of bleaching strength, duration of bleaching strength of at least thirty minutes, and the absence of a foul or irritating odor are required for substances used as sources of bleaching activation in bleaches for hard surface soiling that use oxygen-based bleaching agents. Accordingly, as a result of earnest research regarding sources of bleaching activation that satisfy the above conditions, the inventors perfected the present invention by discovering that specific organic acid peroxides have no irritating odor while also demonstrating superior bleaching effects.

In other words, the present invention provides a bleaching composition containing the following:

(a) Hydrogen peroxide or peroxide which produces hydrogen peroxide in aqueous solution; and,

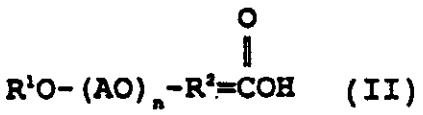

(b) An organic acid peroxide precursor that produces organic acid peroxide represented with the general formula:

(I)

wherein R^1 represents an optionally substituted straight chain or branched chain alkyl or alkenyl group having 1-5 carbon atoms, R^2 represents an optionally substituted straight chain or branched chain alkylene group having 1-8 carbon atoms, n number of A represent identical or different alkylene groups having from 2 to 4 carbon atoms, and n represents an integer from 0-100, by reacting with hydrogen peroxide or a peroxide which produces hydrogen peroxide in aqueous solution wherein the organic acid peroxide is not formed by the use of an enzyme and the organic acid peroxide precursor is:

(1) the acid anhydride of the organic acid represented with general formula (II) indicated below:

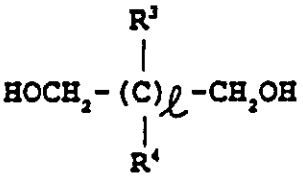

(II)

wherein R^1, R^2, A and n have the same meanings as in the previous formulae; or,

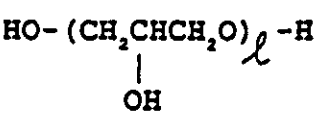

(2) the esters or acid amides of the organic acid of general formula (II) and the compounds indicated in (III) through (VIII) below:

(III)

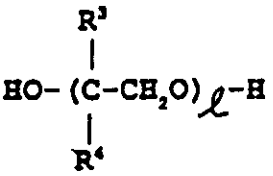

wherein R^3 and R^4 represent identical or different hydrogen atoms, methyl groups, ethyl groups, hydroxyl groups or hydroxyalkyl groups having 1-3 carbon atoms, and ℓ represents an integer from 1-10

(IV)

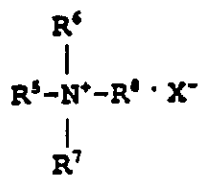

wherein ℓ has the same meaning as in the previous formulae

(V)

wherein R^3, R^4 and ℓ have the same meanings as in the previous formulae

(VI)

wherein R^5, R^6, R^7 and R^8 represent identical or different hydrogen atoms, straight chain or branched chain alkyl

groups or alkenyl groups having 1-22 carbon atoms, or hydroxyalkyl groups having 1-3 carbon atoms, with at least one group being a hydroxyalkyl group having 1-3 carbon atoms, and X represents a halogen atom

(VII) Cyclic alcohol or cyclic polyhydroxyalcohol

(VIII) $R^9(N-R^{11})_p-H$ (with R^{10} on the nitrogen)

wherein R^9 and R^{10} represent either identical or different hydrogen atoms, straight chain or branched chain alkyl or alkenyl groups having 1-22 carbon atoms or hydroxyalkyl groups having 1-3 carbon atoms, or may form a saturated or unsaturated ring by bonding with each other; at least one of the groups from among R^9 and p number of R^{10} represents a hydrogen atom; and, R^{11} represents an alkylene group having 1-3 carbon atoms or an oxyalkylene group having 1-3 carbon atoms, while p represents an integer from 1 to 3.

R_1 and R_2 may have substituted groups such as methoxy or ethoxy groups.

Examples of peroxides that produce hydrogen peroxide in aqueous solution include sodium percarbonate, sodium tripolyphosphate and hydrogen peroxide addition products, sodium pyrophosphate and hydrogen peroxide addition products, urea and hydrogen peroxide addition products, $4Na_2SO_4 \cdot 2H_2O_2 \cdot NaCl$, sodium perborate monohydrate, sodium perborate tetrahydrate, sodium persilicate, sodium peroxide and calcium peroxide. From among these, sodium percarbonate, sodium perborate monohydrate and sodium perborate tetrahydrate are particularly preferable.

In consideration of the storage stability of organic acid peroxide, the above organic acid peroxide is produced in the present invention at the time of use. In other words, in the present invention hydrogen peroxide or peroxide which produces hydrogen peroxide in aqueous solution is combined with an organic acid peroxide precursor (bleaching activator) which produces the above organic acid peroxide in use by reacting with hydrogen peroxide.

Examples of organic acid peroxide precursors which produce the above organic acid peroxide (I) include the following:

Examples of organic acid (II) include methoxyacetic acid, 2-methoxypropionic acid, ethoxyacetic acid, 2-ethoxypropionic acid, propoxyacetic acid, 2-propoxypropionic acid, p-propoxybenzoic acid, butoxyacetic acid, 2-butoxypropionic acid, 2-methoxyethoxyacetic acid, 2-methoxy-1-methylethoxyacetic acid, 2-methoxy-2-methylethoxyacetic acid, 2-ethoxyethoxyacetic acid, 2-(2-ethoxyethoxy)propionic acid, 2-ethoxy-1-methylethoxyacetic acid, 2-ethoxy-2-methylethoxyacetic acid, 2-propoxyethoxyacetic acid, 2-propoxy-1-methylethoxyacetic acid, 2-propoxy-2-methylethoxyacetic acid, 2-butoxyethoxyacetic acid, 2-butoxy-1-methylethoxyacetic acid, 2-butoxy-2-methylethoxyacetic acid, 2-(2-methoxyethoxy)ethoxyacetic acid, 2-(2-methoxy-1-methylethoxy)ethoxyacetic acid, 2-(2-methoxy-2-methylethoxy)ethoxyacetic acid and 2-(2-ethoxyethoxy)ethoxyacetic acid.

Examples of alcohol (III) include trimethylene glycol, tetramethylene glycol, hexamethylene glycol, neopentyl glycol, trimethylol propane, pentaerythritol and sorbitol.

Examples of alcohol (IV) include glycerin and polyglycerins such as diglycerin and triglycerin.

Examples of alcohol (V) include ethylene glycol and polyethylene glycols such as diethylene glycol and triethylene glycol and ethylcaritol.

Examples of alcohol (VI) include hydroxyalkylammonium compounds such as N,N,N-trimethyl-N-hydroxymethylammonium chloride, N,N,N-trimethyl-N-hydroxyethylammonium chloride and N-oleyl-N,N-dimethyl-N-hydroxymethylammonium bromide.

Examples of cyclic alcohols or cyclic polyhydroxy-alcohols include spiroglycol compounds such as 3,9-bis(1-hydroxymethyl-1-methylpropyl)-2,4,8,10-tetraoxaspiro [5,5] undecane and 3,9-bis(1-ethyl-1-hydroxymethylpropyl)-2,4,8,10-tetraoxaspiro[5,5]undecane;sorbitane; sugars such as glucose, maltose, lactose, sucrose, cellobiose, fructose and galactose; and, sugars substituted with an alkyl group having 1-18 carbon atoms.

Examples of amine (VIII) include ethylamine, isopropylamine, 2-ethylhexylamine, oleylamine, diethylamine, diisopropylamine, diisobutylamine, monoethanolamine, diethanolamine, ethylenediamine, diethylenetriamine, piperidine, morpholine, pyrrole and imidazole.

Other examples of organic acid peroxide precursors include the esters of organic acid (II) and 1,3-dihydroxyacetone or N-hydroxysuccinimide, as well as the acid amides of organic acid (II) and pyroglutamic acid.

From the organic acid peroxide precursors that have been listed above, esters of organic acid (II) and ethylene glycol, diethylene glycol or glycerin, or the acid amide of organic acid (II) and ethylenediamine are particularly preferable.

Although organic acid peroxide precursors are susceptible to decomposition during storage in the presence of slight amounts of moisture, air (oxygen) and trace metals and when subjected to the effects of light, stability can be improved by adding a small amount of antioxidant to the organic acid peroxide precursor.

Although commonly known substances can be used as antioxidants, those that are preferable include phenol-based antioxidants such as 3,5-di-tert-butyl-4-hydroxytoluene and 2,5-di-tert-butylhydroquinone; amine-based antioxi-

dants such as N,N'-diphenyl-p-phenylenediamine and phenyl-4-piperizinyl-carbonate; sulfur-based antioxidants such as didodecyl-3,3'-thiodipropionate and ditridecyl-3,3'-thiodipropionate; phosphor-based antioxidants such as tris(isodecyl)phosphate and triphenylphosphate; and, natural antioxidants such as L-ascorbic acid, its sodium salts and DL-α-tocopherol. These antioxidants may be used independently or in combinations of two or more. From among these, 3,5-di-tert-butyl-4-hydroxytoluene, 2,5-di-tert-butylhydroquinone and DL-α-tocopherol are particularly preferable.

These antioxidants are blended into the bleaching composition of the present invention preferably at a proportion of 0.01-1.0 wt% of the organic acid peroxide precursor, and particularly preferably at a proportion of 0.05-0.5 wt%.

The hydrogen peroxide or peroxide is blended into the mixture during use preferably at a proportion of 0.5-98 wt%, and particularly preferably at a proportion of 1-50 wt% so that the effective oxygen concentration is preferably 0.1-3 wt% and particularly preferably 0.2-2 wt%. In addition, the organic acid peroxide precursor is blended into the composition during use preferably at a proportion of 0.1-50 wt% and particularly preferably at a proportion of 0.5-30 wt%.

In order to improve the effectiveness of the bleaching composition of the present invention, the pH is preferably adjusted to 5-13 and, particularly preferably to 6-10.5. Buffering agents may be blended into the composition for this purpose. Examples of buffering agents include alkali metal hydroxides such as sodium hydroxide and potassium hydroxide; amine derivatives such as ammonium hydroxide, mono-, di- and triethanol; alkali metal carbonates such as sodium carbonate and potassium carbonate; and, alkali metal silicates such as sodium silicate and potassium silicate. In addition, alkali metal sulfates such as sodium sulfate, potassium sulfate and lithium sulfate; ammonium sulfate; alkali metal bicarbonates such as sodium bicarbonate, potassium bicarbonate and lithium bicarbonate; and, ammonium bicarbonate may be used to improve performance as necessary. These are preferably blended into the bleaching composition at a proportion of 0-30 wt%.

In addition, it is preferable that a surface active agent be blended into the bleaching composition of the present invention for the purpose of promoting penetration of the bleaching activity source into the soiling. Examples of surface active agents include non-ionic surface active agents such as alkylglycoside, polyoxyethylenealkylether, sorbitane fatty acid ester, polyoxyethylenesorbitan fatty acid ester, polyoxyethylene fatty acid ester, oxyethyleneoxypropylene block polymer (Pluronic®), fatty acid monoglyceride and amine oxide; anionic surface active agents such as soap, alkyl sulfate, alkylbenzene sulfonate, polyoxyethylenealkyl sulfate ester salt and sulfosuccinate monoester; mono- or di-alkylamine and its polyoxyethylene addition products; cationic surface active agents such as mono- or di- long-chain alkyl quaternary ammonium salts; and, amphoteric surface activators such as carbobetaine, sulfobetaine and hydroxysulfobetaine. These are blended into the bleaching composition at preferably a proportion of 0.1-5 wt%.

Moreover, monovalent alcohols like methanol, ethanol and propanol; diols like ethylene glycol, diethylene glycol, triethylene glycol, propylene glycol, dipropylene glycol, butylene glycol and hexylene glycol; and, triols like glycerin may be added to the bleaching composition of the present invention as necessary. Furthermore, water soluble solvents such as mono- or diethers of lower monovalent alcohols and di- or triols like diethylene glycol methylether, ethylene glycol methylether, ethylene glycol monoethylether, diethylene glycol monoethylether, ethylene glycol monopropylether and diethylene glycol monopropylether; solubilizing agents such as p-toluene sodium sulfonate, xylene sodium sulfonate, alkenyl sodium sulfonate and uric acid; penetrating agents; suspending agents such as clay; inflammable, synthetic polymer thickeners; abrasives; pigments; and, perfumes may be blended into the bleaching composition within a range that does inhibit the effectiveness of the present invention.

Hydrogen peroxide or peroxide that produces hydrogen peroxide in aqueous solution	0.5-98%

Organic acid peroxide precursor	0.1-50%
Buffering agent	0-30%
Surface active agent	0-5%
Water soluble solvent	0-50%
Solubilizing agent	0-10%
Thickener, Suspending agent	0-5%
Abrasive	0-20%
Pigment, dye, perfume, etc.	As suitable

Although the bleaching composition of the present invention can be used in the form of a single preparation, it is preferable to package the hydrogen peroxide or peroxide which produces hydrogen peroxide in aqueous solution and organic acid peroxide precursor in separate containers, mix them immediately prior to use (adding water as necessary) to form into a solution, slurry or paste, and then immediately coat or spray onto the target surface as this eliminates any apprehension regarding storage stability. The effective oxygen concentration at the time of use is typically adjusted to 0.1-3% and preferably adjusted to 0.2-1%.

In the case the peroxide and organic acid peroxide precursor are solids, dissolving such in water is troublesome and tedious making these difficult for typical household use. The components of a bleaching composition for hard surface soiling that is suitable for use as a mold remover and is also easy to use are as follows:

(a)	Hydrogen peroxide	1-6 wt%, preferably 1-4 wt%
(b)	Above organic acid peroxide precursor, liquid at room temp.	2-20 wt%, preferably 5-15 wt%
(c)	Water soluble solvent	1-50 wt%, preferably 1-30 wt%
(d)	Water	Remainder

In addition, the range of the pH of the above composition is 8-11.5, and preferably 9-10.5.

The above composition is prepared immediately prior to use. The mixing together beforehand of those components that may be mixed together without resulting in problems in terms of storage stability to form a liquid results in added convenience during use.

For example, in the case of an aqueous solution of hydrogen peroxide, liquid bleaching activator and alkaline solvent containing water, a container is used which allows the above components to be mixed in a single operation immediately prior to use, so that its ease of use will be in no way inferior to conventional hypochlorous acid based bleach sprays. Other arbitrary components should be added in advance in order to prevent the occurrence of decreases in storage stability and effectiveness.

Furthermore, the components and pH of the above composition are the components and pH of the mixture immediately prior to use after mixing. Water soluble solvent (c) not only serves to improve bleaching strength, but also acts to stabilize the bubbles that are necessary when using the composition of the present invention in its spray form.

Accordingly, as the present invention is able to provide a bleaching composition for hard surface soiling which has no irritating odor and also demonstrates superior bleaching strength of considerable duration, it is able to overcome the problems of conventional bleaches for hard surface soiling that are encountered during practical use. [Description of the Preferred Embodiments]

Although the following describes the preferred embodiments of the present invention, the present invention is not limited to these preferred embodiments.

<Bleaching Strength Measurement Method>

A model mold plate was placed horizontally and 40µl of an aqueous solution of mold remover composition was dropped onto the plate. After allowing to stand for 30 minutes, the plate was washed with water and allowed to dry. After drying, lightness (L value) was measured using the Model 1001DP colorimeter made by Nippon Denki Kogyo Co., Ltd.

Model Mold Plate

The model plate was inoculated with Cladosporium herbarum and incubated at 30°C for 14 days. A plastic plate (ABS plastic) was used for the model mold plate. (The L value of the plastic plate was 92.4 and the L value of the model mold plate was 60-70.)

Evaluation

The higher the L value the greater the mold bleaching strength. The measured L values are indicated as shown below.

L Value	
90 or greater	○
86-89	◎
81-85	△
80 or less	×

<Odor>

The odor of the aqueous solution of mold removal composition was evaluated by 10 panelists.

O: Absence of irritating or foul odor
X: Presence of irritating or foul odor

Embodiment 1

Aqueous solutions of mold remover composition (effective oxygen concentration of approximately 0.5%) containing 3% of hydrogen peroxide, 15% of potassium carbonate and 10% of the acid anhydrides indicated below were prepared, and submitted for bleaching strength and odor testing.
Those results are shown in Table 1.

Table 1

Acid Anhydrides	Bleaching Strength	Odor
Methoxyacetic anhydride	○	○
Ethoxyacetic anhydride	○	○
Methoxypropionic anhydride	○	○
Anisic anhydride *	○	○

*Comparative Example

Embodiment 2

Aqueous solutions of mold remover composition (effective oxygen concentration of approximately 1.35%) containing 10% sodium percarbonate and 10% of the esters and amides indicated below 10% were prepared, and submitted for bleaching strength and odor testing. Those results are shown in Table 2.

Embodiment 3

Aqueous solutions of mold remover composition (effective oxygen concentration of approximately 0.5%) containing 3% of hydrogen peroxide, 15% of potassium carbonate and 10% of the various acid anhydrides indicated in Table 3 were prepared, and submitted for bleaching strength and odor testing.

Those results are shown in Table 3.

Table 3

Acid Anhydride	Bleaching Strength (L Value)	Odor
3,6-dioxa-heptanic anhydride	89	○
3,6,9-trioxa-decanic anhydride	89	○
Butoxyacetic anhydride	89	○

Embodiment 4

Aqueous solutions of mold remover composition (effective oxygen concentration of approximately 1.35%) containing 10% sodium percarbonate, 10% of the esters indicated in Table 2 and 2% alkylglycoside were prepared, and submitted for bleaching strength and odor testing.

Those results are shown in Table 4.

Furthermore, the alkylglycoside used is represented with the general formula $R_1(OR_2)_xG_y$ (wherein $R_1 = C_{10}$, x = 0, y = 1.35 and G is a glucose residue).

Table 4

Ester	Bleaching Strength (L Value)	Odor

Embodiment 5

Aqueous solutions of mold remover composition (effective oxygen concentration of approximately 1.35%) containing 10% sodium percarbonate, 10% of the esters indicated in Table 2 and 2% alkylglycoside were prepared, and submitted for bleaching strength and odor testing.

Those results are shown in Table 5.

Furthermore, the alkylglycoside used is represented with the general formula $R_1(OR_2)_xG_y$ (wherein $R_1 = C_{10}$, x =

0, y = 1.35 and G is a glucose residue).

Table 5

Note: *1 Oxyethylene group

*2 Oxypropylene group

Embodiment 6

The lavatory-use bleaching composition indicated in Table 6 was prepared and evaluations of bleaching strength and odor were conducted as described below.

Furthermore, the substances indicated in Table 7 were used for the organic acid peroxide precursors.

Table 6

Sodium percarbonate (PC)	10% (effective oxygen concentration: 1.35%)
Organic acid peroxide precursor (Table 2)	No. of moles equal to effective oxygen concentration of PC
Lauryldiglycoside	2%
De-ionized water	Remainder

<Bleaching Strength Measurement Method>

Urinals were used for 14 days without rinsing with water after use. 5ml of bleaching composition having the compositions indicated in Table 1 were sprinkled on the soiling in the urinals. After allowing to stand for 15 minutes, the urinals were rinsed with water and the bleaching effects were visually evaluated. The evaluation standards used at that time are as indicated below.

4: Soiling was removed extremely well
3: Soiling was removed considerably
2: Soiling was removed somewhat
1: Soiling was not removed at all

Furthermore, the points in Table 7 are the average values of 10 evaluators.

<Odor>

The odor of the lavatory-use bleaching composition was evaluated by 10 panelists.

O: Absence of irritating or foul odor
X: Presence of irritating or foul odor

These results are indicated in Table 7.

Table 7

No.	Organic Acid Peroxide Precursor	Evaluation Score	Odor
Embodiments

Embodiment 7

Artificially created model drain pipe soiling consisting of 100g of powdered soap, 50g of soybean oil, 50g of rape seed oil and 100g of liquid paraffin were added to and thoroughly mixed with 10kg of 100° DH hard water. This was then circulated through a transparent polyvinyl hose having an inner diameter of 1.2cm using a circulating pump.

When the mixture was circulated for 5-6 hours, model sludge began to accumulate over the entire surface of the inner walls of the polyvinyl hose. This soiling was not able to be removed with water rinsing alone to any significant degree.

After one end of the above hose cut to a length of 30cm was sealed with a rubber stopper and 3g of the bleaches having the compositions indicated below were added to the other end of the hose, the hose portions were placed upright in a test tube holder and water was poured in until the hoses were nearly full.

After a fixed period of time, the hoses were observed for the degree to which the model sludge had been removed. Those results are indicated in Table 8.

Bleach 1 (Embodiment)

Sodium percarbonate	45%
3,6-dioxaheptanic acid diethylene glycol diester	45%
Polyoxethylenlaurylether (no. of moles added: 6)	5%
Sodium carbonate	5%

Bleach 2 (Comparative Example)

Sodium percarbonate	75%
Polyoxethylenlaurylether (no. of moles added: 6)	5%
Sodium carbonate	20%

Table 8

	After 30 minutes	After 1 hour	After 2 hours	After 4 hours
Bleach 1	○	○	◎	-
Bleach 2	×	△	○	◎

Furthermore, the symbols used in the table refer to the following:

◎: Soiling removed from 95% or more of inner wall surface area
○: Soiling removed from 50-95% of inner wall surface area
△: Soiling removed from 20-50% of inner wall surface area
×: Soiling removed from 20% or less of inner wall surface area

Embodiment 8

The mold removers having the compositions indicated below were prepared and testing of mold removal was performed in the same manner as in Embodiment 1 by macroscopically observing the surface of the mold plates. Those testing results are indicated in Table 9.

*Mold Remover Composition

Hydrogen peroxide	3 wt%
Monomethoxyacetic acid glycerol ester	10 wt%
Potassium carbonate	15 wt%
Ethyl alcohol	Amounts shown in Table 1
Water	Remainder

Table 9

Amount of Ethyl Alcohol	Evaluation Results
3 wt%	◎
15 wt%	◎
30 wt%	○
45 wt%	○

The evaluation standards used at that time are as indicated below.

◎: Entire mold plate was bleached
○: A few unbleached portions remain

Embodiment 9

(1)	5% hydrogen peroxide aqueous solution		45 wt%
(2)	Diester of 3,6-dioxaheptanic acid and ethylene glycol		10 wt%
(3)	Aqueous solution containing:		45 wt%
	Potassium carbonate	40 wt%	
	Ethylene glycol monomethylether	5 wt%	
	Alkylglycoside	4 wt%	

A separately packaged container containing solutions (1) through (3) above was attached to a spray container. This was then mixed immediately prior to use (pH 10.5) and sprayed onto the tile joints of tile walls in a bathroom in which there was extensive mold growth. After allowing to stand for 1 hour and rinsing with water, nearly all of the mold was removed.

Embodiment 10

The bleaching compositions having the compositions indicated in Table 10 were prepared. After storing for 5, 20 and 60 days at 50°C, aqueous bleach solutions were prepared containing 10 wt% of the bleaching composition and 3 wt% of hydrogen peroxide (effective oxygen concentration approximately 0.5%) and 15% of potassium carbonate. These were then submitted for testing of bleaching strength and odor in the same manner as in Embodiment 1. Those results are indicated in Table 10.

Table 10

	Bleaching Composition		5 Days Storage		20 Days Storage		60 Days Storage	
	Precursor	Antioxidant	L Value	Odor	L Value	Odor	L Value	Odor
Embodiment 1	EA-EG*1	BHT*4 200ppm	92	○	92	○	92	○
Embodiment 2	EEA-EG*2	" 500ppm	92	○	92	○	92	○
Embodiment 3	BA-GLY*3	" 800ppm	91	○	91	○	91	○
Embodiment 4	EE(AN)*4	" 1000ppm	90	○	90	○	90	○
Comparative Example 1	EEA-EG*2	Not added	90	○	88	○	86	○
Comparative Example 2	EA-TEG*5	Not added	90	○	87	○	84	×

*1 Diester of ethoxyacetic acid and ethylene glycol

*2 Diester of 2-ethoxyethoxyacetic acid and ethylene glycol

*3 Triester of butoxyacetic acid and glycerin

*4 Acid anhydride of 2-ethoxyethoxyacetic acid

*5 Diester of ethoxyacetic acid and triethylene glycol

*6 3,5-di-tert-butyl-4-hydroxytoluene

Embodiment 11

The bleaching compositions having the compositions indicated in Table 11 were prepared. After storing for 20 days at 50°C, aqueous bleach solutions were prepared containing 10 wt% of the bleaching compositions and 3 wt% of hydrogen peroxide (effective oxygen concentration approximately 0.5%) and 15% of potassium carbonate. These were then submitted for testing of bleaching strength and odor in the same manner as in Embodiment 1. Those results are indicated in Table 11.

Table 11

	Bleaching Composition		Amount of Antioxidant Added (ppm)					
	Precursor	Antioxidant	L Value	Odor	L Value	Odor	L Value	Odor
Embodiment 5	EA-EG*1	BHT*5	92	○	92	○	92	○
Embodiment 6	EEA-EG*2	Tocopherol	92	○	92	○	92	○
Embodiment 7	BA-GLY*3	BHT*5	91	○	91	○	91	○
Embodiment 8	EE(AN)*4	BHT*5	90	⊙	90	○	90	○
Comparative Example 3	TAED*4	BHT*5	91	×	91	×	91	×

*1 Diester of 2-ethoxyethoxyacetic acid and ethylene glycol

*2 Triester of butoxyacetic acid and glycerin

*3 Acid anhydride of 2-ethoxyethoxyacetic acid

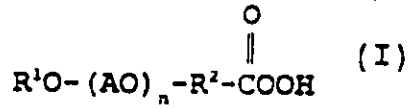

*4 Tetraacetylethylenediamine

*5 3,5-di-tert-butyl-4-hydroxytoluene

Claims

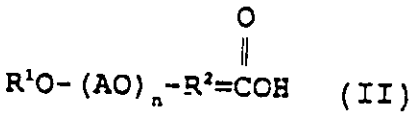

1. A bleaching composition containing the following:

(a) hydrogen peroxide or peroxide which produces hydrogen peroxide in aqueous solution; and
(b) an organic acid peroxide precursor that produces organic acid peroxide represented with general formula (I):

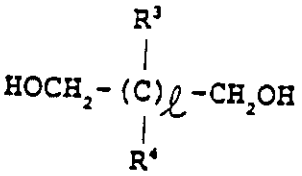

wherein R^1 represents an optionally substituted straight chain or branched chain alkyl or alkenyl group having 1-5 carbon atoms, R^2 represents an optionally substituted straight chain or branched chain alkylene group having 1-8 carbon atoms, n number of A represent identical or different alkylene groups having from 2 to 4 carbon atoms, and n represents an integer from 0-100, by reacting with hydrogen peroxide or peroxide which produces hydrogen peroxide in aqueous solution; characterised in that the composition does not contain an enzyme; and the organic acid peroxide precursor is:

(1) the acid anhydride of the organic acid represented with general formula (II) indicated below:

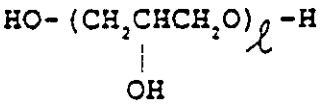

wherein R^1, R^2, A and n have the same meanings as in the previous formulae; or
(2) the esters or acid amides of the organic acid of general formula (II) and the compounds indicated in (III) through (VIII) below:

(III)

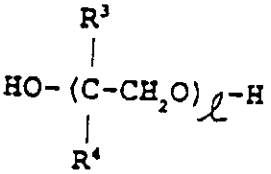

wherein R^3 and R^4 represent identical or different hydrogen atoms, methyl groups, ethyl groups, hydroxyl groups or hydroxyalkyl groups having 1-3 carbon atoms, and ℓ represents an integer from 1-10;

(IV)

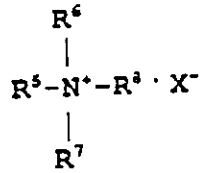

wherein ℓ has the same meaning as in the previous formulae;

(V)

wherein R^3, R^4 and ℓ have the same meanings as in the previous formulae;

(VI)

wherein R^5, R^6, R^7 and R^8 represent identical or different hydrogen atoms, straight chain or branched chain alkyl groups or alkenyl groups having 1-22 carbon atoms, or hydroxyalkyl groups having 1-3 carbon atoms, with at least one group being a hydroxyalkyl group having 1-3 carbon atoms, an X represents a halogen atom;

(VIII) cyclic alcohol or cyclic polyhydroxyalcohol

$$(VIII) \qquad R^9(N-R^{11})_p-H \quad (R^{10})$$

wherein R^9 and R^{10} represent either identical or different hydrogen atoms, straight chain or branched chain alkyl or alkenyl groups having 1-22 carbon atoms or hydroxyalkyl groups having 1-3 carbon atoms, or may form a saturated or unsaturated ring by bonding with each other; at least one of the groups from among R^9 and p number of R^{10} represents a hydrogen atom; and, R^{11} represents an alkylene group having 1-3 carbon atoms or an oxyalkylene group having 1-3 carbon atoms, while p represents an integer from 1 to 3.

2. A bleaching composition according to Claim 1 in which the organic acid peroxide precursor is an ester of ethylene glycol, diethylene glycol or glycerin and the organic acid represented with general formula (II), or an acid amine of ethylenediamine and the organic acid represented with general formula (II).

3. The bleaching composition according to any of Claims 1 or 2, in which the organic acid peroxide precursor is such that R_1 is an alkyl group having 1-4 carbon atoms, R_2 is an alkylene having 1-3 carbon atoms, A is an alkylene group having 2-3 carbons atoms and n is an integer from 0-20.

4. The bleaching composition according to any of Claims 1-3, in which the proportion of hydrogen peroxide or peroxide is 0.5-98 % by weight and the proportion of organic acid peroxide precursor is 0.1-50 % by weight.

5. A bleaching composition consisting of Agent 1 containing hydrogen peroxide or peroxide which produces hydrogen peroxide in aqueous solution, and Agent 2 containing the organic acid peroxide precursor described in Claim 1.

6. A bleaching composition according to Claim 5, in which Agent 2 contains antioxidant.

7. A bleaching composition according to Claim 6, in which the antioxidant is selected from 3,5-di-tert-butyl-4-hydroxytoluene, DL-α-tocopherol and 2,5-di-tert-butylhydroxyquinone.

8. A bleaching composition according to any of Claims 6 and 7, in which the antioxidant is blended in at a proportion of 0.01-1.0 weight % of organic acid peroxide precursor.

9. A bleaching composition according to Claim 6, which comprises a buffer.

10. The use of a bleaching composition according to any previous claim to bleach and clean hard surfaces.

11. The use of a bleaching composition according to claim 10 to remove mould.

Patentansprüche

1. Bleichzusammensetzung enthaltend:

(a) Wasserstoffperoxid oder Peroxid, welches in wäßriger Lösung Wasserstoffperoxid erzeugt; und
(b) einen organischen Säureperoxidvorläufer, welcher das durch die allgemeine Formel (I) dargestellte organische Säureperoxid erzeugt:

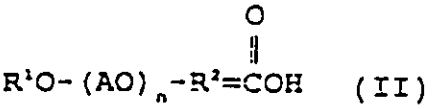

$$R^1O-(AO)_n-R^2-\overset{O}{\overset{\|}{C}}OOH \qquad (I)$$

worin bedeuten: R^1 eine gegebenenfalls substituierte geradkettige oder verzweigtkettige Alkyl- oder Alkenylgruppe mit 1 bis 5 Kohlenstoffatomen, R^2 eine gegebenenfalls substituierte geradkettige oder verzweigtkettige Alkylengruppe mit 1 bis 8 Kohlenstoffatomen, n eine Zahl für A, welches identische oder unterschiedliche

Alkylengruppen mit 2 bis 4 Kohlenstoffatomen bezeichnet, wobei n eine ganze Zahl von 1 bis 100 darstellt,

durch Reagieren mit Wasserstoffperoxid, welches Wasserstoffperoxid in wäßriger Lösung erzeugt;
dadurch gekennzeichnet, daß die Zusammensetzung kein Enzym enthält und der organische Säureperoxidvorläufer

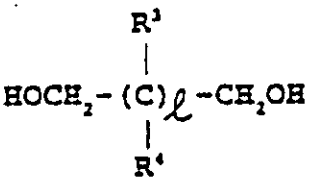

(1) das Säureanhydrid der durch die allgemeine unten angegebene Formel (II) dargestellten organischen Säure ist:

(II)

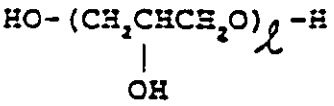

worin R^1, R^2, A und n die gleiche Bedeutung wie in der vorhergehenden Formel besitzen; oder
(2) die Ester oder Säureamide der organischen Säure der allgemeinen Formel (II) und der in (III) bis (VIII) unten angegebenen Verbindungen sind:

(III)

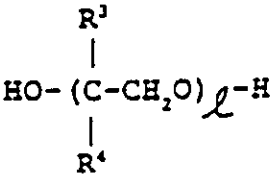

worin R^3 und R^4 identische oder unterschiedliche Wasserstoffatome, Methylgruppen, Ethylgruppen, Hydroxylgruppen oder Hydroxyalkylgruppen mit 1 bis 3 Kohlenstoffatomen sind und ℓ eine ganze Zahl von 1 bis 10 bedeutet;

(IV)

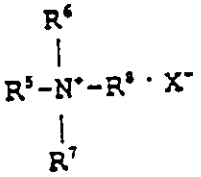

worin ℓ die gleiche Bedeutung wie in den vorhergehenden Formeln besitzt

(V)

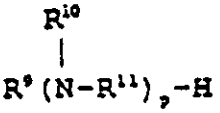

worin R^3, R^4 und ℓ die gleiche Bedeutung wie in den vorherhehenden Formeln besitzen

(VI)

worin R^5, R^6, R^7 und R^8 identische oder unterschiedliche Wasserstoffatome, geradkettige oder verzweigtkettige Alkylgruppen oder Alkenylgruppen mit 1 bis 22 Kohlenstoffatomen oder Hydroxyalkylgruppen mit 1 bis 3 Kohlenstoffatomen bedeuten, wobei wenigstens eine Gruppe eine Hydroxyalkylgruppe mit 1 bis 3 Kohlenstoffatomen ist, und X bedeutet ein Halogenatom;
(VIII) ein cyclischer Alkohol oder cyclischer Polyhydroxyalkohol

(VIII)

worin R^9 und R^{10} entweder identische oder unterschiedliche Wasserstoffatome, geradkettige oder verzweigtkettige Alkyl- oder Alkenylgruppen mit 1 bis 22 Kohlenstoffatomen oder Hydroxyalkylgruppen mit 1 bis 3 Kohlenstoffatomen bedeuten, oder einen gesättigten oder ungesättigten Ring durch Verknüpfen untereinander bilden; wobei wenigstens eine der Gruppen von R^9 und der p-Anzahl von R^{10} ein Wasserstoffatom bedeuten; und R^{11} bedeutet eine Alkylengruppe mit 1 bis 3 Kohlenstoffatomen oder eine Oxyalkylengruppe mit 1 bis 3 Kohlenstoffatomen, während p eine ganze Zahl von 1 bis 3 bedeutet.

2. Bleichzusammensetzung nach Anspruch 1, worin der organische Säureperoxidvorläufer ein Ester von Ethylenglykol, Diethylenglykol oder Glycerin ist und der durch allgemeine Formel (II) dargestellten organischen Säure oder ein Säureamin von Ethylendiamin und der durch allgemeine Formel (II) dargestellten organischen Säure.

3. Bleichzusammensetzung nach einem der Ansprüche 1 oder 2, worin der organische Säureperoxidvorläufer so ausgestaltet ist, daß R^1 eine Alkylgruppe mit 1 bis 4 Kohlenstoffatomen, R^2 ein Alkylen mit 1 bis 3 Kohlenstoffatomen, A eine Alkylengruppe mit 2 bis 3 Kohlenstoffatomen und n eine ganze Zahl von 0 bis 20 bedeuten.

4. Bleichzusammensetzung nach einem der Ansprüche 1 bis 3, worin der Anteil von Wasserstoffperoxid oder Peroxid 0,5 bis 98 Gew.-% und der Anteil an organischem Säureperoxidvorläufer 0,1 bis 50 Gew.-% beträgt.

5. Bleichzusammensetzung bestehend aus dem Mittel 1, enthaltend Wasserstoffperoxid oder Peroxid, welches Wasserstoffperoxid in wäßriger Lösung erzeugt, und aus Mittel 2, enthaltend den in Anspruch 1 beschriebenen organischen Säureperoxidvorläufer.

6. Bleichzusammensetzung nach Anspruch 5, worin Mittel 2 ein Antioxidans enthält.

7. Bleichzusammensetzung nach Anspruch 6, worin das Antioxidans ausgewählt ist aus 3,5-Di-tert-butyl-4-hydroxytoluol, DL-α-Tocopherol und 2,5-Di-tert-butyl-hydroxychinon.

8. Bleichzusammensetzung nach einem der Ansprüche 6 und 7, worin das Antioxidans mit einem Anteil von 0,01 bis 1,0 Gew.-% des organischen Säureperoxidvorläufers vermischt ist.

9. Bleichzusammensetzung nach Anspruch 6, welche einen Puffer umfaßt.

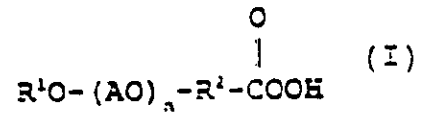

10. Verwendung der Bleichzusammensetzung nach einem der vorhergehenden Ansprüche zum Bleichen und Reinigen von harten Oberflächen.

11. Verwendung der Bleichzusammensetzung nach Anspruch 10 zur Entfernung von Schimmel.

Revendications

1. Composition de blanchiment contenant les composants suivants :

   (a) du peroxyde d'hydrogène ou un peroxyde qui produit du peroxyde d'hydrogène en solution aqueuse; et
   (b) un précurseur de peroxyde d'acide organique qui produit un peroxyde d'acide organique representé par la formule générale (I) :

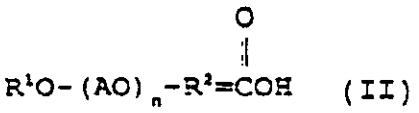

(I)

   dans laquelle R^1 représente un groupe alkyle ou alcényle comportant 1 à 5 atomes de carbone, à chaîne droite ou ramifiée, éventuellement substitué, R^2 représente un groupe alkylène ayant 1 à 8 atomes de carbone, à chaîne droite ou ramifiée, éventuellement substitué, les n groupes A représentent des groupes alkylène identiques ou différents ayant de 2 à 4 atomes de carbone, et n représente un entier de 0 à 100,

   par réaction avec du peroxyde d'hydrogène ou un peroxyde qui produit du peroxyde d'hydrogène en solution aqueuse;
   caractérisée en ce que la composition ne contient pas d'enzyme; et le précurseur de peroxyde d'acide organique

est :

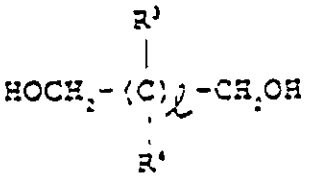

(1) l'anhydride d'acide dérivé de l'acide organique représenté par la formule générale (II) présentée ci-dessous :

(II)

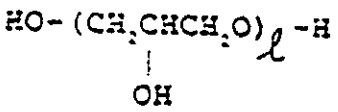

dans laquelle R^1, R^2, A et n ont les mêmes significations que dans la formule précédente; ou
(2) les esters ou amides d'acide dérivés de l'acide organique de formule générale (II) et des composés désignés par les formules (III) à (VIII) ci-dessous :

(III)

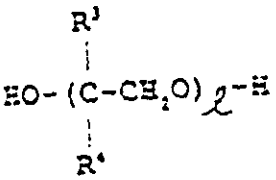

dans laquelle R^3 et R^4, identiques ou différents, représentent des atomes d'hydrogène, des groupes méthyle, des groupes éthyle, des groupes hydroxyle ou des groupes hydroxyalkyle ayant 1 à 3 atomes de carbone et ℓ représente un entier de 1 à 10;

(IV)

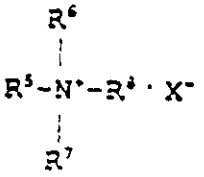

dans laquelle ℓ a la même signification que dans la formule précédente;

(V)

dans laquelle R^3, R^4 et ℓ ont les mêmes significations que dans les formules précédentes;

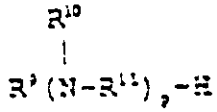

(VI)

dans laquelle R^5, R^6, R^7 et R^8, identiques ou différents, représentent des atomes d'hydrogène, des groupes alkyle ou alcényle à chaîne droite ou ramifiée ayant 1 à 22 atomes de carbone, ou des groupes hydroxyalkyle ayant 1 à 3 atomes de carbone, au moins un groupe étant un groupe hydroxyalkyle ayant 1 à 3 atomes de carbone, et X représente un atome d'halogène,

(VII) un alcool cyclique ou un alcool polyhydrique cyclique;

(VIII)

dans laquelle R^9 et R^{10}, identiques ou différents, représentent des atomes d'hydrogène, des groupes alkyle ou alcényle à chaîne droite ou ramifiée ayant 1 à 22 atomes de carbone, ou des groupes hydroxyalkyle ayant 1 à 3 atomes de carbone, ou peuvent former un cycle saturé ou insaturé par liaison de l'un avec l'autre; au moins un groupe parmi R^9 et les p groupes R^{10} représentant un atome d'hydrogène; et R^{11} représente un groupe alkylène

ayant 1 à 3 atomes de carbone ou un groupe oxyalkylène ayant 1 à 3 atomes de carbone, p représentant un entier de 1 à 3.

2. Composition de blanchiment selon la revendication 1 dans laquelle le précurseur de peroxyde d'acide organique est un ester d'éthylèneglycol, de diéthylèneglycol ou de glycérol et de l'acide organique représenté par la formule générale (II), ou est une amine acide dérivée de l'éthylènediamine et de l'acide organique représenté par la formule générale (II).

3. Composition de blanchiment selon l'une quelconque des revendications 1 ou 2, dans laquelle le précurseur de peroxyde d'acide organique est tel que R^1 est un groupe alkyle ayant 1 à 4 atomes de carbone, R^2 est un groupe alkylène ayant 1 à 3 atomes de carbone, A est un groupe alkylène ayant 2 à 3 atomes de carbone et n est un entier de 0 à 20.

4. Composition de blanchiment selon l'une quelconque des revendications 1 à 3, dans laquelle la proportion de peroxyde d'hydrogène ou de peroxyde est de 0,5 à 98% en poids et la proportion de précurseur de peroxyde d'acide organique est de 0,1 à 50 % en poids.

5. Composition de blanchiment constituée d'un Agent 1 contenant du peroxyde d'hydrogène ou un peroxyde qui produit du peroxyde d'hydrogène en solution aqueuse, et d'un Agent 2 contenant le précurseur de peroxyde d'acide organique décrit dans la revendication 1.

6. Composition de blanchiment selon la revendication 5, dans laquelle l'Agent 2 contient un anti-oxydant.

7. Composition de blanchiment selon la revendication 6, dans laquelle l'antioxydant est choisi parmi le 3,5-di-tert-butyl-4-hydroxytoluène, le DL-α-tocophérol et la 2,5-di-tert-butylhydroxyquinone.

8. Composition de blanchiment selon l'une quelconque des revendications 6 et 7, dans laquelle l'antioxydant est mélangé en une proportion de 0,01 à 1,0% en poids par rapport au précurseur de peroxyde d'acide organique.

9. Composition de blanchiment selon la revendication 6, qui comprend un tampon.

10. Utilisation d'une composition de blanchiment selon l'une quelconque des revendications précédentes pour blanchir et nettoyer des surfaces solides.

11. Utilisation d'une composition de blanchiment selon la revendication 10, pour l'élimination de moisissures.
