CYCLOPROPYL AMIND DERIVATIVES TARGETING THE HISTAMINE H3 RECEPTOR

Disclosed herein is at least one cyclopropyl amide derivative, at least one pharmaceutical composition comprising at least one cyclopropyl amide derivative disclosed herein, and at least one method of using at least one cyclopropyl amide derivative disclosed herein for treating at least one histamine H3 receptor associated condition therewith.

The histamine H3 receptor is of current interest in developing new medicaments. The H3 receptor is a presynaptic autoreceptor located both in the central and peripheral nervous systems, the skin, and in organs, such as, for example, the lung, the intestine, probably the spleen, and the gastrointestinal tract. Recent evidence suggests the H3 receptor has intrinsic, constitutive activity in vitro as well as in vivo (i.e., it is active in the absence of an agonist). Compounds acting as inverse agonists can inhibit this activity. The histamine H3 receptor has been shown to regulate the release of histamine and also of other neurotransmitters, such as, for example, serotonin and acetylcholine. Some histamine H3 ligands, such as, for example, a histamine H3 receptor antagonist or inverse agonist may increase the release of neurotransmitters in the brain, whereas other histamine H3 ligands, such as, for example, histamine H3 receptor agonists may inhibit the biosynthesis of histamine, as well as, inhibit the release of neurotransmitters. This suggests that histamine H3 receptor agonists, inverse agonists, and antagonists could mediate neuronal activity. As a result, efforts have been undertaken to develop new therapeutics that target the histamine H3 receptor.

Conversely, various features of the invention that are, for brevity reasons, described in the context of a single embodiment, may also be combined so as to form sub-combinations thereof.

30 Unless specifically stated otherwise herein, references made in the singular may also include the plural. For example, "a" and "an" may refer to either one, or one or more.

Embodiments identified herein as exemplary are intended to be illustrative and not limiting.

Unless otherwise indicated, any heteroatom with unsatisfied valences is assumed to have hydrogen atoms sufficient to satisfy the valences.

The definitions set forth herein take precedence over definitions set forth in any patent, patent application, and/or patent application publication incorporated herein by reference.

5 Definitions of terms used in describing the invention are set forth hereinbelow. Unless otherwise indicated, the initial definition provided for a group or term applies each time such group or term is used individually or as part of another group.

Throughout the specification, groups and substituents thereof may be chosen by one skilled in the field to provide stable moieties and compounds.

10 The term " C_m-C_n " or " C_m-C_n group" used alone or as a prefix, refers to any group having m to n carbon atoms. For example, the term " C_1-C_4 alkyl" refers to an alkyl group containing 1, 2, 3, or 4 carbon atoms.

The terms "alkyl" and "alk" refer to a straight or branched chain alkane (hydrocarbon) radical containing from 1 to 12 carbon atoms. Exemplary "alkyl" and "alk" groups include, but
15 are not limited to, for example, methyl; ethyl; propyl; isopropyl; 1-methylpropyl; n-butyl, t-butyl; isobutyl; pentyl; hexyl; isohexyl; heptyl; 4,4-dimethylpentyl; diethylpentyl; octyl; 2,2,4-trimethylpentyl; nonyl; decyl; undecyl; and dodecyl.

The term "hydrocarbon" refers to a chemical structure comprising only carbon and hydrogen atoms.

20 The term "hydrocarbon radical" refers to a hydrocarbon that has had at least one hydrogen removed therefrom.

The term "aryl" refers to monocyclic or bicyclic aromatic hydrocarbon rings having from 6 to 12 carbon atoms in the ring portion. Exemplary aryl groups include but are not limited to, for example, phenyl; phen-1-yl-2-yl; phen-1-yl-3-yl; phen-1-yl-4-yl; phen-1-yl-5-yl; phen-1-yl-

If compounds of the present invention contain one or more chiral centers, the compounds of the invention may exist 1) in (and be isolated as) enantiomeric or diastereomeric forms,

and/or 2) as a racemic mixture. The present invention includes any possible enantiomers, diastereomers, racemates or mixtures thereof, of the compounds of the formulae described herein. The optically active forms of the compound of the invention may be prepared, for example, by chiral chromatographic separation of a racemate, by synthesis from optically active starting materials or by asymmetric synthesis based on the procedures described hereafter.

It will also be understood that certain compounds of the invention may exist in solvated, for example hydrated, as well as unsolvated forms. It will further be understood that the present invention encompasses all such solvated forms of the compounds of the formulae described herein that possess the activity mentioned hereinbelow.

The compounds of the formulae described herein can also form salts. As a result, when a compound of a formulae described herein is referred to, such reference includes, unless otherwise indicated, salts thereof. In one embodiment, the compounds of the formulae described herein form pharmaceutically acceptable salts. In another embodiment, the compounds of the formulae described herein form salts that can, for example, be used to isolate and/or purify the compounds of the formulae described herein.

Generally, pharmaceutically acceptable salts of a compound in accordance with the formulae described herein can be obtained by using standard procedures well known in the art. These standard procedures include, but are not limited to, for example, the reacting of a sufficiently basic compound, such as, for example, an alkyl amine with a suitable acid, such as, for example, HCl or acetic acid, to afford a physiologically acceptable anion. It may also be possible to make a corresponding alkali metal (such as sodium, potassium, or lithium) or an alkaline earth metal (such as a calcium) salt by treating a compound in accordance with the formulae described herein, which have a suitably acidic proton, such as, for example, a carboxylic acid or a phenol with one equivalent of an alkali metal or alkaline earth metal hydroxide or alkoxide (such as, for example, an ethoxide or methoxide), or a suitably basic organic amine (such as, for example, a choline or meglumine) in an aqueous medium, followed by conventional purification techniques.

In one embodiment, a compound in accordance with the formulae described herein may be converted to a pharmaceutically acceptable salt or solvate thereof, particularly, an acid addition salt, such as, for example, hydrochloride, hydrobromide, phosphate, acetate, fumarate, maleate, tartrate, citrate, methanesulphonate, and *p*-toluenesulphonate.

In general, the compounds of the formulae described herein can be prepared in accordance with the following Schemes and the general knowledge of one skilled in the art and/or in accordance with the methods set forth in the Examples that follow. Solvents,

temperatures, pressures, and other reaction conditions may readily be selected by one of ordinary skill in the art. Starting materials are commercially available or readily prepared by one skilled in the art. Combinatorial techniques can be employed in the preparation of compounds, for example, where the intermediates possess groups suitable for these techniques.

- 5 The term “amino-protecting group” refers to art-recognized moieties capable of attaching to an amino group so as to prevent the amino group from taking place in reactions occurring elsewhere on the molecule to which the amino group is attached. Acceptable amino-protecting groups, include but are not limited to, for example, amino-protecting groups described in “Protective Groups in Organic Synthesis”, 2nd edition, John Wiley & Sons, 1981. The amino-protecting group may be, for example, a urethane type protective group (which is also referred to as a carbamate protective group), which includes but is not limited to, for example, arylalkyloxycarbonyl groups, such as, for example, benzyloxycarbonyl; and alkoxycarbonyl groups, such as, for example, methoxycarbonyl and tert-butoxycarbonyl. Typically, the amino-protecting group is tert-butoxycarbonyl.

Guanosine 5'-O-(3-[³⁵S]thio)triphosphate [GTPγS] Binding Assay

A GTPγS binding assay can be used to investigate antagonist properties of compounds in CHO cells (Chinese Hamster Ovary) transfected with human Histamine H3 receptor (hH3R). Membranes from CHO cells expressing hH3R (10μg/well) are diluted in GTPγS assay buffer (20mM Hepes, 10 mM MgCl₂, 100mM NaCl, pH 7.4) and preincubated with saponine (3 μg/ml),
25 GDP (10 μM) and PVT-WGA SPA beads (125 μg/well) (Amersham) for 30 minutes. To determine antagonist activity, (R)-α-methyl histamine (30 nM) is added in 96 well SPA plate with [³⁵S]GTPγS (0.2 nM) and various concentration of H3R antagonists. The GTPγS binding assay is started with addition of the mixture membrane/saponine/GDP and incubated for 90 minutes at room temperature. The amount of bound [³⁵S]GTPγS is determined by using the
30 MicroBeta Trilux counter (PerkinElmer). The percentage of [³⁵S]GTPγS bound in each sample is calculated as a percentage of that bound control sample incubated in absence of H3 antagonist. Duplicate determinations are obtained for each concentration, and the data are analyzed using ExcelFit4 to obtain the IC₅₀.

Intermediate 37 (389g, 1.90 moles) was mixed in 2-MeTHF (6.7 L) at $t_{\text{jacket}}=25\text{ }^{\circ}\text{C}$.

1,1'-Carbonyldiimidazole (412 g, 2.09 moles, 82.1% w/w) was added in 1 portion. The reaction slurry was heated to $t_{\text{jacket}}=55\text{ }^{\circ}\text{C}$. The gas evolution decreased after approximately 1h. The reaction slurry was heated to $t_{\text{jacket}}=85\text{ }^{\circ}\text{C}$ for 3 h and then cooled to $t_{\text{jacket}}=50\text{ }^{\circ}\text{C}$. **Intermediate 32** (490 g, 2.08 moles, 96.3% w/w) and TEA (290 mL, 2.09 moles) were added to the reaction slurry. 2-MeTHF (2 L) was used for rinsing. The charging vessel was rinsed with H_2O (1 L). If the pH was not ≥ 12 , more NaOH was charged in the same concentration as previously. Hydrogen peroxide (4.89 kg , 50.3 moles , $35\%\text{ w/w}$) was added at a rate to maintain t_{inner} below $35\text{ }^{\circ}\text{C}$. The charging vessel was rinsed with H_2O (1 L) and the reaction slurry was left stirring for 0.5–1.0 h. Analysis of a sample on HPLC indicated full conversion at this point using the following gradient method (mobile phase 20-95% B; A: 5% CH_3CN in H_2O with 0.05% formic acid, B: 95% CH_3CN in H_2O with 0.05% formic acid, 8 min run) on Chromolith Performance RP-18e, $4.6 \times 100\text{ mm}$. The reaction mixture was cooled to $t_{\text{jacket}}=0\text{ }^{\circ}\text{C}$ and left stirring for at least 0.5 h when the

temperature was reached. The sodium salt of **Intermediate 37** was filtered off and washed with cold H₂O (2×7 L). The solid was slurry washed on the filter with NaHSO₄ × H₂O (2.76 kg, 20.0 moles) diluted in H₂O (35 L). The slurry was kept stirring at *t*_{jacket}=0 °C for 1 h. If the pH was not < 3.7, it was adjusted with NaHSO₄ × H₂O in H₂O. The product was filtered off, washed with cold H₂O (3 ×14 L). Drying under vacuum at 40 °C gave **Intermediate 37** (4.0 kg, 18.2 moles, 93.4% w/w), 83% yield. ¹H-NMR (DMSO-*d*₆): δ 12.40 (s, 1H), 7.94 (s, 1H), 7.79 (d, 2H, *J* = 8 Hz), 7.32 (s, 1H), 7.23 (d, 2H, *J* = 8 Hz), 2.44 (m, 1H), 1.88 (m, 1H), 1.47 (m, 1H), 1.39 (m, 1H); ¹³C-NMR (DMSO-*d*₆): δ 173.83, 167.67, 143.94, 132.17, 127.68, 125.73, 25.21, 24.67, 17.11; LC-MS (ES): *m/z* 206 (M+1). *R*_t=2.13 min with the analytical method (mobile phase: 5-90% B; A: H₂O with 0.1% formic acid, B: CH₃CN, 8.6 min run) on Xbridge C18, 3.0 x 50mm, 2.5μm particale size.
