NOVEL BENZENESULFONAMIDES AS CALCIUM CHANNEL BLOCKERS**TECHNICAL FIELD**

5 The present invention relates to compounds that are calcium channel blockers, compositions including such compounds, and methods of treating conditions and disorders using such compounds and compositions.

BACKGROUND OF THE INVENTION

Voltage-gated calcium channels (VGCC) play an integral role in the regulation of 10 membrane ion conductance, neurotransmitter release, and cellular excitability. VGCC are composed of the pore-forming $\alpha 1$ subunit and auxiliary $\alpha 2\delta$ and β subunits that modulate channel expression and functional properties (Dolphin, A. C. A short history of voltage-gated calcium channels. British Journal of Pharmacology 2006, 147 (Suppl. 1), S56-S62.). These channels can be classified into low-voltage activated (LVA; T-type or $Ca_v3.x$) and 15 high-voltage activated (HVA; L-type or $Ca_v1.x$ and N-, P/Q- and R-types or $Ca_v2.x$) channels. N-, P/Q and R channels typically activate at more positive membrane potentials (~ -30 mV) and are involved in “presynaptic” neurotransmission (McGivern J. G. Targeting N-type and T-type calcium channels for the treatment of pain. Drug Discovery Today 2006, 11, 245-253.). T-type channels are activated at relatively negative membrane potentials (~ -60 20 mV) and are primarily involved in “postsynaptic” excitability (Shin, H.-S.; et al. T-type Ca^{2+} channels as therapeutic targets in the nervous system. Curr. Opin. in Pharmacology 2008, 8, 33-41.).

N-type channel α_δ subunits are encoded by a single gene (α_1B or $Ca_v2.2$) in contrast 25 to pharmacologically defined L- and T-type currents that are encoded by multiple α_1 -subunit genes. A diversity of N-type channels arises due to extensive alternative splicing of the α subunit gene that generates variants with different expression patterns and GPCR-modulated biophysical properties (Gray, A. C.; et al. Neuronal calcium channels: splicing for optimal performance. Cell Calcium, 2007, 42(4-5), 409-417.). The primary sequence for $Ca_v2.2$ is highly conserved across species (rat and human share 91% identity at the amino acid level).

30 N-type channels are widely expressed in the central nervous system (CNS) (cortex, hippocampus, striatum, thalamus, brain stem nuclei and spinal cord) and in the peripheral nervous system (PNS) (adult sympathetic nervous system and dorsal root ganglia) (Ino, M.; et al. Functional disorders of the sympathetic nervous system in mice lacking the α_1B subunit

($\text{Ca}_v2.2$) of N-type calcium channels. *Proc. Natl. Acad. Sci. USA* 2001, 98(9), 5323-5328). In pain pathways, N-type channels are expressed in the rostral ventral medulla, an important site of descending pain modulation (Urban, M. O.; et al. *Medullary N-type and P/Q-type calcium channels contribute to neuropathy-induced allodynia. Neuroreport* 2005, 16(6), 563-566.) and are a major contributor to the synaptic neurotransmission that occurs between C/A δ nociceptors and spinal lamina I neurons (Bao, J.; et al. *Differences in Ca^{2+} channels governing generation of miniature and evoked excitatory synaptic currents in spinal laminae I and II. J Neurosci.* 1998, 18(21), 8740-50. Heinke, B.; et al. *Pre- and postsynaptic contributions of voltage-dependent Ca^{2+} channels to nociceptive transmission in rat spinal lamina I neurons. Eur. J. Neurosci.* 2004, 19(1), 103-111.). In contrast, P/Q type channels are expressed almost exclusively in laminae II-IV of the spinal cord and show little co-localization with Substance P and N-type channels (Westenbroek, R. E.; et al. *Localization of Ca^{2+} channel subtypes on rat spinal motor neurons, interneurons, and nerve terminals. J. Neurosci.* 1998, 18(16), 6319-6330.).

Following nerve injury there is increased expression of $\text{Ca}_v2.2$ (Westenbroek, R. E.; et al. *Localization of Ca^{2+} channel subtypes on rat spinal motor neurons, interneurons, and nerve terminals. J. Neurosci.* 1998, 18(16), 6319-6330. Cizkova, D.; et al. *Localization of N-type Ca^{2+} channels in the rat spinal cord following chronic constrictive nerve injury. Exp. Brain Res.* 2002, 147, 456-463. Yokoyama, K.; et al. *Plastic change of N-type calcium channel expression after preconditioning is responsible for prostaglandin E2-induced long-lasting allodynia. Anesthesiology* 2003, 99(6), 1364-1370.) and $\alpha 2\delta 1$ subunits (Luo, Z. D.; et al. *Upregulation of dorsal root ganglion $\alpha 2\delta$ calcium channel subunit and its correlation with allodynia in spinal nerve-injured rats. J. Neurosci.* 2001, 21(6), 1868-1875. Newton, R. A.; et al. *Dorsal root ganglion neurons show increased expression of the calcium channel $\alpha 2\delta-1$ subunit following partial sciatic nerve injury. Mol. Brain Res.* 2001, 95(1-2), 1-8.) in addition to increases in the superficial layers of the dorsal horn of the spinal cord supporting a role for N-type channels in neuropathic pain. Recently a nociceptor-specific $\text{Ca}_v2.2$ splice variant has been identified in the dorsal root ganglion (Bell, T. J.; et al. *Cell specific alternative splicing increases calcium channel density in the pain pathway. Neuron* 2004, 41(1), 127-138.). These channels have distinct electrophysiological properties and current densities (Castiglioni, A. J.; et al. *Alternative splicing in the C-terminus of $\text{Ca}_v2.2$ controls expression and gating of N-type calcium channels. J. Physiol.* 2006, 576(Pt 1), 119-134.) compared to wild-type $\text{Ca}_v2.2$ channels. While G-protein coupled receptor inhibition of

wildtype N-type channels is typically mediated by G $\beta\gamma$ and is voltage-dependent, the nociceptor specific splice variant is inhibited by GPCR activation (e.g. opioids) in a voltage-independent fashion (Raingo, J.; et al. Alternative splicing controls G protein-dependent inhibition of N-type calcium channels in nociceptors. *Nat. Neurosci.* 2007, 10(3), 285-292.).

5 This mechanism substantially increases the sensitivity of Ca_v2.2 channels to opiates and gamma-aminobutyric acid (GABA) suggesting that cell-specific alternative splicing of mRNA for Ca_v2.2 channels serves as a molecular switch that controls the sensitivity of N-type channels to neurotransmitters and drugs that modulate nociception. Collectively these data provide further support for the role of Ca_v2.2 channels in pain states.

10 The relative contributions of various HVA Ca²⁺ channels in nociceptive signaling have been evaluated using knockout mice studies. Ca_v2.2 knockout mice are healthy, fertile, and do not display overt neurological deficits (Ino, M.; et al. Functional disorders of the sympathetic nervous system in mice lacking the alpha 1B subunit (Ca_v2.2) of N-type calcium channels. *Proc. Natl. Acad. Sci. USA* 2001, 98(9), 5323-5328. Kim, C.; et al. Altered 15 nociceptive response in mice deficient in the alpha_{1B} subunit of the voltage-dependent calcium channel. *Mol. Cell. Neurosci.* 2001, 18(2), 235-245. Hatakeyama, S.; et al. Differential nociceptive responses in mice lacking the alpha_{1B} subunit of N-type Ca²⁺ channels. *Neuroreport* 2001, 12(11), 2423-2427. Liu; L.; et al. In vivo analysis of voltage-dependent calcium channels. *J. Bioenerg. Biomembr.* 2003, 35(6), 671-685.). This finding 20 suggests that other types of Ca_v channels are able to compensate for the lack of Ca_v2.2 channels at most synapses in these mice (Pietrobon, D. Function and dysfunction of synaptic calcium channels: insights from mouse models. *Curr. Opin. Neurobiol.* 2005, 15(3), 257-265.). Ca_v2.2 deficient mice are resistant to the development of inflammatory and neuropathic pain (Kim, C.; et al. Altered nociceptive response in mice deficient in the 25 alpha_{1B} subunit of the voltage-dependent calcium channel. *Mol. Cell. Neurosci.* 2001, 18(2), 235-245. Hatakeyama, S.; et al. Differential nociceptive responses in mice lacking the alpha_{1B} subunit of N-type Ca²⁺ channels. *Neuroreport* 2001, 12(11), 2423-2427. Saegusa, H.; et al. Suppression of inflammatory and neuropathic pain symptoms in mice lacking the N-type calcium channel. *EMBO J.* 2001, 20(10), 2349-2356.), have decreased sympathetic 30 nervous system function (Ino, M.; et al. Functional disorders of the sympathetic nervous system in mice lacking the alpha 1B subunit (Ca_v2.2) of N-type calcium channels. *Proc. Natl. Acad. Sci. USA* 2001, 98(9), 5323-5328.), and altered responses to both ethanol and anesthetics (Newton, R. A.; et al. Dorsal root ganglion neurons show increased expression of

the calcium channel alpha2delta-1 subunit following partial sciatic nerve injury. *Brain Res. Mol. Brain Res.* 2001, 95(1-2), 1-8. Takei, R. et al. Increased sensitivity to halothane but decreased sensitivity to propofol in mice lacking the N-type Ca^{2+} channel. *Neurosci. Lett.* 2003, 350(1), 41-45.). Additional behavioral studies indicate that $\text{Ca}_v2.2$ knockout mice are 5 less anxious, are hyperactive, and show enhanced vigilance compared to wild-type littermates (Beuckmann, C. T.; et al. N-type calcium channel alpha_{1B} subunit($\text{Ca}_v2.2$) knock-out mice display hyperactivity and vigilance state differences. *J. Neurosci.* 2003, 23(17), 6793-6797.).

N- and P/Q-type channels are localized at neuronal synaptic junctions and contribute 10 significantly to neurotransmitter release (Olivera, B. M.; et al. Calcium channel diversity and neurotransmitter release: the omega-conotoxins and omega agatoxins. *Annu. Rev. Biochem.* 1994, 63, 823-867. Miljanich, G. P.; et al. Antagonists of neuronal calcium channels: structure, function, and therapeutic implications. *Annu. Rev. Pharmacol. Toxicol.* 1995, 35, 15 707-734.). N-type channels play a major role in the release of glutamate, acetylcholine, dopamine, norepinephrine, GABA and calcitonin gene-related protein (CGRP). P/Q-type channels may be involved in the release of glutamate, aspartate, 5HT, GABA and probably 20 glycine (Pietrobon, D. Function and dysfunction of synaptic calcium channels: insights from mouse models. *Curr. Opin. Neurobiol.* 2005, 15(3), 257-265.).

L, P/Q and N-type channels are blocked by channel specific antagonists i.e., 25 dihydropyridines, ω -agatoxin IVA and ω -conotoxin MVIIA/ ziconotide, respectively. Agatoxin IVa has been shown to block excitatory (Luebke, J. I.; et al. Multiple calcium channel types control glutamatergic synaptic transmission in the hippocampus. *Neuron* 1993, 11(5), 895-902.) as well as inhibitory neurotransmission (Takahashi, T.; et al. Different types of calcium channels mediate central synaptic transmission. *Nature* 1993, 30 366(6451), 156-158.). Intrathecal injection of selective N-type channel blockers (e.g. conotoxin-derived peptides such as GVIA, MVIIA (ziconotide), and CVID) significantly attenuates pain responses in animal models of neuropathic pain, formalin-induced pain, and post-operative pain (Chaplan, S. R.; et al. Role of voltage-dependent calcium channel subtypes in experimental tactile allodynia. *J. Pharmacol. Exp. Ther.* 1994, 269(3), 1117-1123. Malmberg, A. B.; et al. Voltage-sensitive calcium channels in spinal nociceptive processing: blockade of N-and P-type channels inhibits formalin-induced nociception. *J. Neurosci.* 1994, 14(8), 4882-4890. Bowersox, S. S.; et al. Selective N-type neuronal voltage-sensitive calcium channel blocker, SNX-111, produced spinal antinociception in rat

models of acute, persistent and neuropathic pain. *J. Pharmacol. Exp. Ther.* 1996, 279(3), 1243-1249. Wang, Y. X.; et al. Effects of intrathecal administration of ziconotide, a selective neuronal N-type calcium channel blocker, on mechanical allodynia and heat hyperalgesia in a rat model of postoperative pain. *Pain* 2000, 84(2-3), 151-158. Scott, D. A.; et al. Actions of intrathecal omega-conotoxins CVI, GVIA, MVIIA, and morphine in acute and neuropathic pain in the rat. *Eur. J. Pharmacol.* 2002, 451(3), 279-286.). These peptide blockers bind to the pore region of the channel, do not show voltage- or frequency-dependent activity, and show irreversible channel block (Feng, Z. P.; et al. Determinants of inhibition of transiently expressed voltage-gated calcium channels by omega-conotoxins GVIA and MVIIA. *J. Biol. Chem.* 2003, 278(22), 20171-20178.). Ziconotide potently blocks neurotransmitter release in the spinal cord dorsal horn (Matthews, E. A.; et al. Effects of spinally delivered N-and P-type voltage-dependent calcium channel antagonists on dorsal horn neuronal responses in a rat model of neuropathy. *Pain* 2001, 92(1-2), 235-246. Smith, M. T.; et al. The novel N-type calcium channel blocker, AM336, produces potent dose-dependent antinociception after intrathecal dosing in rats and inhibits substance P release in rat spinal cord slices. *Pain* 2002, 96(1-2), 119-127. Heinke, B.; et al. Pre- and postsynaptic contributions of voltage-dependent Ca^{2+} channels to nociceptive transmission in rat spinal lamina I neurons. *Eur. J. Neurosci.* 2004, 19(1), 103-111.) and in dorsal root ganglion (DRG) neurons (Evans, A. R.; et al. Differential regulation of evoked peptide release by voltage-sensitive calcium channels in rat sensory neurons. *Brain Res.* 1996, 712(2), 265-273. Smith, M. T.; et al. The novel N-type calcium channel blocker, AM336, produces potent dose-dependent antinociception after intrathecal dosing in rats and inhibits substance P release in rat spinal cord slices. *Pain* 2002, 96(1-2), 119-127.). It also potently and fully blocks depolarization-induced release of substance P from rat spinal cord slices. In contrast, intrathecal delivery of the selective P/Q type blocker ω -agatoxin IVA had no effects on mechanical allodynia in the spinal nerve ligation model (Chaplan, S. R.; et al. Role of voltage-dependent calcium channel subtypes in experimental tactile allodynia. *J. Pharmacol. Exp. Ther.* 1994, 269(3), 1117-1123.) or thermal hyperalgesia in the chronic constriction injury model (Yamamoto, T.; et al. Differential effects of intrathecally administered N- and P-type voltage-sensitive calcium channel blockers upon two models of experimental mononeuropathy in the rat. *Brain Res.* 1998, 794(2), 329-332.) of neuropathic pain.

Accordingly, since pain is the most common symptom of disease and the most frequent complaint with which patients present to physicians, there is a need for compounds,

such as those of the present invention, that are novel calcium channel blockers that have a utility in treating pain, amongst other conditions.

Compounds of the present application may exist as stereoisomers wherein, asymmetric or chiral centers are present. These stereoisomers are "R" or "S" depending on the configuration of substituents around the chiral carbon atom. The terms "R" and "S" used 15 herein are configurations as defined in IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, Pure Appl. Chem., 1976, 45: 13-30.

The present application contemplates various stereoisomers and mixtures thereof and these are specifically included within the scope of this application. Stereoisomers include enantiomers and diastereomers, and mixtures of enantiomers or diastereomers. Individual 20 stereoisomers of compounds of the present application may be prepared synthetically from commercially available starting materials which contain asymmetric or chiral centers or by preparation of racemic mixtures followed by resolution which is well known to those of ordinary skill in the art. These methods of resolution are exemplified by (1) attachment of a mixture of enantiomers to a chiral auxiliary, separation of the resulting mixture of 25 diastereomers by recrystallization or chromatography and liberation of the optically pure product from the auxiliary or (2) direct separation of the mixture of optical enantiomers on chiral chromatographic columns.

Geometric isomers may exist in the present compounds. The invention contemplates the various geometric isomers and mixtures thereof resulting from the disposition of 30 substituents around a carbon-carbon double bond, a carbon-nitrogen double bond, a cycloalkyl group, or a heterocycle group. Substituents around a carbon-carbon double bond or a carbon-nitrogen bond are designated as being of Z or E configuration and substituents around a cycloalkyl or a heterocycle are designated as being of cis or trans configuration.

Within the present invention it is to be understood that compounds disclosed herein may exhibit the phenomenon of tautomerism.

Thus, the formulae drawings within this specification can represent only one of the possible tautomeric or stereoisomeric forms. It is to be understood that the invention 5 encompasses any tautomeric or stereoisomeric form, and mixtures thereof, and is not to be limited merely to any one tautomeric or stereoisomeric form utilized within the naming of the compounds or formulae drawings.

The present invention also includes isotopically-labeled compounds, which are identical to those recited in formula (I), formula (II), formula (III) or formula (IV), but for the 10 fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes suitable for inclusion in the compounds of the invention are hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine, and chlorine, such as, but not limited to ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , ^{17}O , ^{31}P , ^{32}P , ^{35}S , ^{18}F , and ^{36}Cl , respectively. Substitution with heavier isotopes 15 such as deuterium, i.e., ^2H , can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Compounds incorporating positron-emitting isotopes are useful in medical imaging and positron-emitting tomography (PET) studies for determining the distribution of receptors. Suitable positron-emitting isotopes that 20 can be incorporated in compounds of formula (I), formula (II), formula (III) or formula (IV) are ^{11}C , ^{13}N , ^{15}O , and ^{18}F . Isotopically-labeled compounds of formula (I), formula (II), formula (III) or formula (IV) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying 25 Schemes and Examples using appropriate isotopically-labeled reagent in place of non-isotopically-labeled reagent.

(i) **In Vitro Methods—Electrophysiologic Assessment of calcium channel activity:**

Patch-clamp recordings were performed using HEK293 cells stably expressing hCa_v3.2. Cells were plated in T175 flasks and grown at 37 °C and under 5% CO₂ to approximately 50% confluence. On the day of the experiment, cells were harvested with 5 Detachin™ cell detachment solution (Genlantis, San Diego, CA) and maintained in serum-free culture medium supplemented with 25 mM HEPES up to several hours prior to experiment. Whole-cell patch-clamp recordings were obtained using extracellular saline consisting of (mM): 87.5 CsCl, 40 TEA-Cl, 5 CaCl₂, 1 MgCl₂, 10 HEPES, 10 glucose. The pH was adjusted to 7.2 with CsOH and the osmolarity was adjusted to approximately 310 10 mOsm with sucrose. Intracellular solution consisted of (mM): 112 CsCl, 27 CsF, 2 NaCl, 8.2 EGTA, 10 HEPES. Prior to an experiment 4 mM Mg₂ATP was added and the pH was adjusted to 7.2 with CsOH with an osmolarity of approximately 290 mOsm. A two-pulse 15 voltage protocol was utilized to assess compound inhibition. First, cells were held with an 8 s pre-pulse at -100 mV prior to a 160 ms test pulse to -30 mV. This was followed by an 8 s pre-pulse at approximately -75 mV prior to a 160 mV test pulse to -30 mV. Increasing 20 concentrations of antagonist were applied to individual cells in a multi-addition format with 5 minutes in each test concentration. For each cell, responses were normalized to dimethyl sulfoxide vehicle control to generate concentration-response curves.

(ii) In Vivo Data-- Capsaicin induced secondary mechanical hyperalgesia model:

Sprague Dawley rats were briefly restrained, and capsaicin was administered at 10 µg in 10 µL of vehicle by intraplantar injection into the center of the right hind paw. Secondary 5 mechanical hyperalgesia (SMH) was measured at the heel away from the site of injection 180 minutes following capsaicin exposure. Compounds and gabapentin (positive control), were administered p.o. 60 minutes before testing (2 hours after capsaicin) or i.p. 30 minutes before testing (2.5 hours after capsaicin). SMH was measured using calibrated von Frey filaments (Stoelting, Woodale, IL). Following the 1 hour habituation in the testing room, rats were 10 moved to individual plexiglass chambers that sit on top of a wire mesh to allow for access for stimulation of the plantar surface of the hind paws. Rats were allowed to acclimate to the new chambers for 15 minutes before the onset of testing. The paw withdrawal threshold was determined by increasing and decreasing stimulus intensity (force: g) and calculated using Dixon's up-down method (Chaplan, S. R.; Bach, F. W.; Pogrel, J. W.; Chung, J. M.; Yaksh, 15 T. L.; Quantitative assessment of tactile allodynia in the rat paw. J. Neuroscience Methods 1994, 53(1), 55-63.). The filaments (maximum force of 15.0 g) were held in place for 8 seconds or until there was a withdrawal response from the mechanical stimulation.

5 Calcium channel blockers have been associated with a slightly greater decreased risk of stroke compared to other types of antihypertensive agents (Angeli, F.; et al. Calcium channel blockade to prevent stroke in hypertension. *American Journal of Hypertension* 2004, 17(9), 817-822). The enhanced effect did not correlate with differences in systolic blood pressure and the mechanism of action remains unknown. However, calcium channel 10 blockers have been associated with blockade of central neuronal calcium influx and subsequent ischemic injury in two rodent models (Barone, F. C.; et al. SB 201823-A antagonizes calcium currents in central neurons and reduces the effects of focal ischemia in rats and mice. *Stroke* 1995, 26, 1683-1690.). In another model of global ischemia, a calcium channel blocker offered neuroprotection although not permanently (Colbourne, F.; et 15 al. Continuing postischemic neuronal death in CA1: Influence of ischemia duration and cytoprotective doses of NBQX and SNX-111 in rats. *Stroke* 1999, 30(3), 662-668.). Additionally, diminished progression of carotid atherosclerosis has been observed with calcium channel blocker use (Zanchetti, A.; et al. Calcium antagonist lacidipine slows down progression of asymptomatic carotid atherosclerosis. Principal results of the European 20 lacidipine study on atherosclerosis (ELSA), a randomized, double-blind, long-term trial. *Circulation* 2002, 106, r47-r52.).

An increase in intracellular calcium concentration has been correlated with seizure activity (Heinemann, U.; et al. Extracellular free calcium and potassium during paroxysmal activity in the cerebral cortex of the cat. *Exp. Brain Res.* 1977, 27, 237-243.). Several 25 studies have indicated that calcium channel blockers produce anticonvulsant activity (Vezzani, A.; et al. Effects of various calcium channel blockers on three different models of limbic seizures in rats. *Neuropharmacology* 1988, 27(5), 451-458. Otoom, S.; et al. Nifedipine inhibits picrotoxin-induced seizure activity: further evidence on the involvement 30 of L-type calcium channel blockers in epilepsy. *Fundamental & Clinical Pharmacology* 2006, 20, 115-119.).

Calcium channel blockers have been evaluated in the treatment of bipolar disorders and manic depression for decades. There are suggestions that the calcium channel subtype has influence on efficacy of these disorders (Gitlin, M. Treatment-resistant bipolar disorder.

Molecular Psychiatry 2006, 11, 227-240. Levy, N. A.; Janicak, P. G. Bipolar Disorders 2000, 2, 108-119.).

Calcium channel blockers have also been associated with the treatment of anxiety and depression (Saade, S.; et al. The L-type calcium channel blocker nimodipine mitigates 5 "learned helplessness" in rats. Pharmacology, Biochemistry and Behavior 2003, 74, 269-278.).

Antischizophrenic drugs have been found to be calcium channel antagonists (Gould, R. J.; et al. Antischizophrenic drugs of the diphenylbutylpiperidine type act as calcium channel antagonists. Proc. Natl. Acad. Sci. USA 1983, 80, 5122-5125.). Other calcium 10 channel blockers have been suggested for the treatment of schizophrenia (Tort, A. B. L.; et al. Atypical antipsychotic profile of flunarizine in animal models. Psychopharmacology 2005, 177, 344-348.).

Migraines are treated with calcium channel blockers (Arulmoshi, D. K.; et al. Migraine: Current concepts and emerging therapies. Vascular Pharmacology 2005, 43, 176-15 187. Gladstone, J. P.; et al. 30 Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention can be varied so as to obtain an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular patient, compositions and mode of administration. The selected dosage level depends upon the activity of the particular compound, the route of administration, the severity of the condition being treated and the condition and prior medical history of the patient being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required to achieve the

desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

Compounds of the invention can also be administered as a pharmaceutical composition comprising the compounds of interest in combination with one or more pharmaceutically acceptable carriers. The phrase "therapeutically effective amount" of the compound of the invention means a sufficient amount of the compound to treat disorders, at a reasonable benefit/risk ratio applicable to any medical treatment. It is understood, however, that the total daily usage of the compounds and compositions of the invention will be decided by the attending physician within the scope of sound medical judgment. The specific 5 therapeutically effective dose level for any particular patient depends upon a variety of factors including the disorder being treated and the severity of the disorder; activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs 10 used in combination or coincidental with the specific compound employed; and like factors well-known in the medical arts. For example, it is well within the skill of the art to start 15 doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

The total daily dose of the compounds of this invention administered to a human or 20 other animal range from about 0.01 mg/kg body weight to about 100 mg/kg body weight. More preferable doses can be in the range of from about 0.01 mg/kg body weight to about 30 mg/kg body weight. If desired, the effective daily dose can be divided into multiple doses for purposes of administration. Consequently, single dose compositions may contain such amounts or submultiples thereof to make up the daily dose.

The pharmaceutical compositions comprise compounds of the present invention that may be formulated together with one or more non-toxic pharmaceutically acceptable carriers.

Another aspect of the present invention is a pharmaceutical composition comprising compounds of the invention, or a pharmaceutically acceptable salt thereof, and one or more pharmaceutically acceptable carriers, alone or in combination with one or more nonsteroidal anti-inflammatory drugs (NSAID), opioid analgesics, barbiturates, benzodiazepines,

The pharmaceutical compositions of this invention can be administered to humans and other mammals orally, rectally, parenterally, intracisternally, intravaginally, 15 intraperitoneally, topically (as by powders, ointments or drops), buccally or as an oral or nasal spray. The term "parenterally" as used herein, refers to modes of administration which include intravenous, intramuscular, intraperitoneal, intrasternal, subcutaneous and intraarticular injection and infusion.

The term "pharmaceutically acceptable carrier" as used herein, means a non-toxic, 20 inert solid, semi-solid or liquid filler, diluent, encapsulating material or formulation auxiliary of any type. Some examples of materials which can serve as pharmaceutically acceptable carriers are sugars such as, but not limited to, lactose, glucose and sucrose; starches such as, but not limited to, corn starch and potato starch; cellulose and its derivatives such as, but not limited to, sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered 25 tragacanth; malt; gelatin; talc; excipients such as, but not limited to, cocoa butter and suppository waxes; oils such as, but not limited to, peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; glycols; such a propylene glycol; esters such as, but not limited to, ethyl oleate and ethyl laurate; agar; buffering agents such as, but not limited to, magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; 30 isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as, but not limited to, sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening,

flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator.

Pharmaceutical compositions of this invention for parenteral injection comprise pharmaceutically acceptable sterile aqueous or nonaqueous solutions, dispersions, 5 suspensions or emulsions as well as sterile powders for reconstitution into sterile injectable solutions or dispersions just prior to use. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (such as glycerol, propylene glycol, polyethylene glycol and the like), vegetable oils (such as olive oil), injectable organic esters (such as ethyl oleate) and suitable mixtures thereof. Proper fluidity 10 can be maintained, for example, by the use of coating materials such as lecithin, by the maintenance of the required particle size in the case of dispersions and by the use of surfactants.

These compositions may also contain adjuvants such as preservatives, wetting agents, emulsifying agents and dispersing agents. Prevention of the action of microorganisms can be 15 ensured by the inclusion of various antibacterial and antifungal agents, for example, paraben, chlorobutanol, phenol sorbic acid and the like. It may also be desirable to include isotonic agents such as sugars, sodium chloride and the like. Prolonged absorption of the injectable pharmaceutical form can be brought about by the inclusion of agents which delay absorption such as aluminum monostearate and gelatin.

20 In some cases, in order to prolong the effect of the drug, it is desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This can be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, 25 delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

Injectable depot forms are made by forming microencapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be 30 controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter or by incorporating sterilizing agents in the form of sterile solid

compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium just prior to use.

Solid dosage forms for oral administration include capsules, tablets, pills, powders and granules. In such solid dosage forms, the active compound may be mixed with at least 5 one inert, pharmaceutically acceptable excipient or carrier, such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol and silicic acid; b) binders such as carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose and acacia; c) humectants such as glycerol; d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain 10 silicates and sodium carbonate; e) solution retarding agents such as paraffin; f) absorption accelerators such as quaternary ammonium compounds; g) wetting agents such as cetyl alcohol and glycerol monostearate; h) absorbents such as kaolin and bentonite clay and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate and mixtures thereof. In the case of capsules, tablets and pills, the 15 dosage form may also comprise buffering agents.

Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such carriers as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

The solid dosage forms of tablets, dragees, capsules, pills and granules can be 20 prepared with coatings and shells such as enteric coatings and other coatings well-known in the pharmaceutical formulating art. They may optionally contain opacifying agents and may also be of a composition such that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

25 The active compounds can also be in micro-encapsulated form, if appropriate, with one or more of the above-mentioned carriers.

Liquid dosage forms for oral administration include pharmaceutically acceptable 30 emulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethyl formamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan and mixtures thereof.

Besides inert diluents, the oral compositions may also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring and perfuming agents.

Suspensions, in addition to the active compounds, may contain suspending agents as, 5 for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar, tragacanth and mixtures thereof.

Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating 10 carriers or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at room temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

Compounds of the present invention can also be administered in the form of 15 liposomes. As is known in the art, liposomes are generally derived from phospholipids or other lipid substances. Liposomes are formed by mono- or multi-lamellar hydrated liquid crystals which are dispersed in an aqueous medium. Any non-toxic, physiologically acceptable and metabolizable lipid capable of forming liposomes can be used. The present compositions in liposome form can contain, in addition to a compound of the present invention, stabilizers, preservatives, excipients and the like. The preferred lipids are natural 20 and synthetic phospholipids and phosphatidyl cholines (lecithins) used separately or together.

Methods to form liposomes are known in the art. See, for example, Prescott, Ed., Methods in Cell Biology, Volume XIV, Academic Press, New York, N.Y. (1976), p. 33 et seq.

Dosage forms for topical administration of a compound of this invention include 25 powders, sprays, ointments and inhalants. The active compound may be mixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives, buffers or propellants which may be required. Ophthalmic formulations, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

The compounds of the present invention can be used in the form of pharmaceutically 30 acceptable salts derived from inorganic or organic acids. The phrase "pharmaceutically acceptable salt" means those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like and are commensurate with a reasonable benefit/risk ratio.

Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge et al. describe pharmaceutically acceptable salts in detail in (J. Pharmaceutical Sciences, 1977, 66: 1 et seq). The salts can be prepared in situ during the final isolation and purification of the compounds of the invention or separately by reacting a free base function with a suitable organic acid. Representative acid addition salts include, but are not limited to acetate, adipate, alginate, citrate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, glycerophosphate, hemisulfate, heptanoate, hexanoate, fumarate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethansulfonate (isothionate), lactate, malate, maleate, methanesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, palmitoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, tartrate, thiocyanate, phosphate, glutamate, bicarbonate, p-toluenesulfonate and undecanoate. Also, the basic nitrogen-containing groups can be quaternized with such agents as lower alkyl halides such as, but not limited to, methyl, ethyl, propyl, and butyl chlorides, bromides and iodides; dialkyl sulfates like dimethyl, diethyl, dibutyl and diamyl sulfates; long chain halides such as, but not limited to, decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides; arylalkyl halides like benzyl and phenethyl bromides and others. Water or oil-soluble or dispersible products are thereby obtained. Examples of acids which can be employed to form pharmaceutically acceptable acid addition salts include such inorganic acids as hydrochloric acid, hydrobromic acid, sulfuric acid, and phosphoric acid and such organic acids as acetic acid, fumaric acid, maleic acid, 4-methylbenzenesulfonic acid, succinic acid and citric acid.

Basic addition salts can be prepared in situ during the final isolation and purification of compounds of this invention by reacting a carboxylic acid-containing moiety with a suitable base such as, but not limited to, the hydroxide, carbonate or bicarbonate of a pharmaceutically acceptable metal cation or with ammonia or an organic primary, secondary or tertiary amine. Pharmaceutically acceptable salts include, but are not limited to, cations based on alkali metals or alkaline earth metals such as, but not limited to, lithium, sodium, potassium, calcium, magnesium and aluminum salts and the like and nontoxic quaternary ammonia and amine cations including ammonium, tetramethylammonium, 25 tetraethylammonium, methylammonium, dimethylammonium, trimethylammonium, triethylammonium, diethylammonium, ethylammonium and the like. Other representative organic amines useful for the formation of base addition salts include ethylenediamine, ethanolamine, diethanolamine, piperidine, piperazine and the like.

The term "pharmaceutically acceptable prodrug" or "prodrug" as used herein, represents those prodrugs of the compounds of the present invention which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response, and the like,

5 commensurate with a reasonable benefit/risk ratio, and effective for their intended use.

The present invention contemplates compounds of the invention formed by synthetic means or formed by in vivo biotransformation of a prodrug.

The compounds of the invention can exist in unsolvated as well as solvated forms,

including hydrated forms, such as hemi-hydrates. In general, the solvated forms, with

10 pharmaceutically acceptable solvents such as water and ethanol among others are equivalent to the unsolvated forms for the purposes of the invention.

Subsequent hydrolysis under conditions known to one skilled in the art supplies benzoic acid analogs of formula (10-2). Coupling of compounds of formula (10-2) with compounds of formula X-H, wherein the H is a hydrogen on a nitrogen atom contained within a heterocycle and X is said heterocycle as described in the Summary of the Invention, under amide bond coupling conditions gives compounds of formula (2-2). Examples of conditions known to generate amides from a mixture of a carboxylic acid and an amine include but are not limited to adding a coupling reagent such as but not limited to N-(3-dimethylaminopropyl)-N'-ethylcarbodiimide (EDC or EDCI), 1,3-dicyclohexylcarbodiimide (DCC), bis(2-oxo-3-oxazolidinyl)phosphinic chloride (BOPCl), O-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU), O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium tetrafluoroborate (TBTU), 2-(1H-benzo[d][1,2,3]triazol-1-yl)-1,1,3,3-tetramethylisouronium hexafluorophosphate(V) (HBTU), and 2-(3H-[1,2,3]triazolo[4,5-b]pyridin-3-yl)-1,1,3,3-tetramethylisouronium hexafluorophosphate(V). The coupling reagents may be added as a solid, a solution or as the reagent bound to a solid support resin. In addition to the coupling reagents, auxiliary-coupling reagents may facilitate the coupling

reaction. Auxiliary coupling reagents that are often used in the coupling reactions include but are not limited to (dimethylamino)pyridine (DMAP), 1-hydroxy-7-azabenzotriazole (HOAT) and 1-hydroxybenzotriazole (HOBT). The reaction may be carried out optionally in the presence of a base such as triethylamine or diisopropylethylamine. The coupling reaction

5 may be carried out in solvents such as but not limited to tetrahydrofuran, 2-methyltetrahydrofuran, *N,N*-dimethylformamide, dichloromethane, and ethyl acetate or mixtures thereof. The reaction may be conducted at ambient or elevated temperatures.

It is appreciated that the synthetic schemes and specific examples as illustrated in the Examples section are illustrative and are not to be read as limiting the scope of the invention as it is defined in the appended claims. All alternatives, modifications, and equivalents of the 20 synthetic methods and specific examples are included within the scope of the claims.

Optimum reaction conditions and reaction times for each individual step may vary depending on the particular reactants employed and substituents present in the reactants used. Unless otherwise specified, solvents, temperatures and other reaction conditions may be readily selected by one of ordinary skill in the art. Specific procedures are provided in the

25 Examples section. Reactions may be worked up in the conventional manner, e.g. by eliminating the solvent from the residue and further purified according to methodologies generally known in the art such as, but not limited to, crystallization, distillation, extraction, trituration and chromatography. Unless otherwise described, the starting materials and

reagents are either commercially available or may be prepared by one skilled in the art from commercially available materials using methods described in the chemical literature.

Routine experimentations, including appropriate manipulation of the reaction conditions, reagents and sequence of the synthetic route, protection of any chemical functionality that may not be compatible with the reaction conditions, and deprotection at a suitable point in the reaction sequence of the method are included in the scope of the invention. Suitable protecting groups and the methods for protecting and deprotecting different substituents using such suitable protecting groups are well known to those skilled in the art; examples of which may be found in T. Greene and P. Wuts, *Protecting Groups in Chemical Synthesis* (3rd ed.), John Wiley & Sons, NY (1999), which is incorporated herein by reference in its entirety. Synthesis of the compounds of the invention may be accomplished by methods analogous to those described in the synthetic schemes described hereinabove and in specific examples.

Starting materials, if not commercially available, may be prepared by procedures selected from standard organic chemical techniques, techniques that are analogous to the synthesis of known, structurally similar compounds, or techniques that are analogous to the above described schemes or the procedures described in the synthetic examples section.

When an optically active form of a compound of the invention is required, it may be obtained by carrying out one of the procedures described herein using an optically active starting material (prepared, for example, by asymmetric induction of a suitable reaction step), or by resolution of a mixture of the stereoisomers of the compound or intermediates using a standard procedure (such as chromatographic separation, recrystallization or enzymatic resolution).

Similarly, when a pure geometric isomer of a compound of the invention is required, it may be obtained by carrying out one of the above procedures using a pure geometric isomer as a starting material, or by resolution of a mixture of the geometric isomers of the compound or intermediates using a standard procedure such as chromatographic separation.

The organic layer was concentrated, ethanol (40 mL) was added, and the mixture was concentrated to give ethyl 3-({[4-(trifluoromethyl)phenyl]amino}sulfonyl)benzoate.

20 Step B: To the product of Step A was added ethanol (25 mL) followed by a solution of NaOH (1.93 g, 48.3 mmol) in water (25 mL). The reaction was stirred at ambient temperature for 1.5 hours. To the mixture was added dropwise 1 *N* HCl (95 mL), and the mixture was stirred at ambient temperature overnight. The solids were collected by filtration, washed with water (2×20 mL), and dried in a vacuum oven at 45 °C overnights to give 3-({[4-(trifluoromethyl)phenyl]amino}sulfonyl)benzoic acid: ^1H NMR (400 MHz, $\text{DMSO}-d_6$) δ ppm 7.28 (d, $J = 8.4$ Hz, 2H), 7.62 (d, $J = 8.5$ Hz, 2H), 7.71 (t, $J = 7.8$ Hz, 1H), 8.03 (ddd, $J = 7.8, 1.9, 1.1$ Hz, 1H), 8.15 (dt, $J = 7.8, 1.4$ Hz, 1H), 8.34 (t, $J = 1.7$ Hz, 1H), 10.98 (s, 1H), 13.54 (s, 1H); MS (ESI) m/z 344 ($\text{M}-\text{H}$) $^-$.

30 Step C: To 3-({[4-(trifluoromethyl)phenyl]amino}sulfonyl)benzoic acid (4.35 g, 12.6 mmol) and 2-(3*H*-[1,2,3]triazolo[4,5-*b*]pyridin-3-yl)-1,1,3,3-tetramethylisouronium hexafluorophosphate(V) (5.27 g, 13.9 mmol) in *N,N*-dimethylacetamide (30 mL) and 2-methyltetrahydrofuran (90 mL) was added 1,4-diazabicyclo[4.4.0]decane (2.47 g, 17.6 mmol). The mixture was stirred at ambient for 4.5 hours. The solids were collected by filtration, washed with ethanol (15 mL), and dried overnight at 55 °C to yield the title compound as the hydrochloride salt: ¹H NMR (400 MHz, DMSO-*d*₆) δ ppm 1.23-1.99 (m, 6 H), 2.79-3.65 (m, 8 H), 4.53 (s, 1 H),
